    \MySecurityGroup2 -Description 'Example group 2'
Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 0 -ToPort 0 -
    Protocol icmp -GroupId $Group2.Id
Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 0 -ToPort 0 -
    Protocol icmp -GroupId $Group1.Id
```

Parameters

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more destination security groups to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more destination CIDR IP address ranges to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Grant-HypSecurityGroupIngress

March 11, 2024

Adds an ingress rule to a security group.

Syntax

```
Grant-HypSecurityGroupIngress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -GroupId <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Grant-HypSecurityGroupIngress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -IPRange <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is deprecated. Adding an egress rule permits network traffic from source CIDR IP address ranges or security groups to pass to instances within a security group.

Examples

EXAMPLE 1

Create a security group and grant ingress on port 80 from anywhere.

```
$Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup -Description 'Example group'
Grant-HypSecurityGroupIngress $Group.FullPath -FromPort 80 -ToPort 80 -
    Protocol tcp -IPRange '0.0.0.0/0'
```

EXAMPLE 2

Make 2 security groups and permit group 1 access to group 2 only on port 8080 while granting full access to group 1 from group 2.

```
$Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
     -Name MySecurityGroup1 -Description 'Example group 1'
$Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    \MySecurityGroup2 -Description 'Example group 2'
Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort
    8080 -Protocol tcp -GroupId $Group2.Id
Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort
    8080 -Protocol tcp -GroupId $Group1.Id
Grant-HypSecurityGroupEgress $Group2.FullPath -Protocol '-1' -GroupId
    $Group1.Id
Grant-HypSecurityGroupIngress $Group1.FullPath -Protocol '-1' -GroupId
    $Group2.Id
```

Parameters

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more source security groups from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more source CIDR IP address ranges from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

New-HypStorage

March 11, 2024

Creates a new storage tier definition for use in a subsequent New-Item operation.

Syntax

```
New-HypStorage
   [-JobGroup] <Guid>
   -StorageType <StorageType>
   -StoragePath <String[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to create a new storage tier definition, this definition can then be associated with a subsequent New-Item operation via the JobGroup reference.

Examples

EXAMPLE 1

The command creates a new job group with the unique id specified by $job which can subsequently be fed into the New-Item cmdlet. It defines a TemporaryStorage tier which will cause disks to be added to the storage path 'XDHyp:\Connections\MyConnection\Primary Storage.storage'.

```
$job = [Guid]::NewGuid()
New-HypStorage -JobGroup $job -StorageType TemporaryStorage -
    StoragePath @('XDHyp:\Connections\MyConnection\Primary Storage.
    storage')
```

Parameters

-JobGroup

Specifies the JobGroup uid that is used to associate data from calls to this cmdlet with the subsequent New-Item operation.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorageType

The type of the new storage tier. Currently the only storage type is TemporaryStorage.

Type:	StorageType
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path to the storage that will be added. The path must be in one of the following formats: <drive>:\Connections\<ConnectionName>\MyStorage.storage or <drive>:\Connections{<ConnectionUid>}\MyStorage.storage

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

New-HypVMSnapshot

March 11, 2024

Creates a new snapshot for the specified VM item path.

Syntax

```
New-HypVMSnapshot
    [-SnapshotName] <String>
    [[-SnapshotDescription] <String>]
    [-LoggingId <Guid>]
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to create a new snapshot of a virtual machine, for a given Host Service provider path to a VM. The resulting snapshot can then be used for operations that require a snapshot to work.

Examples

EXAMPLE 1

This command creates a snapshot of a VM called 'MyVm.vm'within a hypervisor connection called 'MyConnection'.

```
New-HypVMSnapshot -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
    -SnapshotName "New snapshot" -SnapshotDescription "Example snapshot"

                    XDHyp:\Connections\MyConnection\MyVm.vm\New
                       snapshot.snapshot
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the virtual machine item for which to create a new snapshot. The path specified must be in one of the following formats:

<drive>:\Connections\<Connection Name>\<Item Path of VM object>

or <drive>:\Connections{<connection Uid>\<Item Path of VM object>}

or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>

or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SnapshotName

The name of the new snapshot. This is visible in the hypervisor management console.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SnapshotDescription

The description to add to the snapshot. This is visible in the hypervisor management console.

Type:	String
Position:	3
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Outputs

String

The provider path to the newly created snapshot.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

SnapshotNameAlreadyInUse

The specified name is already in use and will cause a name resolution clash.

FailedToCreateSnapshot

The snapshot creation process failed.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

SnapshotChainTooLong

Snapshot creation failed. Snapshot chain is too long.

SnapshotCreationNotAuthorized

Snapshot creation failed. User not authorized to create snapshots.

Register-HypPvsServer

March 11, 2024

Register PVS Site.

Syntax

```
Register-HypPvsServer
        -SiteId <Guid>
        -SiteName <String>
        -FarmId <Guid>
        -FarmName <String>
        -ServerId <Guid>
        -ServerName <String>
        -ServerAddress <String>
        -Thumbprint <String>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Use this command to register PvsSites with with SiteId FarmId and ResourceLocation.

Examples

EXAMPLE 1

This command registers a PvsServer with 00000000-0000-0000-0000-000000000000 in each attribute

```
Register-HypPvsServer -SiteId 00000000-0000-0000-0000-000000000000 -
    SiteName exampleSiteName -FarmId
    00000000-0000-0000-0000-000000000000 -FarmName exampleFarmName -
    ServerId 00000000-0000-0000-0000-000000000000 -ServerAddress xyz.abc
    .local -ServerName exampleServerName
```

Parameters

-SiteId

The ID of the PVS site.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SiteName

The Name of the PVS site.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FarmId

The ID of the PVS farm.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FarmName

The Name of the PVS farm.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServerId

The Server ID of the PVS server.

Type:	Guid
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServerName

The PVS Server Name

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServerAddress

The PVS Server Address

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Thumbprint

The PVS Server Certificate SSL Thumbprint

Type:	String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Register-HypPvsSite

March 11, 2024

Register PVS Site.

Syntax

```
Register-HypPvsSite
        -SiteId <Guid>
        -SiteName <String>
        -FarmId <Guid>
        -FarmName <String>
        -ResourceLocation <Guid>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Use this command to register PvsSites with with SiteId FarmId and ResourceLocation.

Examples

EXAMPLE 1

This command registers a PvsSite with 00000000-0000-0000-0000-000000000000 in each attribute

```
Register-HypPvsSite -SiteId 00000000-0000-0000-0000-000000000000 -
    SiteName exampleSiteName -FarmId
    00000000-0000-0000-0000-000000000000 -FarmName exampleFarmName -
    ResourceLocation 00000000-0000-0000-0000-000000000000
```

Parameters

-SiteId

The ID of the PVS site.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SiteName

The Name of the PVS site.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-FarmId

The ID of the PVS farm.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FarmName

The Name of the PVS farm.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ResourceLocation

The ResourceLocation ID of the PVS server.

Type:	Guid
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

Remove-HypHostingUnitMetadata

March 11, 2024

Removes metadata from the given HostingUnit.

Syntax

```
Remove-HypHostingUnitMetadata
       [-HostingUnitUid] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-HostingUnitUid] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
```

```
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-HostingUnitName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-HostingUnitName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-InputObject] <HostingUnit[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-InputObject] <HostingUnit[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given HostingUnit.

Examples

EXAMPLE 1

Remove all metadata from all HostingUnit objects.

```
Get-HypHostingUnit | % {
  Remove-HypHostingUnitMetadata -Map $_.MetadataMap  }
```

Parameters

-HostingUnitUid

Id of the HostingUnit

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HostingUnitName

Name of the HostingUnit

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HostingUnit[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-HypHostingUnitNetwork

March 11, 2024

Removes networks from a hosting unit.

Syntax

```
Remove-HypHostingUnitNetwork
      [-NetworkPath] <String>
      [-LiteralPath] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove networks from a hosting unit. This does not remove the network from the hypervisor, only the reference to the network for the Host Service. After it is removed, the network is no longer available for associating with virtual NICs (when creating new virtual machines with the Machine Creation Service). Any virtual machines that have been created already continue to use the network until they are removed from the deployment. This command cannot be used if the connection for the hosting unit is in maintenance mode. If the network to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the network location.

Examples

EXAMPLE 1

The command removes the network called “newNetwork.network”from the hosting unit called “MyHostingUnit”

```
Remove-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
   newNetwork.network'
```

Parameters

-LiteralPath

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkPath

Specifies the path in the hosting unit provider of the network to remove. The path specified must be in one of the following formats: <drive>:\Connections\<HostingUnitName>\MyNetwork.network or <drive>:\Connections{<hostingUnit Uid>}\MyNetwork.network

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypHostingUnitNetwork (Path parameter).

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkObjectToDeleteDoesNotExist

The network path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Remove-HypHostingUnitStorage

March 11, 2024

Removes storage from a hosting unit.

Syntax

```
Remove-HypHostingUnitStorage
      [-StoragePath <String>]
      [-StorageType <StorageType>]
      [-LiteralPath] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove storage locations from a hosting unit. This does not remove the storage from the hypervisor, only the reference to the storage for the Host Service. After removal, the storage is no longer used to store hard disks (when creating new virtual machines with the Machine Creation Service). The hard disks located already on the storage remain in place and virtual machines that have been created already continue to use the storage until they are removed from the deployment. Do not use this command if the connection for the hosting unit is in maintenance mode. If the storage location to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the storage location.

Examples

EXAMPLE 1

The command removes the OS storage location called "newStorage.storage"from the hosting unit called "MyHostingUnit"

```
Remove-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage'
```

EXAMPLE 2

The command removes all OS storage from all hosting units called "Host1".

```
Get-ChildItem XDHYP:\HostingUnits\Host\*.storage | Remove-
   HypHostingUnitStorage XDHYP:\HostingUnits\Host1
```

EXAMPLE 3

The command removes all PersonalvDisk storage from all hosting units called "Host1".

```
Get-ChildItem XDHYP:\HostingUnits\Host\*.storage | Remove-
    HypHostingUnitStorage -StorageType PersonalvDiskStorage
```

Parameters

-LiteralPath

Specifies the path to the hosting unit which defines the storage. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path in the hosting unit provider of the storage to remove. If StoragePath is not specified, all storage is removed from the hosting unit.

The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyStorage.storage

or <drive>:\Connections{<Connection Uid>}\MyStorage.storage

or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyStorage.storage

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StorageType

Specifies the type of storage in StoragePath. Supported storage types are:

OSStorage

PersonalvDiskStorage

TemporaryStorage

Type:	StorageType
Position:	Named
Default value:	OSStorage
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypHostingUnitStorage (StoragePath parameter).

Outputs

Citrix.XDPowerShell.HostingUnit

Remove-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.XDPowerShell.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

AdditionalStorage

The list of additional storage items that the hosting unit can use.

Metadata <Citrix.XDPowerShell.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

After storage is removed, it is the administrator's responsibility to maintain its contents. The Citrix XenDesktop Machine Creation Service does not attempt to clean up any data that is stored in the storage location.

If all storage is removed from the hosting unit, other features of the Machine Creation Service stops functioning until some storage is added again.

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStorageObjectToDeleteDoesNotExist

The storage path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Remove-HypHypervisorConnectionAddress

March 11, 2024

Removes addresses from the list of available connection addresses.

Syntax

```
Remove-HypHypervisorConnectionAddress
      [-LiteralPath] <String>
      [-HypervisorAddress] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove addresses that can be used to connect to the hypervisor specified by the hypervisor connection. If all addresses are removed, the connection cannot be used until a valid address is added to the hypervisor connection.

Examples

EXAMPLE 1

The command removes the address “http:\\myserver.com”from the hypervisor connection called “MyHypervisorConnection”.

```
Remove-HypHypervisorConnectionAddress -LiteralPath XDHyp:\HostingUnits\
   MyHypervisorConnection -HypervisorAddress 'http:\\myserver.com'
```

EXAMPLE 2

The command removes all addresses from all the hypervisor connections currently defined.

```
Get-Item -Path XDHYP:\Connections\* | Remove-
   HypHypervisorConnectionAddress
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hosting unit item to which to add the address. The path specified must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorAddress

Specifies the address to be removed. If this parameter is not provided, all addresses are removed from the hypervisor connection.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypHypervisorConnectionAddress (Path parameter).

Outputs

None

By default, this cmdlet returns no output.

Notes

Changes to a hypervisor connection affect all entities that reference the connection. If all addresses are removed from the connection, any other entities that reference the hypervisor connection (e.g. hosting units) cannot make new connections to the hypervisor.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist

The hypervisor connection to which the address is to be added could not be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-HypHypervisorConnectionMetadata

March 11, 2024

Removes metadata from the given HypervisorConnection.

Syntax

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-InputObject] <HypervisorConnection[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-InputObject] <HypervisorConnection[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given HypervisorConnection.

Examples

EXAMPLE 1

Remove all metadata from all HypervisorConnection objects.

```
Get-HypHypervisorConnection | % {
  Remove-HypHypervisorConnectionMetadata -Map $_.MetadataMap  }
```

Parameters

-HypervisorConnectionUid

Id of the HypervisorConnection

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Name of the HypervisorConnection

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Add-HypHypervisorConnectionMetadata
- Set-HypHypervisorConnectionMetadata

Remove-HypHypervisorConnectionScope

March 11, 2024

Remove the specified HypervisorConnection(s) from the given scope(s).

Syntax

```
Remove-HypHypervisorConnectionScope
      [-Scope] <String[]>
      -InputObject <HypervisorConnection[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionScope
      [-Scope] <String[]>
      -HypervisorConnectionUid <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionScope
      [-Scope] <String[]>
      -HypervisorConnectionName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-HypHypervisorConnectionScope command is used to remove one or more Hypervisor-Connection objects from the given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter
- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid
- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To remove a HypervisorConnection from a scope you need permission to change the scopes of the HypervisorConnection.

If the HypervisorConnection is not in a specified scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Removes a single HypervisorConnection from the 'Finance'scope.

```
Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionUid
    6702C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Removes a single HypervisorConnection from multiple scopes.

```
Remove-HypHypervisorConnectionScope Finance,Marketing -
    HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Removes all visible HypervisorConnection objects from the 'Finance'scope.

```
Get-HypHypervisorConnection | Remove-HypHypervisorConnectionScope
    Finance
```

EXAMPLE 4

Removes HypervisorConnection objects with a name starting with an 'A'from the 'Finance'scope.

```
Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionName A
    *
```

Parameters

-Scope

Specifies the scopes to remove the objects from.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the HypervisorConnection objects to be removed.

Type:	HypervisorConnection[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionUid.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

Accept wildcard characters:	False

-HypervisorConnectionName

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionName.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Remove-HypMetadata

March 11, 2024

Removes metadata from a hypervisor connection or hosting unit.

Syntax

```
Remove-HypMetadata
      [-Property <String>]
      [-LiteralPath] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove custom data from a specific hosting unit or hypervisor connection. If the Property parameter is not provided, all metadata is removed from the specified item.

Examples

EXAMPLE 1

The command removes the metadata with the property "MyProperty"from the hypervisor connection called "MyConnection".

```
Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -
    Property MyProperty
```

EXAMPLE 2

The command removes all the metadata from the hypervisor connection called "MyConnection".

```
Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection
```

EXAMPLE 3

The command removes all the metadata from all the hypervisor connections.

```
dir XDHyp:\connections | Remove-HypMetadata
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hosting unit or hypervisor connection item from which to remove the metadata. The path specified must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

or <drive>:\Connections\<Connection Name>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Property

Specifies the property name of the metadata to be removed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypMetadata (Path parameter).

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataObjectToDeleteDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The hypervisor connection supplied in the path does not exist.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Related Links

- about_HypHostSnapin
- Remove-HypMetadata

Remove-HypServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-HypServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-HypService | % {
  Remove-HypServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-HypEnabledFeatureList

March 11, 2024

Refreshes the Host service's list of enabled features.

Syntax

```
Reset-HypEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Host Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Host service instance's list of enabled features.

```
1  Reset-HypEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-HypServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Host Service.

Syntax

```
Reset-HypServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Host Service access permissions and configuration service locations. The Reset-HypServiceGroupMembership command must be run on at least one instance of the service type (Hyp) after installation and registration with the configuration service. Without this operation, the Host services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-HypServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
   HypServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-HypServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Host.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-HypServiceGroupMembership command.

Outputs

Citrix.Host.Sdk.ServiceInstance

Reset-HypServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Host Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Revoke-HypSecurityGroupEgress

March 11, 2024

Removes an egress rule from a security group.

Syntax

```
Revoke-HypSecurityGroupEgress
       [-LiteralPath] <String>
       -Protocol <String>
       [-FromPort <Decimal>]
```

```
        [-ToPort <Decimal>]
        -GroupId <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Revoke-HypSecurityGroupEgress
        [-LiteralPath] <String>
        -Protocol <String>
        [-FromPort <Decimal>]
        [-ToPort <Decimal>]
        -IPRange <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet is deprecated. To remove a rule, specify parameters matching an existing rule's values.

Examples

EXAMPLE 1

Create a security group, grant full egress to anywhere, then revoke access and delete the security group.

```
$Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup -Description 'Example group'
Grant-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '
    0.0.0.0/0'
Revoke-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '
    0.0.0.0/0'
Remove-Item $Group.FullPath
```

Parameters

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more destination security groups to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more destination CIDR IP address ranges to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups cannot be removed in AWS if they are referened by rules from other security groups.

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Revoke-HypSecurityGroupIngress

March 11, 2024

Removes an ingress rule from a security group.

Syntax

```
Revoke-HypSecurityGroupIngress
       [-LiteralPath] <String>
       -Protocol <String>
       [-FromPort <Decimal>]
       [-ToPort <Decimal>]
       -GroupId <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Revoke-HypSecurityGroupIngress
       [-LiteralPath] <String>
       -Protocol <String>
```

```
        [-FromPort <Decimal>]
        [-ToPort <Decimal>]
        -IPRange <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet is deprecated. To remove a rule, specify parameters matching an existing rule's values.

Examples

EXAMPLE 1

Create 2 security groups, grant access from group 1 to group 2, then revoke access.

```
$Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup1 -Description 'Example group 1'
$Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup2 -Description 'Example group 2'
Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group2.Id
Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group1.Id
Revoke-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group2.Id
Revoke-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group1.Id
```

Parameters

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more source security groups from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more source CIDR IP address ranges from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups cannot be removed in AWS if they are referened by rules from other security groups.

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Set-HypAdminConnection

March 11, 2024

Set the controller to be used by the cmdlets that form the Host service PowerShell snap-in.

Syntax

```
Set-HypAdminConnection
   [-AdminAddress <String>]
   [-BearerToken <String>]
   [-AdminClientIP <String>]
   [-TraceParent <String>]
   [-TraceState <String>]
   [<CommonParameters>]
```

Description

Use this command to set the default controller address to be used by the cmdlets to communicate with the controller. Most Host service cmdlets take an 'AdminAddress'parameter that can be used to define the controller (when used, this overrides this setting). However, the Set-Location cmdlet in the Host service provider does not offer this option. Therefore, the controller address must be set using this cmdlet, if no other cmdlets have set the address previously in the current runspace.

Examples

EXAMPLE 1

This command sets the controller address for the commands to be “myserver.com”. All commands run use this address until it is altered, either by another call to this command or by the use of the ‘AdminAddress’parameter in another command in the Host service snap-in.

```
1  Set-HypAdminConnection -AdminAddress myserver.com
```

Parameters

-AdminAddress

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Type:	String
Position:	Named
Default value:	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BearerToken

Specifies the bearer token assigned to the calling user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminClientIP

Specifies the client IP of the calling user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TraceParent

Specifies the trace parent assigned for internal diagnostic tracing use

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TraceState

Specifies the trace state assigned for internal diagnostic tracing use

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- about_HypHostSnapin

Set-HypDBConnection

March 11, 2024

Configures a database connection for the Host Service.

Syntax

```
Set-HypDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Host Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Set-HypDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
1  Set-HypDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Host Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-HypDBConnection cmdlet returns an object describing the status of the Host Service together with extra diagnostics information. Possible values are:

- OK:

The Host Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Host Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Host Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Host Service currently in use is newer than, and incompatible with, the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

- DBOlderVersionThanService:

The version of the Host Service schema on the database is newer than, and incompatible with, the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Host Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Host Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Host Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-HypDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Host Service.

Syntax

```
Set-HypDBCredentials
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-HypDBCredentials
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Host Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Host Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-HypDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-HypDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-HypDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-HypDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-HypHostingUnitMetadata

March 11, 2024

Adds or updates metadata on the given HostingUnit.

Syntax

```
Set-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-HostingUnitName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-HostingUnitName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-InputObject] <HostingUnit[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-InputObject] <HostingUnit[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HostingUnit objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the HostingUnit with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                        Value
---                                        -----
property                                   value
```

Parameters

-HostingUnitUid

Id of the HostingUnit

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HostingUnitName

Name of the HostingUnit

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HostingUnit[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-HypHostingUnitMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-HypHostingUnitStorage

March 11, 2024

Sets options for a storage location on a hosting unit.

Syntax

```
Set-HypHostingUnitStorage
   [-LiteralPath] <String>
   [-StoragePath] <String>
   [-StorageType <StorageType>]
   [-Superseded <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to set options for storage locations that are defined for a hosting unit. Do not use this command if the connection for the hosting unit is in maintenance mode.

Examples

EXAMPLE 1

The command updates a storage location called “newStorage.storage”associated with the hosting unit called “MyHostingUnit”.

```
Set-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage' -Superseded $true

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage, /newStorage.storage }

          PersonalvDiskStorage : {
 /newStorage.storage }

          VMTaggingEnabled     : True
          AdditionalStorage    : {
 TemporaryStorage }

          Metadata             : {
  }
```

Parameters

-LiteralPath

Specifies the path to the hosting unit which defines the storage. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path to the storage that will be modified. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyStorage.storage

or <drive>:\Connections{<Connection Uid>}\MyStorage.storage

or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyStorage.storage

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StorageType

Specifies the type of storage in StoragePath. Supported storage types are:

OSStorage

PersonalvDiskStorage

TemporaryStorage

Type:	StorageType
Position:	Named
Default value:	OSStorage
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Superseded

Specifies that this storage has been superseded and must not be used for future provisioning operations. Existing virtual machines using this storage will continue to function.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

Outputs

Citrix.XDPowerShell.HostingUnit

Set-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.XDPowerShell.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

AdditionalStorage

The list of additional storage items that the hosting unit can use.

Metadata <Citrix.XDPowerShell.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

The storage path must be valid for the hosting unit. The rules that are applied are as follows:

XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can be produced.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStoragePathInvalid

The specified path is invalid.

HostingUnitStoragePathInvalid

The storage path cannot be found or is invalid. See notes above about validity.

HostingUnitStorageDuplicateObjectExists

The specified storage path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Set-HypHypervisorConnectionMetadata

March 11, 2024

Adds or updates metadata on the given HypervisorConnection.

Syntax

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-InputObject] <HypervisorConnection[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-InputObject] <HypervisorConnection[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the HypervisorConnection with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E
   -48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-HypervisorConnectionUid

Id of the HypervisorConnection

Type:	Guid
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Name of the HypervisorConnection

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-HypHypervisorConnectionMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-HypServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-HypServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypServiceMetadata
   [-InputObject] <Service[]>
```

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-HypServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-HypServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-HypVolumeServiceConfiguration

March 11, 2024

Applies a change to one of the VolumeServiceConfiguration instances in the site.

Syntax

```
Set-HypVolumeServiceConfiguration
   -ConnectionType <String>
   -VolumeServiceConfigurationName <String>
   -VolumeWorkerPackageUri <String>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-HypVolumeServiceConfiguration
   -ConnectionType <String>
    -VolumeServiceConfigurationName <String>
    -RegionName <String>
    -BaseLinuxTemplateId <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Volume service configurations are used to control how cloud-based host connections behave when provisioning machines. They contain two pieces of information. The first is a per-region specification of the cloud template that provides the standard Linux operating system for the cloud. The second is the specification of a URL from which the Citrix Volume Worker software can be installed (not all cloud connections make use of this URL, but they all make use of the template map).

Each cmdlet invocation can be used to either change the volume worker URL, or to modify (or add) an entry in the Linux template map. These two operations are supported by parameter sets. To change both properties, you must invoke the cmdlet twice.

Examples

EXAMPLE 1

This command specifies a Linux template that should be used by default for CloudPlatform connections.

```
Set-HypVolumeServiceConfiguration -VolumeServiceConfigurationName
    SiteDefault -ConnectionType CloudPlatform -RegionName Region1 -
    BaseLinuxTemplateId 9883ba7a-74bf-4002-9b12-18bcc2c2fae8
```

EXAMPLE 2

This command specifies a worker package download URL that should be used by default for CloudPlatform connections.

```
Set-HypVolumeServiceConfiguration -VolumeServiceConfigurationName
    SiteDefault -ConnectionType CloudPlatform -VolumeWorkerPackageUri "
    http://cloudadmin.net/citrix/volumeworker/version1"
```

Parameters

-ConnectionType

Specifies the cloud connection type, such as “AWS”or “CloudPlatform”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VolumeServiceConfigurationName

Specifies the name of the configuration you want to modify. This parameter is used alongside the ConnectionType to specify a single configuration set unambiguously. There can be only one named configuration per connection type. In a newly-configured site, there will be exactly one configuration set called “SiteDefault”for each of CloudPlatform and AWS.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VolumeWorkerPackageUri

Specifies a (new) URI for the volume worker package.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RegionName

Specifies the cloud region in which the Linux template resides. This parameter is used only when passing the BaseLinuxTemplateId parameter. The format of the string is cloud-specific. For example, for an AWS-based cloud, it would be a region identifier such as “us-east-1”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-BaseLinuxTemplateId

Specifies a change to the standard Linux template that should be used in the cloud. When passing this parameter, you must also specify the RegionName parameter to indicate the region in which this template resides. The format of the string is cloud-specific. For example, for an AWS-based cloud, it would be an AMI identifier such as “ami-1234abcd”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.VolumeServiceConfiguration

This cmdlet returns the updated VolumeServiceConfiguration object.

Start-HypVM

March 11, 2024

Starts a VM.

Syntax

```
Start-HypVM
     [-LiteralPath] <String>
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

This command provides a mechanism to start a VM.

Examples

EXAMPLE 1

This command starts a VM called ‘MyVm.vm’within a hypervisor connection called ‘MyConnection’ .

```
Start-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the virtual machine item to start. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections{<connection Uid>\<Item Path of VM object>} or

<drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

- about_HypHostSnapin

Stop-HypVM

March 11, 2024

Stops a VM by issuing a Shutdown request

Syntax

```
Stop-HypVM
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to change the power state of a VM from running to stopped.

Examples

EXAMPLE 1

This command stops a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

```
Stop-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the virtual machine item to stop. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Test-HypDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Host Service.

Syntax

```
Test-HypDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-HypDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-HypDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Host Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-HypDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
   Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Host Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-HypDBConnection cmdlet returns an object describing the status of the selected Host Service instance that would result if the connection string were used with the Set-HypDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-HypDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Host Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Host Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Host Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Host Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Host Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Host Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-HypHostingUnitNameAvailable

March 11, 2024

Checks to ensure that the proposed name for a hosting unit is unused.

Syntax

```
Test-HypHostingUnitNameAvailable
    -HostingUnitName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to check that the proposed name for a hosting unit is unused. This check is done without regard for scoping of the existing hosting unit, so the names of inaccessible hosting units are also checked.

Examples

EXAMPLE 1

This tests whether the value of $NewHostingUnitName is unique or not, and can be used to create a new hosting unit or rename an existing one without failing. True is returned if the name is unique.

```
Test-HypHostingUnitNameAvailable -HostingUnitName $NewHostingUnitName
```

Parameters

-HostingUnitName

The name or names of the hosting units(s) to be tested.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

object[]

An array of PSObjects which pair the name and availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Test-HypHypervisorConnectionNameAvailable

March 11, 2024

Checks to ensure that the proposed name for a hypervisor connection is unused.

Syntax

```
Test-HypHypervisorConnectionNameAvailable
    -HypervisorConnectionName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to check that the proposed name for a hypervisor connection is unused. This check is done without regard for scoping of the existing hypervisor connection, so the names of inaccessible hypervisor connection are also checked.

Examples

EXAMPLE 1

This tests whether the value of $NewConnectionName is unique or not, and can be used to create a new hypervisor connection or rename an existing one. True is returned if the name is unique.

```
Test-HypHypervisorConnectionNameAvailable -HypervisorConnectionName
    $NewConnectionName
```

Parameters

-HypervisorConnectionName

The name or names of the hypervisor connection(s) to be tested.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

object[]

An array of PSObjects which pair the name and availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Test-HypPvsCollectionNameAvailable

March 11, 2024

Tests availability of collection name.

Syntax

```
Test-HypPvsCollectionNameAvailable
    -SiteId <Guid>
    -CollectionName <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Test the availability of a collection name against a site.

Examples

EXAMPLE 1

This command tests the availability of a Collection Name.

```
Test-HypPvsCollectionNameAvailable -SiteId
    00000000-0000-0000-0000-000000000000 -CollectionName "CollectionName
    "
```

Parameters

-SiteId

Target Site ID to validate against.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CollectionName

Collection name to test.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a Site to validate against.

String

Collection name to test availability for.

Outputs

None

By default, this cmdlet returns no output.

Unregister-HypPvsServer

March 11, 2024

Unregister PVS Server.

Syntax

```
Unregister-HypPvsServer
           -ServerId <Guid>
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Use this command to remove a PvsServer with the corresponding ServerId

Examples

EXAMPLE 1

This command unregisters the PVS server with ServerId 00000000-0000-0000-0000-000000000000

```
Unregister-HypPvsServer -ServerId 00000000-0000-0000-0000-000000000000
```

Parameters

-ServerId

The ID of the PVS Server.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

Unregister-HypPvsSite

March 11, 2024

Unregister PVS Site.

Syntax

```
Unregister-HypPvsSite
           -SiteId <Guid>
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Use this command to remove a PvsSite with the corresponding SiteId

Examples

EXAMPLE 1

This command unregisters the PVS site with SiteId 00000000-0000-0000-0000-000000000000

```
Unregister-HypPvsSite -SiteId 00000000-0000-0000-0000-000000000000
```

Parameters

-SiteId

The ID of the PVS site.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Update-HypHypervisorConnection

March 11, 2024

Requests the host service to update the connection properties that depend on the version

of hypervisor in use.

Syntax

```
Update-HypHypervisorConnection
      [-LoggingId <Guid>]
      [-LiteralPath] <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to update the version-specific properties of a hypervisor connection, after an upgrade to the hypervisor system which may provide new capabilities.

Examples

EXAMPLE 1

This command requests that the properties of Connection1 be updated to match the current capabilities of the hypervisor.

```
Update-HypHypervisorConnection -LiteralPath xdhyp:\connections\
   Connection1
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to be updated. The path specified must be in one of the following formats; <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections{HypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode and cannot be updated.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

about_ProvMachineCreationSnapIn

March 11, 2024

Topic

about_ProvMachineCreationSnapin

Short Description

The Machine Creation Service PowerShell snap-in provides administrative functions for the Machine Creation Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Prov'.

Long Description

The Machine Creation Service PowerShell snap-in enables both local and remote administration of the Machine Creation Service. It provides facilities to create virtual machines and manage the associated disk images.

The snap-in provides two main entities:

Provisioning Scheme

Specifies details of new virtual machines created by the Machine Creation Service. Provisioning schemes define the following information.

Hosting Unit

Provides details of the hypervisor and storage on which new virtual machines will be created. Stored and maintained by the Host Service and PowerShell snap-in.

Identity Pool

Lists the Active Directory computer accounts available for use by new virtual machines. Stored and maintained by the Active Directory Identity Service and PowerShell snap-in.

Master Image

Specifies the disk image that will be used for new virtual machines. Accessed through the hosting provider in the Host Service snap-in.

Provisioned VM

Defines the virtual machines created by the Machine Creation Services. These virtual machines are associated with the provisioning scheme from which they were created.

The processes of creating provisioning schemes and new virtual machines can take a significant amount of time to complete. For this reason, these long-running tasks can be run asynchronously so that other commands are accessible while the processes are running. Note, however, that only one long-running task can operate on a provisioning scheme at any one time. The processes are monitored using the Get-ProvTask command. For more information, see the help for Get-ProvTask.

about_ProvMachineCreationSnapIn

Topic

about_ProvMachineCreationSnapin

Short Description

The Machine Creation Service PowerShell snap-in provides administrative functions for the Machine Creation Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Prov'.

Long Description

The Machine Creation Service PowerShell snap-in enables both local and remote administration of the Machine Creation Service. It provides facilities to create virtual machines and manage the associated disk images.

The snap-in provides two main entities:

Provisioning Scheme

Specifies details of new virtual machines created by the Machine Creation Service. Provisioning schemes define the following information.

Hosting Unit

Provides details of the hypervisor and storage on which new virtual machines will be created. Stored and maintained by the Host Service and PowerShell snap-in.

Identity Pool

Lists the Active Directory computer accounts available for use by new virtual machines. Stored and maintained by the Active Directory Identity Service and PowerShell snap-in.

Master Image

Specifies the disk image that will be used for new virtual machines. Accessed through the hosting provider in the Host Service snap-in.

Provisioned VM

Defines the virtual machines created by the Machine Creation Services. These virtual machines are associated with the provisioning scheme from which they were created.

The processes of creating provisioning schemes and new virtual machines can take a significant amount of time to complete. For this reason, these long-running tasks can be run asynchronously so that other commands are accessible while the processes are running. Note, however, that only one long-running task can operate on a provisioning scheme at any one time. The processes are monitored using the Get-ProvTask command. For more information, see the help for Get-ProvTask.

about_Prov_CustomProperties

Topic

Citrix Machine Creation Service SDK - Custom Properties

Short Description

Overview of custom properties settings of the provisioning scheme.

Long Description

Custom properties are the properties of the provisioning scheme that are specific to the target hosting infrastructure. Custom properties can be used to control or tune behaviors of the provisioning scheme.

Custom Properties For Azure

The following custom properties are specific to hosting infrastructure targets using the AzureRM plugin.

- StorageAccountType: Deprecated. This property will be removed in the future, use property StorageType instead.
- StorageType: Storage type used for provisioned virtual machine disks. Storage types include: Standard_LRS, StandardSSD_ZRS, Premium_ZRS, StandardSSD_LRS and Premium_LRS. If this property is not specified, Standard_LRS is used by default.
- IdentityDiskStorageType: Storage type used for the provisioned virtual machine identity disk. If this property is not specified, StandardSSD_LRS is used by default.
- WBCDiskStorageType: Storage type for the provisioned virtual machine write back cache disk. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the value specified in the StorageType property is used for WBCDiskStorageType.

- StorageTypeAtShutdown: Storage type for the provisioned virtual machine disks when it's powered down. It applies to OS disk and write back cache disk only if the provisioning scheme has UseWriteBackCache enabled. When the machine is powered back on, its storage type will be switched back to StorageType property for OS disk and WBCDiskStorageType for write back cache disk. If WBCDiskStorageType is not specified, it will default to StorageType. Default value for this property is empty. Standard_LRS will result in storage type change at shutdown. Any other value will result in an error. Also, when StorageType is selected as either StandardSSD_ZRS or Premium_ZRS, setting StorageTypeAtShutdown to Standard_LRS will result in an error too as this feature is not compatible with ZRS.
- ResourceGroups: Resource groups used to contain provisioned virtual machines. If this property is not specified, Citrix managed resource groups are created. Once the provisioning scheme is created, this property cannot be changed from Citrix managed resource groups to user created resource groups, and vice versa. It can be changed only from one user created resource groups set to another.
- LicenseType: The license type used for provisioned virtual machines. The valid values include Windows_Server, Windows_Client, RHEL_BYOS, and SLES_BYOS. Windows_Server and Windows_Client are for Windows OS. RHEL_BYOS and SLES_BYOS are for Linux OS. If LicenseType is not provided or a null value, Azure will charge the license.
- OsType: Operating system type used for the provisioned virtual machine. OS types include either Windows or Linux. If an OS type is not specified, Windows is used by default.
- UseManagedDisks: Indicate whether to use Azure managed disks for the provisioned virtual machine. Specify either True or False. If this property is not specified, the default value is determined upon the SchemaVersion custom property value (See SchemaVersion). Once the provisioning scheme is created, this property cannot be changed.
- PersistWBC: Persist the write back cache disk for the non-persistent provisioned virtual machine between power cycles. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the write back cache disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.
- PersistOsDisk: Persist the OS disk when power cycling the non-persistent

provisioned virtual machine. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the OS disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.

- PersistVm: Persist the non-persistent provisioned virtual machines in Azure environments when power cycling. Specify either True or False. This property only applies when the PersistOsDisk property is set to True. If this property is not specified, they will be deleted from Azure when powered off.
- MachinesPerStorageAccount: The maximum number of virtual machines containing unmanged disks that can be provisioned under a single Azure storage account. This property only applies when the UseManagedDisks property is set to False. If this property is not specified, a maximum value of 40 is used by default.
- StorageAccountsPerResourceGroup: The maximum number of Azure storage accounts provisioned under a single Azure resource group. This property only applies when the UseManagedDisks property is set to False. If this property is not specified, a maximum value of 100000 is used by default.
- DiskEncryptionSetId: The Azure Encryption Set ID that references the customer-managed encryption used for the server-side encryption key to encrypt disks for provisioned virtual machines. The supplied value must be a valid Azure resource ID. This property only applies when the UseManagedDisks property is set to True. If this property is not specified, Citrix takes no action on the provisioned virtual machines. Virtual machine disks use Azure storage encryption for data at rest. Once the provisioning scheme is created, this property cannot be changed.
- UseSharedImageGallery: Use Azure Shared Image Gallery as a published image repository for MCS to provision virtual machines in Azure. Specify either True or False. This property only applies when the UseManagedDisks property is set to True. If this property is not specified, UseSharedImageGallery is set to False by default, and the prepared images for the machine catalog are stored as managed disk snapshots.
- SharedImageGalleryReplicaRatio: The ratio of virtual machines to shared image gallery version replicas. This value is an integer greater than 0. This property only applies when the UseSharedImageGallery property is set to True. If this property is not specified,

SharedImageGalleryReplicaRatio is set to 1000 for persistent OS disks and 40 for non-persistent OS disks by default.

- SharedImageGalleryReplicaMaximum: The maximum number of replicas for each shared image gallery version. This value is an integer greater than 0. This property only applies when the UseSharedImageGallery property is set to True. If this property is not specified, SharedImageGalleryReplicaMaximum is set to 10 by default.
- DedicatedHostGroupId: The Azure Dedicated Host Group ID. Format the value as "myResourceGroup/myHostGroup". If this property is used, virtual machines are provisioned on the Azure dedicated hosts specified by DedicatedHostGroupId.
- EnableIntuneEnroll: Automatically enroll the provisioned virtual machines with Microsoft Intune to manage them with policy and apps at scale. This property only applies to a provisioning scheme with IdentityType set to "AzureAd". If this property is not specified, the provisioned virtual machine will not be enrolled with Intune.
- Zones: The Azure Availability Zones containing provisioned virtual machines. Use a comma as a delimiter for multiple zones. If this property is not specified, the provisioned virtual machine is randomly placed across all Azure Availability Zones in the region defined by the hosting unit.
- UseEphemeralOsDisk: Use Azure Ephemeral OS disk for the provisioned virtual machine. Specify either True or False. This property only applies when the UseManagedDisks property is not False and the UseSharedImageGallery property is set to True. When the UseEphemeralOsDisk property is set to True, the chosen virtual machine size supports the size of the Ephemeral OS disk and the cache disk, which is larger than the master image disk. If this property is not specified, UseEphemeralOsDisk is set to False by default. Once the provisioning scheme is created, this property cannot be changed.
- SchemaVersion: This value is a float and is added (value as float 2) automatically to CustomProperties if omitted in CustomProperties. If this property is set to greater than or equal to 2, MCS will use managed disks by default, unless UseManagedDisks property is set to False. If this property is set to less than 2, MCS will use unmanaged disks by default, unless UseManagedDisks property is set to True.

- UseTempDiskForWBC: Indicates whether to use Azure temporary storage to store write back cache file. Specify either True or False. If this property is not specified, the UseTempDiskForWBC parameter is set to False by default.
  The Azure temporary storage can be used to store write back cache file when all the following conditions are meet:

  PersistWBC is False
  UseTempDiskForWBC is True
  UseWriteBackCache is True
  UseEphemeralOsDisk is False
  Azure temporary storage has enough space for both paging file and write back cache file.

- PageFileDiskDriveLetterOverride: The drive letter of the disk where the page file is stored. The drive letter should be between ‘C’and ‘Z’.
  The properties ‘PageFileDiskDriveLetterOverride’, ‘InitialPageFileSizeInMB’, and ‘MaxPageFileSizeInMB’should always come together.

- InitialPageFileSizeInMB: The initial page file size in megabytes which must be between 16 MB and 16777216 MB, and not greater than the maximum page file size.

- MaxPageFileSizeInMB: The maximum page file size in megabytes which must be greater than or equal to the initial page file size, and less than 16777216 MB. Also it can not exceed the amount of free space on the drive.

- BackupVmConfiguration: A secondary list of service offerings optionally paired with type as Spot
  to fall back on when machine power on fails due to resource shortage error from Azure.
  Type when not specified will be inferred as Regular.
  We would always try to power on with the primary service offering first, and only when that fails we
  would try secondary config starting from the first item in the list.
  Failure to power on with primary or any of the secondary configs will result in a “Resource Not Available”error.
  Few examples of how to specify this property:
  “<CustomProperties>
  <Property xsi:type=“‘StringProperty‘”Name=“‘BackupVmConfiguration‘”Value=‘”[‘ServiceOffering’: ‘A’, ‘ServiceOffering’: ‘B’, ‘ServiceOffering’: ‘C’]‘”/></CustomProperties>”
  <Property xsi:type=“‘StringProperty‘”Name=“‘BackupVmConfiguration‘”Value=‘”[{‘ServiceOffering’: ‘A’, ‘Type’: ‘Spot’}, {‘ServiceOffering’: ‘B’, ‘Type’: ‘Regular’}, {‘ServiceOffering’: ‘C’, ‘Type’: ‘Spot’}]‘”/></CustomProperties>”

Custom Properties For Aws

The following custom properties are specific to hosting infrastructure targets using the AWS plugin.

- AwsCaptureInstanceProperties: Capture AWS instance properties, including the Identity Access Management role and tags from the master image, then apply them to the provisioned virtual machines. Specify either True or False. If this property is not specified, AwsCaptureInstanceProperties is set to False by default.
  Note: AwsCaptureInstanceProperties is now deprecated.
- AwsOperationalResourcesTagging: Apply tags from master image to all Citrix created operational resources including virtual machines, VM disks, VM network interfaces, S3 buckets, S3 objects, launch templates and AMIs. Specify either True or False. When setting this property to True, you must also set the AwsCaptureInstanceProperties parameter to True or must have supplied Machine Profile. If neither of these two values are specified, the AwsOperationalResourcesTagging parameter is set to False by default.

Custom Properties For Gcp

The following custom properties are specific to hosting infrastructure targets using the GCP plugin.

- CatalogZones: GCP zones to place provisioned virtual machines. Use comma as delimiter for multiple zones. If this property is not specified, the provisioned virtual machine is randomly placed across GCP zones.
- CryptoKeyId: Use the customer-managed encryption key to encrypt data on provisioned virtual machines. Format the value as "project:location:keyRing:key".If this property is not specified, a google managed encryption key is used.
- StorageType: Storage type used for provisioned virtual machine disks. Storage types depend on the region/zone, but can include: pd-standard, pd-balanced, pd-ssd, local-ssd, and pd-extreme. If this property is not specified, the master image's boot disk type is used by default.
- IdentityDiskStorageType: Storage type used for the provisioned virtual machine identity disk. If this property is not specified, 'pd-standard' is used by default.
- WBCDiskStorageType: Storage type for the provisioned virtual machine write back cache disk. This property only applies to a provisioning

scheme with UseWriteBackCache enabled. If this property is not specified, ‘pd-standard’is used by default.
- PersistOsDisk: Persist the OS disk when power cycling the non-persistent provisioned virtual machine. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the OS disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.
- PersistWBC: Persist the write back cache disk for the non-persistent provisioned virtual machine between power cycles. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the write back cache disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.

Custom Properties For Vmware

The following custom properties are specific to hosting infrastructure targets using the VMware plugin.

- FolderId: The ID of a VM Placement Folder. If a valid value for the FolderID is specified, for example, “group-v1234”, VMs are created in that folder ID. If the property is not specified, VMs are created in the same folder where the master image is placed.

Custom Properties For Scvmm

The following custom properties are specific to hosting infrastructure targets using the SCVMM plugin.

- AzureArcSubscriptionId: Azure subscription id that the virtual machine will be connected to as an Azure Arc connected virtual machine. If this property is not specified, the virtual machine will fail to connect to Azure Arc.
- AzureArcRegion: Azure region that the virtual machine will be connected to as an Azure Arc connected virtual machine. If this property is not specified, the virtual machine will fail to connect to Azure Arc.
- AzureArcResourceGroup: Azure resource group that the virtual machine will be connected to as an Azure Arc connected virtual machine. If this property is not specified, the virtual machine will fail to connect to Azure Arc.

- EnableAzureArcOnboarding: Indicates whether to connect the MCS provisioned virtual machines to Azure Arc. Specify either True or False.
  This property only applies to the SCVMM managed Azure Stack HCI cluster.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like ''High*''-or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double

quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned

property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID

that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Add-ProvImageVersionMetadata

March 11, 2024

Adds metadata on the given image version scheme.

Syntax

```
Add-ProvImageVersionMetadata
   [-PreparedImageVersionUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvImageVersionMetadata
    [-PreparedImageVersionUid] <Guid>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvImageVersionMetadata
    [-PreparedImageDefinitionName] <String>
    [-PreparedImageVersionNumber] <String>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvImageVersionMetadata
    [-PreparedImageDefinitionName] <String>
    [-PreparedImageVersionNumber] <String>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvImageVersionMetadata
    [-InputObject] <ImageVersion[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvImageVersionMetadata
    [-InputObject] <ImageVersion[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given image version objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ImageVersionMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the image version with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Add-ProvImageVersionMetadata -PreparedImageVersionUid 4CECC26E-48E1-423
    F-A1F0-2A06DDD0805C -Name property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-PreparedImageVersionUid

Id of the image verison

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-PreparedImageDefinitionName

Name of the image definition

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-PreparedImageVersionNumber

Version number of the image version

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

ImageVersion objects to which the metadata is to be added.

Type:	ImageVersion[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the image version specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageVersion

You can pipe a ImageVersion object or any object containing a parameter called 'ImageDefinitionName'and 'ImageVersionNumber'or 'ImageVersionUid'to Add-ImageVersionMetadata.

PSObject

A metadata map object can be piped to the Add-ImageVersionMetadata command.

Outputs

Citrix.MachineCreation.Sdk.Metadata

Add-ProvImageVersionMetadata returns an array of objects containing the newly added metadata.

Property <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes ————InvalidParameterCombination

The cmdlet parameters are inconsistent.

ImageVersionNotFound

One of the specified image version was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Add-ProvMetadataConfiguration

March 11, 2024

Add VM metadata configuration settings for a plugin.

Syntax

```
Add-ProvMetadataConfiguration
   [-PluginType] <String>
   [-ConfigurationName] <String>
   [-ConfigurationValue] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to configure metadata setting for a hypervisor. Customer can run the command to manage the allowed Azure VM extension list.

When an extension is added, it will be installed for catalog machines if the extension is also defined in MachineProfile VM/Template.

Extensions that are not in the allowed list will be automatically ignored during catalog creation.

Examples

EXAMPLE 1

Add Azure VM extension AADLoginForWindows

```
Add-ProvMetadataConfiguration -PluginType "AzureRmFactory" -
   ConfigurationName "Extension" -ConfigurationValue "
   AADLoginForWindows"
```

Parameters

-PluginType

The name of the hypervisor plug-in factory. Currently, AzureRmFactory is the only supported plug-in factory.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ConfigurationName

The configuration name. Currently, Extension is the only supported configuration.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ConfigurationValue

The setting for metadata configuration, for example Azure extension type.

Type:	String
Position:	4
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ConfigurationValueAlreadyExists

The configuration has already been added to the database.

ConfigurationNotValid

The plugin type or configuration name is not valid. AzureRmFactory is the only plugin type, and Extension is the only configuration supported.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, check the Windows event logs on your self-hosted delivery controller or contact Citrix support if using Citrix DaaS (Citrix-hosted delivery controller).

Add-ProvSchemeControllerAddress

March 11, 2024

Adds a list of controller addresses to a provisioning scheme, not recommended any more due to an enhancement in that the list of controller address can be automatically retrieved from the broker.

Syntax

```
Add-ProvSchemeControllerAddress
   [-ProvisioningSchemeName] <String>
   [-ControllerAddress] <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeControllerAddress
   -ProvisioningSchemeUid <Guid>
   [-ControllerAddress] <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to associate controller hosts, or a set of brokers, with a specific provisioning scheme. This optional data is passed to the machines created by the Machine Creation Services, where it is used to associate the newly created machine with a broker. The list is returned along with the assigned provisioning scheme.

Examples

EXAMPLE 1

Add a set of controllers to the provisioning scheme with the identifier "01a4a008-8ce8-4165-ba9c-cdf15a6b0501".

```
Add-ProvSchemeControllerAddress -ProvisioningSchemeUid "01a4a008-8ce8
   -4165-ba9c-cdf15a6b0501" -ControllerAddress (ddcA.citrix.com,ddcB.
   citrix.com,ddcC.citrix2.com)

CleanOnBoot                   : True
ControllerAddress             : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }

CpuCount                      : 1
DiskSize                      : 20
HostingUnitName               : HostUnit1
HostingUnitUid                : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
IdentityPoolName              : idPool1
IdentityPoolUid               : 03743136-e43b-4a87-af74-ab71686b3c16
MachineCount                  : 0
MachineProfile                :
MasterImageVM                 : Base.vm/base.snapshot
MasterImageVMDate             : 17/05/2020 09:53:40
MemoryMB                      : 1024
Metadata                      : {
 Department = Sales }

MetadataMap                   : {
 [Department = Sales] }

ProvisioningSchemeName        : Scheme2
ProvisioningSchemeUid         : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
ProvisioningSchemeVersion     : 1
TaskId                        : 00000000-0000-0000-0000-000000000000

Warnings                       : {
  }

WriteBackCacheDiskIndex        : 0
```

EXAMPLE 2

Add controller addresses to a provisioning scheme using a ProvisioningScheme object.

```
Get-ProvScheme -ProvisioningSchemeName scheme1 | Add-
    ProvSchemeControllerAddress -ControllerAddress (ddcA.citrix.com,ddcB
    .citrix.com,ddcC.citrix2.com)

CleanOnBoot                    : True
ControllerAddress              : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }

CpuCount                       : 1
DiskSize                       : 20
HostingUnitName                : HostUnit1
HostingUnitUid                 : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
IdentityPoolName               : idPool1
IdentityPoolUid                : 03743136-e43b-4a87-af74-ab71686b3c16
MachineCount                   : 0
MachineProfile                 :
MasterImageVM                  : Base.vm/base.snapshot
MasterImageVMDate              : 17/05/2020 09:53:40

Warnings                      : {
  }

WriteBackCacheDiskIndex       : 0
```

Parameters

-ProvisioningSchemeName

The name for the provisioning scheme that the list of addresses is to be added to.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme that the list of addresses is to be added to.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerAddress

Specifies the array of controller DNS names to be added to the provisioning scheme.

Type:	String[]
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Add-ProvSchemeControllerAddress.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

Add-ProvSchemeControllerAddress returns the updated ProvisioningScheme object containing the union of the old and new controller address lists.

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Add-ProvSchemeMetadata

March 11, 2024

Adds metadata on the given provisioning scheme.

Syntax

```
Add-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-ProvisioningSchemeName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-ProvisioningSchemeName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-InputObject] <ProvisioningScheme[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-InputObject] <ProvisioningScheme[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given provisioning scheme objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ProvSchemeMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the provisioning scheme with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Add-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-ProvisioningSchemeUid

Id of the ProvisioningScheme

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Name of the ProvisioningScheme

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

ProvisioningScheme objects to which the metadata is to be added.

Type:	ProvisioningScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the provisioning scheme specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Add-ProvSchemeMetadata.

PSObject

A metadata map object can be piped to the Add-ProvSchemeMetadata command.

Outputs

Citrix.MachineCreation.Sdk.Metadata

Add-ProvSchemeMetadata returns an array of objects containing the newly added metadata.

Property <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Add-ProvSchemeScope

March 11, 2024

Add the specified provisioning scheme(s) to the given scope(s).

Syntax

```
Add-ProvSchemeScope
   [-Scope] <String[]>
   -InputObject <ProvisioningScheme[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeScope
   [-Scope] <String[]>
   -ProvisioningSchemeUid <Guid[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeScope
   [-Scope] <String[]>
   -ProvisioningSchemeName <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-ProvSchemeScope command is used to associate one or more provisioning schemes with given scope(s).

To add a provisioning scheme to a scope, you need permission to change the scopes of the provisioning scheme and permission to add objects to all of the scopes you have specified.

If the provisioning scheme is already in a scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Adds a single provisioning scheme to the 'Finance'scope.

```
Add-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073-4080-
    A0EE-EC74CB537C52
```

EXAMPLE 2

Adds a single provisioning scheme to the multiple scopes.

```
Add-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702C5D0-
    C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Adds all visible provisioning schemes to the 'Finance'scope.

```
Get-ProvScheme | Add-ProvSchemeScope Finance
```

EXAMPLE 4

Adds all provisioning schemes whose name starts with letter 'A'to the 'Finance'scope.

```
Add-ProvSchemeScope Finance -ProvisioningSchemeName A*
```

Parameters

-Scope

Specifies the scopes to add the objects to.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the ProvisioningScheme objects to be added.

Type:	ProvisioningScheme[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Specifies the ProvisioningScheme objects to be added by the UID of the provisioning scheme.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Specifies the ProvisioningScheme objects to be added by the name of the provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Add-ProvScope.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Add-ProvTaskMetadata

March 11, 2024

Adds metadata on the given Task.

Syntax

```
Add-ProvTaskMetadata
   [-TaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvTaskMetadata
   [-TaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to store additional custom data against given Task objects.

This cmdlet does not overwrite existing metadata on an object - use the Set-ProvTaskMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Add-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name
    property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-TaskId

Id of the Task.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Add-ProvTaskMetadata command.

PSObject

A metadata map object can be piped to the Add-ProvTaskMetadata command.

Outputs

Citrix.MachineCreation.Sdk.Metadata

Add-ProvTaskMetadata returns an array of objects containing the newly added metadata.

Property <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Cancel-ProvVMUpdate

March 11, 2024

(DEPRECATED) Cancels pending property updates on provisioned virtual machines.

Syntax

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeName <String>
      -VMName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeUid <Guid>
      -VMName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet has been deprecated and replaced by %5BClear-ProvVMUpdateTimeWindow%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/MachineCreation/Clear-ProvVMUpdateTimeWindow.html). %5BClear-ProvVMUpdateTimeWindow%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/MachineCreation/Clear-ProvVMUpdateTimeWindow.html) is the new name for Cancel-ProvVMUpdate and provides all the same functionality, please use it going foward in place of Cancel-ProvVMUpdate.

This cmdlet clears the ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil fields on virtual machines, canceling any pending property updates. If a machine is already powering on with a property update, it cannot be cancelled with this cmdlet.

Examples

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will have pending property updates cancelled.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId' and 'ProvisioningSchemeName' to Cancel-ProvVMUpdate.

Outputs

None

By default, this cmdlet returns no output.

Clear-ProvSchemeWarning

March 11, 2024

Clears warnings from a Provisioning Scheme.

Syntax

```
Clear-ProvSchemeWarning
      -ProvisioningSchemeName <String>
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Clear-ProvSchemeWarning
      -ProvisioningSchemeUid <Guid>
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to clear warnings from a provisioning scheme.

Examples

EXAMPLE 1

Clears all warnings from the provisioning scheme named 'MyScheme'.

```
Get-ProvScheme -ProvisioningSchemeName MyScheme | Clear-
    ProvSchemeWarning -All
```

EXAMPLE 2

Clears all warnings from the provisioning scheme named 'MyScheme'.

```
Clear-ProvSchemeWarning -ProvisioningSchemeName MyScheme -All
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to clear warnings from.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to clear warnings from.

Type:	Guid

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-All

Whether to clear all warnings from the provisioning scheme. This is the only option supported at this time.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe an object containing a string property called 'ProvisioningSchemeName'to Clear-ProvSchemeWarning.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Clear-ProvVMUpdateTimeWindow

March 11, 2024

Cancels pending property updates on provisioned virtual machines.

Syntax

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeName <String>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeName <String>
     -VMName <String[]>
     [-LoggingId <Guid>]
```

```
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeUid <Guid>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeUid <Guid>
     -VMName <String[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Provides the ability to clear pending property updates on existing virtual machines.

This cmdlet clears the ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil fields on virtual machines, canceling any pending property updates. If a machine is already powering on with a property update, it cannot be cancelled with this cmdlet.

Examples

EXAMPLE 1

Clear the time window for all VMs in azure-catalog, canceling the pending property update for each machine.

```
Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
   ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
   ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
   ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
   ---------------------------------  -----------------------------
azu01                                1              3/11/2022  11:00:00
   PM         3/12/2022  12:00:00 AM
azu02                                1              3/11/2022  11:00:00
   PM         3/12/2022  12:00:00 AM
azu03                                1              3/11/2022  11:00:00
   PM         3/12/2022  12:00:00 AM
azu04                                1              3/11/2022  11:00:00
   PM         3/12/2022  12:00:00 AM

Clear-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog
```

```
10
11 Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
       ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
       ProvisioningSchemeUpdateUntil
12 VMName       ProvisioningSchemeVersion
       ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
13 ------       -------------------------
       ---------------------------------  ----------------------------
14 azu01                                1
15 azu02                                1
16 azu03                                1
17 azu04                                1
```

EXAMPLE 2

Clear the time window for machines azu01,azu02 in azure-catalog, canceling the pending property update for the two machines. The other machines remain having a property update time window set.

```
 1 Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
       ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
       ProvisioningSchemeUpdateUntil
 2 VMName       ProvisioningSchemeVersion
       ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
 3 ------       -------------------------
       ---------------------------------  ----------------------------
 4 azu01                                1               3/11/2022  11:00:00
       PM         3/12/2022  12:00:00 AM
 5 azu02                                1               3/11/2022  11:00:00
       PM         3/12/2022  12:00:00 AM
 6 azu03                                1               3/11/2022  11:00:00
       PM         3/12/2022  12:00:00 AM
 7 azu04                                1               3/11/2022  11:00:00
       PM         3/12/2022  12:00:00 AM
 8
 9 Cancel-ProvVMUpdate -ProvisioningSchemeName azure-catalog -VMName azu01
       ,azu02
10
11 Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
       ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
       ProvisioningSchemeUpdateUntil
12 VMName       ProvisioningSchemeVersion
       ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
13 ------       -------------------------
       ---------------------------------  ----------------------------
14 azu01                                1
15 azu02                                1
16 azu03                                1               3/11/2022  11:00:00
       PM         3/12/2022  12:00:00 AM
17 azu04                                1               3/11/2022  11:00:00
       PM         3/12/2022  12:00:00 AM
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will have pending property updates cancelled.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called ‘VMId’and ‘ProvisioningSchemeName’to Clear-ProvVMUpdateTimeWindow.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Confirm-ProvOperationEvent

March 11, 2024

Acknowledge a list of MCS operation events.

Syntax

```
Confirm-ProvOperationEvent
        [-EventId <Int32[]>]
        [-LinkedObjectType <String>]
        [-LinkedObjectUid <Guid>]
        [-All]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Allows you to set the EventState from New to Acknowledged.

Examples

EXAMPLE 1

Sets the operation event with a EventId of 42 to Acknowledged.

```
Set-ProvOperationEvent -EventId 42
```

EXAMPLE 2

Sets all operation events for provisioning scheme with ID 93f2c1b3-3015-4d63-92fe-678f1523b4de to Acknowledged.

```
Set-ProvOperationEvent -LinkedObjectType ProvisioningScheme -
    LinkedObjectUid 93f2c1b3-3015-4d63-92fe-678f1523b4de
```

Parameters

-EventId

The array of event id which all associated operation events will be set to Acknowledged.

Type:	Int32[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LinkedObjectType

The type of the linked object for which all associated operation events will be set to Acknowledged.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectUid

The unique identifier of the linked object for which all associated operation events will be set to Acknowledged.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-All

All operation events will be set to Acknowledged.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Export-ProvScheme

March 11, 2024

Exports a provisioning scheme in the form of a JSON encoded string.

Syntax

```
Export-ProvScheme
      -ProvisioningSchemeName <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Export-ProvScheme
      -ProvisioningSchemeUid <Guid>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The primary use of this cmdlet is to export a provisioning scheme and the VMs provisioned with this scheme. The exported JSON string can then be used to import this provisioning scheme and provisioned VMs into another site. The exported JSON string contains data about the provisioning scheme, image history, and provisioned VMs. However, it does not contain any AD accounts created during provisioning. Use cmdlet Export-AcctIdentityPool to export the identity pool containing those AD accounts.

Examples

EXAMPLE 1

Exports the provisioning scheme with the name MyScheme.

```
Export-ProvScheme -ProvisioningSchemeName MyScheme
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Export-ProvScheme.

Outputs

String

A JSON encoded string describing the provisioning scheme, image history, and VMs created with the provisioning scheme.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

- Import-AcctIdentityPool

Get-ProvDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the MachineCreation Service.

Syntax

```
Get-ProvDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected MachineCreation Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the MachineCreation Service instance running on controller "controller1.mydomain.net".

```
Get-ProvDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current MachineCreation Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the MachineCreationService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix MachineCreation Service.

Syntax

```
Get-ProvDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix MachineCreation Service database schema, add a new MachineCreation service to an existing site, remove a MachineCreation service from a site, or create a database server logon for a MachineCreation service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected MachineCreation service instance, otherwise the scripts relate to MachineCreation service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to MachineCreation service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to MachineCreation service roles

If ScriptType is Evict, the returned script contains:

- Removal of MachineCreation service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix MachineCreation Service and copies it to a file called "C:\MachineCreationSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a MachineCreation service schema.

```
Get-ProvDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\MachineCreationSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the MachineCreation service. This can be used when configuring a mirror server for use.

```
1  Get-ProvDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
       MachineCreationLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new MachineCreation service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the MachineCreation services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix MachineCreation Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a MachineCreation Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a MachineCreation Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the MachineCreation Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the

required permissions for local services to access the database schema for MachineCreation services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the MachineCreation Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Test-ProvDBConnection

Get-ProvDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix MachineCreation Service.

Syntax

```
Get-ProvDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix MachineCreation Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix MachineCreation Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix MachineCreation Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix MachineCreation Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix MachineCreation Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-ProvServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-ProvDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix MachineCreation Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-ProvDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix MachineCreation Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any MachineCreation services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ProvServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvImageDefinition

March 11, 2024

Gets the list of image definitions.

Syntax

```
Get-ProvImageDefinition
    [-PreparedImageDefinitionUid <Guid>]
    [[-PreparedImageDefinitionName] <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Lets you retrieve the list of defined image definitions.

Examples

EXAMPLE 1

Returns all of the available image definitions.

```
Get-ProvImageDefinition

CreateTime                      : 1/1/2022 12:00:00

PreparedImageDefinitionName     : Image1
PreparedImageDefinitionUid      : 7585f0de-192e-4847-a6d8-22713c3a2f42
UseWriteBackCache               : False
```

Parameters

-PreparedImageDefinitionName

The name of the image definition.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PreparedImageDefinitionUid

The unique identifier of the image definition.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definition and contains the following information:

CreateTime <DateTime>

The date and time when the image definition was created.

CustomProperties <string>

Properties of the image definition which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

Description <string>

The description of the image definition.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the definition uses.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the definition uses.

OsType <string>

The OS type for the image versions in this image definition.

PreparedImageDefinitionName <string>

The name of the image definition.

PreparedImageDefinitionUid <Guid>

The unique identifier for the image definition.

UseWriteBackCache <bool>

Whether or not to use write back cache for the image versions in this image definition.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Get-ProvImageRuntimeEnvironment

March 11, 2024

Get image runtime Environment.

Syntax

```
Get-ProvImageRuntimeEnvironment
   -ImageVersionUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvImageRuntimeEnvironment
   -ProvisioningSchemeUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allow you to extract information from 'ImageRutimeInfo'field in provisioning scheme or image version.

Examples

EXAMPLE 1

Get the image runtime environment associated with the given image version.

```
$res = Get-ProvImageRuntimeEnvironment -ImageVersionUid a80c8338-e7af
    -48d6-8f08-21d2590b21b6
PS C:\Users\hanw> $res

Capabilities           : {
 [AzureAdSupported, True], [HybridAzureAdSupported, True], [
    IntuneSupported, False] }

DeviceEnrollmentStatus : Unknown
IdentityJoinStatus     : NotDomainJoined
OperatingSystem        : Citrix.MachineCreation.Sdk.OperatingSystemInfo
PagingFileSettings     : {
 Citrix.MachineCreation.Sdk.PagingFileSetting }

VDASessionSupport      : MultiSession

PS C:\Users\hanw> $res.OperatingSystem

FullName                          Type
--------                          ------------------
Windows Server 2019 Datacenter    Windows
```

EXAMPLE 2

Get the image runtime environment associated with the given provisioning scheme.

```
$res = Get-ProvImageRuntimeEnvironment -ProvisioningSchemeUid c0c55fa2
    -3d9f-44ee-8aba-3baec6547525
PS C:\Users\hanw> $res

Capabilities           : {
 [AzureAdSupported, False], [HybridAzureAdSupported, False], [
    IntuneSupported, True] }

DeviceEnrollmentStatus : Unknown
IdentityJoinStatus     : NotDomainJoined
OperatingSystem        : Citrix.MachineCreation.Sdk.OperatingSystemInfo
PagingFileSettings     :
VDASessionSupport      : SingleSession

```

```
15
16 PS C:\Users\hanw> $res.OperatingSystem
17
18 FullName       Type
19 --------       ------------------
20 Ubuntu 22.04   Linux
```

Parameters

-ImageVersionUid

The unique identifier of image version.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageRuntimeEnvironment

This object provides details of the image runtime environment and contains the following infrmation:

Capabilities <System.Collections.Generic.IDictionary<string, string»

The capabilities of the image such as 'AzureAdSupported'.

DeviceEnrollmentStatus <string>

The device enrollment status of the image.

IdentityJoinStatus <string>

The identity join status of the image.

OperatingSystem <Citrix.MachineCreation.Sdk.OperatingSystemInfo>

The operating system information of the image.

PagingFileSettings <Citrix.MachineCreation.Sdk.PagingFileSetting[]>

The page file settings of the image.

VDASessionSupport <string>

Specifies the session support of the VDA on the image. Valid values are: 'SingleSession', 'MultiSession', 'Unknown'.

Notes

The Get-ProvImageRuntimeEnvironment cmdlet returns an object containing the following six sub-objects:

- The image capabilities
- The device enrollment status
- The identity join status
- The operating system information of the image
- The page file settings of the image
- The type of VDA installed on the image

Get-ProvImageScheme

March 11, 2024

Gets the list of image schemes.

Syntax

```
Get-ProvImageScheme
    [-PreparedImageSchemeUid <Guid>]
    [[-PreparedImageSchemeName] <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Lets you retrieve the list of defined image schemes.

Examples

EXAMPLE 1

Returns all of the available image schemes.

```
Get-ProvImageScheme

CpuCount                          : 1
CustomProperties                  :

```

```
14 ServiceOffering                :
```

Parameters

-PreparedImageSchemeName

The name of the image scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PreparedImageSchemeUid

The unique identifier of the image scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageScheme

This object provides details of the image scheme and contains the following information:

CpuCount <int>

The number of processors that VMs will be created with when using this scheme.

CustomProperties <string>

Properties of the scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme uses.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme uses.

MachineProfile <string>

The inventory path to the source VM used by the scheme as a template.

MemoryMB <int>

The maximum amount of memory that VMs will be created with when using this scheme.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

PreparedImageSchemeName <string>

The name of the image scheme.

PreparedImageSchemeUid <Guid>

The unique identifier for the image scheme.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-ProvImagesPendingDelete

March 11, 2024

Returns the list of pending image(s) to be deleted

Syntax

```
Get-ProvImagesPendingDelete
    [-HostingUnitUid <Guid>]
    [[-ImageId] <String>]
    [-StorageId <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list for each pending image which needs to be deleted. This check is done without regard for scoping of existing provisioning schemes, and hosting connection.

Examples

EXAMPLE 1

Gets the operation 'f68c0712-4643-496e-bf94-14b95b2e5c47'.

```
Get-ProvPendingImageDelete -HostingUnitUid "f68c0712-4643-496e-bf94-14
    b95b2e5c47"

HostingUnitUid : f68c0712-4643-496e-bf94-14b95b2e5c47
```

```
Id              : 1
ImageId         : 2cf68213-bd35-4adc-9c69-5de723cba469
InProgress      : True
PendingState    : DiskInUse
Reason          : Begin Delete threw an exception
StorageId       : 693fa4ab-1d67-478f-98a2-c4766d63d7eb
TimeAdded       : 8/25/2022 4:04:39 AM
```

Parameters

-ImageId

The identifiers of the image(s)/ to be tested.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostingUnitUid

The identifiers of the hosting units(s) to be tested.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StorageId

The identifier for the storage location on which the virtual image is located.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Host.Sdk.HostingUnit

Filter pending image for delete by hosting unit identifer.

Citrix.Host.Sdk.ImageId

Filter pending image for delete by image identifer.

Outputs

Citrix.MachineCreation.Sdk.PendingImageDelete

The object has the following properties: Id <Int> The unique image record id

HostingUnitUid <Guid> The unique identifier of the hostingunit.

ImageId <string> The unique identifier of the image to be deleted.

InProgress <bool> Indicates whether the operation is in progress.

StorageId <string> The storage location on the hypervisor where the image resides.

TimeAdded <DateTime> The date and time when the operation was last queued for action.

PendingState <string> The state of the pending images to be deleted.

Reason <string> The reason why the image is in the pending state for deletion.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned.

CouldNotQueryDatabase The query required to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvImageVersion

March 11, 2024

Get a list of image versions.

Syntax

```
Get-ProvImageVersion
    [-PreparedImageVersionUid <Guid>]
    [[-PreparedImageVersionNumber] <String>]
    [-PreparedImageDefinitionUid <Guid>]
    [-PreparedImageDefinitionName <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to retrieve the list of defined image versions.

Examples

EXAMPLE 1

Returns all of the available image versions.

```
Get-ProvImageVersion

CreateTime                                : 1/1/2022 12:00:00

```

Parameters

-PreparedImageVersionNumber

The image version number to retrieve.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageVersionUid

The image version identifier to retrieve.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionUid

The identifier of image definition where image versions are contained.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionName

The name of image definition where image versions are contained.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageVersion

This object provides details of the image version and contains the following information:

CreateTime <DateTime>

The date and time when the image version was created.

Description <string>

The description of the image version.

DiskSize <int>

The disk size (in GB) that is used to create VMs.

Error <string>

Error state that has occurred with this image version.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the definition uses.

ImageRuntimeInfo <string>

The image runtime information like operating system info, VDA components, etc.

ImageStatus <string>

The status of the image version.

ImageVersionMetadata <string>

The metadata associated with this image version.

MasterImageId <string>

The hypervisor Id of master image used in this image version.

MasterImageVM <string>

The inventory path to the VM snapshot copy used in this image version.

PageFileSettings <string>

The page file settings to meet hypervisor-specific features demands.

PreparedImageDefinitionName <string>

The name of image definition used in this image version.

PreparedImageDefinitionUid <Guid>

The unique identifier of image definition used in this image version.

PreparedImageReplicas <Citrix.MachineCreation.Sdk.ImageReplica[]>

Image replication information for this image version.

PreparedImageSchemeUid <Guid>

The unique identifier of image scheme used in this image version.

PreparedImageVersionNumber <string>

The version number of the image version.

PreparedImageVersionUid <Guid>

The unique identifier for the image version.

UpdatePageFileSettings <bool>

Whether to update page file settings for write back cache

VMMetadata <string>

The metadata that will be used to created VMs in a plain text format.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this image version.

WriteBackCacheDiskIndex <int>

The disk index that the hypervisor reported as the actual disk index attachment point for the write back cache at image preparation time.

WriteBackCacheMemorySize <int>

The memory size in MB of write back cache in this image version.

WriteBackCacheDiskSize <int>

The disk size in MB of write back cache in this image version.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Get-ProvInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the MachineCreation Service.

Syntax

```
Get-ProvInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix MachineCreation Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-ProvDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix MachineCreation Service database schema version number.

```
Get-ProvInstalledDBVersion
```

EXAMPLE 2

Get the versions of the MachineCreation Service database schema for which upgrade scripts are supplied.

```
1  Get-ProvInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-ProvInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the MachineCreation

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvMetadataConfiguration

March 11, 2024

Get VM metadata configuration settings for a plugin.

Syntax

```
Get-ProvMetadataConfiguration
    [-PluginType <String>]
    [-ConfigurationName <String>]
    [-CitrixDefined <Boolean>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to get metadata settings for a specific hypervisor.

Examples

EXAMPLE 1

Get all configuration settings

```
Get-ProvMetadataConfiguration

PluginType ConfigurationName ConfigurationValue    CitrixDefined
---------- ----------------- ------------------    -------------
AzureRM    Extension         AADLoginForWindows             True
AzureRM    Extension         CustomScriptExtension         False
```

EXAMPLE 2

Get configuration settings for AzureRM plugin

```
Get-ProvMetadataConfiguration -PluginType "AzureRm"

PluginType ConfigurationName ConfigurationValue    CitrixDefined
---------- ----------------- ------------------    -------------
AzureRM    Extension         AADLoginForWindows             True
AzureRM    Extension         CustomScriptExtension         False
```

EXAMPLE 3

Get supported VM extensions for AzureRM plugin

```
Get-ProvMetadataConfiguration -PluginType "AzureRm" -ConfigurationName
    "Extension"

PluginType ConfigurationName ConfigurationValue    CitrixDefined
---------- ----------------- ------------------    -------------
AzureRM    Extension         AADLoginForWindows             True
AzureRM    Extension         CustomScriptExtension         False
```

Parameters

-PluginType

The name of the hypervisor plug-in factory. Currently, AzureRmFactory is the only supported plug-in factory.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConfigurationName

The configuration name. Currently, Extension is the only supported configuration.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CitrixDefined

Indicates whether it is defined by Citrix

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvMetadataConfiguration

The object has the following properties:

PluginType <string>

The name of Plugin

ConfigurationName <string>

The name of configuration

ConfigurationValue <string>

The value of configuration

CitrixDefined <bool>

Indicates if the configuration is defined by Citrix.

Notes

In the case of failure, the following errors can result.

Error Codes

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

ExceptionThrown An unexpected error occurred. For more details, check the Windows event logs on your self-hosted delivery controller or contact Citrix support if using Citrix DaaS (Citrix-hosted delivery controller).

Get-ProvObjectReference

March 11, 2024

Returns the number of local objects holding references to objects from other services.

Syntax

```
Get-ProvObjectReference
   [-HostingUnitUid <Guid[]>]
   [-IdentityPoolUid <Guid[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns for each hosting unit or identity pool GUID the number of references by provisioning schemes or by long running task. This check is done without regard for scoping of existing provisioning schemes, references by inaccessible schemes are also checked.

Examples

EXAMPLE 1

This checks a single hosting unit for objects that have references to it. The result shows there is only one provisioning scheme relating to it.

```
Get-ProvObjectReference -HostingUnitUid 5B66A060-85E1-4DBD-9D1B-
   BF79881D3BB1

Count          : 1
ObjectId       : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source         : ProvisioningScheme
Target         : HostingUnit

```

```
Count          : 0
ObjectId       : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source         : Task
Target         : HostingUnit
```

EXAMPLE 2

This iterates all available identity pools for objects that have references to them, using specification by property name. The result shows that for each identity pool there is one provisioning scheme relating to it.

```
Get-AcctIdentityPool | Get-ProvObjectReference

Count          : 1
ObjectId       : 7a63cd15-8a6f-450e-9c09-72fb9f211898
Source         : ProvisioningScheme
Target         : IdentityPool

Count          : 0
ObjectId       : 7a63cd15-8a6f-450e-9c09-72fb9f211898
Source         : Task
Target         : IdentityPool
```

Parameters

-HostingUnitUid

The identifiers of the hosting units(s) to be tested.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The identifiers of the identity pool(s) to be tested.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Host.Sdk.HostingUnit

You can pipe an object containing a parameter called 'HostingUnitUid' to Get-ProvObjectReference.

Citrix.ADIdentity.Sdk.IdentityPool

You can pipe an object containing a parameter called 'IdentityPoolUid' to Get-ProvObjectReference.

Outputs

ObjectReferenceCount

An object containing the input object identifier, its type, the types of referencing objects, and the number of references.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvOperationEvent

March 11, 2024

Gets a list of MCS operation events.

Syntax

```
Get-ProvOperationEvent
    [-EventId <Int32>]
    [-EventCategory <String>]
    [-EventSeverity <String>]
    [-EventSource <String>]
    [-OperationType <String>]
    [-OperationTargetType <String>]
    [-LinkedObjectType <String>]
    [-LinkedObjectUid <Guid>]
    [-Locale <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to retrieve the list of MCS operation events.

Examples

EXAMPLE 1

Returns the operation event with a Id of 42.

```
Get-ProvOperationEvent -EventId 42
```

EXAMPLE 2

Returns the operation events for provisioning scheme with ID 93f2c1b3-3015-4d63-92fe-678f1523b4de.

```
Get-ProvOperationEvent -LinkedObjectType ProvisioningScheme -
    LinkedObjectUid 93f2c1b3-3015-4d63-92fe-678f1523b4de
```

Parameters

-EventId

The id of the operation event to retrieve.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EventCategory

The category of the operation event to retrieve.

Type:	String
Accepted values:	Error, Warning
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EventSeverity

The severity of the operation event to retrieve.

Type:	String
Accepted values:	Critical, Important, Significant, Urgent
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EventSource

The source of the operation event to retrieve.

Type:	String
Accepted values:	AwsEc2Plugin, AzureRmPlugin, GcpPlugin, Mcs
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationType

The type of the operation event to retrieve.

Type:	String
Accepted values:	ConfigurationManagement, ImageManagement, None, PowerManagement, PreflightCheck, ProvisioningSchemeManagement, ProvisioningVmManagement, ResourceManagement
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationTargetType

The target type of the operation event to retrieve.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectType

The type of the linked object to get the operation events of.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectUid

The unique identifier of the linked object to get the operation events of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Locale

The locale to get the operation event message and recommendation of.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.OperationEvent

This object provides details of the operation event and contains the following information:

EventId <int> The unique identifier of this operation event.

LinkedObjectUid <Guid> The unique identifier for the linked resource this operation event is associated with.

LinkedObjectType <string> The type of the linked resource (e.g. ProvisioningScheme) this operation event is associated with.

EventCategory <string> The category of this operation event.

EventSeverity <string> The severity of this operation event.

EventSource <string> The source of this operation event.

EventState <string> The state of this operation event.

EventMessage <string> The description of this operation event.

EventDateTime <DateTime> The date and time this operation event was created (UTC).

EventAdditionalData <string> Optional, additional data related to this operation event.

OperationType <string> The description of this operation event.

OperationName <string> The description of this operation event.

OperationTargetType <string> The description of this operation event.

OperationTargetName <string> The description of this operation event.

Recommendation <string> Optional, the recommended action of this operation event.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvOrphanedResource

March 11, 2024

Gets the list of orphaned resources created while schemes provisioning.

Syntax

```
Get-ProvOrphanedResource
   -HypervisorConnectionUid <Guid[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Let you retrieve the list of orphaned provisioning resources, such as disks, snapshots, galleries, virtual machines and network interfaces etc.

Examples

EXAMPLE 1

Returns the orphaned resource objects

```
$pluginId = 'AzureRmFactory'
$connections = Get-ChildItem xdhyp:\connections | where {
  $_.PluginId -eq $pluginId  }

$result = Get-ProvOrphanedResource -HypervisorConnectionUid
   $connections.HypervisorConnectionUid
$result
resourceId

   ResourceType              ProvisioningSchemeId
   Metadata
```

```
 8  -----------------

       ------------                --------
       --------
 9  {

```

Parameters

-HypervisorConnectionUid

Connection Uids group to specific hypervisor.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.HypResource

This object provides details of hypervisor orphaned resource.

Id <string> An Id of hypervisor orphaned resource.

ResourceType <string> Resource type of hypervisor orphaned resource.

ProvisioningSchemeId <string> ProvisioningSchemeId of hypervisor orphaned resource.

Metadata <Citrix.MachineCreation.Sdk.ProvisionedResourceMetadata[]> Hypervisor resource orphaned metadata key/value.

Notes

The Get-ProvOrphanedResource cmdlet returns an object containing three sub-objects:

- The Id of hypervisor orphaned resource.
- The ProvisioningSchemeId of hypervisor orphaned resource.
- The resource type of hypervisor orphaned resource.
- The hypervisor orphaned resource metadata.

Get-ProvResource

March 11, 2024

Gets the list of resources created for provisioning schemes, image versions, and virtual machines.

Syntax

```
Get-ProvResource
   -ProvisioningSchemeName <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvResource
   -ProvisioningSchemeUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Let you retrieve the list of provisioning resources, such as disks created for a provisioning scheme, image versions, and virtual machines.

Examples

EXAMPLE 1

Returns the ProvisionedScheme object, ProvisionedImageVersion object, and ProvisionedVirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result

ProvisionedScheme
    ProvisionedImageVersion
-----------------
    ----------------------
Citrix.MachineCreation.Sdk.ProvisionedSchemeResource {
 /example.vm/example.snapshot, /example...
```

EXAMPLE 2

Returns the Id, Name, and Resource of the ProvisionedScheme object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedScheme

Id                                   Name                   Resource
--                                   ----                   --------
e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92 Example_Catalog
```

EXAMPLE 3

Returns ImageStatus, ID, and Name of the ProvisionedImageVersion sub-object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedImageVersion

```

```
ImageStatus Id                                   Name
----------- --                                   ----

```

EXAMPLE 4

Returns the Resource (Id, ResourceType, and Metadata) of the ProvisionedImageVersion object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
   a309-1d53f7882e92'
$result.ProvisionedImageVersion[1].Resource

Id                                   ResourceType Metadata
--                                   ------------ --------
0005f0fa-2f3f-4361-9103-5d9e6b9c656c Disk         {
 Role, StorageId }
```

EXAMPLE 5

Returns the Metadata (Role and StorageId) of the resource of the ProvisionedImageVersion sub-object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
   a309-1d53f7882e92'
$result.ProvisionedImageVersion[1].Resource[0].Metadata

---       -----
Role      Base Disk
StorageId 1a033f55-d552-5ba9-e364-2af7b859303e
```

EXAMPLE 6

Returns ID, Name, and Resource of the provisioned virtual machines for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
   a309-1d53f7882e92'
$result.ProvisionedVirtualMachine

```

```
Id                                   Name        Resource
--                                   ----        --------

00000000-0000-0000-0000-000000000000 Disk         {
 Role, StorageId }
```

EXAMPLE 8

Returns the Metadata (Role, ParentDiskID, and StorageId for OS Delta Disk) of the Resource of the ProvisionedVirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedVirtualMachine[0].Resource[0].Metadata

Key          Value
---          -----
Role         OS Delta Disk
ParentDiskId 5eef2ad5-2b05-442c-a5b5-1a7e9ecaf36d
StorageId    1a033f55-d552-5ba9-e364-2af7b859303e
```

EXAMPLE 9

Returns the Metadata (Role and StorageId for Identity Disk) of the Resource of the ProvisionedVirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92'
$result.ProvisionedVirtualMachine[0].Resource[1].Metadata

Key       Value
---       -----
Role      Identity Disk
StorageId 1a033f55-d552-5ba9-e364-2af7b859303e
```

EXAMPLE 10

Returns the Metadata (Role and StorageId for Personal Virtual Disk) of the Resource of the ProvisionedVirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92'
$result.ProvisionedVirtualMachine[0].Resource[2].Metadata

Key       Value
---       -----
Role      PersonalVDisk
StorageId
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Get-ProvResource.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedResource

This object provides details of the provisioning scheme and contains the following information:

ProvisionedScheme <Citrix.MachineCreation.Sdk.ProvisionedSchemeResource>

An object containing provisioning scheme id, name, and resources attached to the provisioning scheme.

ProvisionedImageVersion <Citrix.MachineCreation.Sdk.ProvisionedImageVersionResource[] >

A list of objects containing provisioning scheme id, name, and resources attached to the provisioning image versions.

ProvisionedVirtualMachine <Citrix.MachineCreation.Sdk.ProvisionedVirtualMachineResource[] >

A list of objects containing provisioning scheme id, name, and resources attached to the provisioned virtual machines.

Notes

The Get-ProvResource cmdlet returns an object containing three sub-objects:

- The provisioned scheme
- Array of provisioned image versions
- Array of provisioned virtual machines

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Get-ProvScheme

March 11, 2024

Gets a list of provisioning schemes.

Syntax

```
Get-ProvScheme
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to retrieve the list of defined provisioning schemes.

Examples

EXAMPLE 1

Returns all of the available provisioning schemes.

```
Get-ProvScheme

52 WriteBackCacheDiskSize        : 24
53 WriteBackCacheMemorySize      : 256
54 Warnings                      : {
55   }
56
57 WriteBackCacheDiskIndex       : 0
58 WindowsActivationType         : MultipleActivationKey
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ScopeId

Gets only results with a scope matching the specified scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ScopeName

Gets only results with a scope matching the specified scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

PreparedImageDefinitionName <string>

The name for the image definition used for the provisioning scheme.

PreparedImageVersionNumber <string>

The version number for the image version used for the provisioning scheme.

PreparedImageVersionUid <Guid>

The identifier for the image version used for the provisioning scheme.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

WindowsActivationType <string>

Windows Activation Type set on the Master Image which has a mapping with the Provisioning Scheme.This feature is supported from 2303 and successive VDA versions. Any previous VDA version or if the vda is not of Windows Operating System Type, the field would be "UnsupportedVDA"

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned

CouldNotQueryDatabase

The query to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvSchemeMasterVMImageHistory

March 11, 2024

Gets the list of master VM snapshots that have been used to provide hard disks to provisioning schemes.

Syntax

```
Get-ProvSchemeMasterVMImageHistory
   [-ProvisioningSchemeName <String>]
   [-ProvisioningSchemeUid <Guid>]
   [-MasterImageVM <String>]
   [-VMImageHistoryUid <Guid>]
   [-ImageStatus <String>]
   [-ShowAll]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to discover the master VM snapshots used to provide the hard disk image for provisioning schemes. This information includes the date and time when the image was created.

By default, this cmdlet returns only those snapshots that have been used previously. This information can be used to roll-back a provisioning scheme to a previous image.

The ShowAll parameter may be supplied to also show the snapshot for the image currently in use, and the snapshots for any images prepared for later use.

Examples

EXAMPLE 1

Gets all the hard disk images that have been used across all provisioning schemes.

```
Get-ProvSchemeMasterVMImageHistory

VMImageHistoryUid      : 3cba3a75-89cd-4868-989b-27feb378fec5
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
MasterImageVM          : /Base.vm/base.snapshot
Date                   : 17/05/2020 09:27:50
FunctionalLevel        :
ImageStatus            : Current
MasterImageId          : base-vm\base
MasterImageNote        : Office365 installed
```

EXAMPLE 2

Roll back the provisioning scheme to use the hard disk from the update1.snapshot for the provisioning scheme called “MyScheme”.

```
Get-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName MyScheme -
    masterImageVM "/BaseXp.vm/update1.snapshot" | Publish-
    ProvMasterVMImage
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MasterImageVM

The inventory path to the VM snapshot item used as the master VM image.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMImageHistoryUid

The unique identifier of the image history item.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ImageStatus

The status of the provisioning scheme image.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ShowAll

Show all images. This includes images currently in use, and images prepared for later use.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.VMImage

This object represents a master VM image history item. It contains the following parameters:

VMImageHistoryUid <Guid>

The unique identifier of the history item.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme used for the VM.

ProvisioningSchemeName <string>

The name of the provisioning scheme used for the VM.

MasterImageVM <string>

The inventory path to the Snapshot item that was used as the master VM image.

Date <DateTime>

The date and time when the VM or snapshot was used in the provisioning scheme.

FunctionalLevel <string>

The FunctionalLevel of the VDA installed on the VM.

ImageStatus <string>

The status of the provisioning scheme image.

MasterImageId <string>

The unique identifier of the snapshot, as assigned by the hosting unit.

MasterImageNote <string>

The note of the provisioning scheme image.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CouldNotQueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvSchemeResourceInStorage

March 11, 2024

Gets the summary of the base disk and machine count in each OS storage for the provisioning scheme.

Syntax

```
Get-ProvSchemeResourceInStorage
   [-ProvisioningSchemeName] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvSchemeResourceInStorage
   -ProvisioningSchemeUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Lets you retrieve the resource summary in each OS storage of the provisioning scheme, such as base disks and the machine count.

Examples

EXAMPLE 1

Returns the provisioning scheme name, hosting unit name, hosting unit id, and provisioning resource in storage object of the associated provisioning scheme id.

```
Get-ProvSchemeResourceInStorage -ProvisioningSchemeUid '9c08beec-154e-4
   a00-ad56-f97adb69aad4'

  ProvisioningSchemeName       : Vmware-MC
```

```
 ProvisioningSchemeUid         : 9c08beec-154e-4a00-ad56-f97adb69aad4
 HostingUnitName               : Vmware-hostingUnit
 HostingUnitUid                : 56b22b5e-b54d-49bc-a6f7-5dd336f6f70b
 ProvResourceInStorage         : {
datastore-11, datastore-12 }
```

EXAMPLE 2

Returns the provisioning scheme name, hosting unit name, hosting unit id, and provisioning resource in storage object of all the provisioning schemes with hosting unit as “Vmware-hostingUnit”.

```
Get-ProvScheme |Where-Object {
 $_.HostingUnitName -eq "Vmware-hostingUnit" }
  | Get-ProvSchemeResourceInStorage

 ProvisioningSchemeName        : Vmware-MC
 ProvisioningSchemeUid         : 9c08beec-154e-4a00-ad56-f97adb69aad4
 HostingUnitName               : Vmware-hostingUnit
 HostingUnitUid                : 56b22b5e-b54d-49bc-a6f7-5dd336f6f70b
 ProvResourceInStorage         : {
datastore-11, datastore-12 }

 ProvisioningSchemeName        : Vmware-MC2
 ProvisioningSchemeUid         : e9aa1cf8-b2a8-4c3c-a309-1d53f7882e76
 HostingUnitName               : Vmware-hostingUnit
 HostingUnitUid                : 56b22b5e-b54d-49bc-a6f7-5dd336f6f70b
 ProvResourceInStorage         : {
datastore-11, datastore-12 }
```

EXAMPLE 3

Returns the ID, name, and resource of the provisioned scheme object of the provisioning scheme id “9c08beec-154e-4a00-ad56-f97adb69aad4”.

```
$result = Get-ProvSchemeResourceInStorage -ProvisioningSchemeUid '9
    c08beec-154e-4a00-ad56-f97adb69aad4'
$result.ProvResourceInStorage | Format-List -Property *

OSStorageId         : datastore-11
OSStoragePath       : /Datacenter1.datacenter/Cluster1.cluster/
    datastore1.storage
OSStorageSuperseded : False
BaseDiskId          : {
 Version=2,LsiLogicScsi,1000,group-v4,[Datastore1]
Vmware-MC-baseDisk-datastore-11/Vmware-MC-baseDisk-datastore-11.vmdk,
    resgroup-93,Vmfs }

MachineCount        : 2
```

```
12
13 OSStorageId          : datastore-12
14 OSStoragePath        : /Datacenter1.datacenter/Cluster1.cluster/
      datastore2.storage
15 OSStorageSuperseded : False
16 BaseDiskId           : {
17   }
18
19 MachineCount         : 0
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Get-ProvSchemeResourceInSt

Outputs

Citrix.MachineCreation.Sdk.ProvSchemeResourceInStorage

The object provides the resource details of the provisioning scheme and contains the following information:

ProvisioningSchemeName <string>

The name of the provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme.

HostingUnitName <string>

The name of the hosting unit being used by the provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by the provisioning scheme.

ProvisionedResourceInStorage <Citrix.MachineCreation.Sdk.ProvisionedResourceInStorage[]>

A list of objects containing the OS storage id, path, base disk Id, and the number of machines located in the storage.

Notes

The Get-ProvSchemeResourceInStorage cmdlet returns an object containing the following five sub-objects:

- The provisioned scheme name
- The provisioned scheme id
- The hosting unit name
- The hosting unit id
- Array of provisioned resource in OS storage

- Get-ProvResource

Get-ProvSchemeVersion

March 11, 2024

Gets saved provisioning scheme configuration versions

Syntax

```
Get-ProvSchemeVersion
    [-ProvisioningSchemeUid] <Guid>
    [-Version <Int32>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-ProvSchemeVersion
    [-ProvisioningSchemeName] <String>
    [-Version <Int32>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
```

```
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to list saved provisioning scheme configuration versions.

Examples

EXAMPLE 1

Configurations are listed for provisioning scheme AzureCatalog

```
Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog
CpuCount                : 2
CustomProperties        :
MachineProfile          : machineprofile.folder\matspo.resourcegroup\
   matspo-vm.templatespec\hibernate-2nic-fix.templatespecversion
MemoryInMB              : 14336
NetworkMaps             : {
 0, 1 }

ProvisioningSchemeName : AzureCatalog
ProvisioningSchemeUid  : 5b37b311-fa3f-49dd-b93b-661b9e6fa571
SecurityGroups          : {
  }

ServiceOffering         : serviceoffering.folder\Standard_D2s_v5.
   serviceoffering
VMMetadata              : {
 , , ,  ... }

Version                 : 2

CpuCount                : 2
CustomProperties        :
MachineProfile          : machineprofile.folder\matspo.resourcegroup\
   matspo-vm.templatespec\hibernate-2nic-fix.templatespecversion
MemoryInMB              : 14336
NetworkMaps             : {
 0, 1 }

ProvisioningSchemeName : AzureCatalog
ProvisioningSchemeUid  : 5b37b311-fa3f-49dd-b93b-661b9e6fa571
SecurityGroups          : {
  }

```

```
ServiceOffering        : serviceoffering.folder\Standard_D2s_v5.
    serviceoffering
VMMetadata             : {
 , , ,  ... }

Version                : 1
```

EXAMPLE 2

Version 2 is listed for provisioning scheme AzureCatalog

```
Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog -Version 2
CpuCount               : 2
CustomProperties       :
MachineProfile         : machineprofile.folder\matspo.resourcegroup\
    matspo-vm.templatespec\hibernate-2nic-fix.templatespecversion
MemoryInMB             : 14336
NetworkMaps            : {
 0, 1 }

ProvisioningSchemeName : AzureCatalog
ProvisioningSchemeUid  : 5b37b311-fa3f-49dd-b93b-661b9e6fa571
SecurityGroups         : {
  }

ServiceOffering        : serviceoffering.folder\Standard_D2s_v5.
    serviceoffering
VMMetadata             : {
 , , ,  ... }

Version                : 2
```

Parameters

-ProvisioningSchemeUid

Filter by the unique identifier of the provisioning scheme.

Type:	Guid
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

Filter by the name of the provisioning scheme.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Version

Filter by the version of the provisioning scheme

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningSchemeVersion

The object has the following properties:

Version <int>

The current version of the configuration

CpuCount <int>

The number of processors allocated to VMs in the provisioning scheme.

MemoryInMB <int>

The maximum amount of memory allocated to VMs in the provisioning scheme.

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in cloud hypervisors.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

Get-ProvSchemeWarning

March 11, 2024

Gets a list of provisioning schemes warnings.

Syntax

```
Get-ProvSchemeWarning
   [-ProvisioningSchemeUid <Guid>]
   [-ProvisioningSchemeName <String>]
   [-WarningId <Int32>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to retrieve the list of provisioning scheme warnings.

Examples

EXAMPLE 1

Returns the warning with a warning Id of 42.

```
Get-ProvSchemeWarning -WarningId 42

ProvisioningSchemeName       : CatalogWindows11AWS
ProvisioningSchemeUid        : 7585f0de-192e-4847-a6d8-22713c3a2f42
WarningId                    : 42
WarningMessage               : Deprecated custom attribute
RecommendedAction            : Remove obsolete custom attribute
AdditionalData               : AwsCaptureInstanceProperties is now
   deprecated
WarningStateType             : New
OperationName                : New-ProvScheme
WarningReportingDateTime     : 17/05/2022 09:27:50
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to get the warnings of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme to get the warnings of.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-WarningId

The id of the warning to retrieve.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvWarning

This object provides details of the provisioning scheme warning and contains the following information:

WarningId <int> The Unique identifier of this warning.

ProvisioningSchemeUid <Guid> The unique identifier for this provisioning scheme this warning is associated with.

ProvisioningSchemeName <Guid> The name for this provisioning scheme this warning is associated with.

WarningMessage <string[]> The warning description.

RecommendedAction <string> The optional recommended action to take to help resolve the warning.

AdditionalData <string> Optional, additional data related to the warning.

WarningStateType <string> The warning state of this provisioning scheme warning, either New or Acknowledged.

OperationName <string> The operation which triggered the warning.

WarningReportingDateTime <DateTime> The date and time the warning was created (UTC).

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvScopedObject

March 11, 2024

Gets the details of the scoped objects for the Machine Creation Service.

Syntax

```
Get-ProvScopedObject
   [-ScopeId <Guid>]
   [-ScopeName <String>]
   [-ObjectType <ScopedObjectType>]
   [-ObjectId <String>]
   [-ObjectName <String>]
   [-Description <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Examples

EXAMPLE 1

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

```
Get-ProvScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Parameters

-ScopeId

Gets scoped object entries for the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ScopeName

Gets scoped object entries with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectType

Gets scoped object entries for objects of the given type.

Type:	ScopedObjectType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ObjectId

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectName

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Gets scoped object entries for objects with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ScopedObject

You can pipe any object containing a parameter called 'ScopeId', 'ScopeName', 'ObjectType', 'ObjectId' or 'ObjectName', or any combination of them as filter parameter(s) to Get-ProvScopedObject.

Outputs

Citrix.MachineCreation.Sdk.ScopedObject

The Get-ProvScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Unique identifier of the scope.

ScopeName <string>

Display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <string>

Unique identifier of the object.

ObjectName <string>

Display name of the object.

Description <string>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvService

March 11, 2024

Gets the service record entries for the MachineCreation Service.

Syntax

```
Get-ProvService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the MachineCreation Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the MachineCreation Service running in the current service group.

```
Get-ProvService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries. The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.Service

The Get-ProvServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-ProvServiceAddedCapability

March 11, 2024

Gets any added capabilities for the MachineCreation Service on the controller.

Syntax

```
Get-ProvServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the MachineCreation Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the MachineCreation Service.

```
Get-ProvServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvServiceConfigurationData

March 11, 2024

Gets configuration data for the service.

Syntax

```
Get-ProvServiceConfigurationData
    [-Name <String[]>]
    [-Value <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
```

```
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to retrieve the configuration parameters for the Machine Creation Service.

Examples

EXAMPLE 1

Get the Configuration data for the service.

```
Get-ProvConfigurationData

Name                : DeltaDiskDelete.timeDelay
Value               : 10
```

Parameters

-Name

The configuration data item name.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Value

The configuration data item value.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ServiceConfigurationData

This object provides details of the configuration data and contains the following information:

Name <string>

The name for the configuration item.

Value <string>

The value for the configuration item.

Notes

In the case of failure the following errors can be produced.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvServiceInstance

March 11, 2024

Gets the service instance entries for the MachineCreation Service.

Syntax

```
Get-ProvServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the MachineCreation Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the MachineCreation Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1 Get-ProvServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ServiceInstance

The Get-ProvServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Prov.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvServiceStatus

March 11, 2024

Gets the current state of the MachineCreation Service on the controller.

Syntax

```
Get-ProvServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the MachineCreation Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the MachineCreation Service.

```
Get-ProvServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-ProvServiceStatus command returns an object containing the status of the MachineCreation Service together with extra diagnostics information.

DBUnconfigured

The MachineCreation Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The MachineCreation is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The MachineCreation is connected to a database that is valid, but it does not have the full functionality required so the MachineCreation cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

DBOlderVersionThanService

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The MachineCreation Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the MachineCreation Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the MachineCreation and the database has been lost for an extended period of time, or has failed due to a configuration problem. The MachineCreation service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvTask

March 11, 2024

Gets the task history for the Machine Creation Service.

Syntax

```
Get-ProvTask
   [[-TaskId] <Guid>]
   [-Type <JobType>]
   [-Active <Boolean>]
   [-Metadata <String>]
```

```
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list of tasks that have run or are currently running on the Machine Creation Service.

Examples

EXAMPLE 1

Get all completed tasks for the Machine Creation Service. All tasks will publish at least the fields listed above, plus more related to the particular task being performed.

```
Get-ProvTask -Active $false

TaskId                   : cfe5b3a2-c471-443e-b05e-8658e672d10f
Active                   : False
Host                     : NYSERVER
DateStarted              : 10/10/2020 15:27:34
Type                     : DisusedImageCleanup
Metadata                 : {
  }

CurrentOperation         :
TaskProgress             : 100
LastUpdateTime           : 10/10/2020 15:28:12
ActiveElapsedTime        : 56
DateFinished             : 10/10/2020 15:28:12
TerminatingError         :
Status                   : Finished
TaskExpectedCompletion   : 10/10/2012 15:28:12
...
```

Parameters

-TaskId

Specifies the task identifier to be returned.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Type

Specifies the type of task to be returned.

Type:	JobType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Active

Specifies whether currently running tasks only or completed tasks only are returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Specifies the metadata entry that returned tasks should contain.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains at least the fields listed below. The fields output order and additional fields are related to the particular task type being performed.

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Status <string>

Where in its lifecycle the task is.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

Notes

If the command fails, the following errors can result.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvVM

March 11, 2024

Gets the VMs created using Machine Creation Services.

Syntax

```
Get-ProvVM
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-VMName <String>]
    [-Locked <Boolean>]
    [-Tag <String>]
    [-OutOfDate]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to obtain a list of the VMs that were created using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Gets all the Virtual Machines that were provisioned using the Provisioning Scheme called 'MyScheme'.

```
Get-ProvVM -provisioningSchemeName MyScheme

ADAccountName                    : MYDomain\computer2$
ADAccountSid                     : S
   -1-5-21-3751941309-1176885247-1409628468-3179
CpuCount                         : 1
CreationDate                     : 17/05/2021 09:35:22
Domain                           : steve.dum.local
ImageOutOfDate                   : False
Lock                             : True
MemoryMB                         : 512
ProvisioningSchemeName           : XenPS
ProvisioningSchemeUid            : 5135a865-ba49-4e5f-87f2-2
   d65ee7a4e51
ProvisioningSchemeUpdateRequested : 17/05/2021 09:39:03
ProvisioningSchemeVersion        : 1
Tag                              : Brokered
```

```

WindowsActivationStatusErrorCode    : KeyLimitExceeded
WindowsActivationStatusError        : Windows activation failed because
    the maximum number of activations have been exceeded for the
    specified activation key
```

EXAMPLE 2

Gets all the Virtual Machines that were locked, regardless of which Provisioning Scheme the VM was created with.

```
Get-ProvVM -Locked $true

ADAccountName                       : MYDomain\computer1$
```

```
ADAccountSid                          : S

```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the VM in the hypervisor.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Locked

Indicates whether only VMs that are marked as locked are returned or not (see Lock-ProvVM and Unlock-ProvVM for details).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

The tag string that was associated with the VM when it was locked.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OutOfDate

Indicates that the image currently assigned to the VM is out of date. The image will be updated the next time the VM is restarted.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

The object has the following properties:

ADAccountSid <string>

The SID of the AD computer account that the VM is using.

ADAccountName <string>

The name of the AD computer account that the VM is using.

CpuCount <int>

The number of processors allocated to the VM.

CreationDate <DateTime>

The date and time when the VM was created.

Domain <string>

The Domain of the AD computer account that the VM is using.

ImageOutOfDate <bool>

Indicates if the image will be updated next time the VM is started.

Lock <bool>

Indicates whether the VM is locked or not.

MemoryMB <int>

The maximum amount of memory allocated to the VM.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

PropertyUpdateWindowStart <DateTime>

Defines the start of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

PropertyUpdateWindowEnd <DateTime>

Defines the end of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme currently used by this VM.

ProvVMConfigurationVersion <int>

The version of the custom configuration currently used by this VM.

Tag <string>

Provides the string associated with a locked VM.

VMId <string>

The identifier for the VM in the hypervisor.

VMName <string>

The name of the VM in the hypervisor.

AssignedImage <string>

The identifier (in the hypervisor) for the hard disk image that the VM is currently assigned.

BootedImage <string>

The identifier (in the hypervisor) for the hard disk image with which the VM is currently started.

HostingUnitUid <Guid>

The unique identifier of the hosting unit that was used to create the VM.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection that was used to create the VM.

IdentityDiskIndex <int>

The disk index on which the identity disk is attached.

LastBootTime <DateTime>

The date and time of the last start of the VM.

OSDiskIndex <int>

The disk index on which the hard disk image, from which the VM is currently started, is attached. It is set to [int]::MinValue for VMs inherited from versions of XenDesktop 5.6 or earlier.

PersonalVDiskIndex <int>

The disk index on which the personal vdisk is attached. Defaults to [int]::MinValue for VMs without a personal vDisk.

PersonalVDiskStorage <string>

The identifier (in the hypervisor) for the storage on which the personal vDisk image attached to the VM is located. This is set only if the VM has a personal vDisk attached.

StorageId <string>

The identifier (in the hypervisor) for the storage on which the hard disk image, from which the VM is currently started, is located.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings Used to create the VM.

IdentityDiskId <string>

The identifier (in the hypervisor) for the identity disk attached to the VM.

IdentityDiskStorage <string>

The identifier (in the hypervisor) for the storage on which the identity disk image from which the VM is currently started is located.

PersonalVDiskId <string>

The identifier (in the hypervisor) for the personal vDisk attached to the VM. This is set only if the VM has a personal vDisk attached.

SecurityGroups <string[]>

The security groups that has been applied to the VM. This only applies in a Cloud provisioning context.

AdditionalStorage <System.Collections.Generic.Dictionary[string, AdditionalStorageDiskImage]>

Additional storage disk images attached to this VM keyed by their storage tier names.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache if specified in MB.

UseFullDiskCloneProvisioning <bool>

Indicates if the VM was created using the dedicated full disk clone feature.

CustomVmData <string>

Hypervisor specific custom data packet that has been associated with the virtual machine if any.

WorkgroupMachine <bool>

Indicates if the VM is joined to a workgroup.

WindowsActivationType <string>

Windows Activation Type of the Provisioned Virtual Machine. The default value is unknown and the field is populated once the virtual machine registers with DDC. This is supported only on 2303 and successive versions.

WindowsActivationStatus <string>

Windows Activation Status of the provisioned virtual machine. This is by default set to unknown and is updated when the vda registers with the DDC. The updated values can be Active:The virtual machine is licensed and activated, Inactive:The virtual machine is unlicensed, Errored:An error occured while trying to activate the system.

WindowsActivationStatusErrorCode <string>

The default value is Unknown. If successful, it displays as Success, else it displays with the associated error code.

WindowsActivationStatusVirtualMachineError <string>

Provides a detailed information of potential error message seen while activating the windows system

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvVMConfiguration

March 11, 2024

Gets the custom configuration properties for virtual machines created using Machine Creation Services.

Syntax

```
Get-ProvVMConfiguration
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-VMName <String>]
    [-VMId <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to list current configuration properties for virtual machines created using Machine Creation Services.

The returned list of properties details what has been applied to VMs specifically with Set-ProvVM. It does not consistute the full set of properties VMs will have when the configuration is applied, to view that information use Get-ProvVMConfigurationResultantSet

Examples

EXAMPLE 1

Configuration is listed on the ProvScheme. Get-ProvVMConfiguration is used to obtain configuration data for all machines in test-catalog. Compare with Example 1 under Get-ProvVMConfigurationResultantSet

```
Get-ProvScheme -ProvisioningSchemeName test-catalog | select
    ProvisioningSchemeName, ServiceOffering, CustomProperties
ProvisioningSchemeName : test-catalog
ServiceOffering        : serviceoffering.folder\Standard_D2_v3.
    serviceoffering
```

```
CustomProperties       : <CustomProperties xmlns="http://schemas.citrix
    .com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
                           <Property xsi:type="StringProperty" Name="
                              SchemaVersion" Value="2" />
                           <Property xsi:type="StringProperty" Name="
                              UseManagedDisks" Value="true" />
                           <Property xsi:type="StringProperty" Name="
                              OsType" Value="Windows" />
                           </CustomProperties>
...

Get-ProvVMConfiguration -ProvisioningSchemeName test-catalog

```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMId

The ID of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedMachineConfiguration

The object has the following properties:

Version <int>

The current version of the configuration

CpuCount <int>

The number of processors allocated to the VM.

MemoryInMB <int>

The maximum amount of memory allocated to the VM.

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in cloud hypervisors.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

VMId <string>

The identifier for the VM in the hypervisor.

VMName <string>

The name of the VM in the hypervisor.

Get-ProvVMConfigurationResultantSet

March 11, 2024

Gets the resultant configuration properties for virtual machines created using Machine Creation Services.

Syntax

```
Get-ProvVMConfigurationResultantSet
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-VMName <String>]
    [-VMId <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to list the resultant configuration properties for virtual machines created using Machine Creation Services. This merges properties at the provisioning scheme level with those set on a machine with Set-ProvVM specifically.

To configure a machine with custom configuration data, see Set-ProvVM To list just the properties specific to a machine, use Get-ProvVMConfiguration

Examples

EXAMPLE 1

Configuration is listed on the ProvScheme. Get-ProvVMConfigurationResultantSet is used to obtain configuration data for all machines in test-catalog. Compare with Example 1 under Get-ProvVMConfiguration

```
Get-ProvScheme -ProvisioningSchemeName test-catalog | select
    ProvisioningSchemeName, ServiceOffering, CustomProperties
ProvisioningSchemeName : test-catalog
ServiceOffering        : serviceoffering.folder\Standard_D2_v3.
    serviceoffering

```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-VMId

The ID of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedMachineConfigurationResultantSet

The object has the following properties:

CpuCount <int>

The number of processors allocated to the VM.

MemoryInMB <int>

The maximum amount of memory allocated to the VM.

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

VMId <string>

The identifier for the VM in the hypervisor.

VMName <string>

The name of the VM in the hypervisor.

Import-ProvScheme

March 11, 2024

Import a provisioning scheme into the site

Syntax

```
Import-ProvScheme
      [-ProvisioningSchemeData <String>]
      [-Scope <String[]>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet imports a provisioning scheme into the site. The data passed to this cmdlet should generally be obtained through the Export-ProvScheme cmdlet from a different site.

Examples

EXAMPLE 1

Import the JSON encoded data that is in $provisioningSchemeData.

```
Import-ProvScheme -ProvisioningSchemeData $provisioningSchemeData

CleanOnBoot                  : True
ControllerAddress            : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }

Parameters

-ProvisioningSchemeData

JSON encoded string of a provisioning scheme, image history, and VMs created with the provisioning scheme.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Scope

The administration scopes to be applied to the new provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a JSON encoded string of a provisioning scheme to Import-ProvScheme.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

CouldNotQueryDatabase The query required to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

Import-ProvVM

March 11, 2024

Import provisioning virtual machines under the given provisioning scheme.

Syntax

```
Import-ProvVM
       [-ProvisioningSchemeName <String>]
       -ProvisioningVirtualMachineData <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Import-ProvVM
       [-ProvisioningSchemeUid <Guid>]
       -ProvisioningVirtualMachineData <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet reads the list of provisioning virtual machines (VMs) of a given provisioning scheme and imports them to the database. The list of VMs can be obtained from the output of the Export-ProvScheme cmdlet. If a VM in the list already exists in the database, it will fail silently. If the provisioning scheme the VM is associated with does not exist, it will return an error. This cmdlet returns a list of VM objects imported successfully.

Examples

EXAMPLE 1

Import the JSON encoded provisioning virtual machines that is in $ExportedProvVMs

```
Import-ProvVM -ProvisioningSchemeName ExampleCatalog -
    provisioningVirtualMachineData $ExportedProvVMs

FailureReason                                : The VM already exists
ImportStatus                                 : Failed
WindowsActivationStatusVirtualMachineError   : The information is
    currently unavailable
```

Parameters

-ProvisioningVirtualMachineData

JSON encoded string of VMs created with the provisioning scheme

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImportProvVmModel

The returned objects provides details of the provisioning virtuam machines and contains the following information.

FailureReason <string> The reason for the failure of importing the VM.

ImportStatus <string> The status of the imported VM.

ADAccountName <string> The name of the AD computer account that the VM is using.

ADAccountSid <string> The SID of the AD computer account that the VM is using.

CpuCount <int> The number of processors allocated to the VM.

CreationDate <DateTime> The date and time when the VM was created.

Domain <string> The Domain of the AD computer account that the VM is using.

ImageOutOfDate <bool> Indicates if the image will be updated next time the VM is started.

Lock <bool> Indicates whether the VM is locked or not.

MemoryMB <int> The maximum amount of memory allocated to the VM.

PropertyUpdateWindowEnd <DateTime> Defines the end of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

PropertyUpdateWindowStart <DateTime> Defines the start of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

ProvisioningSchemeName <string> The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid> The unique identifier of the provisioning scheme associated with the VM.

ProvisioningSchemeVersion <int> The version of the provisioning scheme currently used by this VM.

ProvVMConfigurationVersion <int> The version of the custom configuration currently used by this VM.

Tag <string> Provides the string associated with a locked VM.

VMId <string> The identifier for the VM in the hypervisor.

VMName <string> The name of the VM in the hypervisor.

AssignedImage <string> The identifier (in the hypervisor) for the hard disk image that the VM is currently assigned.

BootedImage <string> The identifier (in the hypervisor) for the hard disk image with which the VM is currently started.

HostingUnitUid <Guid> The unique identifier of the hosting unit that was used to create the VM.

HypervisorConnectionUid <Guid> The unique identifier of the hypervisor connection that was used to create the VM.

IdentityDiskIndex <int> The disk index on which the identity disk is attached.

LastBootTime <DateTime> The date and time of the last start of the VM.

OSDiskIndex <int> The disk index on which the hard disk image, from which the VM is currently started, is attached. It is set to [int]::MinValue for VMs inherited from versions of XenDesktop 5.6 or earlier.

PersonalVDiskIndex <int> The disk index on which the personal vdisk is attached. Defaults to [int]::MinValue for VMs without a personal vDisk.

PersonalVDiskStorage <string> The identifier (in the hypervisor) for the storage on which the personal vDisk image attached to the VM is located. This is set only if the VM has a personal vDisk attached.

StorageId <string> The identifier (in the hypervisor) for the storage on which the hard disk image, from which the VM is currently started, is located.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]> The NIC/network mappings Used to create the VM.

IdentityDiskId <string> The identifier (in the hypervisor) for the identity disk attached to the VM.

IdentityDiskStorage <string> The identifier (in the hypervisor) for the storage on which the identity disk image from which the VM is currently started is located.

PersonalVDiskId <string> The identifier (in the hypervisor) for the personal vDisk attached to the VM. This is set only if the VM has a personal vDisk attached.

SecurityGroups <string[]> The security groups that has been applied to the VM. This only applies in a Cloud provisioning context.

AdditionalStorage <System.Collections.Generic.Dictionary[string, AdditionalStorageDiskImage]> Additional storage disk images attached to this VM keyed by their storage tier names.

UseFullDiskCloneProvisioning <bool> Indicates if the VM was created using the dedicated full disk clone feature.

WriteBackCacheMemorySize <int> The size of the write-back memory cache if specified in MB.

CustomVmData <string> Hypervisor specific custom data packet that has been associated with the virtual machine if any.

WorkgroupMachine <bool> Indicates if the VM is joined to a workgroup.

WindowsActivationType <string> Windows Activation Type of the Provisioned Virtual Machine. The default value is unknown and the field is populated once the virtual machine registers with DDC. This is supported only on 2303 and successive versions.

WindowsActivationStatus <string> Windows Activation Status of the provisioned virtual machine. This is by default set to unknown and is updated when the vda registers with the DDC. The updated values can be Active:The virtual machine is licensed and activated, Inactive:The virtual machine is unlicensed, Errored:An error occured while trying to activate the system.

WindowsActivationStatusErrorCode <string> The default value is Unknown. If successful, it displays as Success, else it displays with the associated error code.

WindowsActivationStatusVirtualMachineError <string> Provides a detailed information of potential error message seen while activating the windows system

Notes

The scope of Import-ProvVm is limited to importing (newly added) VMs only. It assumes

the items below.

1. Import-AcctIdentityPool is done.
2. Import-ProvScheme is done.
3. The input data to Import-ProvVM includes the list of Provisioning VMs.

Lock-ProvVM

March 11, 2024

Locks one or more VM(s).

Syntax

```
Lock-ProvVM
    -ProvisioningSchemeName <String>
    [-VMID] <String[]>
    [-Tag <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Lock-ProvVM
    -ProvisioningSchemeUid <Guid>
    [-VMID] <String[]>
    [-Tag <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to ‘lock’virtual machine(s) with a tag string. This indicates that the VM is being used, and prevents other commands from removing the VM without unlocking it.

Examples

EXAMPLE 1

Locks the VM with the Id ‘bc79802c-ba6e-8de8-99e9-4c35d7ad24b4’in the provisioning scheme ‘MyScheme’with the tag ‘LockedString’.

```
Lock-ProvVM -provisioningSchemeName MyScheme -VMId  bc79802c-ba6e-8de8
    -99e9-4c35d7ad24b4 -Tag LockedString
```

EXAMPLE 2

Locks all the VMs in the provisioning scheme ‘MyScheme’with the tag ‘LockedString’.

```
Get-ProvVM -provisioningSchemeName MyScheme | Lock-ProvVM -Tag
    LockedString
```

Parameters

-VMID

Array of the virtual machine Ids (hypervisor context).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme for which VMs must be locked.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme for which VMs must be locked.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	True

-Tag

The string to be held against the VM being locked.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Lock-ProvVM.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

VMDoesNotExist

The specified VM cannot be located.

VMAlreadyLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

PermissionDenied

The user is not authorized to perform this operation

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Move-ProvVMDisk

March 11, 2024

Move the disks of full clone virtual machines to a new storage.

Syntax

```
Move-ProvVMDisk
    [-ProvisioningSchemeName] <String>
    -VMName <String[]>
    -DestinationStorageId <String>
    [-DiskType <DiskMovingType>]
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-ProvVMDisk
    [-ProvisioningSchemeUid] <Guid>
    -VMName <String[]>
    -DestinationStorageId <String>
    [-DiskType <DiskMovingType>]
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to move the disks of full clone virtual machines to a new storage and the new storage info will be updated to MCS database.

Examples

EXAMPLE 1

Move the disks of machine01 in provisioning scheme myProvScheme to storage datastore1

```
Move-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName "
    machine01" -DestinationStorageId datastore1
```

EXAMPLE 2

Move the disks of machine01 and machine02 in provisioning scheme myProvScheme to storage datastore1

```
Move-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName ("
    machine01","machine02") -DestinationStorageId datastore1
```

EXAMPLE 3

Move all VMs'disks in provisioning scheme myProvScheme to storage datastore1

```
1  ,(Get-ProvVM -ProvisioningSchemeName "myProvScheme") | Move-ProvVMDisk
      -ProvisioningSchemeName "myProvScheme" -DestinationStorageId
      datastore1
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme from which VMs'disks will be moved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which VMs'disks will be moved.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

List of VM names that will be have the disk moving.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-DestinationStorageId

Indicates the destination storageId. The details can refer to Get-ProvSchemeResourceInStorage

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DiskType

Indicates the type of disks which will be moved

Type:	DiskMovingType
Position:	Named
Default value:	All
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether an identifier for the task must returned before completion of the task. The progress of the task can be monitored using 'get-ProvTask'command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMName'and 'ProvisioningSchemeName'to move disks.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall “Running”task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For move vm disks task, this is always “Move-ProvVMDisk”.

Status <string>

Where in its lifecycle the task is.

DiskMovedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See DiskMoveFailedVirtualMachines for details of the object parameters.

DiskMoveFailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

NotStartedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

The cmdlet is associated with a task of type MoveVMDiskTask, and while active will move through the following operations (CurrentOperation field):

ValidatingInputs

MoveVMDisks

ReplicateBaseDisks

RemoveStaleBaseDsik

Only one long-running task for each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

New-ProvImageDefinition

March 11, 2024

Create a new image definition.

Syntax

```
New-ProvImageDefinition
   [-PreparedImageDefinitionName] <String>
   [-Description <String>]
   -HostingUnitName <String>
   -OsType <String>
   [-CustomProperties <String>]
   [-UseWriteBackCache]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-ProvImageDefinition
   [-PreparedImageDefinitionName] <String>
   [-Description <String>]
   -HostingUnitUid <Guid>
   -OsType <String>
   [-CustomProperties <String>]
   [-UseWriteBackCache]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Lets you create a new image definition. An image definition can contain multiple image versions (See New-ProvImageVersion). The image definition defines basic information of all its image versions.

Examples

EXAMPLE 1

Create a new image definition with name “MyImage”on HostingUnit Hu.

```
New-ProvImageDefinition -PreparedImageDefinitionName MyImage -
   HostingUnitName Hu -OsType Windows -Description "Windows image"

  CreateTime                     : 1/1/2022 12:00:00
  CustomProperties               :
  Description                    : Windows image
  HostingUnitName                : Hu
  HostingUnitUid                 : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
  OsType                         : Windows
  PreparedImageDefinitionName    : MyImage
  PreparedImageDefinitionUid     : 7585f0de-192e-4847-a6d8-22713c3a2f42
  UseWriteBackCache              : False
```

Parameters

-PreparedImageDefinitionName

The name of the image definition to be created.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-OsType

A value indicating the OS type for the image versions in this image definition.

Type:	String
Accepted values:	Linux, Windows
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitName

The name of the hosting unit used for the image definition.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit used for the image definition.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

A value indicating the image description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the image scheme that are specific to the target hosting infrastructure.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseWriteBackCache

Indicates whether or not write back cache is enabled for the image versions in this image definition.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definitions and contains the following information:

CreateTime <DateTime>

The date and time when the image definition was created.

CustomProperties <string>

Properties of the image definition which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

Description <string>

The description for this image definition.

HostingUnitName <string>

The name of the hosting unit being used by this image definition.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image definition.

OsType <string>

The OS type for this image definition.

PreparedImageDefinitionName <string>

The name of this image Definition.

PreparedImageDefinitionUid <Guid>

The unique identifier for this image definition.

UseWriteBackCache <bool>

Whether to use WriteBackCache of this image definition.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

New-ProvImageScheme

March 11, 2024

Creates a new image scheme.

Syntax

```
New-ProvImageScheme
   [-PreparedImageSchemeName] <String>
   -HostingUnitName <String>
   [-VMCpuCount <Int32>]
   [-VMMemoryMB <Int32>]
   -NetworkMapping <Hashtable>
   [-ServiceOffering <String>]
   [-CustomProperties <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-ProvImageScheme
   [-PreparedImageSchemeName] <String>
   -HostingUnitUid <Guid>
   [-VMCpuCount <Int32>]
   [-VMMemoryMB <Int32>]
   -NetworkMapping <Hashtable>
   [-ServiceOffering <String>]
   [-CustomProperties <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Lets you create a new image scheme. The image scheme is a collection of all of the data that is required to prepare a template against which virtual machines can be created. An image scheme will be used in New-ImageVersion command to prepare an image.

It therefore requires the following: Hosting Unit A reference to an item defined in the Host Service that defines the hypervisor, the network, and the storage to be used.

This cmdlet requires information to be provided that is retrieved using other snap-ins that form part of the Citrix Machine Creation Services: Hosting Unit Service Snapin The snap-in that provides information about the hypervisors.

Examples

EXAMPLE 1

Creates a new image scheme with the name “XenPS”using the hosting unit “XenHu”.

```
New-ProvImageScheme -PreparedImageSchemeName XenPS -HostingUnitName
    XenHu

CpuCount                  : 0
CustomProperties          :
HostingUnitName           : XenHu
HostingUnitUid            : e5d4a2c9-6650-4cfc-93cc-1686db82b92e
MachineProfile            :
MemoryMB                  : 0
NetworkMaps               : []
PreparedImageSchemeName   : XenPS
PreparedImageSchemeUid    : 85bd21c6-851b-420a-a702-2fa2ee6f0052
ServiceOffering           :
```

EXAMPLE 2

Creates a new image scheme with the name “azurescheme”using the hosting unit “azure”.

```
New-ProvImageScheme -PreparedImageSchemeName azurescheme -
    HostingUnitName azure -ServiceOffering "XDHyp:\HostingUnits\azure\
    serviceoffering.folder\Standard_B2ms.serviceoffering" -
    NetworkMapping @{
 "0"="XDHyp:\HostingUnits\azure\virtualprivatecloud.folder\East US.
     region\virtualprivatecloud.folder\hu.resourcegroup\hu.
     virtualprivatecloud\default.network" }

CpuCount                  : 0
CustomProperties          :
HostingUnitName           : azure
HostingUnitUid            : e5d4a2c9-6650-4cfc-93cc-1686db82b92e
MachineProfile            :
MemoryMB                  : 0
NetworkMaps               : [{
 "DeviceId":"0","NetworkId":"","NetworkPath":"virtualprivatecloud.
     folder\\East US.region\\virtualpr
                           ivatecloud.folder\\hu.resourcegroup\\hu.
                              virtualprivatecloud\\default.network" }
 ]
PreparedImageSchemeName   : myImageScheme
PreparedImageSchemeUid    : b5a55401-ad36-4f53-b0e0-dbb6a5bdf6fd
ServiceOffering           : serviceoffering.folder\Standard_B2ms.
    serviceoffering
```

Parameters

-PreparedImageSchemeName

The name of the image scheme to be created. This must be a name that is not being used by an existing image scheme, and it must not contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitName

The name of the hosting unit used for the image scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit used for the image scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VM in New-ImageVersion command is created with a single NIC, which is mapped to the default network in the HostingUnit. If this parameter is supplied, machine is created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMCpuCount

The number of processors used by virtual machines created from the image scheme.

Type:	Int32
Position:	Named
Default value:	The number of CPUs assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory used by virtual machines created from the image scheme.

Type:	Int32
Position:	Named
Default value:	The amount of memory assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating machines in Cloud Hypervisors.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the image scheme that are specific to the target hosting infrastructure.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

The inventory path to the source that is used as a template. This profile identifies the values for the VMs created by the catalog. This must be a path to an item in the same hosting unit that the hosting unit name or hosting unit UID refers to.

Valid paths are of the format:

XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageScheme

This object provides details of the image scheme and contains the following information:

CpuCount <int>

The number of processors that will be used to create VMs.

CustomProperties <string>

Properties of the image scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

HostingUnitName <string>

The name of the hosting unit being used by this image scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image scheme.

MachineProfile <string>

The inventory path to the source VM used by the image scheme as a template.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

PreparedImageSchemeName <string>

The name of this image scheme.

PreparedImageSchemeUid <Guid>

The unique identifier for this image scheme.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

Notes

In case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

DatabaseMissingCapabilites

The database supporting the service instance being used has not been upgraded to support the personal vDisk feature.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ScopeNotFound

One or more of the scopes nominated for the new image scheme do not exist.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

ImageSchemeNameAlreadyExists

The specified image scheme name has already existed.

New-ProvImageVersion

March 11, 2024

Prepare an image version in one image definition which can be used by provisioning scheme to provisioning virtual machines.

Syntax

```
New-ProvImageVersion
   -MasterImageVM <String>
   [-PreparedImageVersionNumber] <String>
   -PreparedImageDefinitionName <String>
   -PreparedImageSchemeName <String>
   [-Description <String>]
   [-NoImagePreparation]
   [-WriteBackCacheDiskSize <Int32>]
   [-WriteBackCacheMemorySize <Int32>]
   [-Metadata <Hashtable>]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-ProvImageVersion
   -MasterImageVM <String>
   [-PreparedImageVersionNumber] <String>
   -PreparedImageDefinitionUid <Guid>
   -PreparedImageSchemeUid <Guid>
   [-Description <String>]
```

```
    [-NoImagePreparation]
    [-WriteBackCacheDiskSize <Int32>]
    [-WriteBackCacheMemorySize <Int32>]
    [-Metadata <Hashtable>]
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The prepared image version can be assigned to provisioning schemes to provision virtual machines

A snapshot is used rather than a VM, so that the content of the hard disk for the image scheme can be easily determined.

As the snapshot is specified using a path into the Citrix Host Service Powershell Provider, the Citrix Host Service Powershell snap-in must also be loaded for this cmdlet to be used.

Examples

EXAMPLE 1

Prepares a new master hard disk image for the myImage version 1 using the “base.snapshot”hard disk image.

```
New-ProvImageVersion -PreparedImageVersionNumber 1 -
    PreparedImageDefinitionName myImage -PreparedImageSchemeName
    myImageScheme -MasterImageVM XDHyp:\H
  stingUnits\HostUnit1\RhoneCC_baseXP.vm\base.snapshot -
     RunAsynchronously

Parameters

-PreparedImageVersionNumber

The version number of the image version to be created.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MasterImageVM

The path in the hosting unit provider to the virtual machine snapshot that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot item in the same hosting unit that the hosting unit name or hosting unit Uid refers to.

Valid paths are of the format; XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<SnapshotName>

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PreparedImageDefinitionName

The name for the image definition used for the image version.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageSchemeName

The name for the image scheme used for the image version.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionUid

The identifier for the image definition used for the image version.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageSchemeUid

The identifier for the image scheme used for the image version.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

A value indicating the image version description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NoImagePreparation

Gets or sets a flag indicating that Image Preparation should be disabled

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheDiskSize

The size in GB of any temporary storage disk used by the write back cache. Should be used in conjunction with WriteBackCacheMemorySize.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheMemorySize

The size in MB of any write back cache if required. Should be used in conjunction with WriteBackCacheDiskSize. Setting RAM Cache to 0 but specifying Disk Cache effectively disables the RAM Cache. However, there will be some memory still used to allow the I/O Optimization to operate.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets or sets metadata of the image version.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For new image version tasks this is always "NewImageVersion".

Status <string>

Where in its lifecycle the task is.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateStarted <DateTime>

The date and time when the task was started.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Storage <Citrix.MachineCreation.Sdk.NewProvSchemeStorage[]>

Storage objects to be used for the new image version task.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warnings associated with the new image version task.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

PreparedImageVersionNumber <string>

The version number of the image versions that the task was for.

PreparedImageVersionUid <Guid>

The unique identifier of the image version that the task was for.

PreparedImageDefinitionName <string>

The name of the image definition for which the image version is created.

PreparedImageDefinitionUid <Guid>

The unique identifier of the image definition that the task was for.

PreparedImageSchemeUid <Guid>

The unique identifier of the image scheme which is used for this image version.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master image for the task.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image version, if specified.

CustomProperties <string>

The properties of the image version that are specific to the target hosting infrastructure.

InitialBatchSizeHint <int>

The number of VMs that are expected to be added to the scheme as an initial batch.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new image version will use.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringImageVersion

Indicates that the task is storing the image version data to the database.

Finished

Indicates that the task has completed with no errors.

ImageVersionAlreadyExists

Indicates that the task failed because a image version with the same name already exists.

MasterVMImageIsNotPartOfImageDefinitionHostingUnit,

Indicates that the hosting unit that the master image originated from is not the hosting unit that the image definition is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM Image path does not refer to a Snapshot item.

InvalidMasterVMConfiguration

The VM snapshot specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot specified as the master is currently in an invalid state.

InsufficientResources

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Holds string data providing more details about the current task state.

TaskProgress

The progress of the task 0-100%.

WriteBackCacheDiskSize <int>

The size of any write-back cache disk (zero if the write-back cache feature was not selected).

WriteBackCacheMemorySize <int>

The size of the write-back cache (zero if the write-back cache feature was not selected).

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The list of NIC to network associations, if specified.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

Notes

Only one long-running task per image version can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

The cmdlet is associated with a task of type NewImageVersion, and while active will move through the following operations (CurrentOperation field)

Description

Allows you to create a new provisioning scheme. The creation process makes a copy of the hard disk attached to a virtual machine snapshot or VM template and stores it in every storage location that the hosting unit referenced by the provisioning scheme defines. This is a long-running task and typically takes several minutes to complete (depending on the size of the hard disk that is being copied and the number of snapshots that the hard disk consists of).

A snapshot or VM template must be used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

Because the snapshot or VM template are specified using a path into the Citrix Host Service PowerShell Provider, the Citrix Host Service PowerShell snap-in must also be loaded to use this cmdlet.

This cmdlet requires information to be provided that is retrieved using other snap-ins that form part of the Citrix Machine Creation Services:

Hosting Unit Service Snapin

The snap-in that provides information about the hypervisors.

AD Identity Service Snapin

The snap-in that provides information about the identity pools.

The provisioning scheme is a collection of all of the data that is required to form a template against which virtual machines can be created. It therefore requires the following:

Hosting Unit

A reference to an item defined in the Host Service that defines the hypervisor, the network, and the storage to be used.

Identity Pool

A reference to the collection of Active Directory accounts that is used for VMs created from the provisioning scheme.

Examples

EXAMPLE 1

Creates a new provisioning scheme with the name “XenPS”using the hosting unit “XenHu”and the identity pool “idPool1”from the master VM snapshot called “Base.snapshot”.

```
New-ProvScheme -ProvisioningSchemeName XenPS -HostingUnitName XenHu -
    IdentityPoolName idPool1 -CleanOnBoot -MasterImageVM XDHyp:\
    HostingUnits\XenHU\Base.vm\Base.snapshot

TaskId                                  : 90e93b9d-a225-4701-ad50-
    fa1546af35ac
Type                                    : NewProvisioningScheme
Status                                  : Finished
CurrentOperation                        :
TaskExpectedCompletion                  :
LastUpdateTime                          : 17/05/2020 08:24:08
ActiveElapsedTime                       : 11
DateStarted                             : 17/05/2020 08:22:22
DateFinished                            : 17/05/2020 08:24:08
TerminatingError                        :

EXAMPLE 2

Creates a new provisioning scheme with the name “AWS1”using the hosting unit “aws-test”and the identity pool “idPool1”from the master VM snapshot called “TemplateAmi”. The machine instance “server-vda”is used as a Machine Profile when creating the provisioning scheme so all other parameters are taken from the instance.

```
1 $provScheme = New-ProvScheme -ProvisioningSchemeName AWS1 -
      HostingUnitName aws-test -IdentityPoolName idPool1 -MasterImageVM "
      XDHyp:\HostingUnits\aws-test\TemplateAmi (ami-06927522c36bf4109).
      template" -CleanOnBoot -MachineProfile "XDHyp:\HostingUnits\aws-test
      \us-east-1a.availabilityzone\server-vda (i-0c136ee2a01a3dd60).vm"
```

EXAMPLE 3

Creates a new provisioning scheme with the name “AWS2”using the hosting unit “aws-test”and the identity pool “idPool2”from the master VM snapshot called “TemplateAmi”. The version “1”of the launch template with name “machine-profile-lt”and id “lt-06927522c36bg5698”is used as a Machine Profile when creating the provisioning scheme so all other parameters are taken from this launch template version. If instance type value (ServiceOffering) is empty in the machine profile launch template version and no service offering is provided in cmdlet parameter, the cmdlet will return error.

```
1 $provScheme = New-ProvScheme -ProvisioningSchemeName AWS2 -
      HostingUnitName aws-test -IdentityPoolName idPool2 -MasterImageVM "
      XDHyp:\HostingUnits\aws-test\TemplateAmi (ami-06927522c36bf4109).
      template" -CleanOnBoot -MachineProfile "XDHyp:\HostingUnits\aws-test
      \machine-profile-lt (lt-06927522c36bg5698).launchtemplate\lt
      -06927522c36bg5698 (1).launchtemplateversion"
```

EXAMPLE 4

Creates a new provisioning scheme with the name “XenPS”using the hosting unit “XenHu”and the identity pool “idPool1”from the master VM snapshot called “Base.snapshot”asynchronously. To get the task details, use Get-ProvTask -TaskID <task id>.

```
New-ProvScheme -ProvisioningSchemeName XenPS -HostingUnitName XenHu -
    IdentityPoolName idPool1 -CleanOnBoot -MasterImageVM XDHyp:\
    HostingUnits\XenHU\Base.vm\Base.snapshot -RunAsynchronously

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to be created. This must not be a name that is being used by an existing provisioning scheme, and must not contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitName

The name of the hosting unit to be used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool to be used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The unique identifier of the hosting unit to be used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier of the identity pool to be used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageVersionUid

The identifier for the image version used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionName

The name for the image definition used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageVersionNumber

The version number for the image version used for the provisioning scheme.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MasterImageVM

The path in the hosting unit provider to the VM snapshot or template that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot or Template item in the same hosting unit specified by HostingUnitName or HostingUnitUid. Valid paths are of the format:

XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<SnapshotName>.snapshot
XDHyp:\HostingUnits\<HostingUnitName>\<path>\<TemplateName>.template

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-VMCpuCount

The number of processors that will be used to create VMs from the provisioning scheme.

Type:	Int32
Position:	Named
Default value:	The number of CPUs assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory that will be used to created VMs from the provisioning scheme in MB.

Type:	Int32
Position:	Named
Default value:	The amount of memory assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseWriteBackCache

Indicates whether write-back cache is enabled for the VMs created from this provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NoImagePreparation

Indicates that image preparation should not be performed on this provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, VMs are created with a single NIC, which is mapped to the default network in the hosting unit. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

Type:	Hashtable
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

The FunctionalLevel of the VDA installed on the given MasterImageVM.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-CleanOnBoot

Indicates whether the VMs created from this provisioning scheme are reset to their initial condition each time they are started.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Scope

The administration scopes to be applied to the new provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

The metadata to be associated with this provisioning scheme.

Type:	Hashtable
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating VMs in Cloud Hypervisors.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecurityGroup

The security groups to apply to VMs created in Cloud Hypervisors.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenancyType

Indicates whether to use tenancy type Shared, Instance or Host when creating VMs in Cloud Hypervisors.

Type:	String
Accepted values:	Host, Instance, Shared
Position:	Named
Default value:	Shared
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

Currently only supported with Azure. Defines the inventory path to the source VM used by the provisioning scheme as a template. This profile identifies the properties for the VMs created from the scheme. The VM must be in the hosting unit that HostingUnitName or HostingUnitUid refers to. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written back to the CustomProperties.

Valid paths are of the format: XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the provisioning scheme that are specific to the target hosting infrastructure. See about_ProvCustomProperties for more information.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResetAdministratorPasswords

Indicates whether the passwords for administrator accounts are reset on created machines.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseFullDiskCloneProvisioning

Indicates whether VMs should be created using the dedicated full disk clone feature.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Validate

Indicates whether a dry run of the configuration validation will be performed.

Type:	SwitchParameter
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MasterImageNote

A note for the master image.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This can not be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InitialBatchSizeHint

Provides a predictive hint for the number of initial VMs that will be added to the MCS catalog when the scheme is successfully created. Callers should supply this parameter in situations where the completion of New-ProvScheme will be closely followed by a New-ProvVM call to create an initial batch of VMs in the catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PVSSite

PVS Site to be assigned to the VMs in the Provisioning Scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PVSvDisk

PVS vDisk to be assigned to the VMs in the Provisioning Scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeType

The type of Provisioning Scheme to created, either MCS or PVS, defaults to MCS

Type:	ProvisioningSchemeType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ForceCreate

If specified, the provisioning scheme will be created even in the event of creation failure.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new provisioning scheme tasks, this is always NewProvisioningScheme.

Status <string>

Where in its lifecycle the task is.

CurrentOperation <string>

Operation specific phase of the overall “Running”task state.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateStarted <DateTime>

The date and time when the task was started.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Storage <Citrix.MachineCreation.Sdk.NewProvSchemeStorage[]>

Storage objects to be used for the new provisioning scheme task.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warnings associated with the new provisioning scheme task.

ProvisioningSchemeName <string>

The name of the provisioning scheme being created.

MasterImage <string>

The inventory path of the VM snapshot or template to be used as the master VM image for the task.

IdentityPoolName <string>

The name of the identity pool to be used by the new provisioning scheme.

IdentityPoolUid <guid>

The unique identifier name of the identity pool to be used by the new provisioning scheme.

HostingUnitName <string>

The name of the hosting unit to be used by the new provisioning scheme.

HostingUnitUid <guid>

The unique identifier of the hosting unit to be used by the new provisioning scheme.

CustomProperties <string>

The properties of the provisioning scheme that are specific to the target hosting infrastructure.

InitialBatchSizeHint <int>

The number of VMs that are expected to be added to the scheme as an initial batch.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme being created.

TaskState <Citrix.MachineCreation.Sdk.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

The task has begun but has not done anything yet.

LocatingResources,

The workflow is locating resources from other services.

HostingUnitNotFound

The task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

The task failed because the required VM snapshot or VM template could not be located.

ConsolidatingMasterImage

The task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

The task is replicating the consolidated master image.

StoringProvisioningScheme

The task is storing the provisioning scheme data in the database.

Finished

The task completed with no errors.

ProvisioningSchemeAlreadyExists

The task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

The task failed because the specified identity pool could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

The task failed because the hosting unit from which the master image originated is not the same hosting unit that the provisioning scheme is using.

MasterVmImageIsNotASnapshot

The task failed because the master VM path does not refer to a snapshot or VM template item.

ProvisioningSchemeNotFound

The task failed because it could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

The task failed because a task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The task failed because the VM snapshot or VM template specified as the master has an invalid configuration.

InvalidMasterVMState

The task failed because the VM snapshot or VM template specified as the master is currently in an invalid state.

InsufficientResources

The task failed because the hypervisor did not have enough resources to complete the task.

DiskConsolidationFailed

The disk consolidation task failed. Details are in the task state information string.

StorageNotFound

The task failed because no associated storage was found in the hosting unit.

ConfigurationError

The task failed because the service is unable to contact one of the other services. This is because not all appropriate Configuration Service registrations have been performed.

RequestedFeatureNotEnabled

The task failed because a requested feature is not enabled.

MachineProfileNotSupported

The task failed because machine profile is not supported.

FailedToReadMachineProfile

Failed to read the Machine Profile.

Canceled

The task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Additional information about the current task state.

TaskProgress <double>

The progress of the task 0-100%.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

MasterImageNote <string>

The note of the master image.

WriteBackCacheDiskSize <int>

The size of any write-back cache disk (zero if the write-back cache feature was not selected).

WriteBackCacheMemorySize <int>

The size of the write-back cache (zero if the write-back cache feature was not selected).

WriteBackCacheDriveLetter <char>

The drive letter of write back cache disk (default empty which means to be allocated by operating system).

Scopes <Citrix.Fma.Sdk.ServiceCoreScopeReference[]>

The delegated administration scopes to which the scheme will belong.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The list of NIC to network associations, if specified.

ProvisioningSchemeMetadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the provisioning scheme, if specified.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

DedicatedTenancy <bool>

Whether to use dedicated tenancy when creating VMs in Cloud Hypervisors.

ResetAdministratorPasswords <bool>

Whether to reset the passwords for administrator accounts on created machines.

StatusMessageSubstitutions <string[]>

List of strings to be substituted into custom error or status messages from provisioning plug-ins.

GpuTypeId <string>

The id of the GPU type used by this provisioning scheme, null if no GPU.

UseFullDiskCloneProvisioning <bool>

Indicates whether the machines are provisioned using the dedicated full disk clone feature.

Notes

The cmdlet is associated with a task of type NewProvisioningScheme, and while active will move through the following operations (CurrentOperation field):

ValidatingInputs

ConsolidatingMasterImage

PreparingMasterImage

ReplicatingMasterImage

CommittingScheme

Only one long-running task for each provisioning scheme can be processed at a time.

In case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ScopeNotFound

One or more of the scopes nominated for the new provisioning scheme do not exist.

ImageVersionNotFound

The specified image version for the new provisioning scheme do not exist.

ImageVersionNotReady

The specified image version for the new provisioning scheme is not ready for use.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

VhdParametersMustBeSupplied

When parameter VhdTemplateSource or VhdResultDestination is supplied, both parameters are required to be supplied.

ServiceDoesNotSupportFullDiskClone

The full disk clone parameter is being used when the service does not support the full disk clone feature. Upgrade the service or remove the parameter.

FullDiskCloneDoesNotSupportCleanOnBootVMs

The full disk clone functionality is applicable to dedicated provisioned machines only.

CannotUseWriteBackCacheWithCleanOnBootDisabled

Cannot turn on writebackcache on persistent catalog. Do not use -UseWriteBackCache without specifying -CleanOnBoot.

New-ProvVM

March 11, 2024

Creates new virtual machines.

Syntax

```
New-ProvVM
   -ProvisioningSchemeName <String>
   -ADAccountName <String[]>
   [-FastBuild]
   [-NetworkMapping <Hashtable>]
   [-AutoAssignVLAN]
```

```
    [-SecurityGroup <String[]>]
    [-MachinesPerAssistant <Int32>]
    [-MaxAssistants <Int32>]
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
New-ProvVM
   -ProvisioningSchemeName <String>
   -ADAccountSid <String[]>
   [-FastBuild]

   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Lets you create new virtual machines with the configuration specified by a provisioning scheme.

The virtual machines are created using all of the storage specified in the provisioning scheme. The storage are used in a Round Robin mechanism.

For the duration of this task, the AD accounts are locked by the AD Identity Service, which prevents the same accounts from being used by other machine creation tasks.

Examples

EXAMPLE 1

Creates a new virtual machine using the AD account “domain\account”in the provisioning scheme “MyScheme”.

```
New-ProvVM -ProvisioningSchemeName MyScheme -ADAccountName "domain\
    Account"

TaskId                              : 90e93b9d-a225-4701-ad50-
    fa1546af35ac
Type                                : NewVirtualMachine
Status                              : Finished

```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme in which the VMs are created.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountName

A list of the Active Directory account names that are used for the VMs. The accounts must be provided in a domain-qualified format. This parameter accepts Identity objects as returned by the New-AcctADAccount cmdlet,

or any PSObject with string properties “Domain”and “ADAccountName”.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountSid

A list of the Active Directory account sids that are used for the VMs.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme in which the VMs are created.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FastBuild

Indicates whether the command can run faster by using optimizations in the creation process. This may mean that VMs created cannot be started until ResetVM operations have been performed by the Broker and Machine Identity Services.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VMs are created with network settings as inherited from the provisioning scheme. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoAssignVLAN

Indicates whether the VLAN of the network should be automatically assigned to the new VM or if the VLAN from the master image should be used

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecurityGroup

The security groups to apply to machines created in Cloud Hypervisors.

Type:	String[]
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesPerAssistant

The number of concurrent volume operations that may be performed by each volume worker helper machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAssistants

The maximum number of volume worker help machines that may be created for this operation.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For provisioning new VM tasks, this is always "NewVirtualMachine".

Status <string>

Where in its lifecycle the task is.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateStarted <DateTime>

The date and time when the task was started.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

MasterImage <string>

The inventory path of the VM snapshot that was used as the master image for the task.

MasterImageId <string>

The unique identifier of the VM snapshot as assigned by the hosting unit.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the task.

StatusMessageSubstitutions <string[]>

List of strings to be substituted into custom error or status messages from provisioning plug-ins.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the task.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

HypervisorInMaintenanceMode

Indicates that the hypervisor is not available for normal use.

NoAvailableStorage

Indicates that no storage is available for the hypervisor.

NoAvailableNetwork

Indicates that no network is available for the hypervisor.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

The job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation

Provides more detailed information about the current task state.

HostingUnitUid

The unique identifier of the hosting unit that is used by the provisioning task.

HostingUnitName <string>

The name of the hosting unit that is used by the provisioning task.

IdentityPoolUid <guid>

The unique identifier of the identity pool that is used by the provisioning task.

IdentityPoolName <string>

The name of the identity pool that is used by the provisioning task.

VirtualMachinesToCreateCount <int>

The total number of virtual machines that the task is trying to create.

VirtualMachinesCreatedCount <int>

The number of virtual machines that the task has created so far. Details of the machines that were created are in the CreatedVirtualMachines parameter.

VirtualMachinesCreationFailedCount <int>

The number of virtual machines that the task has failed to create. Details of the machines that were not created are in the FailedVirtualMachines parameter.

CreatedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

Object array of created virtual machines summary information. The object properties are:

ADAccountName <string>

The domain qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier within the hypervisor in which the VM resides.

VMName <string>

The display name of the virtual machine within the hypervisor in which the VM resides.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See CreatedVirtualMachines for details of the object parameters.

Notes

The cmdlet is associated with a task of type NewVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

CreatingVirtualMachines

ReleasingAccountLocks

Only one long-running task in each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified.

When running asynchronously, the cmdlet terminates before the job does,

so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller being used, or Citrix Virtual Apps and Desktops logs.

Publish-ProvMasterVMImage

March 11, 2024

Update the master image associated with the provisioning scheme.

Syntax

```
Publish-ProvMasterVMImage
        -MasterImageVM <String>
        [-ProvisioningSchemeName] <String>
        [-DoNotStoreOldImage]
        [-VhdTemplateSource <String>]
        [-VhdResultDestination <String>]
        [-AppScanResultsFile <String>]
        [-FunctionalLevel <String>]
        [-MasterImageNote <String>]
        [-RunAsynchronously]
        [-PurgeJobOnSuccess]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Publish-ProvMasterVMImage
        -MasterImageVM <String>
        -ProvisioningSchemeUid <Guid>
        [-DoNotStoreOldImage]
        [-VhdTemplateSource <String>]
        [-VhdResultDestination <String>]
        [-AppScanResultsFile <String>]
        [-FunctionalLevel <String>]
        [-MasterImageNote <String>]
        [-RunAsynchronously]
        [-PurgeJobOnSuccess]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Publish-ProvMasterVMImage
        [-ProvisioningSchemeName] <String>
        [-DoNotStoreOldImage]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```

       -ProvisioningSchemeUid <Guid>
       [-DoNotStoreOldImage]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to update the hard disk image used to create virtual machines. If the provisioning scheme is a 'CleanOnBoot'type, then the next time that virtual machines are started, their hard disks are updated to this new image. Regardless of the 'CleanOnBoot'type, all new virtual machines created after this command will use this new hard disk image.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

A snapshot or VM template is used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot or VM template are specified using a path into the Citrix Host Service PowerShell Provider, the Citrix Host Service PowerShell snap-in must also be loaded to use this cmdlet.

The previous hard disk image path is stored into the history (see Get-ProvSchemeMasterVMImageHistory). The data stored in the history allows to do a rollback to revert to the previous hard disk image if required.

Examples

EXAMPLE 1

Updates the master hard disk image for the provisioning Scheme "MyScheme"to use the "base.snapshot"hard disk image.

```
Publish-ProvMasterVMImage -ProvisioningSchemeName MyScheme -
    MasterImageVM XDHyp:\HostingUnits\HostUnit1\RhoneCC_baseXP.vm\base.
    snapshot

TaskId                  : 248f102f-073f-45fe-aea9-1819a6d6dd1f
Active                  : False
Host                    : MyHost
DateStarted             : 17/05/2010 17:37:57
Type                    : PublishImage
Metadata                : {
  }

```

```
WorkflowStatus          : Completed
ProvisioningSchemeUid   : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName  : MyScheme
MasterImage             : /RhoneCC_baseXP.vm/base.snapshot
HostingUnitName         : HostUnit1
HostingUnitUid          : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
MasterImageNote         :
ADIdentityPoolName      :
ADIdentityPoolUid       : 03743136-e43b-4a87-af74-ab71686b3c16
CurrentOperation        :
TaskState               : Finished
TaskStateInformation    :
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to which the hard disk image should be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MasterImageVM

The path in the hosting unit provider to the VM snapshot or template that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path

to a Snapshot or Template item in the same hosting unit used by the provisioning scheme specified by ProvisioningSchemeName or ProvisioningSchemeUid. Valid paths are of the format:

XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<SnapshotName>.snapshot
XDHyp:\HostingUnits\<HostingUnitName>\<path>\<TemplateName>.template

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to which the hard disk image should be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VhdTemplateSource

A file path to a source VHD template to be used when performing application scanning during image preparation. The presence of this parameter in conjunction with VhdResultDestination implies that application scanning is to be performed

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-VhdResultDestination

A file path (including file name) where the VHD disk file containing the results of application scanning should be written.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppScanResultsFile

File name to which the results of application scanning should be written.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

The FunctionalLevel of the VDA installed on the given MasterImageVM.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MasterImageNote

The note of the master image.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the cmdlet should return before it completes. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database once the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotStoreOldImage

Indicates that the current image should not be added to the image history list for the provisioning scheme. This is useful when rolling back to a previous image.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Publish-ProvMasterVMImage.

Outputs

Guid

When "RunAsynchronously"is specified, this identifier is returned to provide the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For publish master image for provisioning scheme tasks this is always "PublishImage".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is being used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the task.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the task.

MasterImage <string>

The path of the VM snapshot or template that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool being used for this task.

IdentityPoolUid <guid>

The unique identifier of the identity pool being used for this task.

HostingUnitName <string>

The name of the hosting unit being used for this task.

HostingUnitUid

The unique identifier of the hosting unit being used for this task.

MasterImageNote

The note of the master image.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot or VM template could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringProvisioningScheme

Indicates that the task is storing the provisioning scheme data to the database.

Finished

Indicates that the task has completed with no errors.

ProvisioningSchemeAlreadyExists

Indicates that the task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

Indicates that the task failed because the identity pool specified could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

Indicates that the hosting unit that the master image originated from is not the same hosting unit that the provisioning scheme is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM image path does not refer to a snapshot or a VM template item.

ProvisioningSchemeNotFound

Could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

A task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The VM snapshot or VM template specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot or VM template specified as the master is currently in an invalid state.

InsufficientResources

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Holds string data providing more details about the current task state.

TaskProgress <double>

The progress of the task 0-100%.

Notes

The cmdlet is associated with a task of type PublishImage, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

ConsolidatingMasterImage

PreparingMasterImage

ReplicatingMasterImage

CommittingScheme

Only one long-running task per provisioning scheme can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvImageDefinition

March 11, 2024

Remove an image definition.

Syntax

```
Remove-ProvImageDefinition
      -PreparedImageDefinitionName <String>
      [-PurgeDBOnly]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageDefinition
      -PreparedImageDefinitionUid <Guid>
      [-PurgeDBOnly]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove an image definition and its image versions. The image definition can contain multiple image versions. If it still has image versions used by provisioning scheme, the image scheme can not be removed.

Examples

EXAMPLE 1

Remove the image definition by name and its image versions.

```
Remove-ProvImageDefinition -PreparedImageDefinitionName MyImage
```

Parameters

-PreparedImageDefinitionName

The name of the image definition to be removed.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PreparedImageDefinitionUid

The unique identifier for the image definition to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PurgeDBOnly

If this option is specified, this command will only remove the image definition data from the Citrix site database. However, the disk images created by its image versions still remain in the hypervisor. The hypervisor administrator can remove hard disk images using the tools provided by the hypervisor itself. This option can also be used when you are no longer able to contact the hypervisor and you want to remove the image definition from Citrix site database. This parameter cannot be used with "ForgetVM".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageDefinition

You can pipe an object containing a parameter called 'PreparedImageDefinitionName'or 'Prepared-ImageDefinitionUid'to Remove-ProvImageDefinition.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information: TaskId <Guid> The identifier for the task that was performed. Active <bool> Indicates whether the task is still processing or is complete. Host <string> The name of the host on which the task is running or was run. DateStarted <DateTime> The date and time when the task was started. Metadata

<Citrix.MachineCreation.Sdk.Metadata[]> The list of metadata stored for the task. For new tasks, this is empty until metadata is added. ProvImageDefinitionUid <Guid> The unique identifier of the image definition. ProvImageDefinitionName <string> The name of the image definition. CurrentOperation <string> Operation specific phase of the overall "Running"task state. TaskProgress <double> The progress of the task 0-100%. LastUpdateTime <DateTime> The date and time of the last task status update. ActiveElapsedTime <int> Number of seconds the task has taken for active execution. DateFinished <DateTime> The date and time when the task was completed. TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError> Diagnostic information if the task completely fails. Type <Citrix.XDInterServiceTypes.JobType> The type of task. For new reset disk tasks, this is always "Reset-ProvVMDisk". Status <string> TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState> The state of the task. This can be any of the following:

Processing Indicates that the task is in its initial state. LocatingResources, Indicates that the task is locating information from other services. HostingUnitNotFound Indicates that the required hosting unit could not be located. ImageDefinitionNotFound Indicates that the required image definition could not be located. Finished Indicates that the task is complete. FinishedWithErrors Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine. RemovingImageVersion Indicates that the task is removing image version. RemovingImageDefinition Indicates that the task is removing image definition. Failed Job failed for reasons specified in TaskStateInformation. Canceled Indicates that the task was stopped by user intervention (using Stop-ProvTask) TaskStateInformation <string> Provides more detailed information about the current task state. WorkflowStatus <System.Workflow.Runtime.WorkflowStatus> Indicates the status of the workflow that is used to process the task. TaskExpectedCompletion <DateTime> The date and time at which the task is expected to complete.

Notes

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ImageDefinitionNotFound

The specified image definition could not be located.

UnableToRemoveImageDefinitionDueToAssociatedProvisioningScheme

The image definition still has image versions used by provisioning scheme and can not be removed.

UnableToRemoveImageDefinitionWithPreparingImageVersion

The image definition has image version in preparing and can not be removed.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ProvImageScheme

March 11, 2024

Removes an image scheme

Syntax

```
Remove-ProvImageScheme
      -PreparedImageSchemeName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageScheme
      -PreparedImageSchemeUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove an image Scheme. The image scheme may associate with image versions. If associated image versions exist, the image scheme can not be removed.

Examples

EXAMPLE 1

Remove the image scheme by name.

```
Remove-ProvImageScheme -PreparedImageSchemeName azurescheme
```

Parameters

-PreparedImageSchemeName

The name of the image scheme to be removed.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-PreparedImageSchemeUid

The unique identifier for the image scheme to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageScheme

You can pipe an object containing a parameter called 'ImageSchemeName'or 'ImageSchemeUid'to Remove-ImageScheme.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ImageSchemeNotFound

The specified image scheme could not be located.

UnableToRemoveImageSchemeDueToAssociatedImageVersion

The image scheme associated with image versions and can not be removed.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ProvImagesPendingDelete

March 11, 2024

Remove pending image to delete.

Syntax

```
Remove-ProvImagesPendingDelete
      [-Id] <Int32>
      [-ForceDelete]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove image which are pending to be delete

Examples

EXAMPLE 1

Trying to delete a image which is in use

```
Remove-ProvImagesPendingDelete -Id 1 -ForceDelete
Remove-ProvImagesPendingDelete : Image is in use.
At line:1 char:1
+ Remove-ProvImagesPendingDelete -PendingDeleteId 1 -ForceDelete
+ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
+ CategoryInfo          : InvalidOperation: (:) [Remove-
    ProvImagesPendingDelete], InvalidOperationException
+ FullyQualifiedErrorId : Citrix.XDPowerShell.MachineCreationStatus.
    DiskIsInUse,Citrix.MachineCreation.Sdk.Commands.
    RemoveProvImagesPendingDeleteCommand
```

EXAMPLE 2

Trying to delete the image which does not exits

```
Remove-ProvImagesPendingDelete -Id 3 -ForceDelete
Remove-ProvImagesPendingDelete : There is no pending image to delete.
At line:1 char:1
+ Remove-ProvImagesPendingDelete -PendingDeleteId 3 -ForceDelete
+ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
+ CategoryInfo          : InvalidOperation: (:) [Remove-
    ProvImagesPendingDelete], InvalidOperationException
+ FullyQualifiedErrorId : Citrix.XDPowerShell.MachineCreationStatus.
    NoPendingDiskToDelete,Citrix.MachineCreation.Sdk.Commands.
    RemoveProvImagesPendingDeleteComman
d
```

Parameters

-Id

Pendig image record ID, in DB

Type: Int32

Position:	2
Default value:	0
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ForceDelete

If this switch is enabled, we force delete the image from hypervisor

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Related Links

- Get-ProvImagesPendingDelete

Remove-ProvImageVersion

March 11, 2024

Remove specified image version.

Syntax

```
Remove-ProvImageVersion
      -PreparedImageDefinitionName <String>
      -PreparedImageVersionNumber <String>
      [-PurgeDBOnly]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersion
      -PreparedImageVersionUid <Guid>
      [-PurgeDBOnly]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove an image version and its relevant hard disk image that has been prepared to provision virtual machines.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

Examples

EXAMPLE 1

Removes image version with Guid 90e93b9d-a225-4701-ad50-fa1546af35ac and its prepared master hard disk image.

```
Remove-ProvImageVersion -PreparedImageVersionUid 90e93b9d-a225-4701-
    ad50-fa1546af35ac
```

EXAMPLE 2

Removes image version v1.0 in image1 and its prepared master hard disk image.

```
Remove-ProvImageVersion -PreparedImageVersionNumber 1 -
    PreparedImageDefinitionName image1
```

Parameters

-PreparedImageDefinitionName

The name of image definition which the image version belongs to.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PreparedImageVersionNumber

The version number of image version.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PreparedImageVersionUid

The identifier of image version.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-PurgeDBOnly

If this option is specified, this command will only remove the image version data from the Citrix site database. However, the disk images created in the image version still remain in the hypervisor. The hypervisor administrator can remove hard disk images using the tools provided by the hypervisor itself. This option can also be used when you are no longer able to contact the hypervisor and you want to remove the image version from Citrix site database. This parameter cannot be used with "ForgetVM" .

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageVersion

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ImageVersionNotFound

The specified image version could not be located.

UnableToRemoveImageVersionInPreparing

Unable to remove an image version in preparing

UnableToRemoveImageVersionDueToAssociatedProvisioningScheme

Unable to remove specified image version due to associated provisioning scheme.

UnableToRemoveImageVersionDueToAssociatedVirtualMachine

Unable to remove specified image version due to associated virtual machine.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ProvImageVersionMetadata

March 11, 2024

Removes metadata from the given image version.

Syntax

```
Remove-ProvImageVersionMetadata
      [-PreparedImageVersionUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersionMetadata
      [-PreparedImageVersionUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersionMetadata
      [-PreparedImageDefinitionName] <String>
      [-PreparedImageVersionNumber] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersionMetadata
      [-PreparedImageDefinitionName] <String>
      [-PreparedImageVersionNumber] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersionMetadata
      [-InputObject] <ImageVersion[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersionMetadata
      [-InputObject] <ImageVersion[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given image version.

Examples

EXAMPLE 1

Remove all metadata from all image version objects.

```
Get-ProvImageVersion | % {
  Remove-ProvImageVersionMetadata -Map $_.MetadataMap  }
```

Parameters

-PreparedImageVersionUid

Id of the image version

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-PreparedImageDefinitionName

Name of the image definition

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-PreparedImageVersionNumber

Version number of the image version

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	ImageVersion[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “Sys-

tem.Collections.Generic.Dictionary[string, string];"). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageVersion

You can pipe a ImageVersion object or any object containing a parameter called 'PreparedImageDefinitionName'and 'PreparedImageVersionNumber'or 'PreparedImageVersionUid'to Remove-ProvImageVersionMetadata.

PSObject

A metadata map object can be piped to the Remove-ProvImageVersionMetadata command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes ————InvalidParameterCombination

The cmdlet parameters are inconsistent.

ObjectNotFound

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvMetadataConfiguration

March 11, 2024

Remove VM metadata configuration settings for a plugin.

Syntax

```
Remove-ProvMetadataConfiguration
      [-PluginType] <String>
      [-ConfigurationName] <String>
      [-ConfigurationValue] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove configure metadata setting.

Examples

EXAMPLE 1

Remove Azure VM extension AADLoginForWindows from the supported list. Only customer added item can be removed.

```
Remove-ProvMetadataConfiguration -PluginType "AzureRmFactory" -
    ConfigurationName "Extension" -ConfigurationValue "
    AADLoginForWindows"
```

Parameters

-PluginType

The name of the hypervisor plug-in factory. Currently, AzureRmFactory is the only supported plug-in factory.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ConfigurationName

The configuration name. Currently, Extension is the only supported configuration.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ConfigurationValue

The value for metadata configuration, for example Azure extension type.

Type:	String
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ConfigurationDoesNotExist

The configuration cannot be found in the database.

ConfigurationCitrixDefined

The user cannot remove Citrix defined configurations.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, check the Windows event logs on your self-hosted delivery controller or contact Citrix support if using Citrix DaaS (Citrix-hosted delivery controller).

Remove-ProvOperationEvent

March 11, 2024

Removes one or more MCS operation events.

Syntax

```
Remove-ProvOperationEvent
      [-EventId <Int32[]>]
      [-LinkedObjectType <String>]
      [-LinkedObjectUid <Guid>]
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Allows you to remove a set of existing MCS operation events.

Examples

EXAMPLE 1

Removes all of the operation events of the provisioning scheme with id 7585f0de-192e-4847-a6d8-22713c3a2f42.

```
Remove-ProvOperationEvent -LinkedObjectType ProvisioningScheme -
    LinkedObjectUid 7585f0de-192e-4847-a6d8-22713c3a2f42
```

Parameters

-EventId

The array of event id which all associated operation events will be removed.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LinkedObjectType

The type of the linked object for which all associated operation events will be removed.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectUid

The unique identifier of the linked object for which all associated operation events will be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-All

All operation events will be removed.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Remove-ProvScheme

March 11, 2024

Removes a provisioning scheme

Syntax

```
Remove-ProvScheme
      [-ProvisioningSchemeName] <String>
      [-PurgeDBOnly]
      [-ForgetVM]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvScheme
      -ProvisioningSchemeUid <Guid>
      [-PurgeDBOnly]
      [-ForgetVM]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove a provisioning Scheme. The provisioning scheme must not contain any VMs unless the 'ForgetVM'or 'PurgeDBOnly'option is specified. Use the Get-ProvTask command to monitor the progress of this task.

Examples

EXAMPLE 1

Remove the empty provisioning scheme by name.

```
Remove-ProvScheme -ProvisioningSchemeName $provScheme.
    ProvisioningSchemeName
```

EXAMPLE 2

Deletes provisioning scheme 'Catalog-1'data from the Citrix site database

```
Get-ProvScheme -ProvisioningSchemeName Catalog-1 | Remove-ProvScheme -
    PurgeDBOnly

TaskId                 : 02693f9c-8fa0-41c8-ab23-15853537fbb1
Active                 : False
Host                   : E73755-92-1
DateStarted            : 8/19/2022 12:50:34 PM
Metadata               :
ProvisioningSchemeName : Catalog-1
ProvisioningSchemeUid  : 60851748-3476-43c7-b406-c25f1a952185
PurgeDBOnly            : True
ForgetVm               : False
RemovedVirtualMachines : {
  }

FailedVirtualMachines  : {
  }

TaskState              : Finished
TaskStateInformation   :
CurrentOperation       :
TaskProgress           : 100
LastUpdateTime         : 8/19/2022 12:50:36 PM
ActiveElapsedTime      : 0
DateFinished           : 8/19/2022 12:50:36 PM
TerminatingError       :
Type                   : RemoveProvScheme
Status                 : Finished
WorkflowStatus         : Completed
```

```
TaskExpectedCompletion :
```

EXAMPLE 3

Removes all the Citrix-assigned identifiers(like tags or custom-attributes) on provisioning scheme, VMs and their related resources from hypervisor and also the deletes provisioning scheme 'Catalog-1' data from the Citrix site database.

```
Get-ProvScheme -ProvisioningSchemeName Catalog-1 | Remove-ProvScheme -
    ForgetVM

TaskId                 : 02693f9c-8fa0-41c8-ab23-15853537fbb1

DateFinished           : 8/19/2022 12:50:36 PM
TerminatingError       :
Type                   : RemoveProvScheme
Status                 : Finished
WorkflowStatus         : Completed
TaskExpectedCompletion :
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to be removed.

Type: String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PurgeDBOnly

If this option is specified, this command will only remove the provisioning scheme data from the Citrix site database. However, the VMs and related resources created in the provisioning scheme still remain in the hypervisor. The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. This option can also be used when you are no longer able to contact the hypervisor and you want to remove the provisioning scheme from Citrix site database. This parameter cannot be used with "ForgetVM".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ForgetVM

If this option is specified, this command will remove the provisioning scheme data from the Citrix site database and also delete Citrix-assigned identifiers(like tags or custom-attributes) on provisioning scheme, VMs and their related resources from hypervisor. However, the VMs and related resources created in the provisioning scheme still remain in the hypervisor after removing identifiers(like tags or custom-attributes). The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. This parameter is only applied to persistent VMs and cannot be used with "PurgeDBOnly".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvScheme.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information: TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new reset disk tasks, this is always "Reset-ProvVMDisk".

Status <string> ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

If the hosting unit referenced by the provisioning scheme no longer exists (that is, has been removed using the Hosting Unit PowerShell snap-in), the provisioning scheme data is deleted from the database without errors. However, the hard disks associated with the provisioning scheme cannot be removed and remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

UnableToRemoveProvisioningSchemeDueToAssociatedVM

The provisioning scheme contained VMs and the 'ForgetVM' or 'PurgeDBOnly' parameter was not specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

The cmdlet is associated with a task of type DisusedImageCleanUp, and while active will move through the following operations (CurrentOperation field)

Running

Remove-ProvSchemeControllerAddress

March 11, 2024

Removes controller addresses from a provisioning scheme.

Syntax

```
Remove-ProvSchemeControllerAddress
      [-ProvisioningSchemeName] <String>
      [-ControllerAddress] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeControllerAddress
      -ProvisioningSchemeUid <Guid>
      [-ControllerAddress] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes the specified controller addresses from the specified provisioning scheme.

Examples

EXAMPLE 1

Remove all controller addresses from the provisioning scheme with the name “scheme1”.

```
Get-ProvScheme -ProvisioningSchemeName scheme1 | Remove-
   ProvSchemeControllerAddress

CleanOnBoot                 : True
ControllerAddress           : {
  }

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme that controller addresses are to be removed from.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme that controller addresses are to be removed from.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerAddress

Specifies the array of controller DNS names to be removed from the provisioning scheme.

Type:	String[]
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	String[]
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Remove-ProvSchemeControllerAddress.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ControllerAddressNotFound

The specified address was not associated with the provisioning scheme.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeMasterVMImageHistory

March 11, 2024

Removes the history of provisioning scheme master image VMs.

Syntax

```
Remove-ProvSchemeMasterVMImageHistory
      [-ProvisioningSchemeName] <String>
      [-VMImageHistoryUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMasterVMImageHistory
      -ProvisioningSchemeUid <Guid>
      [-VMImageHistoryUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMasterVMImageHistory
      -VMImageHistoryUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove the record of previously used master image VMs or snapshots for provisioning schemes.

Examples

EXAMPLE 1

Removes all history for the provisioning scheme called "MyScheme".

```
Remove-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName MyScheme
```

EXAMPLE 2

Removes all history for all provisioning schemes.

```
Get-ProvScheme | Remove-ProvSchemeMasterVMImageHistory
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-VMImageHistoryUid

The unique identifier of the image history item.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

Type:	Guid
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Remove-ProvSchemeMasterVMImageHistory.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeMetadata

March 11, 2024

Removes metadata from the given provisioning scheme.

Syntax

```
Remove-ProvSchemeMetadata
      [-ProvisioningSchemeUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
      [-ProvisioningSchemeUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
      [-ProvisioningSchemeName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
      [-ProvisioningSchemeName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
      [-InputObject] <ProvisioningScheme[]>
      -Name <String>
```

```
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
        [-InputObject] <ProvisioningScheme[]>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given provisioning scheme.

Examples

EXAMPLE 1

Remove all metadata from all provisioning scheme objects.

```
Get-ProvScheme | % {
  Remove-ProvSchemeMetadata -Map $_.MetadataMap  }
```

Parameters

-ProvisioningSchemeUid

Id of the provisioning scheme

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Name of the provisioning scheme

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	ProvisioningScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvSchemeMetadata.

PSObject

A metadata map object can be piped to the Remove-ProvSchemeMetadata command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeScope

March 11, 2024

Remove the specified provisioning scheme(s) from the given scope(s).

Syntax

```
Remove-ProvSchemeScope
      [-Scope] <String[]>
      -InputObject <ProvisioningScheme[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeScope
      [-Scope] <String[]>
      -ProvisioningSchemeUid <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeScope
      [-Scope] <String[]>
      -ProvisioningSchemeName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-ProvSchemeScope command is used to remove one or more provisioning schemes from the given scope(s).

To remove a provisioning scheme from a scope you need permission to change the scopes of the provisioning scheme.

If the provisioning scheme is not in a specified scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Removes a single provisioning scheme from the 'Finance'scope.

```
Remove-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073
    -4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Removes a single provisioning scheme from multiple scopes.

```
Remove-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702
    C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Removes all visible provisioning schemes from the 'Finance'scope.

```
Get-ProvScheme | Remove-ProvSchemeScope Finance
```

EXAMPLE 4

Removes provisioning schemes whose name starts with an 'A'from the 'Finance'scope.

```
Remove-ProvSchemeScope Finance -ProvisioningSchemeName A*
```

Parameters

-Scope

Specifies the scopes to remove the objects from.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the ProvisioningScheme objects to be removed.

Type:	ProvisioningScheme[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Specifies the ProvisioningScheme objects to be removed by the unique identifier of the provisioning scheme(s).

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Specifies the ProvisioningScheme objects to be removed by the name of the provisioning scheme(s).

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvScope.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeVersion

March 11, 2024

Removes a provisioning scheme configuration version

Syntax

```
Remove-ProvSchemeVersion
      [-ProvisioningSchemeName] <String>
      -Version <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeVersion
      -ProvisioningSchemeUid <Guid>
      -Version <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove a prior provisioning scheme configuration version.

Examples

EXAMPLE 1

Removes version 3 of provisioning scheme MyScheme.

```
Remove-ProvSchemeVersion -ProvisioningSchemeName MyScheme -Version 3
```

EXAMPLE 2

Removes version 1 of provisioning scheme with Uid 5b37b311-fa3f-49dd-b93b-661b9e6fa571.

```
Remove-ProvSchemeVersion -ProvisioningSchemeUid 5b37b311-fa3f-49dd-b93b
   -661b9e6fa571 -Version 1
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme with the version to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme with the version to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Version

The version to remove. Cannot be the current provisioning scheme version in use or a version referenced by any machine in the provisioning scheme.

Type:	Int32
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvSchemeVersion.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound The specified provisioning scheme could not be located.

ProvisioningSchemeVersionNotFound The specified ProvisioningScheme version could not be located.

ProvisioningSchemeVersionRemovalConflict The provisioning scheme version cannot be removed due to it being referenced by other resources.

CannotRemoveCurrentProvisioningSchemeVersion The provisioning scheme version cannot be removed since it is the current version.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

Remove-ProvSchemeWarning

March 11, 2024

Removes one or more provisioning scheme warnings.

Syntax

```
Remove-ProvSchemeWarning
      [-ProvisioningSchemeName <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeWarning
      [-ProvisioningSchemeUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeWarning
      [-WarningId <Int32>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeWarning
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Allows you to remove a set of existing provisioning scheme warnings.

Examples

EXAMPLE 1

Removes all of the provisioning scheme warnings matching the specified ProvisioningSchemeUid.

```
Remove-ProvSchemeWarning -ProvisioningSchemeUid 7585f0de-192e-4847-a6d8
    -22713c3a2f42
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme for which all associated warnings will be removed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme for which all associated warnings will be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningId

The id of the warning to remove.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-All

Remove all warnings.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Remove-ProvServiceConfigurationData

March 11, 2024

Removes configuration data from the service.

Syntax

```
Remove-ProvServiceConfigurationData
      [[-Name] <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove data item from the Machine Creation Service configuration data.

Examples

EXAMPLE 1

Removes the configuration data item with name “MyName”.

```
Remove-ProvServiceConfigurationData -Name "MyName"
```

Parameters

-Name

The name of the configuration data item to remove.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Remove-ProvServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-ProvServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
```

```
5         [<CitrixCommonParameters>]
6         [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
1  Get-ProvService | % {
2    Remove-ProvServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-ProvTask

March 11, 2024

Removes completed tasks from the database for the Machine Creation Service.

Syntax

```
Remove-ProvTask
       [-TaskId] <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Enables completed tasks that have run within the Machine Creation Service to be removed from the database.

Examples

EXAMPLE 1

Remove entries for all completed tasks from the Machine Creation Service.

```
Get-ProvTask -active $false | Remove-ProvTask
Success
```

Parameters

-TaskId

Specifies the identifier for the task to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-ProvTask command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

InvalidWorkflow

The specified task could not be found.

InvalidWorkflowState

The task was not in an appropriate state for the requested operation.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvTaskMetadata

March 11, 2024

Removes metadata from the given Task.

Syntax

```
Remove-ProvTaskMetadata
      [-TaskId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvTaskMetadata
      [-TaskId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvTaskMetadata
      [-InputObject] <Task[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvTaskMetadata
      [-InputObject] <Task[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Task.

Examples

EXAMPLE 1

Remove all metadata from all Task objects.

```
Get-ProvTask | Remove-ProvTaskMetadata
```

Parameters

-TaskId

Id of the Task.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-ProvTaskMetadata command.

PSObject

A metadata map object can be piped to the Remove-ProvTaskMetadata command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvVM

March 11, 2024

Removes virtual machines created by Machine Creation Services.

Syntax

```
Remove-ProvVM
       [-ProvisioningSchemeName] <String>
       -VMName <String[]>
       [-PurgeDBOnly]
       [-ForgetVM]
       [-RunAsynchronously]
       [-PurgeJobOnSuccess]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ProvVM
       [-ProvisioningSchemeUid] <Guid>
       -VMName <String[]>
       [-PurgeDBOnly]
       [-ForgetVM]
       [-RunAsynchronously]
       [-PurgeJobOnSuccess]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Allows you to remove VMs from the Machine Creation Services and hypervisor.

Examples

EXAMPLE 1

Remove all VMs from provisioning scheme XenPS

```
,(Get-ProvVM -ProvisioningSchemeName XenPS) | Remove-ProvVM XenPS

            TaskId                          : cfb506a5-cc7e-4a49-ac7b-
                dd960029d0d3
            Active                          : False
            Host                            : DDC
            DateStarted                     : 10/10/2021 16:39:45
            Metadata                        : {
 }

            CurrentOperation                :
            TaskProgress                    : 100
            LastUpdatedTime                 : 10/10/2021 16:39:50
            ActiveElapsedTime               : 5
            DateFinished                    : 10/10/2021 16:39:50
            TerminatingError                :
            Type                            : RemoveVirtualMachine
            Status                          : Finished
            PurgeDBOnly                     : False
            ForgetVM                        : False
            RemovedVirtualMachines          : {
XD\IP0001$, XD\IP0002$ }

            FailedVirtualMachines           : {
 }

            ProvisioningSchemeName          : XenPS
            ProvisioningSchemeUid           : e1afc8fb-3f52-42ea-9a17-305
                fdb0b6ee4
            TaskState                       : Finished
            TaskStateInformation            :
            WorkflowStatus                  : Completed
            TaskExpectedCompletion          : 10/10/2021 16:39:50
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme from which VMs will be removed.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which VMs will be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

List of VM names that will be removed from the provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-PurgeDBOnly

If this option is specified, this command will only remove VM objects from the Machine Creation Services database; however, the VMs and hard disk copies still remain in the hypervisor. The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor

itself. If not specified, the VMs and hard disk copies are also removed from hypervisor storage. This parameter is exclusive with "ForgetVM".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ForgetVM

If this option is specified, this command will only remove VM objects from the Machine Creation Services database; however, the VMs and hard disk copies still remain in the hypervisor after removing VMs' citrix tags/identifiers. The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. If not specified, the VMs and hard disk copies are also removed from hypervisor storage. This parameter is only applied to persistent VMs and exclusive with "PurgeDBOnly".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMName'and 'ProvisioningSchemeName'to Remove-ProvVM.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new remove-VM tasks, this is always "RemoveVirtualMachine".

Status <string>

Where in its lifecycle the task is.

PurgeDBOnly <bool>

Whether the named VMs are only removed from the Machine Creation Service database, but still remain in the hypervisor.

ForgetVm <bool>

Whether the named VMs are only removed from the Machine Creation Service database, but still remain in the hypervisor after removing VMs'citrix tags/identifiers.

RemovedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

Object array of removed virtual machines summary information. The object properties are:

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See RemovedVirtualMachines for details of the object parameters.

ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

The cmdlet is associated with a task of type RemoveVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

RemovingVirtualMachines

Only one long-running task for each provisioning scheme can be processed at a time.

This task still operates if the hosting unit or VMs in the hypervisor are missing. This removes the data from the Citrix Machine Creation Services, but the VMs remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Rename-ProvImageDefinition

March 11, 2024

Changes the parameter values for a image definition.

Syntax

```
Rename-ProvImageDefinition
      [-PreparedImageDefinitionName] <String>
      -NewPreparedImageDefinitionName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-ProvImageDefinition
      -PreparedImageDefinitionUid <Guid>
      -NewPreparedImageDefinitionName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to rename an existing image definition.

Examples

EXAMPLE 1

Renames an image definition from “CurrentName”to “NewName”.

```
Rename-ProvImageDefinition -PreparedImageDefinitionName CurrentName -
    NewPreparedImageDefinitionName NewName

CreateTime                      : 1/1/2022 12:00:00
CustomProperties                :
Description                     : Windows image
HostingUnitName                 : Hu
HostingUnitUid                  : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
OsType                          : Windows
PreparedImageDefinitionName     : NewName
PreparedImageDefinitionUid      : 7585f0de-192e-4847-a6d8-22713c3a2f42
UseWriteBackCache               : False
```

Parameters

-PreparedImageDefinitionName

The current name of the image definition.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionUid

The unique identifier of the image definition that is to be renamed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewPreparedImageDefinitionName

The new name for the image definition. This must not be a name that is being used by an existing image definition, and it must not contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definitions and contains the following information:

CreateTime <DateTime>

The date and time when the image definition was created.

CustomProperties <string>

Properties of the image definition which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

Description <string>

The description for this image definition.

HostingUnitName <string>

The name of the hosting unit being used by this image definition.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image definition.

OsType <string>

The OS type for this image definition.

PreparedImageDefinitionName <string>

The name of this image definition.

PreparedImageDefinitionUid <Guid>

The unique identifier for this image definition.

UseWriteBackCache <bool>

Whether to use WriteBackCache of this image definition.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Rename-ProvScheme

March 11, 2024

Renames a provisioning scheme.

Syntax

```
Rename-ProvScheme
      [-ProvisioningSchemeName] <String>
      [-NewProvisioningSchemeName] <String>
      [-PassThru]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-ProvScheme
      -ProvisioningSchemeUid <Guid>
      [-NewProvisioningSchemeName] <String>
      [-PassThru]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to change the name of an existing provisioning scheme. The unique identifier of the provisioning scheme never changes after it has been created, therefore, the provisioning scheme can always be identified by its unique identifier regardless of any name changes.

Examples

EXAMPLE 1

Renames a provisioning scheme from “currentName”to “NewName”.

```
Rename-ProvScheme -provisioningSchemeName CurrentName -
    NewProvisioningSchemeName NewName
```

EXAMPLE 2

Renames a provisioning scheme from “currentName”to “NewName”and displays the resulting state.

```
Rename-ProvScheme -provisioningSchemeName CurrentName -
    NewProvisioningSchemeName NewName -PassThru

CleanOnBoot                  : True
ControllerAddress            : {

Parameters

-ProvisioningSchemeName

The current name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme that is to be renamed.

Type:	Guid
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewProvisioningSchemeName

The new name for the provisioning scheme. This must not be a name that is being used by an existing provisioning scheme, and it must not contain any of the following characters \/;:#.*?=<>|[]()’””

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Defines whether the command returns a result showing the new state of the updated identity pool.

Type:	SwitchParameter
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNameAlreadyExists

A provisioning scheme with the same name as the new provisioning scheme name already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Request-ProvVMUpdate

March 11, 2024

(DEPRECATED) Requests a property update on provisioned virtual machines.

Syntax

```
Request-ProvVMUpdate
       -ProvisioningSchemeName <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Request-ProvVMUpdate
       -ProvisioningSchemeName <String>
       -VMName <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Request-ProvVMUpdate
       -ProvisioningSchemeUid <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Request-ProvVMUpdate
       -ProvisioningSchemeUid <Guid>
       -VMName <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet has been deprecated and replaced by Set-ProvVMUpdateTimeWindow. Please see the examples on this page that describe how to transition to the new cmdlet.

Provides the ability to synchronize the properties of existing virtual machines with any changes occurred on the provisioning scheme.

This cmdlet updates the ProvisioningSchemeUpdateRequested field on virtual machines to the current time, which indicates that the machines will synchronize to the property updates occurred on the provisioning scheme upon next start.

Examples

EXAMPLE 1

To request all machines in a catalog to apply property updates on next boot, use Set-ProvVMUpdateTimeWindow with parameters -StartsNow and -DurationInMinutes -1.

```
Request-ProvVMUpdate -ProvisioningSchemeName AzuPS

is equivalent to

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AzuPS -StartsNow -
    DurationInMinutes -1
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names requesting for update. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will request for a property update.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Request-ProvVMUpdate.

Outputs

None

By default, this cmdlet returns no output.

Notes

Running Set-ProvScheme to update provisioning scheme properties will only affect future provisioned machines. To request existing VMs in a catalog to be brought up to date upon the next power on, use this cmdlet to request certain or all VMs created from the provisioning scheme associated with the catalog to be updated.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

- Set-ProvVMUpdateTimeWindow

Reset-ProvEnabledFeatureList

March 11, 2024

Refreshes the MachineCreation service's list of enabled features.

Syntax

```
Reset-ProvEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix MachineCreation Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected MachineCreation service instance's list of enabled features.

```
Reset-ProvEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-ProvServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the MachineCreation Service.

Syntax

```
Reset-ProvServiceGroupMembership
     [-ConfigServiceInstance] <ServiceInstance[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Enables you to reload MachineCreation Service access permissions and configuration service locations. The Reset-ProvServiceGroupMembership command must be run on at least one instance of the service type (Prov) after installation and registration with the configuration service. Without this operation, the MachineCreation services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ProvServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    ProvServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-ProvServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-ProvServiceGroupMembership command.

Outputs

Citrix.MachineCreation.Sdk.ServiceInstance

Reset-ProvServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the MachineCreation Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-ProvVMDisk

March 11, 2024

Resets the OS disk of persistent VMs or the Identity disk of persistent and non-persistent VMs.

Syntax

```
Reset-ProvVMDisk
      [-ProvisioningSchemeName] <String>
      -VMName <String[]>
      [-RunAsynchronously]
      [-OS]
      [-PurgeJobOnSuccess]
      [-Force]
      [-LoggingId <Guid>]
      [-WhatIf]
      [-Confirm]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Reset-ProvVMDisk
     [-ProvisioningSchemeName] <String>
     -VMName <String[]>
     [-RunAsynchronously]
     [-Identity]
     [-ResetIdentityInfo]
     [-PurgeJobOnSuccess]
     [-Force]
     [-LoggingId <Guid>]
     [-WhatIf]
     [-Confirm]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Reset-ProvVMDisk
     [-ProvisioningSchemeUid] <Guid>
     -VMName <String[]>
     [-RunAsynchronously]
     [-OS]
     [-PurgeJobOnSuccess]
     [-Force]
     [-LoggingId <Guid>]
     [-WhatIf]
     [-Confirm]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Reset-ProvVMDisk
     [-ProvisioningSchemeUid] <Guid>
     -VMName <String[]>
     [-RunAsynchronously]
     [-Identity]
     [-ResetIdentityInfo]
     [-PurgeJobOnSuccess]
     [-Force]
     [-LoggingId <Guid>]
     [-WhatIf]
     [-Confirm]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Allows you to reset the disks of persistent VMs from Machine Creation Services and hypervisor.

Examples

EXAMPLE 1

Reset the OS disks of all VMs in provisioning scheme myProvScheme

```
,(Get-ProvVM -ProvisioningSchemeName "myProvScheme") | Reset-ProvVMDisk
    -ProvisioningSchemeName "myProvScheme" -OS

TaskId                  : 2706e50b-aff9-44c7-a3e3-8c8c7f1f4ac5

EXAMPLE 4

Reset all configurations in the identity disks of all VMs in provisioning scheme myProvScheme

```
,(Get-ProvVM -ProvisioningSchemeName "myProvScheme") | Reset-ProvVMDisk
    -ProvisioningSchemeName "myProvScheme" -Identity
```

EXAMPLE 5

Only reset the machine password and trust keys in the configuration file in the identity disk of VM machine01

```
Reset-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName "
   machine01" -Identity -ResetIdentityInfo
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme from which VM disks will be reset. This feature is available on VMware, Azure, AWS and Citrix hypervisor.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which VM disks will be reset.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-OS

Indicates that the OS disk should be reset. This parameter is exclusive with "Identity". Either "OS"or "Identity"must be provided.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Identity

Indicates that the identity disk should be reset. This parameter is exclusive with "OS". "Repair-AcctIdentity -Target IdentityInfo"should be executed before this command. By default, all configurations in the identity disk will be reset except the DeviceKeyPair of hybrid Azure AD (if feature applied). If DeviceKeyPair is desired to be reset, Set-AcctADAccountUserCert should be executed in advance.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

List of VM names that will be have the disk reset.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ResetIdentityInfo

Indicates whether only machine password and trust keys in the configuration file will be reset. This parameter is only used with "Identity".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Suppresses prompts for confirmation before proceeding to reset the disk of the specified VMs.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WhatIf

Shows what would happen if the cmdlet runs. The cmdlet is not run.

Type:	SwitchParameter
Aliases:	wi
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Confirm

Prompts for confirmation before running the cmdlet.

Type:	SwitchParameter
Aliases:	cf
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMName'and 'ProvisioningSchemeName'to Reset-ProvVMDisk.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information: TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall “Running”task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new reset disk tasks, this is always “Reset-ProvVMDisk”.

Status <string>

Where in its lifecycle the task is.

ResetVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

Only one long-running task for each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes ————ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

The cmdlet is associated with a task of type ResetVirtualMachine, and while active will move through the following operations (CurrentOperation field)

Schedule-ProvVMUpdate

March 11, 2024

(DEPRECATED) Schedules a property update on provisioned virtual machines.

Syntax

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeName <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeName <String>
        -VMName <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeUid <Guid>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
```

```
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeUid <Guid>
        -VMName <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet has been deprecated and replaced by %5BSet-ProvVMUpdateTimeWindow%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/MachineCreation/Set-ProvVMUpdateTimeWindow.html). %5BSet-ProvVMUpdateTimeWindow%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/MachineCreation/Set-ProvVMUpdateTimeWindow.html) is the new name for Schedule-ProvVMUpdate and provides all the same functionality, please use it going foward in place of Schedule-ProvVMUpdate.

Provides the ability to synchronize the properties of existing virtual machines with any changes occurred on the provisioning scheme.

This cmdlet defines a time window where a provisioning scheme update will take place against either specific machines

in a catalog or an entire catalog. The update will take place when the machine is next booted within the time window.

On each VM an update is scheduled, ProvisioningSchemeUpdateRequested defines the start of the time window and

ProvisioningSchemeUpdateUntil defines the end of the time window. These fields will be cleared upon a successful

provisioning scheme update or if the time window has expired when the machine has booted

Examples

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names to schedule an update for. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will be scheduled for a property update

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme

Type:	Guid
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTimeInUTC

The start time in UTC format of the time window the schedule is active for. Mutually exclusive with StartsNow switch. Must be no more than 5 seconds in the past. The string will be converted into a DateTime using parsing rules defined by the DateTime.Parse method, which allows for a timezone offset to specify time in any timezone. If no timezone offset is specified, UTC will be assumed. See the example usages of Schedule-ProvVMupdate or this link for more details https://docs.microsoft.com/en-us/dotnet/api/system.datetime.parse?view=net-6.0#the-string-to-parse

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartsNow

Whether this schedule should start right away. Mutually exclusive with specific StartTimeInUTC. Implied to be set if StartTimeInUTC is not specified

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInMinutes

The duration in minutes of the time window the schedule is active for. If less than 0, indicates the schedule has no end time

Type:	Int32
Position:	Named
Default value:	120 minutes
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Schedule-ProvVMUpdate.

Outputs

None

By default, this cmdlet returns no output.

Notes

Running Set-ProvScheme to update provisioning scheme properties will only affect future provisioned machines. To schedule existing VMs in a catalog to be brought up to date upon the next power on, use this cmdlet to schedule certain or all VMs created from the provisioning scheme associated with the catalog to be updated.

Set-ProvDBConnection

March 11, 2024

Configures a database connection for the MachineCreation Service.

Syntax

```
Set-ProvDBConnection
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix MachineCreation Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Set-ProvDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
1  Set-ProvDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the MachineCreation Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-ProvDBConnection cmdlet returns an object describing the status of the MachineCreation Service together with extra diagnostics information. Possible values are:

- OK:

The MachineCreation Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the MachineCreation Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the MachineCreation Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the MachineCreation Service currently in use is newer than, and incompatible with, the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

- DBOlderVersionThanService:

The version of the MachineCreation Service schema on the database is newer than, and incompatible with, the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the MachineCreation Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the MachineCreation Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ProvDBCredentials

March 11, 2024

Configures the database server SQL credentials for the MachineCreation Service.

Syntax

```
Set-ProvDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix MachineCreation Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional MachineCreation Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-ProvDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-ProvDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-ProvDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-ProvDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- Get-ProvDBSchema
- Set-ProvDBConnection

Set-ProvImageDefinition

March 11, 2024

Changes the parameter values for a image definition.

Syntax

```
Set-ProvImageDefinition
   [-PreparedImageDefinitionUid] <Guid>
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageDefinition
   -PreparedImageDefinitionName <String>
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the parameters of an existing image definition.

The following parameters are allowed to be updated:

- The description of the image definition.

Examples

EXAMPLE 1

Update a image definition name with uid “7585f0de-192e-4847-a6d8-22713c3a2f42”.

```
Set-ProvImageDefinition -PreparedImageDefinitionUid 7585f0de-192e-4847-
   a6d8-22713c3a2f42 -Description 'Windows image'

CreateTime                    : 1/1/2022 12:00:00
CustomProperties              :
Description                   : Windows image
HostingUnitName               : Hu
HostingUnitUid                : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
OsType                        : Windows
PreparedImageDefinitionName   : MyImage
PreparedImageDefinitionUid    : 7585f0de-192e-4847-a6d8-22713c3a2f42
UseWriteBackCache             : False
```

Parameters

-PreparedImageDefinitionUid

The identifier of the image definition to be updated.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionName

The name of the image definition to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

A value indicating the image definition description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definitions and contains the following information:

CreateTime <DateTime>

The date and time when the image definition was created.

CustomProperties <string>

Properties of the image definition which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

Description <string>

The description for this image definition.

HostingUnitName <string>

The name of the hosting unit being used by this image definition.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image definition.

OsType <string>

The OS type for this image definition.

PreparedImageDefinitionName <string>

The name of this image definition.

PreparedImageDefinitionUid <Guid>

The unique identifier for this image definition.

UseWriteBackCache <bool>

Whether to use WriteBackCache of this image definition.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Set-ProvImageVersion

March 11, 2024

Changes the parameter values for a image version.

Syntax

```
Set-ProvImageVersion
   [-PreparedImageVersionUid] <Guid>
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersion
   -PreparedImageDefinitionName <String>
   -PreparedImageVersionNumber <String>
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the parameters of an existing image version.

The following parameters are allowed to be updated:

- The description of the image version.

Examples

EXAMPLE 1

Update a image definition description with image definition name “MyImage”and image version number “1”.

```
Set-ProvImageVersion -PreparedImageDefinitionName MyImage -
   PreparedImageVersionNumber 1 -Description "Windows image"

CreateTime                        : 5/19/2022 3:20:23 AM
Description                       : Windows image
DiskSize                          : 32
Error                             :
HostingUnitUid                    : b86b4442-6ecb-4b73-a655-7ca7170e19e5

  }

WriteBackCacheDiskIndex          : 0
WriteBackCacheDiskSize           : 0
WriteBackCacheMemorySize         : 0
```

Parameters

-PreparedImageVersionUid

The identifier of the image version to be updated.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageDefinitionName

The name of the image definition to be updated.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageVersionNumber

The version number of the image version to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

The description of the image version to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definitions and contains the following information:

CreateTime <DateTime>

The date and time when the image version was created.

Description <string>

The description of the image version.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

Error <string>

Error state that has occurred with this image version.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image scheme.

ImageRuntimeInfo <string>

The image runtime information like operating system info, VDA components, etc.

ImageStatus <string>

The status of the provisioning scheme image.

ImageVersionMetadata <string>

The metadata associated with this image version.

MasterImageId <string>

The unique identifier of the snapshot, as assigned by the hosting unit.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

PageFileSettings <string>

The page file settings to meet hypervisor-specific features demands.

PreparedImageDefinitionName <string>

The name of the image definition which is used for this image version.

PreparedImageDefinitionUid <Guid>

The unique identifier of the image definition which is used for this image version.

PreparedImageReplicas

Image replication information for this image version.

PreparedImageSchemeUid <Guid>

The unique identifier of the image scheme which is used for this image version.

PreparedImageVersionNumber <string>

The version number of the image version.

PreparedImageVersionUid <Guid>

The unique identifier for the image version.

UpdatePageFileSettings <bool>

Whether to update page file settings for write back cache

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Set-ProvImageVersionMetadata

March 11, 2024

Adds or updates metadata on the given image version.

Syntax

```
Set-ProvImageVersionMetadata
   [-PreparedImageVersionUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersionMetadata
   [-PreparedImageVersionUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersionMetadata
   [-PreparedImageDefinitionName] <String>
   [-PreparedImageVersionNumber] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersionMetadata
   [-PreparedImageDefinitionName] <String>
   [-PreparedImageVersionNumber] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersionMetadata
   [-InputObject] <ImageVersion[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersionMetadata
   [-InputObject] <ImageVersion[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given image version objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the image version with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ProvImageVersionMetadata -PreparedImageVersionUid 4CECC26E-48E1-423
   F-A1F0-2A06DDD0805C -Name property -Value value

Key                                     Value
```

```
---                                     -----
property                                value
```

Parameters

-PreparedImageVersionUid

Id of the image version

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-PreparedImageDefinitionName

Name of the image definition

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-PreparedImageVersionNumber

Version number of the image version

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

ImageVersion objects to which the metadata is to be added or updated.

Type:	ImageVersion[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added or updated. The property must be unique for the provisioning scheme specified. If the name already exists, its value is updated. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageVersion

You can pipe a ImageVersion object or any object containing a parameter called 'PreparedImageDefinitionName'and 'PreparedImageVersionNumber'or 'PreparedImageVersionUid'to Set-ProvImageVersionMetadata.

PSObject

A metadata map object can be piped to the Set-ProvImageVersionMetadata command.

Outputs

System.Collections.Generic.Dictionary[string, string]

Set-ProvImageVersionMetadata returns a dictionary containing the new (name, value)-pairs for the metadata being set.

Key <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes ————InvalidParameterCombination

The cmdlet parameters are inconsistent.

ObjectNotFound

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Set-ProvResourceTags

March 11, 2024

Set provisioning resources tags.

Syntax

```
Set-ProvResourceTags
   [-ProvisioningSchemeName] <String>
   [-InputObject <ProvisionedVirtualMachine[]>]
   [-VMName <String>]
   [-VMBatchSize <Int32>]
   [-ResourceType <ResourceType>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvResourceTags
   -ProvisioningSchemeUid <Guid>
   [-InputObject <ProvisionedVirtualMachine[]>]
   [-VMName <String>]
   [-VMBatchSize <Int32>]
   [-ResourceType <ResourceType>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the tags of the resources created by Citrix during provisioning. The two types of resources created by Citrix are machine catalog level, and virtual machine level. They can be tagged separately or at the same time. Resources are tagged with 'CitrixProvisioningSchemeId', 'CitrixVirtualSiteId'and 'CitrixCustomerId'.

Examples

EXAMPLE 1

Tag MachineCatalog resources in provisioning scheme called "MyProvisioningSchemeName".

```
Set-ProvResourceTags -ProvisioningSchemeName MyProvisioningSchemeName -
    ResourceType MachineCatalog -OutVariable result

```

```
          SuccessfulVirtualMachineCount FailedVirtualMachineCount
             TagOperationErrors
          ----------------------------- ------------------------
             ------------------
                                      0                         0 {
 image.snapshot }

          $result.TagOperationErrors

          ResourceName   ResourceType   TagFailureReason
          ------------   ------------   ----------------
          image.snapshot MachineCatalog OperationNotAllowed
```

EXAMPLE 2

Tag both MachineCatalog and all VirtualMachine resources in provisioning scheme called “MyProvisioningSchemeName”.

```
,(Get-ProvVM -ProvisioningSchemeName myProvisioningSchemeName) | Set-
   ProvResourceTags -ProvisioningSchemeName MyProvisioningSchemeName -
   OutVariable result

          SuccessfulVirtualMachineCount FailedVirtualMachineCount
             TagOperationErrors
          ----------------------------- ------------------------
             ------------------
                                      5                         2 {
 myVirtualMachine0, myVirtualMachine1 }

          $result.TagOperationErrors

          ResourceName      ResourceType   TagFailureReason
          ------------      ------------   ----------------
          myVirtualMachine0 VirtualMachine OperationNotAllowed
          myVirtualMachine1 VirtualMachine OperationNotAllowed
```

EXAMPLE 3

Tag VirtualMachine MyVirtualMachine0’s resources in provisioning scheme called “MyProvisioningSchemeName”.

```
Set-ProvResourceTags -ProvisioningSchemeName MyProvisioningSchemeName -
   VMName MyVirtualMachine0 -ResourceType VirtualMachine -OutVariable
   result

```

```
SuccessfulVirtualMachineCount FailedVirtualMachineCount
   TagOperationErrors
---------------------------- ------------------------
   ------------------
                           1                        0 {
  }
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to be tagged.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to be tagged.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

The VM name list to be tagged.

Type:	ProvisionedVirtualMachine[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

The VM name to be tagged.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMBatchSize

The maximum number of VMs to be tagged in a batch. Range 1-60 with default of 10.

Type:	Int32
Position:	Named
Default value:	10
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceType

Specifies the type of resource. Supported resource types are:

MachineCatalog

VirtualMachine

All

Type:	ResourceType
Position:	Named
Default value:	All
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Set-ProvResourceTags.

Outputs

Citrix.MachineCreation.Sdk.TagOperationDetailedSummary

The Set-ProvResourceTags that contains the following parameters:

SuccessfulVirtualMachineCount <int>

The number of virtual machines to which their machine level resources were tagged successfully.

FailedVirtualMachineCount <int>

The number of virtual machines to which their machine level resources were not tagged.

TagOperationErrors <Citrix.MachineCreation.Sdk.TagOperationError[]>

The list of resources that failed to be tagged. Each one has the following parameters:

ResourceType <string>

Type of the resource.

ResourceName <string>

Name of the resource.

TagFailureReason <string>

Reason for the tag operation failure. This can be one of the following:

OperationNotAllowed

The operation is not allowed because the resources are not in the right state to tag.

TooManyRequests

The request is being throttled because too many requestes arrive.

UnexpectedTagFailure

Failed to tag with unexpected exception.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

SetProvSchemeTagsFailed

An unexpected error occurred while setting machine catalog level resources tags.

SetProvVMTagsFailed

An unexpected error occurred while setting virtual machine level resources tags.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Description

Provides the ability to update the parameters of an existing provisioning scheme. It increments the provisioning scheme's ProvisioningSchemeVersion by 1 each time it is called.

The following parameters are allowed to be updated:

- Number of CPUs that will be used for VMs created from the provisioning scheme.
- Maximum amount of memory that will be used for VMs created from the provisioning scheme.
- Identity pool that will be used for VMs created from the provisioning scheme.
- Machine profile that will be used for VMs created from the provisioning scheme.
- Cloud service offering that will be used for VMs created from the provisioning scheme.
- Custom properties of the provisioning scheme that are specific to the target hosting infrastructure.

To change the provisioning scheme name, see Rename-ProvScheme.

Examples

EXAMPLE 1

Updates a provisioning scheme called "MyScheme"to use two processors on the VMs that are created from the provisioning scheme.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -VMCpuCount 2

CleanOnBoot                 : True
ControllerAddress           : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }

CpuCount                    : 2
DiskSize                    : 20
HostingUnitName             : XenHU
HostingUnitUid              : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
IdentityPoolName            : idPool1
IdentityPoolUid             : 03743136-e43b-4a87-af74-ab71686b3c16
MachineCount                : 0
MachineProfile              :
MasterImageVM               : Base.vm
MasterImageVMDate           : 17/05/2020 09:53:40
MemoryMB                    : 1024
Metadata                    : {
```

```
 Department = Sales }

MetadataMap                    : {
 [Department = Sales] }

ProvisioningSchemeName         : MyScheme
ProvisioningSchemeUid          : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeVersion      : 1
TaskId                         : 00000000-0000-0000-0000-000000000000
VMMetadata                     : {
 0, 1, 0, 0... }

PersonalVDiskDriveLetter       :
PersonalVDiskDriveSize         : 0
UsePersonalVDiskStorage        : False
NetworkMaps                    : {
 0 }

Scopes                         :
DedicatedTenancy               : False
GpuTypeId                      :
ResetAdministratorPasswords    : False
SecurityGroups                 : {
  }

ServiceOffering                :
TenancyType                    : Shared
AzureAdJoinType                :
CurrentMasterImageUid          : c0571690-4f57-4476-901b-fe64d6aecb79
CustomProperties               :
IdentityType:                  : ActiveDirectory
UseFullDiskCloneProvisioning   : False
UseWriteBackCache              : True
WriteBackCacheDiskSize         : 24
WriteBackCacheMemorySize       : 256
Warnings                       : {
  }

WriteBackCacheDiskIndex        : 0
```

EXAMPLE 2

Updates a provisioning scheme called “MyScheme”to use the machine profile called 1.0.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -MachineProfile XDHyp:\
   HostingUnits\AzureHostingUnit\machineprofile.folder\RG.resourcegroup
   \TS.templatespec\1.0.templatespecversion

CleanOnBoot                    : True
ControllerAddress              : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }
```

```
 7
 8  CpuCount                      :
 9  DiskSize                      : 20
10  HostingUnitName               : AzureHostingUnit
11  HostingUnitUid                : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
12  IdentityPoolName              : idPool1
13  IdentityPoolUid               : 03743136-e43b-4a87-af74-ab71686b3c16
14  MachineCount                  : 0
15  MachineProfile                : XDHyp:\HostingUnits\AzureHostingUnit\
       machineprofile.folder\RG.resourcegroup\TS.templatespec\1.0.
       templatespecversion
16  MasterImageVM                 : Base.vm
17  MasterImageVMDate             : 17/05/2020 09:53:40
18  MemoryMB                      : 1024
19  Metadata                      : {
20   Department = Sales }
21
22  MetadataMap                   : {
23   [Department = Sales] }
24
25  ProvisioningSchemeName        : MyScheme
26  ProvisioningSchemeUid         : 7585f0de-192e-4847-a6d8-22713c3a2f42
27  ProvisioningSchemeVersion     : 1
28  TaskId                        : 00000000-0000-0000-0000-000000000000
29  VMMetadata                    : {
30   0, 1, 0, 0... }
31
32  PersonalVDiskDriveLetter      :
33  PersonalVDiskDriveSize        : 0
34  UsePersonalVDiskStorage       : False
35  NetworkMaps                   : {
36   0 }
37
38  Scopes                        :
39  DedicatedTenancy              : False
40  GpuTypeId                     :
41  ResetAdministratorPasswords   : False
42  SecurityGroups                : {
43    }
44
45  ServiceOffering               :
46  TenancyType                   : Shared
47  AzureAdJoinType               :
48  CurrentMasterImageUid         : c0571690-4f57-4476-901b-fe64d6aecb79
49  CustomProperties              :
50  IdentityType:                 : ActiveDirectory
51  UseFullDiskCloneProvisioning  : False
52  UseWriteBackCache             : True
53  WriteBackCacheDiskSize        : 24
54  WriteBackCacheMemorySize      : 256
55  Warnings:                     : {
56    }
57
```

```
WriteBackCacheDiskIndex      : 0
```

EXAMPLE 3

Updates a provisioning scheme to have a new MachineProfile. The provisioning scheme state is then reverted back to version 1 and the original MachineProfile.

```
Get-ProvScheme | select ProvisioningSchemeName, MachineProfile,
    ProvisioningSchemeVersion

ProvisioningSchemeName MachineProfile

    ProvisioningSchemeVersion
---------------------- --------------

    -------------------------
AzureCatalog           XDHyp:\HostingUnits\AzureRes\machineprofile.
    folder\rg.resourcegroup\machineprofile.templatespec\1.0.
    templatespecversion                                        1

Set-ProvScheme -ProvisioningSchemeName AzureCatalog -MachineProfile
    XDHyp:\HostingUnits\AzureRes\machineprofile.folder\rg.resourcegroup\
    machineprofile.templatespec\2.0.templatespecversion

Get-ProvScheme | select ProvisioningSchemeName, MachineProfile,
    ProvisioningSchemeVersion

ProvisioningSchemeName MachineProfile

    ProvisioningSchemeVersion
---------------------- --------------

    -------------------------
AzureCatalog           XDHyp:\HostingUnits\AzureRes\machineprofile.
    folder\rg.resourcegroup\machineprofile.templatespec\2.0.
    templatespecversion                                        2

Set-ProvScheme -ProvisioningSchemeName MyScheme -Version 1

Get-ProvScheme | select ProvisioningSchemeName, MachineProfile,
    ProvisioningSchemeVersion

ProvisioningSchemeName MachineProfile

    ProvisioningSchemeVersion
---------------------- --------------

    -------------------------
AzureCatalog           XDHyp:\HostingUnits\AzureRes\machineprofile.
    folder\rg.resourcegroup\machineprofile.templatespec\1.0.
    templatespecversion                                        1
```

EXAMPLE 4

Updates a provisioning scheme called “MyScheme”to explicitly attach NICs to the network named “Network 2”for new VMs that are created from the provisioning scheme.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -NetworkMapping @{
 "0" = "XDHyp:\HostingUnits\XenHU\Network 2.network" }
```

EXAMPLE 5

Updates a provisioning scheme called “MyScheme”to use the machine profile from the aws ec2 instance - “machine-profile-vm (i-00c55f1107b662c04)”.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -MachineProfile "XDHyp
    :\HostingUnits\AwsHostingUnit\us-east-1a.availabilityzone\machine-
    profile-vm (i-00c55f1107b662c04).vm"
```

EXAMPLE 6

Updates a provisioning scheme called “MyScheme”to use the machine profile from the version “1”of the aws launch template with name “machine-profile-lt”and id “lt-06927522c36bg5698”.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -MachineProfile "XDHyp
    :\HostingUnits\AwsHostingUnit\machine-profile-lt (lt-06927522
    c36bg5698).launchtemplate\lt-06927522c36bg5698 (1).
    launchtemplateversion"
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The identifier of the provisioning scheme to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Version

Specifies a prior version to change the provisioning scheme state to. Cannot be used in conjunction with other parameters that change the provisioning scheme configuration (e.g. -CustomProperties).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMCpuCount

The number of processors that will be used to create VMs from the provisioning scheme, replacing the present one.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory that will be used to created VMs from the provisioning scheme in MB, replacing the present one.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the provisioning scheme that are specific to the target hosting infrastructure. See about_ProvCustomProperties for more information. If a property name already exists its value is updated; otherwise it is added.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

Currently only supported with Azure and AWS. Defines the inventory path to the source VM used by the provisioning scheme as a template. This profile identifies the properties for the VMs created from the scheme. The VM must be in the hosting unit that HostingUnitName or HostingUnitUid refers to. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written back to the CustomProperties.

Valid paths are of the format: XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, the current NICs setting of the provisioning scheme is not updated; otherwise the NICs setting is updated, and new machines will be created with the number of NICs specified in the map, with each NIC attached to the specified network. Cannot set to an empty value.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SecurityGroup

The Security Groups to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheDiskSize

Specifies the size in Gigabytes of the disk to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheMemorySize

Specifies the size in Megabytes of the memory to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the

Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme. Setting this parameter to 0 disables the use of memory for Write Back Cache.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool> Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]> The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int> The number of processors that will be used to create VMs.

DiskSize <int> The disk size (in GB) that will be used to create VMs.

HostingUnitName <string> The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid> The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string> The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid> The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int> The count of machines created with this provisioning scheme.

MachineProfile <string> The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string> The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime> The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int> The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]> The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];> The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string> The name of this provisioning scheme.

ProvisioningSchemeUid <Guid> The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int> The version of the provisioning scheme.

TaskId <Guid> The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]> The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char> The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int> The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool> Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]> The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]> The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool> Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string> The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool> Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string> The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]> The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string> Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string> Deprecated.

CurrentMasterImageUid <Guid> The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string> Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_ProvCustomProperties)

IdentityType <string> Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool> Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool> Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int> The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int> The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]> Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int> The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound The specified provisioning scheme could not be located.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

HostingUnitNotFound The hosting unit referenced by the provisioning scheme could not be resolved.

NetworkPathResolutionFailed The specified network mapping contains invalid or empty network path value.

InvalidMachineProfileMetadata Unable to read the metadata from machine profile.

MachineProfileNotSupportedByHypervisor The hypervisor does not support any functional capability for MachineProfile.

MachineProfileUpdateNotSupported Adding a MachineProfile to the catalog is not supported.

IncorrectTenancyType MachineProfile TenancyType does not match with provisioning scheme.

ServiceOfferingPathResolutionFailed The Service Offering path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

SecurityGroupPathResolutionFailed The Security Group path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

InvalidProvisioningSchemeVersionMaximum The provisioning scheme maximum is set to an invalid value. Value values are in the range (1, 32000).

ProvisioningSchemeVersionMaximumExceeded The change in provisioning scheme could not be performed due to the maximum version number being exceeded. Older versions were not able to be pruned.

Each time Set-ProvScheme is called, a snapshot of the current configuration is saved. To view the prior saved configurations, use Get-ProvVMConfiguration. To adjust the maximum number of prior configurations MCS saves, use Set-ProvServiceConfigurationData to change MaxProvSchemeVersions.

Running Set-ProvScheme to update provisioning scheme properties will only affect future provisioned machines. To have existing VMs in a catalog be brought up to date, use Set-ProvVMUpdateTimeWindow to set a time window for certain or all VMs created from the provisioning scheme associated with the catalog to be updated on next power on within the given time window.

Set-ProvSchemeImage

March 11, 2024

Update the master image associated with the provisioning scheme.

Syntax

```
Set-ProvSchemeImage
   [-ProvisioningSchemeName] <String>
   -PreparedImageDefinitionName <String>
   -PreparedImageVersionNumber <String>
   [-DoNotStoreOldImage]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeImage
   -ProvisioningSchemeUid <Guid>
   -PreparedImageVersionUid <Guid>
   [-DoNotStoreOldImage]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the hard disk image used to provision virtual machines. If the provisioning scheme is a 'CleanOnBoot'type, then the next time that virtual machines are started, their hard disks are updated to this new image. Regardless of the 'CleanOnBoot'type, all new virtual machines created after this command will use this new hard disk image.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

A snapshot or VM template is used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot or VM template are specified using a path into the Citrix Host Service PowerShell Provider, the Citrix Host Service PowerShell snap-in must also be loaded for this cmdlet to be used.

The previous hard disk image path is stored into the history (see Get-ProvSchemeMasterVMImageHistory). The data stored in the history allows for a rollback to be undertaken, to revert to the previous hard disk image if required.

Examples

EXAMPLE 1

Updates the image version for the provisioning Scheme "MyScheme"to use the image definition myImage version 2.

```
Set-ProvSchemeImage -ProvisioningSchemeName MyScheme -
    PreparedImageDefinitionName myImage -PreparedImageVersionNumber 2

TaskId                 : 248f102f-073f-45fe-aea9-1819a6d6dd1f
Active                 : False
Host                   : MyHost
DateStarted            : 17/05/2010 17:37:57
Type                   : SetProvisioningSchemeImage
Status                 :
CurrentOperation       :
TaskExpectedCompletion : 17/05/2010 17:38:43
LastUpdateTime         : 17/05/2010 17:38:43
ActiveElapsedTime      : 46
DateFinished           : 17/05/2010 17:38:43
TerminatingError       :
WorkflowStatus         : Completed
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
ImageVersionNumber     : 2
ImageVersionUid        : 5991ba52-cad1-4e9c-b34f-1a6156e5f140
ImageDefinitionName    : myImage
ImageDefinitionUid     : 42bd09f5-3fac-44a6-8b1c-7c09f1079cc0
MasterImage            : /RhoneCC_baseXP.vm/base.snapshot
HostingUnitName        : HostUnit1
HostingUnitUid         : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
TaskState              : Finished

TaskProgress           : 100
Warnings               : {
  }

DiskSize               : 32
```

Parameters

-ProvisioningSchemeName

The provisioning scheme to which the hard disk image should be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PreparedImageDefinitionName

The name for the image definition used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageVersionNumber

The version number for the image version used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-ProvisioningSchemeUid

The provisioning uid identifier to which the hard disk image should be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PreparedImageVersionUid

The identifier for the image definition used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database once the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotStoreOldImage

Indicates that the current image should not be added to the image history list for the provisioning scheme. This is useful when rolling back to a previous image.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When "RunAsynchronously"is specified, this identifier is returned to provide the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For set provisioning scheme image tasks this is always "SetProvisioningSchemeImage".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is being used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot or VM template that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme will use.

IdentityPoolUid <guid>

The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

MasterImageNote

The note of the provisioning scheme image.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot or VM template could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringProvisioningScheme

Indicates that the task is storing the provisioning scheme data to the database.

Finished

Indicates that the task has completed with no errors.

ProvisioningSchemeAlreadyExists

Indicates that the task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

Indicates that the task failed because the identity pool specified could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

Indicates that the hosting unit that the master image originated from is not the same hosting unit that the provisioning scheme is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM image path does not refer to a snapshot or a VM template item.

ProvisioningSchemeNotFound

Could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

A task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The VM snapshot or VM template specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot or VM template specified as the master is currently in an invalid state.

InsufficientResources

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Holds string data providing more details about the current task state.

TaskProgress

The progress of the task 0-100%.

Notes

Only one long-running task per provisioning scheme can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type SetProvisioningSchemeImage, and while active will move through the following operations (CurrentOperation field)

Set-ProvSchemeMetadata

March 11, 2024

Adds or updates metadata on the given provisioning scheme.

Syntax

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
```

```
    [-InputObject] <ProvisioningScheme[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
    [-InputObject] <ProvisioningScheme[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given provisioning scheme objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the provisioning scheme with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-ProvisioningSchemeUid

Id of the provisioning scheme

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Name of the provisioning scheme

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

ProvisioningScheme objects to which the metadata is to be added or updated.

Type:	ProvisioningScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added or updated. The property must be unique for the provisioning scheme specified. If the name already exists, its value is updated. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Set-ProvSchemeMetadata.

PSObject

A metadata map object can be piped to the Set-ProvSchemeMetadata command.

Outputs

System.Collections.Generic.Dictionary[string, string]

Set-ProvSchemeMetadata returns a dictionary containing the new (name, value)-pairs for the metadata being set.

Key <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Set-ProvSchemeWarning

March 11, 2024

Sets the WarningStateType of a list of provisioning schemes warnings.

Syntax

```
Set-ProvSchemeWarning
   [-ProvisioningSchemeName <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeWarning
   [-ProvisioningSchemeUid <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeWarning
   [-WarningId <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeWarning
    [-All]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to set the WarningStateType from New to Acknowledged.

Examples

EXAMPLE 1

Sets the warning with a WarningId of 42 to Acknowledged.

```
Set-ProvSchemeWarning -WarningId 42
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme for which all associated warnings will be set to Acknowledged.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme for which all associated warnings will be set to Acknowledged.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningId

The id of the warning to set to Acknowledged.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-All

All warnings for all provisioning schemes will be set to Acknowledged.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Set-ProvServiceConfigurationData

March 11, 2024

Sets the value for the given key in the service configuration data.

Syntax

```
Set-ProvServiceConfigurationData
    [-Name] <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to store configuration data for the Machine Creation Service.

Examples

EXAMPLE 1

Sets MaxProvSchemeVersions to 15 in the service configuration.

```
Set-ProvServiceConfigurationData -Name "MaxProvSchemeVersions" -Value
    15

Name                                Value
--------                            -----
MaxProvSchemeVersions                  15
```

Parameters

-Name

Specifies the key name of the configuration data to be added. The name must be unique. If the name already exists, its value is updated.

The name cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ServiceConfigurationData

Set-ProvServiceConfigurationData returns an object containing the new definition of the configuration.

Name <string>

Specifies the name for the item of data.

Value <string>

Specifies the value of the data.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Set-ProvServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-ProvServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-ProvServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ProvServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ProvTaskMetadata

March 11, 2024

Adds or updates metadata on the given Task.

Syntax

```
Set-ProvTaskMetadata
   [-TaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvTaskMetadata
   [-TaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to store additional custom data against given Task object.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Task with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name
    property -Value value

Key                                     Value
```

```
4 ---                                          -----
5 property                                     value
```

Parameters

-TaskId

Id of the Task.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Set-ProvTaskMetadata command.

PSObject

A metadata map object can be piped to the Set-ProvTaskMetadata command.

Outputs

System.Collections.Generic.Dictionary[string, string]

Set-ProvTaskMetadata returns a dictionary containing the new (name, value)-pairs for the metadata being set.

Key <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Set-ProvVM

March 11, 2024

Changes the configuration for a specific provisioned virtual machine.

Syntax

```
Set-ProvVM
   -ProvisioningSchemeName <String>
   -VMName <String>
   [-CpuCount <Int32>]
   [-MemoryInMB <Int32>]
   [-CustomProperties <String>]
   [-ServiceOffering <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeName <String>
   -VMId <String>
   [-CpuCount <Int32>]
   [-MemoryInMB <Int32>]
   [-CustomProperties <String>]
   [-ServiceOffering <String>]
   [-MachineProfile <String>]
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeName <String>
   -VMName <String>
   [-RevertToProvSchemeConfiguration]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeName <String>
   -VMId <String>
   [-RevertToProvSchemeConfiguration]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMName <String>
   [-CpuCount <Int32>]
   [-MemoryInMB <Int32>]
   [-CustomProperties <String>]
   [-ServiceOffering <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMId <String>
   [-CpuCount <Int32>]
   [-MemoryInMB <Int32>]
   [-CustomProperties <String>]
   [-ServiceOffering <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMName <String>
   [-RevertToProvSchemeConfiguration]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMId <String>
   [-RevertToProvSchemeConfiguration]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the configuration of an existing persistent provisioned virtual machine.

These properties are specific customizations unique to the virtual machine and do not apply to any other VMs in the catalog. The final properties the machine will use are a combination of those currently set on the provisioning scheme combines with the settings specified here. Any properties set at the ProvVM-level with this command will override any settings at the ProvScheme-level.

To view the current specific configuration for a machine, use Get-ProvVMConfiguration

To view the final set of properties a machine will have applied (taking into account ProvScheme-level settings), use Get-ProvVMConfigurationResultantSet

Any configuration changes made will not apply right away to the machine. To apply the updates, set an update time window for the machine with Set-ProvVMUpdateTimeWindow and start the machine within the window. Currently, this feature is applicable only to the AWS and Azure environments.

Examples

EXAMPLE 1

Sets the configuration for machine1 to use 2 CPUs. Sets an update time window starting now and reboots the machine to apply the update.

```
Get-ProvVM -ProvisioningSchemeName MyScheme -VMName machine1 | select
   VMName, ProvVMConfigurationVersion
VMName      ProvVMConfigurationVersion
------      --------------------
machine1

Get-ProvVMConfiguration

Set-ProvVM -ProvisioningSchemeName MyScheme -VMName machine1 -CpuCount
   2

Get-ProvVMConfiguration
```

```
CpuCount                : 2
CustomProperties        :
MachineProfile          :
MemoryInMB              :
ProvisioningSchemeName  : MyScheme
ProvisioningSchemeUid   : 378cece5-a824-41f7-9e92-74be76672be6
ServiceOffering         :
VMId                    : 0707da6d-2f0f-a8c7-ce92-3d64f824ac60
VMMetadata              :
VMName                  : machine1
Version                 : 1

Get-ProvVM -ProvisioningSchemeName MyScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName      ProvVMConfigurationVersion
------      --------------------
machine1

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName MyScheme -StartsNow
    -DurationInMinutes -1

New-BrokerHostingPowerAction -Action "Restart" -MachineName machine1

Get-ProvVM -ProvisioningSchemeName MyScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName      ProvVMConfigurationVersion
------      --------------------
machine1                        1
```

EXAMPLE 2

Clears existing configuration for machine1. Sets an update time window starting now and reboots the machine to clear the configuration.

```
Get-ProvVMConfiguration
CpuCount                : 8
CustomProperties        :
MachineProfile          :
MemoryInMB              : 4096

VMMetadata             :
VMName                 : machine1
Version                : 2
```

EXAMPLE 4

In this AWS example Set-ProvVM sets the configuration for machine1 to use T3 Large ServiceOffering. Sets an update time window starting now and reboots the machine to apply the update.

```
Get-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName      ProvVMConfigurationVersion
------      --------------------
machine1

Get-ProvVMConfiguration AWSScheme -VMName machine1

Set-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 -
    ServiceOffering "XDHyp:\HostingUnits\AWSHostingUnit\T3 Large
    Instance.serviceoffering"

Get-ProvVMConfiguration AWSScheme -VMName machine1
CpuCount               :
CustomProperties       :
MachineProfile         :
MemoryInMB             :
ProvisioningSchemeName : AWSScheme
```

```
ProvisioningSchemeUid  : a13a9d94-a2a1-46ee-8363-1d225e9ef468
ServiceOffering        : T3 Large Instance.serviceoffering
VMId                   : i-0bdd24b3309920f3a
VMMetadata             :
VMName                 : machine1
Version                : 1

Get-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName     ProvVMConfigurationVersion
------     -------
machine1

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AWSScheme -VMName
    machine1 -StartsNow -DurationInMinutes -1

New-BrokerHostingPowerAction -Action "Restart" -MachineName machine1

Get-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName     ProvVMConfigurationVersion
------     -------
machine1   1
```

EXAMPLE 5

In this AWS example -RevertToProvSchemeConfiguration clears existing configuration for machine1. Sets an update time window starting now and reboots the machine to clear the configuration.

```
Get-ProvVMConfiguration AWSScheme -VMName machine1
CpuCount               :
CustomProperties       :
MachineProfile         :
MemoryInMB             :
ProvisioningSchemeUid  : a13a9d94-a2a1-46ee-8363-1d225e9ef468
ServiceOffering        : T3 Large Instance.serviceoffering
VMId                   : i-0bdd24b3309920f3a
VMMetadata             :
VMName                 : machine1
Version                : 1

Set-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 -
    RevertToProvSchemeConfiguration

Get-ProvVMConfiguration AWSScheme -VMName machine1
CpuCount               :
CustomProperties       :
MachineProfile         :
MemoryInMB             :
ProvisioningSchemeName : AWSScheme
```

```
ProvisioningSchemeUid  : a13a9d94-a2a1-46ee-8363-1d225e9ef468

VMId                   : i-0bdd24b3309920f3a
VMMetadata             :
VMName                 : machine1
Version                : 2

Get-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName     ProvVMConfigurationVersion
------     -------
machine1   1

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AWSScheme -StartsNow
     -DurationInMinutes -1

New-BrokerHostingPowerAction -Action "Restart" -MachineName machine1

Get-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName      ProvVMConfigurationVersion
------      --------------------
machine1                       2
```

EXAMPLE 6

In this AWS example Set-ProvVM configures machine1 to have a custom MachineProfile. ServiceOffering was read from MachineProfile and set on the configuration

```
Get-ProvVMConfiguration AWSScheme -VMName machine1
CpuCount               :
CustomProperties       :
MachineProfile         :
MemoryInMB             :
ProvisioningSchemeName : AWSScheme
ProvisioningSchemeUid  : a13a9d94-a2a1-46ee-8363-1d225e9ef468
ServiceOffering        :
VMId                   : i-0bdd24b3309920f3a
VMMetadata             :
VMName                 : machine1
Version                : 2

Set-ProvVM -ProvisioningSchemeName AWSScheme -VMName machine1 -
    MachineProfile "XDHyp:\HostingUnits\AWSHostingUnit\LaunchTemplate1.
    launchtemplate\lt-version (4).launchtemplateversion"

Get-ProvVMConfiguration AWSScheme -VMName machine1
CpuCount               :
CustomProperties       :
MachineProfile         : LaunchTemplate1.launchtemplate\lt-version (4).
    launchtemplateversion
```

```
MemoryInMB             :
ProvisioningSchemeName : AWSScheme
ProvisioningSchemeUid  : a13a9d94-a2a1-46ee-8363-1d225e9ef468
ServiceOffering        : T3 Medium Instance.serviceoffering
VMId                   : i-0bdd24b3309920f3a
VMMetadata             : {
 A, A, E, A... }

VMName                 : machine1
Version                : 3
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme the VM is a part of

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

The VM name

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMId

The VM ID

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RevertToProvSchemeConfiguration

If supplied, all existing configuration is cleared for the given machine. It is mutally exclusive with parameters that apply configuration settings

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The identifier of the provisioning scheme the VM is a part of

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CpuCount

The number of processors. Not supported for cloud hypervisors

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MemoryInMB

The maximum amount of memory in megabytes. Not supported for cloud hypervisors

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the provisioned virtual machine that are specific to the target hosting infrastructure. See about_ProvCustomProperties for more information. If a property name already exists its value is updated; otherwise it is added. These properties are merged with prior custom properties set.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ServiceOffering

The cloud ServiceOffering to use. Not supported for on-prem hypervisors

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

A path to the template used to obtain hypervisor-specific settings to be applied to the VM. Some settings have a corresponding CustomProperty. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written to the CustomProperties.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Set-ProvVMUpdateTimeWindow

March 11, 2024

Sets a time window on provisioned virtual machines during which they will undergo a property update on boot.

Syntax

```
Set-ProvVMUpdateTimeWindow
   [-StartTimeInUTC <String>]
   [-StartsNow]
   [-DurationInMinutes <Int32>]
   -ProvisioningSchemeName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVMUpdateTimeWindow
   [-StartTimeInUTC <String>]
   [-StartsNow]
   [-DurationInMinutes <Int32>]
   -ProvisioningSchemeName <String>
   -VMName <String[]>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvVMUpdateTimeWindow
    [-StartTimeInUTC <String>]
    [-StartsNow]
    [-DurationInMinutes <Int32>]
    -ProvisioningSchemeUid <Guid>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvVMUpdateTimeWindow
    [-StartTimeInUTC <String>]
    [-StartsNow]
    [-DurationInMinutes <Int32>]
    -ProvisioningSchemeUid <Guid>
    -VMName <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to synchronize the properties of existing virtual machines with any changes occurred on the provisioning scheme with Set-ProvScheme and any configuration applied with Set-ProvVM.

This cmdlet defines a time window where a property update will take place against either specific machines in a catalog or an entire catalog. The update will take place when the machine is next booted within the time window. Note that running this command does not make the machine automatically reboot or turn on sometime within the time window to apply the update. The power action to initiate the update must either be performed as a part of an autoscale schedule or manually through Studio or the New-BrokerHostingPowerAction cmdlet within the time window. If the time window passes before the machine is booted successfully, the update will not apply and will have to be set again with this cmdlet.

On each VM an update window is set, ProvisioningSchemeUpdateRequested defines the start of the time window and ProvisioningSchemeUpdateUntil defines the end of the time window.

After the update, ProvisioningSchemeVersion on the VM will be updated to match the current version of the ProvScheme, and the ProvVMConfigurationVersion will match the latest configuration on the VM.

Examples

EXAMPLE 1

Change the MachineProfile for the azure-catalog provisioning scheme with Set-ProvScheme, this increments the provisioning scheme version to 2. Set all 4 VMs in azure-catalog to have a property update in the time window starting 3/12/2022 at 3am UTC and lasting for 60 minutes. Times for ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil are displayed in local time (EST in this case). If a catalog machine is booted in that time window, it will update to the latest provisioning scheme settings. The first restart of machine azu01 in this example performs no action since it's before the time window starts, while the second restart is within the window, so the machine is updated and the time window is cleared.

```
Set-ProvScheme -ProvisioningSchemeName azure-catalog -MachineProfile "
    XDHyp:\HostingUnits\azure-unit\machineprofile.folder\new-template.vm
    "

Get-ProvScheme | select ProvisioningSchemeName,
    ProvisioningSchemeVersion
ProvisioningSchemeName   ProvisioningSchemeVersion
----------------------   --------------------------

```

EXAMPLE 2

Set azu01 and azu02 in azure-catalog to have a property update anytime from 11pm EST (-4) until 2 days later. The other machines remain having no property update time window set. Times for ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil are displayed in local time (EST in this case). The update will be run next time each machine boots in that window.

```
Get-ProvVM | select VMName, ProvisioningSchemeVersion,
    ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  -----------------------------
azu01                                1
azu02                                1
azu03                                1
azu04                                1

$duration = New-TimeSpan -Days 2

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
    VMName azu01, azu02 -StartTimeInUTC "3/11/2022 11pm -4" -
    DurationInMinutes $duration.TotalMinutes

Get-ProvVM | select VMName, ProvisioningSchemeVersion,
    ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  -----------------------------
azu01                                1               3/11/2022  11:00:00
    PM         3/13/2022  11:00:00 PM
azu02                                1               3/11/2022  11:00:00
    PM         3/13/2022  11:00:00 PM
azu03                                1
azu04                                1
```

EXAMPLE 3

Set azu01 and azu02 in azure-catalog to have a property update anytime after 7 days from now. The other machines remain having no property update time window set. The update will be run next time each machine boots after the start time.

```
Get-ProvVM | select VMName, ProvisioningSchemeVersion,
    ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  -----------------------------
azu01                                1
azu02                                1
azu03                                1
azu04                                1

$startTime = (Get-Date).AddDays(7).ToUniversalTime()

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
    VMName azu01, azu02 -StartTimeInUTC $startTime -DurationInMinutes -1
```

```
12
13 Get-ProvVM | select VMName, ProvisioningSchemeVersion,
       ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil
14 VMName       ProvisioningSchemeVersion
       ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
15 ------       -------------------------
       ---------------------------------  ----------------------------
16 azu01                                1              3/18/2022  11:32:51
       PM
17 azu02                                1              3/18/2022  11:32:51
       PM
18 azu03                                1
19 azu04                                1
```

EXAMPLE 4

Set azu01 and azu02 in azure-catalog to have a property update when next booted. The other machines remain having no property update time window set.

```
1  Get-ProvVM | select VMName, ProvisioningSchemeVersion,
       ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil
2  VMName       ProvisioningSchemeVersion
       ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil

17 azu04                                1
```

EXAMPLE 5

Change the MachineProfile for the azure-catalog provisioning scheme with Set-ProvScheme, this increments the provisioning scheme version to 2. Configure a custom service offering for azu01. Set all 4 VMs in azure-catalog to have a property update in the time window starting now and lasting for 60 minutes. Times for ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil are displayed in local time (EST in this case). Rebooting azu01 applies both the pending configuration and provisioning scheme updates. Rebooting azu02 applies the pending provisioning scheme update

```
Set-ProvScheme -ProvisioningSchemeName azure-catalog -MachineProfile "
    XDHyp:\HostingUnits\azure-unit\machineprofile.folder\new-template.vm
    "

Get-ProvScheme | select ProvisioningSchemeName,
    ProvisioningSchemeVersion
ProvisioningSchemeName   ProvisioningSchemeVersion
----------------------  --------------------------
azure-catalog                                    2

Set-ProvVM -ProvisioningSchemeName azure-catalog -VMName azu01 -
    ServiceOffering "XDHyp:\HostingUnits\azure-unit\"

azu03                                1               3/11/2022  10:37:14
   PM         3/11/2022 11:37:14 PM
azu04                                1               3/11/2022  10:37:14
   PM         3/11/2022 11:37:14 PM
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names set a time window for. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will have the time window applied

Type:	String[]

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTimeInUTC

The start time in UTC format of the time window. Mutually exclusive with StartsNow switch. Must be no more than 5 seconds in the past. The given string will be converted into a DateTime using parsing rules defined by the DateTime.Parse method, which allows for a timezone offset to specify time in any timezone. If no timezone offset is specified, UTC will be assumed. See the example usages of Set-ProvVMUpdateTimeWindow or this link for more details https://docs.microsoft.com/en-us/dotnet/api/system.datetime.parse?view=net-6.0#the-string-to-parse

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartsNow

Whether this time window should start right away at the current time. Mutually exclusive with specific StartTimeInUTC. Implied to be set if StartTimeInUTC is not specified

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInMinutes

The duration in minutes of the time window. If less than 0, indicates the time window has no upper bound

Type:	Int32
Position:	Named
Default value:	120 minutes
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Set-ProvVMUpdateTimeWindow.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Stop-ProvTask

March 11, 2024

Stops currently running Machine Creation Service tasks.

Syntax

```
Stop-ProvTask
    [-TaskId] <Guid>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables tasks currently running in the Machine Creation Service to be stopped. Once stopped, tasks cannot be resumed.

Examples

EXAMPLE 1

Terminate all tasks currently executing on the Machine Creation Service.

```
Get-ProvTask -active $true | Stop-ProvTask
Success
```

EXAMPLE 2

Terminate the named task executing on the Machine Creation Service.

```
Stop-ProvTask -TaskId bd52e688-e40d-4790-83de-9f7633481454
Success
```

Parameters

-TaskId

Specifies the identifier for the task to be stopped.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Stop-ProvTask command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidWorkflow

The specified task could not be found.

InvalidWorkflowHost

The specified task is executing on a different server.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

DatabaseError

There was a problem communicating with the database.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

- Switch-ProvTask

Switch-ProvTask

March 11, 2024

Moves all Machine Creation Service tasks from the current execution host to another.

Syntax

```
Switch-ProvTask
       [-Host2] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Enables tasks running within the Machine Creation Service to be moved from one execution host to a different host.

Tasks can only execute on a single host. If the host is removed from a deployment, the tasks cannot continue to execute. These 'orphaned'tasks can be moved to a different host within the deployment so that they can continue to execute. All tasks must be moved. There is no mechanism to move individual tasks.

Run the Switch-ProvTask command against the host to which the tasks are to be moved. If you are not running the command directly on the host, use the AdminAddress parameter to specify the host to which tasks will be moved.

Examples

EXAMPLE 1

Transfer the execution of tasks that had been executing on the Machine Creation Service instance on host CRASHED to the local instance.

```
Switch-ProvTask -Host CRASHED
Success
```

Parameters

-Host2

Specifies the host from which the tasks should be removed.

Type:	String
Aliases:	Host
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can result.

Error Codes

PartialData

Only a subset of the requested data was returned.

NoOp

The operation was successful but had no effect.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Test-ProvDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix MachineCreation Service.

Syntax

```
Test-ProvDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix MachineCreation Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-ProvDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix MachineCreation Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-ProvDBConnection cmdlet returns an object describing the status of the selected MachineCreation Service instance that would result if the connection string were used with the Set-ProvDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-ProvDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the MachineCreation Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the MachineCreation Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The MachineCreation Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The MachineCreation Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the MachineCreation Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the MachineCreation Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-ProvInventoryItem

March 11, 2024

Check if an inventory item can be used as an input for machine profile.

Syntax

```
Test-ProvInventoryItem
    -HostingUnitName <String>
    -InventoryPath <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvInventoryItem
    -HostingUnitUid <Guid>
    -InventoryPath <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to validate if an inventory item can be used as an input for the MachineProfile parameter while creating or updating a provisioning scheme.

Examples

EXAMPLE 1

Validates if the Azure template spec inventory item located at XDHyp:\HostingUnits\AzureRes\machineprofile.folde can be used as input for MachineProfile to either New-ProvScheme or Set-ProvScheme. Since the cmdlet returns no response, the template is a valid MachineProfile.

```
Test-ProvInventoryItem -HostingUnitName AzureRes -InventoryPath
    machineprofile.folder\rg.resourcegroup\machineprofile.templatespec
    \1.0.templatespecversion
```

EXAMPLE 2

Validates if version 1.0 of the Azure template spec machineprofile found under the hosting unit with identifier 8101028f-2570-4e17-9129-8e0cfc1e2558 can be used as input for MachineProfile to either New-ProvScheme or Set-ProvScheme. The cmdlet returns some validation errors that must be fixed before the template can be used.

```
Test-ProvInventoryItem -HostingUnitUid 8101028f-2570-4e17-9129-8
    e0cfc1e2558 -InventoryPath machineprofile.folder\rg.resourcegroup\
    machineprofile.templatespec\1.0.templatespecversion

ErrorMessage
---------------
Error: Provided disk encryption set ID in MachineProfile (input from
    the Azure template spec) does not exist
Error: Invalid storage account type in MachineProfile (input from the
    Azure template spec)
```

Parameters

-HostingUnitName

The name of the hosting unit used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InventoryPath

The partial inventory path to be validated as a machine profile. It should only contain the relative path from the hosting unit given in either the HostingUnitName or HostingUnitUid parameters. See the examples for how specify this partial path.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.InventoryItemValidationResult

This object provides a validation error message from the inventory item and contains the following information:

ErrorMessage <string>

String describing a validation error from the inventory item.

Notes

In the case of failure, the following errors can result.

Error Codes

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Test-ProvSchemeNameAvailable

March 11, 2024

Check if the proposed provisioning scheme name is unused.

Syntax

```
Test-ProvSchemeNameAvailable
    -ProvisioningSchemeName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to validate if the proposed name for a provisioning scheme is unused. This check is not limited to scopes of existing provisioning schemes, therefore, the names of inaccessible schemes are also checked.

Examples

EXAMPLE 1

This tests whether the value of $NewSchemeName is unique or not, and can be used to create a new provisioning scheme or rename an existing one without failing. True is returned if the name is good.

```
Test-ProvSchemeNameAvailable -ProvisioningSchemeName $NewSchemeName

Name      : NewScheme1
Available : True
```

Parameters

-ProvisioningSchemeName

The name or names of the provisioning scheme(s) to be tested.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Test-ProvSchemeNameAvailable.

Outputs

Citrix.MachineCreation.Sdk.NameAvailability

Key value pairs of name and its availability.

Name <string>

The provisioning scheme name to be tested.

Available <bool>

The availability of the name.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

    [-CustomProperties <String>]
    [-ServiceOffering <String>]
    [-PassThru]
    [-MachineProfile <String>]
    [-NetworkMapping <Hashtable>]
    [-SecurityGroup <String[]>]
    [-WriteBackCacheDiskSize <Int32>]
    [-WriteBackCacheMemorySize <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvSetProvScheme
    -ProvisioningSchemeUid <Guid>
    [-VMCpuCount <Int32>]
    [-VMMemoryMB <Int32>]
    -IdentityPoolUid <Guid>
    [-CustomProperties <String>]
    [-ServiceOffering <String>]
    [-PassThru]
    [-MachineProfile <String>]
    [-NetworkMapping <Hashtable>]
    [-SecurityGroup <String[]>]
    [-WriteBackCacheDiskSize <Int32>]
    [-WriteBackCacheMemorySize <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to validate the parameters of an existing provisioning scheme without actually updating the provisioning scheme. It will output all the validation failures if any.

The following parameters can be tested:

- Number of CPUs that will be used for VMs created from the provisioning scheme.
- Maximum amount of memory that will be used for VMs created from the provisioning scheme.
- Identity pool that will be used for VMs created from the provisioning scheme.
- Machine profile that will be used for VMs created from the provisioning scheme.
- Cloud service offering that will be used for VMs created from the provisioning scheme.
- Custom properties of the provisioning scheme that are specific to the target hosting infrastructure.

Examples

EXAMPLE 1

Validates the given provisioning scheme parameters

```
1  Test-ProvSetProvScheme -ProvisioningSchemeName MyScheme -
      WriteBackCacheDiskSize 50 -VMCpuCount 50 -VMMemoryMB 1000
2  Parameters               ErrorId
                                                  ErrorCategory
                    ErrorMessage
3  ----------               -------

      ------------
4  {
5   WriteBackCacheDiskSize }
6    WriteBackCacheParametersNotNeeded
        McsValidationErrorCategory WriteBackCacheDiskSize is not needed
        when write back cache is disabled.
7  {
8   CpuCount, MemoryMB }
9        CpuAndMemorySettingViaServiceOfferingOnly
            McsValidationErrorCategory Hypervisor does not support setting
             cpu or memory directly, they can only be specified via
            ServiceOffering.
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The identifier of the provisioning scheme to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMCpuCount

The number of processors that will be used to create VMs from the provisioning scheme, replacing the present one.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory that will be used to created VMs from the provisioning scheme in MB, replacing the present one.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-CustomProperties

The properties of the provisioning scheme that are specific to the target hosting infrastructure. See about_ProvCustomProperties for more information. If a property name already exists its value is updated; otherwise it is added.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

Currently only supported with Azure and AWS. Defines the inventory path to the source VM used by the provisioning scheme as a template. This profile identifies the properties for the VMs created from the scheme. The VM must be in the hosting unit that HostingUnitName or HostingUnitUid refers to. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written back to the CustomProperties.

Valid paths are of the format: XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, the current NICs setting of the provisioning scheme is not updated; otherwise the NICs setting is updated, and new machines will be created with the number of NICs specified in the map, with each NIC attached to the specified network. Cannot set to an empty value.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-SecurityGroup

The Security Groups to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheDiskSize

Specifies the size in Gigabytes of the disk to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheMemorySize

Specifies the size in Megabytes of the memory to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies

to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme. Setting this parameter to 0 disables the use of memory for Write Back Cache.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

IList<Citrix.MachineCreation.Sdk.ProvSchemeValidationFailure>

This object provides a list of validation error messages for given provisioning scheme parameters and contains the following information:

Parameters <IList<string» Name of the parameter that failed validation

ErrorId <string> Error code

ErrorCategory <string> The source of error - MCS or Plugin

ErrorMessage <string> Friendly message describing the validation failure

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound The specified provisioning scheme could not be located.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

HostingUnitNotFound The hosting unit referenced by the provisioning scheme could not be resolved.

NetworkPathResolutionFailed The specified network mapping contains invalid or empty network path value.

WriteBackCacheParametersNotNeeded WriteBackCacheDiskSize is not needed when write back cache is disabled.

CpuAndMemorySettingViaServiceOfferingOnly Hypervisor does not support setting cpu or memory directly, they can only be specified via ServiceOffering.

NetworkPathResolutionFailed The specified network path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

InvalidMachineProfileMetadata Unable to read the metadata from machine profile.

MachineProfileNotSupportedByHypervisor The hypervisor does not support any functional capability for MachineProfile.

MachineProfileUpdateNotSupported Adding a MachineProfile to the catalog is not supported.

IncorrectTenancyType MachineProfile TenancyType does not match with provisioning scheme.

ServiceOfferingPathResolutionFailed The Service Offering path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

SecurityGroupPathResolutionFailed The Security Group path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Unlock-ProvScheme

March 11, 2024

Unlocks a provisioning scheme.

Syntax

```
Unlock-ProvScheme
       [-ProvisioningSchemeName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Unlock-ProvScheme
       -ProvisioningSchemeUid <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to unlock a provisioning scheme that has the Id of a failed task still associated with it. This allows another long-running task to operate on that scheme. The cmdlet will not unlock a scheme with a task still marked as being active. Use %5BStop-ProvTask%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/MachineCreation/Stop-ProvTask.html) (or, if the task is registered with a failed server, Switch-ProvTask and %5BStop-ProvTask%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/MachineCreation/Stop-ProvTask.html)) to stop any active task first.

Examples

EXAMPLE 1

Unlocks the provisioning scheme 'MyScheme'.

```
Unlock-ProvScheme -provisioningSchemeName MyScheme
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Unlock-ProvScheme.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

NoOp

The specified provisioning scheme had no task object associated.

TaskActive

The task object associated with the provisioning scheme is still active.

DatabaseError

An error occurred in the service while attempting a database operation.

CouldNotQueueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Unlock-ProvVM

March 11, 2024

Unlocks a virtual machine.

Syntax

```
Unlock-ProvVM
       -ProvisioningSchemeName <String>
       [-VMID] <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Unlock-ProvVM
       -ProvisioningSchemeUid <Guid>
       [-VMID] <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to unlock a virtual machine.

Examples

EXAMPLE 1

Unlocks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4'in the provisioning scheme 'MyScheme'.

```
Unlock-ProvVM -provisioningSchemeName MyScheme -VMId  bc79802c-ba6e-8
    de8-99e9-4c35d7ad24b4
```

EXAMPLE 2

Unlocks all the VMs in the provisioning scheme 'MyScheme'.

```
Get-ProvVM -provisioningSchemeName MyScheme | Unlock-ProvVM
```

EXAMPLE 3

Unlocks all the VMs that are currently locked.

```
Get-ProvVM -Locked $True | Unlock-ProvVM
```

Parameters

-VMID

The virtual machine Id in the hypervisor.

Type: String[]

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId' and 'ProvisioningSchemeName' to Unlock-ProvVM.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

VMDoesNotExist

The specified VM cannot be located.

VMAlreadyUnLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Unpublish-ProvMasterVMImage

March 11, 2024

Remove a prepared master image from a provisioning scheme.

Syntax

```
Unpublish-ProvMasterVMImage
          [-ProvisioningSchemeName] <String>
          [-LoggingId <Guid>]
          [<CitrixCommonParameters>]
          [<CommonParameters>]
```

```
Unpublish-ProvMasterVMImage
          -ProvisioningSchemeUid <Guid>
          [-LoggingId <Guid>]
          [<CitrixCommonParameters>]
          [<CommonParameters>]
```

```
Unpublish-ProvMasterVMImage
          -VMImageHistoryUid <Guid>
          [-LoggingId <Guid>]
          [<CitrixCommonParameters>]
          [<CommonParameters>]
```

Description

Provides the ability to remove a master image and its hard disk copies that has been prepared for a provisioning scheme to create virtual machines.

The master image is removed from the image history of the provisioning scheme (see Get-ProvSchemeMasterVMImageHistory).

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

Examples

EXAMPLE 1

Removes the prepared master images for the provisioning Scheme "MyScheme".

```
1 Unpublish-ProvMasterVMImage -ProvisioningSchemeName MyScheme
```

EXAMPLE 2

Removes a prepared image identified by its history record.

```
1 Unpublish-ProvMasterVMImage -VMImageHistoryUid 7585f0de-192e-4847-a6d8
    -22713c3a2f42 -Revoke
```

Parameters

-ProvisioningSchemeName

Name of the provisioning scheme from which the specified master image should be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Unique identifier of the provisioning scheme from which the specified master image should be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMImageHistoryUid

Unique identifier of the master image to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Unpublish-ProvMasterVMImage.

Outputs

None

By default, this cmdlet returns no output.

Notes

If a VM Image History UID is specified, the cmdlet will remove the image if it is in the prepared state. If the image is the current image of the provisioning scheme, an error will be returned: there must be a current image associated with a provisioning scheme. The Publish-ProvMasterVMImage cmdlet may be used to replace a current image with a new or previously prepared image.

If a provisioning scheme name or UID is specified, the cmdlet will remove the prepared master image associated with that provisioning scheme if it exists. No error will be returned if no prepared image exists. The current image of the scheme will not be removed.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

about_MonitorMonitorSnapIn

March 11, 2024

Topic

about_MonitorMonitorSnapin

Short Description

The Monitor Service PowerShell snap-in provides administrative functions for the Monitor Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Monitor'.

Long Description

The Monitor Service PowerShell snap-in enables both local and remote administration of the Monitor service. It provides
facilities to query the Monitor service configuration settings and to modify those settings. It also provides the
standard set of Citrix Virtual Apps and Desktops 7 service cmdlets.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also

search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter 'Enabled'# Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled'# Equivalent to 'Enabled -eq $false'

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle"}
Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z"}
$d = [DateTime]"2010-08-23T12:30:00.0Z"

Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2'} # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30'} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30'} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*"}
Get-<Noun> -Filter { Users -contains "Fred*"}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'

Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects

with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries. It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-MonitorNotificationPolicyCondition

March 11, 2024

Add conditions to the existing policy specified and returns the updated policy.

Syntax

```
Add-MonitorNotificationPolicyCondition
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyCondition
   -InputObject <MonitorNotificationPolicy>
   [-AlertThreshold <Int32>]
   [-AlarmThreshold <Int32>]
   [-AlertRenotification <TimeSpan>]
   [-AlarmRenotification <TimeSpan>]
   [-SearchWindow <TimeSpan>]
   [-AlertConditionPersistenceInterval <TimeSpan>]
   [-AlarmConditionPersistenceInterval <TimeSpan>]
   [-Granularity <TimeSpan>]
   [-AlertSampleCount <Int32>]
   [-AlarmSampleCount <Int32>]
   [-AlertSamplePercent <Int32>]
   [-AlarmSamplePercent <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyCondition
   -Uid <Int64>
   -ConditionType <ConditionType>
   [-AlertThreshold <Int32>]
   [-AlarmThreshold <Int32>]
   [-AlertRenotification <TimeSpan>]
   [-AlarmRenotification <TimeSpan>]
   [-SearchWindow <TimeSpan>]
   [-AlertConditionPersistenceInterval <TimeSpan>]
   [-AlarmConditionPersistenceInterval <TimeSpan>]
   [-Granularity <TimeSpan>]
   [-AlertSampleCount <Int32>]
```

```
    [-AlarmSampleCount <Int32>]
    [-AlertSamplePercent <Int32>]
    [-AlarmSamplePercent <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Add conditions to the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Add SessionsConcurrentCount condition to the policy matching the id 100

```
$timeSpan = New-TimeSpan -Seconds 30
$alertThreshold = 10
$alarmThreshold = 20

Add-MonitorNotificationPolicyCondition -Uid 100 -ConditionType
    SessionsConcurrentCount -AlertThreshold $alertThreshold -
    AlarmThreshold $alarmThreshold  -AlertRenotification $timeSpan -
    AlarmRenotification $timeSpan
```

Parameters

-InputObject

Specifies the policy object to which the conditions to be added

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy to which the conditions to be added

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ConditionType

Type of the condition using a text string converted to an enum value Possible values are SessionsConcurrentCount SessionsPeakconnectedCount SessionsPeakDisconnectedCount AverageLogonDuration RDSLoadEvaluator ConnectionFailuresRate ConnectionFailuresCount FailedServerMachineCount FailedDesktopMachineCount LogonDuration IcaRoundtripTime IcaRoundtripTimeAverage IcaRoundtripTimeSessionCount IcaRoundtripTimeSessionPercent MemoryUsage CpuUsage FailedMachinePercentage

Type:	ConditionType
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertThreshold

Threshold value at which the warning notification will be triggered

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmThreshold

Threshold value at which the critical notification will be triggered

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertRenotification

Duration after which the warning notification will be re-triggered

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmRenotification

Duration after which the critical notification will be re-triggered

Type:	TimeSpan
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SearchWindow

The amount of time the condition query will look back for the matching record when it examines the data.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertConditionPersistenceInterval

The amount of time the condition query will look back to check if the alert condition was persisted.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmConditionPersistenceInterval

The amount of time the condition query will look back to check if the alarm condition was persisted.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Granularity

Defines the granularity of the rate in seconds. This value is applicable for 'ConnectionFailuresRate' condition.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertSampleCount

Defines the count of instances to measure before raising the warning notification. This value is applicable for ICA RTT (Session Count) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmSampleCount

Defines the count of instances to measure before raising the critical notification. This value is applicable for ICA RTT (Session Count) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertSamplePercent

Defines the percentage of instances to measure before raising the warning notification. This value is applicable for ICA RTT (Session Percent) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmSamplePercent

Defines the percentage of instances to measure before raising the critical notification. This value is applicable for ICA RTT (Session Percent) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the updated policy object

Add-MonitorNotificationPolicyEmailAddresses

March 11, 2024

Add email addresses to the existing policy specified and returns the updated policy.

Syntax

```
Add-MonitorNotificationPolicyEmailAddresses
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyEmailAddresses
   -InputObject <MonitorNotificationPolicy>
   -EmailAddresses <String[]>
   -EmailCultureName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyEmailAddresses
   -Uid <Int64>
   -EmailAddresses <String[]>
   -EmailCultureName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Add email addresses to the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Add email addresses to the policy matching the id 100

```
$emailaddress = @()
$emailaddress += "user1@abc.com"

Add-MonitorNotificationPolicyEmailAddresses -Uid 100 -EmailAddresses
    $emailaddress -EmailCultureName "en-US"
```

Parameters

-InputObject

Specifies the policy object to which the conditions to be added.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-EmailAddresses

Collection of email addresses to be added

Type:	String[]
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-EmailCultureName

Text encoding of the culture to return the email in

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy to which the conditions to be added.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Collection[MonitorNotificationPolicy]

Returns the collection of policy objects created

Add-MonitorNotificationPolicyTargets

March 11, 2024

Add targets to the existing policy specified and returns the updated policy

Syntax

```
Add-MonitorNotificationPolicyTargets
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyTargets
   -InputObject <MonitorNotificationPolicy>
   [-Scope <String>]
   [-TargetKind <TargetKind>]
   -TargetIds <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyTargets
   -Uid <Int64>
   [-Scope <String>]
   [-TargetKind <TargetKind>]
   -TargetIds <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Add targets to the existing policy specified and returns the updated policy

Examples

EXAMPLE 1

Add targets to the policy matching the id 100

```
$targetIds = @()
$targetIds += "766cde70-3c69-4481-a658-4e11247ac70c"

```

```
4 Add-MonitorNotificationPolicyTargets -Uid 100 -Scope "My Test Targets"
      -TargetKind Site -TargetIds $targetIds
```

Parameters

-InputObject

Specifies the policy object to which the targets to be added

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TargetIds

Object reference to the array of target ids.

Site GUID - for target type Site,

DesktopGroup UUID - for DesktopGroup, RdsWorker target types,

User SID - for User target type

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy to which the targets to be added

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Scope

Description of the collection of target ids

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetKind

String representation of the target type enum.

Possible values are

Site

DesktopGroup

RdsWorker

User

Type:	TargetKind
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the policy object

Related Links

- Get-MonitorNotificationPolicy
- Set-MonitorNotificationPolicy

Get-MonitorConfiguration

March 11, 2024

Gets configuration settings that are used by the Monitor Service.

Syntax

```
Get-MonitorConfiguration
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the configuration settings used by the Monitor Service. These settings are used to modify the behavior of the service.

Examples

EXAMPLE 1

Get the settings in the site database.

```
Get-MonitorConfiguration
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

List of configuration settings used by the Monitor Service.

Related Links

- Set-MonitorConfiguration

Get-MonitorDataStore

March 11, 2024

Gets details for each of the Monitor data stores.

Syntax

```
Get-MonitorDataStore
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns an object for each of the Monitor data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

Examples

EXAMPLE 1

Get the database connection string for the Monitor Service.

```
Get-MonitorDataStore

ConnectionString : Server=.\SQLEXPRESS;Initial Catalog = databaseName;
   Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
```

```
DatabaseType      : SqlServer
Provider          : MSSQL
SchemaName        : MonitorSecondarySchema
Status            : DBUnconfigured
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops 7 logs.

Get-MonitorDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Monitor Service.

Syntax

```
Get-MonitorDBConnection
   [[-DataStore] <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Monitor Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Monitor Service instance running on controller "controller1.mydomain.net".

```
1  Get-MonitorDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	2
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Monitor Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the MonitorService has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Monitor Service.

Syntax

```
Get-MonitorDBSchema
    [-DataStore <String>]
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Monitor Service database schema, add a new Monitor service to an existing site, remove a Monitor service from a site, or create a database server logon for a Monitor service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Monitor service instance, otherwise the scripts relate to Monitor service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Monitor service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Monitor service roles

If ScriptType is Evict, the returned script contains:

- Removal of Monitor service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Monitor Service and copies it to a file called "C:\MonitorSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Monitor service schema.

```
Get-MonitorDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\MonitorSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Monitor service. This can be used when configuring a mirror server for use.

```
Get-MonitorDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    MonitorLogins.sql
```

EXAMPLE 3

Get the full database schema for the secondary data store of the Monitor Service and copy it to a file called 'c:\MonitorSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB'that does not already contain a Monitor Service secondary schema.

```
Get-MonitorDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup
     -DataStore Secondary > c:\MonitorSchema.sql
```

Parameters

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site'or the logical name of the secondary data store.

Type:	String
Position:	Named

Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

Specifies the name of the database into which the new Monitor service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Monitor services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Monitor Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Monitor Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Monitor Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Monitor Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the

required permissions for local services to access the database schema for Monitor services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Monitor Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Monitor Service.

Syntax

```
Get-MonitorDBVersionChangeScript
    [-DataStore <String>]
    -DatabaseName <String>
    -TargetVersion <Version>
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Monitor Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Monitor Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Monitor Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Monitor Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Monitor Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-MonitorServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-MonitorDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Monitor Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	Named
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-MonitorDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Monitor Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Monitor services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-MonitorServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Monitor Service.

Syntax

```
Get-MonitorInstalledDBVersion
   [-DataStore <String>]
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Monitor Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-MonitorDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Monitor Service database schema version number.

```
Get-MonitorInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Monitor Service database schema for which upgrade scripts are supplied.

```
Get-MonitorInstalledDBVersion -Upgrade
```

Parameters

-DataStore

Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-MonitorInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Monitor

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorNotificationEmailServerConfiguration

March 11, 2024

Gets email server configuration

Syntax

```
Get-MonitorNotificationEmailServerConfiguration
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrurns the existing email server configurations required to send email alerts.

Examples

EXAMPLE 1

Returns the email configuration

```
GetMonitorNotificationEmailServerConfigurationCommand
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

ICollection<MonitorNotificationEmailServerConfiguration> System.String

Email server configuration

Related Links

- Set-MonitorNotificationEmailServerConfiguration

Get-MonitorNotificationPolicy

March 11, 2024

Returns a list of MonitorNotificationPolicy objects matching the specified parameters

Syntax

```
Get-MonitorNotificationPolicy
   [-Uid <Int64>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-MonitorNotificationPolicy
   -Name <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of MonitorNotificationPolicy objects matching the specified parameters

Examples

EXAMPLE 1

Returns the policy object having the Id equals to 1

```
Get-MonitorNotificationPolicy -Id 1
```

EXAMPLE 2

Returns the policy object having the name contains 'Server OS Policy'

```
Get-MonitorNotificationPolicy -Name 'Server OS Policy'
```

Parameters

-Name

Returns all of the policies contains the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Uid

Returns the policy with the specified id.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.ICollection`1[[Citrix.Monitor.Sdk.PowerShell.MonitorNotificationPolicy, Citrix.Monitor.PowerShellSnapIn, Version=7.7.0.95, Culture=neutral, PublicKeyToken=e6a2b8abcb991548]]

Returns a collection of policies.

Get-MonitorNotificationSnmpServerConfiguration

March 11, 2024

Gets email server configuration

Syntax

```
Get-MonitorNotificationSnmpServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns the existing Snmpserver configurations required to send Snmp alerts.

Examples

EXAMPLE 1

Returns the Snmp configuration

```
Get-MonitorNotificationSnmpServerConfiguration
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

ICollection<MonitorNotificationEmailServerConfiguration> System.String

Snmp server configuration

Related Links

- Set-MonitorNotificationSnmpServerConfiguration

Get-MonitorService

March 11, 2024

Gets the service record entries for the Monitor Service.

Syntax

```
Get-MonitorService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the Monitor Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Monitor Service running in the current service group.

```
Get-MonitorService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Monitor_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Monitor_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.Service

The Get-MonitorServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

- about_MonitorMonitorSnapin

Get-MonitorServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Monitor Service on the controller.

Syntax

```
Get-MonitorServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Monitor Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Monitor Service.

```
Get-MonitorServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorServiceInstance

March 11, 2024

Gets the service instance entries for the Monitor Service.

Syntax

```
Get-MonitorServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Monitor Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Monitor Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-MonitorServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.ServiceInstance

The Get-MonitorServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Monitor.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Monitor.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorServiceStatus

March 11, 2024

Gets the current state of the Monitor Service on the controller.

Syntax

```
Get-MonitorServiceStatus
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables the status of the Monitor Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will

return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Monitor Service.

```
Get-MonitorServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-MonitorServiceStatus command returns an object containing the status of the Monitor Service together with extra diagnostics information.

DBUnconfigured

The Monitor Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Monitor is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Monitor is connected to a database that is valid, but it does not have the full functionality required so the Monitor cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

DBOlderVersionThanService

The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Monitor Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Monitor Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Monitor and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Monitor service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

New-MonitorCssEventNotification

March 11, 2024

Sends a ConfigSyncService failure event notification to Monitor Service.

Syntax

```
New-MonitorCssEventNotification
   -Mode <Int32>
   -Level <Int32>
   -ConsecutiveDbImportFailCount <Int32>
   -SourceMachineName <String>
   -ResourceLocId <Guid>
   -NotificationTime <DateTime>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Sends a ConfigSyncService failure event notification to Monitor Service. These cmdlet is called by the CSS service.

Examples

EXAMPLE 1

Inserts the CSS event notification to NotificationCssEvent records. Updates the level in case there is a change in it.

```
New-MonitorCssEventNotification -AdminAddress "W2K19ST-VN9BLQD.sgs.
    local:89" -Mode 0 -Level 1 -ConsecutiveDbImportFailCount 4 -
    SourceMachineName "W2K19ST-VN9BLQD.sgs.local" -ResourceLocId $(New-
    Guid) -NotificationTime $(Get-Date)
```

Parameters

-Mode

Mode of the event LHC Outage or CSS failure

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Level

Level warning or critical

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ConsecutiveDbImportFailCount

Count of the consecutive DB import failure on Connector/Controller machine

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SourceMachineName

Connector or notification source machine name

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLocId

Resource location Id of the notification source

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NotificationTime

Time the event sent from ConfigSyncService

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Status of the setting a new CSS failure event notification

Related Links

New-MonitorLhcReports

March 11, 2024

Returns a boolean

Syntax

```
New-MonitorLhcReports
   -EndDate <DateTime>
   -Duration <Single>
   -MachineInZoneCount <Int32>
   -MachineRegisteredCount <Int32>
   -ReconnectedSessionCount <Int32>
   -SessionBrokeredCount <Int32>
   -ZoneName <String>
   -ControllerName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a boolean stating whether a new lhc report was added or not

Examples

EXAMPLE 1

Inserts multiple attributes into LhcReport after the cloud connector outage is over

```
New-MonitorLhcReports -Duration 120 -EndDate 2023-09-05T09
    :13:39.1835337Z -MachineInZoneCount 1 -MachineRegisteredCount 2 -
    SessionBrokeredCount 3 -ReconnectedSessionCount 4 -ZoneName "
    Bangalore" -ControllerName "Dynasty"
```

Parameters

-EndDate

End date of LHC

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Duration

Duration of LHC in minutes

Type:	Single
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineInZoneCount

Count of Machines in zone

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineRegisteredCount

Count of machines registered

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ReconnectedSessionCount

Count of sessions reconnected

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionBrokeredCount

Count of sessions brokered

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Name of zone

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerName

Name of Controller/Cloud connector

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Returns a bool stating LhcReport was saved into db

New-MonitorNotificationPolicy

March 11, 2024

Returns a new MonitorNotificationPolicy object

Syntax

```
New-MonitorNotificationPolicy
   -Name <String>
   [-Description <String>]
   [-Webhook <String>]
   [-IsSnmpEnabled <Boolean>]
   [-Enabled <Boolean>]
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a new policy instance using the specified parameters

Examples

EXAMPLE 1

Creates session policy and persist the data into database

```
New-MonitorNotificationPolicy -Name "Policy1" -Description "Policy
    Description" -Enabled $true
```

Parameters

-Name

Name of policy to create

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Description of policy to create

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Webhook

Webhook URL of policy to create

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSnmpEnabled

boolean value representing if SNMP is enabled for new Policy

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean paramter indicating the enabled state of the policy. true - Enabled, false - Disabled

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the collection of policy objects created

Remove-MonitorNotificationPolicy

March 11, 2024

Removes persisted policy from the database by marking them as deleted

Syntax

```
Remove-MonitorNotificationPolicy
      [-InputObject <MonitorNotificationPolicy[]>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicy
      [-Uid <Int64[]>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes the policy object from database by marking them as deleted and disable all the condtions associated with that

Examples

EXAMPLE 1

Removes the policy with id 1

```
Remove-MonitorNotificationPolicy -Id 1
```

EXAMPLE 2

Removes the policy with id matching the policy object specified

```
Remove-MonitorNotificationPolicy -InputObject $policy
```

Parameters

-InputObject

Removes all of the instances with the id matching in the specified policy objects

Type:	MonitorNotificationPolicy[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Removes all of the instances with the specified ids. If any of the ids are invalid, an exception is thrown.

Type:	Int64[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Return success if all operations are succeeded

Return success if all operations are succeeded. An exception is thrown otherwise

Remove-MonitorNotificationPolicyConditions

March 11, 2024

Remove conditions from the existing policy specified and returns the updated policy.

Syntax

```
Remove-MonitorNotificationPolicyConditions
      -InputObject <MonitorNotificationPolicy>
      -Conditions <ConditionType[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicyConditions
      -Uid <Int64>
      -Conditions <ConditionType[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove conditions from the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Removes the condition SessionPeakconnectedCount from policy matching id 100

```
Remove-MonitorNotificationPolicyConditions -Uid 100 -Conditions
    SessionsPeakconnectedCount
```

Parameters

-InputObject

Specifies the policy object from which the conditions to be removed.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Conditions

Collection of condition types to be removed

Type:	ConditionType[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy from which the conditions to be removed.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the updated policy object

Remove-MonitorNotificationPolicyEmailAddresses

March 11, 2024

Remove email addresses from the existing policy specified and returns the updated policy.

Syntax

```
Remove-MonitorNotificationPolicyEmailAddresses
      -InputObject <MonitorNotificationPolicy>
      -EmailAddresses <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicyEmailAddresses
      -Uid <Int64>
      -EmailAddresses <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove email addresses from the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Removes the email addresses from the policy matching id 100

```
Remove-MonitorNotificationPolicyEmailAddresses -Uid 100 -EmailAddresses
    $emailAddresses
```

Parameters

-InputObject

Specifies the policy object from which the email addresses to be removed

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-EmailAddresses

Collection of email addresses to be removed

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy from which the email addresses to be removed.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the updated policy object

Related Links

Remove-MonitorNotificationPolicyTargets

March 11, 2024

Remove targets from the existing policy specified and returns the updated policy.

Syntax

```
Remove-MonitorNotificationPolicyTargets
      -InputObject <MonitorNotificationPolicy>
      -TargetIds <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicyTargets
      -Uid <Int64>
      -TargetIds <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove targets from the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Removes the targets from policy matching id 100

```
$targetIds = @()
$targetIds += "766cde70-3c69-4481-a658-4e11247ac70d"

Remove-MonitorNotificationPolicyTargets -Uid 100  -TargetIds $targetIds
```

Parameters

-InputObject

Specifies the policy object from the targets to be removed

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TargetIds

Object reference to the array of target ids.

Site GUID - for target type Site

DesktopGroup UUID - for DesktopGroup, RdsWorker target types

Type:	String[]
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy from the targets to be removed

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the policy object

Remove-MonitorServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-MonitorServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-MonitorService | % {
  Remove-MonitorServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-MonitorDataStore

March 11, 2024

Refreshes the database string currently being used by the Monitor service.

Syntax

```
Reset-MonitorDataStore
      [-DataStore] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Returns the string for the database connection currently being used by the Monitor Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Refresh the database connection string for the Monitor Service.

```
Reset-MonitorDataStore -DataStore Secondary
OK
```

Parameters

-DataStore

Specifies the database connection logical name to be used by the Monitor Service. Can be either be 'Site'or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

Type:	String
Position:	2
Default value:	Site
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.ServiceStatus

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops 7 logs.

Reset-MonitorEnabledFeatureList

March 11, 2024

Refreshes the Monitor service's list of enabled features.

Syntax

```
Reset-MonitorEnabledFeatureList
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Monitor Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Monitor service instance's list of enabled features.

```
Reset-MonitorEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-MonitorServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Monitor Service.

Syntax

```
Reset-MonitorServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Monitor Service access permissions and configuration service locations. The Reset-MonitorServiceGroupMembership command must be run on at least one instance of the service type (Monitor) after installation and registration with the configuration service. Without this operation, the Monitor services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-MonitorServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    MonitorServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-MonitorServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Monitor.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-MonitorServiceGroupMembership command.

Outputs

Citrix.Monitor.Sdk.ServiceInstance

Reset-MonitorServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Monitor Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-MonitorConfiguration

March 11, 2024

Sets configuration settings that are used by the Monitor Service.

Syntax

```
Set-MonitorConfiguration
    [-GroomSessionsRetentionDays <Int32>]
    [-GroomFailuresRetentionDays <Int32>]
    [-GroomLoadIndexesRetentionDays <Int32>]
    [-GroomDeletedRetentionDays <Int32>]
    [-GroomSummariesRetentionDays <Int32>]
    [-GroomMachineHotfixLogRetentionDays <Int32>]
    [-GroomMinuteRetentionDays <Int32>]
    [-GroomHourlyRetentionDays <Int32>]
    [-DataCollectionEnabled <Boolean>]
    [-FullPollStartHour <Int32>]
    [-GroomStartHour <Int32>]
    [-GroomStartMinuteOffsetEarliest <Int32>]
    [-GroomStartMinuteOffsetLatest <Int32>]
    [-SyncDataToCasStartHour <Int32>]
    [-ResolutionPollTimeHours <Int32>]
    [-SyncPollTimeHours <Int32>]
    [-DetailedSqlOutputEnabled <Boolean>]
    [-MonitorQueryTimeoutSeconds <Int32>]
    [-CollectHotfixDataEnabled <Boolean>]
    [-GroomApplicationInstanceRetentionDays <Int32>]
    [-GroomApplicationErrorsRetentionDays <Int32>]
    [-GroomApplicationFaultsRetentionDays <Int32>]
    [-GroomNotificationLogRetentionDays <Int32>]
    [-GroomResourceUsageRawDataRetentionDays <Int32>]
    [-GroomResourceUsageMinuteDataRetentionDays <Int32>]
    [-GroomResourceUsageHourDataRetentionDays <Int32>]
    [-GroomResourceUsageDayDataRetentionDays <Int32>]
    [-GroomProcessUsageHourDataRetentionDays <Int32>]
    [-GroomProcessUsageDayDataRetentionDays <Int32>]
    [-GroomSessionMetricsDataRetentionDays <Int32>]
    [-GroomMachineMetricDataRetentionDays <Int32>]
    [-GroomMachineMetricDaySummaryDataRetentionDays <Int32>]
    [-EnableDayLevelGranularityProcessUtilization <Boolean>]
    [-GroomApplicationProbeLogsRetentionDays <Int32>]
    [-EnableHourLevelGranularityProcessUtilization <Boolean>]
    [-EnableMinLevelGranularityProcessUtilization <Boolean>]
    [-GroomSessionAutoReconnectsRetentionDays <Int32>]
    [-DisableHypervisorMonitoring <Boolean>]
    [-SendProcessDataToCASAndDatabase <Boolean>]
    [-SendProcessDataToCASAndSkipDatabase <Boolean>]
    [-DisablePendoTrackEvents <Boolean>]
    [-EnableProcessDataLimitedMachines <Boolean>]
    [-SessionRecordingDataProcessing <Boolean>]
    [-GroomProcessDataLimitedMachinesRetentionDays <Int32>]
    [-ProcessDataLimitedMachinesCount <Int32>]
    [-GroomLhcReportRetentionDays <Int32>]
    [-LoggingId <Guid>]
```

```
49      [<CitrixCommonParameters>]
50      [<CommonParameters>]
```

Description

Sets the configuration settings used by the Monitor Service. Use these settings to modify the behavior of the service.

A database connection need not be configured for this command to be used.

Examples

EXAMPLE 1

Updates the settings in the site database with the newly specified values.

```
1  Set-MonitorConfiguration -GroomSessionsRetentionDays 5 -
       GroomFailuresRetentionDays 4 ...
```

Parameters

-GroomSessionsRetentionDays

Determines how many days to keep Session and Connection records after the Session is terminated.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomFailuresRetentionDays

Determines how many days to keep MachineFailureLog and ConnectionFailureLog records after these are created.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomLoadIndexesRetentionDays

Determines how many days to keep LoadIndex records after these are created.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomDeletedRetentionDays

Determines how many days to keep Machine, Catalog, DesktopGroup and Hypervisor entities around that have a LifecycleState of 'Deleted'. This also deletes any related Session, Connection, Summary, Failure or LoadIndex records.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomSummariesRetentionDays

Determines how many days to keep DesktopGroupSummary, FailureLogSummary and LoadIndex-Summary records at the daily granularity.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMachineHotfixLogRetentionDays

Determines how many days to keep Machine-Hotfix history records at the daily granularity.

Type:	Int32
Position:	Named
Default value:	90
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMinuteRetentionDays

Determines how many days to keep minute data.

Type:	Int32
Position:	Named
Default value:	3
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomHourlyRetentionDays

Determines how many days to keep hourly data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 32 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataCollectionEnabled

Starts / stops data collection. Stopping data collection turns off polling, and does not persist operational event data to the database.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FullPollStartHour

Hour of day when Full Poll should begin.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomStartHour

Hour of day when Grooming should begin. Time with respect to UTC. Expected Values 0-23.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomStartMinuteOffsetEarliest

Earliest minute of day when Grooming should begin. Time with respect to UTC. Expected Values 0-1439.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomStartMinuteOffsetLatest

Latest minute of day when Grooming should begin. Time with respect to UTC. Expected Values 0-1439.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-SyncDataToCasStartHour

Hour of the day when sync to CAS via blob path should start. Default is 1 AM

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResolutionPollTimeHours

Start time for the Resolution Poll worker.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SyncPollTimeHours

Start time for Sync Poll worker.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-DetailedSqlOutputEnabled

Determines if the SqlLog should be enabled to send SQL statements to the CDF Trace

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorQueryTimeoutSeconds

Determines the maximum time Monitoring Service will wait for the database query execution

Type:	Int32
Position:	Named
Default value:	300
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CollectHotfixDataEnabled

This setting determines if the hotfix inventory data should be collected and stored in the database or if it should be thrown away.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationInstanceRetentionDays

Determines how many days to keep the history of application instances.

Type:	Int32
Position:	Named
Default value:	0 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationErrorsRetentionDays

Determines how many days to keep the history of application errors.

Type:	Int32
Position:	Named
Default value:	1 for Platinum, Enterprise and Non-Platinum licenses
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationFaultsRetentionDays

Determines how many days to keep the history of application faults.

Type:	Int32
Position:	Named
Default value:	1 for Platinum, Enterprise and Non-Platinum licenses
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomNotificationLogRetentionDays

FIXME

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageRawDataRetentionDays

Determines how many days to keep Resource Utilization data.

Type:	Int32
Position:	Named
Default value:	1 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageMinuteDataRetentionDays

Determines how many days to keep Resource Utilization summary minute data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageHourDataRetentionDays

Determines how many days to keep Resource Utilization summary hour data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 30 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageDayDataRetentionDays

Determines how many days to keep Resource Utilization summary day data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomProcessUsageHourDataRetentionDays

Determines how many days to keep Process Utilization summary hour data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomProcessUsageDayDataRetentionDays

Determines how many days to keep Process Utilization summary day data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 30 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomSessionMetricsDataRetentionDays

Determines how many days to keep SessionMetrics data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMachineMetricDataRetentionDays

Determines how many days to keep MachineMetrics data.

Type:	Int32
Position:	Named
Default value:	3 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMachineMetricDaySummaryDataRetentionDays

Determines how many days to keep MachineMetricsSummary data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableDayLevelGranularityProcessUtilization

This setting is used to determine to enable or disable Day Level granularity for Process Data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationProbeLogsRetentionDays

Determines how many days to keep the history of application probe logs.

Type:	Int32
Position:	Named
Default value:	7 for Platinum, Enterprise and Non-Platinum licenses
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableHourLevelGranularityProcessUtilization

This setting is used to determine to enable or disable Hour Level granularity for Process Data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableMinLevelGranularityProcessUtilization

This setting is used to determine to enable or disable Minute Level granularity for Process Data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomSessionAutoReconnectsRetentionDays

Determines how many days to keep SessionAutoReconnects data

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 31 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisableHypervisorMonitoring

Disable Hypervisor Monitoring for Cloud

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SendProcessDataToCASAndDatabase

This setting is useful for sending VDA Process data to CAS and Database

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SendProcessDataToCASAndSkipDatabase

This setting is useful for sending VDA Process data to CAS and skip Database

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisablePendoTrackEvents

Disable Pendo Track Events

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableProcessDataLimitedMachines

Enable Process Data to be sent for 5000 Machines when number of VDAs is greater than 5k

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionRecordingDataProcessing

This setting is useful for Processing Session Recording Events that are coming from VDA

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomProcessDataLimitedMachinesRetentionDays

Delete all the table entry

Type:	Int32
Position:	Named
Default value:	7 Days
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessDataLimitedMachinesCount

Number of Machines to be allowed for sending the Process Data

Type:	Int32
Position:	Named
Default value:	5000
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomLhcReportRetentionDays

Determines how many days to keep LhcReport data

Type:	Int32
Position:	Named
Default value:	90
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- Get-MonitorConfiguration

Set-MonitorDBConnection

March 11, 2024

Configures a database connection for the Monitor Service.

Syntax

```
Set-MonitorDBConnection
   [[-DataStore] <String>]
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Monitor Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-MonitorDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-MonitorDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Monitor Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-MonitorDBConnection cmdlet returns an object describing the status of the Monitor Service together with extra diagnostics information. Possible values are:

- OK:

The Monitor Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Monitor Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Monitor Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Monitor Service currently in use is newer than, and incompatible with, the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

- DBOlderVersionThanService:

The version of the Monitor Service schema on the database is newer than, and incompatible with, the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Monitor Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Monitor Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Monitor Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-MonitorDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Monitor Service.

Syntax

```
Set-MonitorDBCredentials
    [[-DataStore] <String>]
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-MonitorDBCredentials
    [[-DataStore] <String>]
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Monitor Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Monitor Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-MonitorDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-MonitorDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-MonitorDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-MonitorDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-MonitorNotificationEmailServerConfiguration

March 11, 2024

Saves a new email server configuration

Syntax

```
Set-MonitorNotificationEmailServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationEmailServerConfiguration
   [-InputObject] <MonitorNotificationEmailServerConfiguration>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationEmailServerConfiguration
   -ProtocolType <EmailProtocolType>
   -ServerName <String>
   -PortNumber <Int32>
   -SenderEmailAddress <String>
   -RequiresAuthentication <Boolean>
   [-Credential <PSCredential>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The saved configuration describes the new settings to be used to send emails

Examples

EXAMPLE 1

Set new email server configration using the specified parameters

```
$secpasswd = ConvertTo-SecureString "PasswordHere" -AsPlainText -Force
$mycreds = New-Object System.Management.Automation.PSCredential ("
   username", $secpasswd)

Set-MonitorNotificationEmailServerConfiguration -ProtocolType Smtp -
   ServerName "mail.citrix.com" -PortNumber 1111 -SenderEmailAddress "
   user1@abc.com" -RequiresAuthentication $true -Credential $mycreds
```

Parameters

-InputObject

Configuration object to persist

Type:	MonitorNotificationEmailServerConfiguration
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProtocolType

Email protocol type.

Possible values are

Smtp

SmtpSsl

SmtpTls

Type:	EmailProtocolType
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Email server name

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PortNumber

Email server port number

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SenderEmailAddress

Sender's email address

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RequiresAuthentication

Whether the server requires authentication

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credential

Configuration credential

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationEmailServerConfiguration

The saved configuration

Set-MonitorNotificationPolicy

March 11, 2024

Set/Modify MonitorNotificationPolicy object

Syntax

```
Set-MonitorNotificationPolicy
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationPolicy
   -InputObject <MonitorNotificationPolicy>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationPolicy
   -Uid <Int64>
   [-Name <String>]
   [-Description <String>]
   [-Webhook <String>]
   [-IsSnmpEnabled <Boolean>]
   [-Enabled <Boolean>]
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a new policy instance using the specified parameters

Examples

EXAMPLE 1

Enable the policy with the id 1

```
Set-MonitorNotificationPolicy -Id 1 -Enable
```

EXAMPLE 2

Update the policy with the id 1 to add new email address

```
$policy = Get-MonitorNotificationPolicy -Uid 1

$policy.EmailAddresses += "newemail@abc.com"

Set-MonitorNotificationPolicy -InputObject $policy
```

EXAMPLE 3

Update the policy with the id 1 to add new target value

```
$policy = Get-MonitorNotificationPolicy -Uid 1
$policy.TargetIds += "766cde70-3c69-4481-a658-4e11247ac70c"

$Policy = Set-MonitorNotificationPolicy -Id 1 -InputObject $policy
```

Parameters

-InputObject

Specifies the new policy object to adjust.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Unique identifier for policy to bet set.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

New Name of the policy.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

String value representing the new Policy description

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Webhook

String value representing the new Policy webhook

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSnmpEnabled

boolean value representing if SNMP is enabled for new Policy

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean paramter indicating the enabled state of the policy. true - Enabled, false - Disabled

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the modified policy

Set-MonitorNotificationSnmpServerConfiguration

March 11, 2024

Saves a new Snmp server configuration

Syntax

```
Set-MonitorNotificationSnmpServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationSnmpServerConfiguration
   [-InputObject] <MonitorNotificationSnmpServerConfiguration>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationSnmpServerConfiguration
   [-ServerName <String>]
   [-PortNumber <Int32>]
   [-SnmpSender <String>]
```

```
    [-EngineId <String>]
    [-AuthPassword <SecureString>]
    [-PrivPassword <SecureString>]
    [-PrivPasswordProtocol <PrivacyProtocolType>]
    [-AuthPasswordProtocol <AuthProtocolType>]
    [-CommunityString <String>]
    [-Protocol <SnmpProtocolType>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The saved configuration describes the new settings to be used to send Snmps

Examples

EXAMPLE 1

Set new Snmp server configration using the specified parameters

```
Set-MonitorNotificationSnmpServerConfiguration -ServerName "
    192.168.100.100" -PortNumber 162 -SnmpSender directoradmin -
    AuthPassword authpassword -AuthPasswordProtocol MD5 -PrivatePassword
     PrivPassword -PrivatePasswordProtocol DES
```

Parameters

-InputObject

Configuration object to persist

Type:	MonitorNotificationSnmpServerConfiguration
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Snmp listener server name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PortNumber

Snmp server port number

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SnmpSender

Sender's Name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EngineId

Engine ID

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AuthPassword

Password used for authentication

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivPassword

Password used for encryption

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivPasswordProtocol

Protocol used for encryption

Type:	PrivacyProtocolType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AuthPasswordProtocol

Protocol used for hash Authentication

Type:	AuthProtocolType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CommunityString

Comunity String for SNMP V2

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Protocol

Snmp protocol used for trap

Type:	SnmpProtocolType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationSnmpServerConfiguration

The saved configuration

Related Links

- Get-MonitorNotificationSnmpServerConfiguration

Set-MonitorServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-MonitorServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
```

```
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-MonitorServiceMetadata
    [-InputObject] <Service[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-MonitorServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                          Value
---                                          -----
property                                     value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-MonitorServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-MonitorDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Monitor Service.

Syntax

```
Test-MonitorDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Monitor Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-MonitorDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Monitor Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-MonitorDBConnection cmdlet returns an object describing the status of the selected Monitor Service instance that would result if the connection string were used with the Set-MonitorDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-MonitorDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Monitor Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Monitor Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Monitor Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Monitor Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Monitor Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Monitor Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-MonitorNotificationEmailServerConfiguration

March 11, 2024

FIXME

Syntax

```
Test-MonitorNotificationEmailServerConfiguration
    [-InputObject] <MonitorNotificationEmailServerConfiguration>
    [-Credential <PSCredential>]
    -EmailAddresses <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorNotificationEmailServerConfiguration
    -ProtocolType <EmailProtocolType>
    -ServerName <String>
    -PortNumber <Int32>
    -SenderEmailAddress <String>
    -RequiresAuthentication <Boolean>
    [-Credential <PSCredential>]
```

```
    -EmailAddresses <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorNotificationEmailServerConfiguration
    -EmailAddresses <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

FIXME

Examples

EXAMPLE 1

Test whether email can be sent using the specified oncfiguration

```
$secpasswd = ConvertTo-SecureString "PasswordHere" -AsPlainText -Force
$mycreds = New-Object System.Management.Automation.PSCredential ("
    username", $secpasswd)

Test-MonitorNotificationEmailServerConfiguration -ProtocolType Smtp -
    ServerName "mail.abc.com" -PortNumber 25 -SenderEmailAddress "
    user1@citrix.com" -RequiresAuthentication $true -EmailAddresses "
    user2@abc.com" -Credential $mycreds
```

Parameters

-InputObject

Configuration object to test

Type:	MonitorNotificationEmailServerConfiguration
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-EmailAddresses

Email addresses to which the test mail to be sent

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ProtocolType

Email protocol Possible values are Smtp SmtpSsl SmtpTls

Type:	EmailProtocolType
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Email server name

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-PortNumber

Email server port number

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SenderEmailAddress

Sender's email address

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RequiresAuthentication

Whether the server requires authentication

Type:	Boolean
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credential

Configuration credential

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

True - when test mail is successfully sent, otherwise false

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                  # Matches Abc*
Get-<Noun> -Company "Abc`*"                   # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter 'Enabled'# Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled'# Equivalent to 'Enabled -eq $false'

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle"}
Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for

objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings

formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Get-OrchBackupRestoreValue

March 11, 2024

Sets a backup restore value to int, string or both.

Syntax

```
Get-OrchBackupRestoreValue
   -Name <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets a backup restore value.

Examples

EXAMPLE 1

Gets the Backup Max Pinned Backups.

```
Get-OrchBackupRestoreValue -Name MaxPinnedBackups
```

Parameters

-Name

Specifies the name of the backup/restore to get.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-BackupRestoreValue cmdlet returns an object containing queried name's value.

Get-OrchBackupRestoreValues

March 11, 2024

Gets all backup restore values.

Syntax

```
Get-OrchBackupRestoreValues
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets all backup restore values.

Examples

EXAMPLE 1

Gets all of the the backup/Restore names and their values.

```
Get-OrchBackupRestoreValues
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-BackupRestoreValue cmdlet returns an object containing queried name's value.

Related Links

- about_OrchOrchestrationSnapin
- Set-OrchBackupRestoreValue
- Get-OrchBackupRestoreValue

Get-OrchDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Orchestration Service.

Syntax

```
Get-OrchDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Orchestration Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Orchestration Service instance running on controller "controller1.mydomain.net".

```
Get-OrchDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Orchestration Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the OrchestrationService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Related Links

- Set-OrchDBConnection
- Get-OrchServiceStatus
- Test-OrchDBConnection

Get-OrchDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Orchestration Service.

Syntax

```
Get-OrchDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Orchestration Service database schema, add a new Orchestration service to an existing site, remove a Orchestration service from a site, or create a database server logon for a Orchestration service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Orchestration service instance, otherwise the scripts relate to Orchestration service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Orchestration service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Orchestration service roles

If ScriptType is Evict, the returned script contains:

- Removal of Orchestration service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Orchestration Service and copies it to a file called "C:\OrchestrationSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Orchestration service schema.

```
Get-OrchDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\OrchestrationSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Orchestration service. This can be used when configuring a mirror server for use.

```
Get-OrchDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    OrchestrationLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Orchestration service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Orchestration services that share the same database instance and are

considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Orchestration Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Orchestration Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Orchestration Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Orchestration Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Orchestration services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Orchestration Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-OrchDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Orchestration Service.

Syntax

```
Get-OrchDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Orchestration Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Orchestration Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Orchestration Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Orchestration Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Orchestration Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-OrchServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-OrchDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Orchestration Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-OrchDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Orchestration Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shut down during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Orchestration services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-OrchServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-OrchInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Orchestration Service.

Syntax

```
Get-OrchInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Orchestration Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-OrchDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Orchestration Service database schema version number.

```
Get-OrchInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Orchestration Service database schema for which upgrade scripts are supplied.

```
Get-OrchInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-OrchInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Orchestration

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-OrchService

March 11, 2024

Gets the service record entries for the Orchestration Service.

Syntax

```
Get-OrchService
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns instances of the Orchestration Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Orchestration Service running in the current service group.

```
Get-OrchService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
```

```
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Orch_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Orch_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Orchestration.Sdk.Service

The Get-OrchServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-OrchServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Orchestration Service on the controller.

Syntax

```
Get-OrchServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Orchestration Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Orchestration Service.

```
Get-OrchServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_OrchOrchestrationSnapin

Get-OrchServiceInstance

March 11, 2024

Gets the service instance entries for the Orchestration Service.

Syntax

```
Get-OrchServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Orchestration Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Orchestration Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-OrchServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Orchestration.Sdk.ServiceInstance

The Get-OrchServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Orch.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Orchestration.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-OrchServiceStatus

March 11, 2024

Gets the current state of the Orchestration Service on the controller.

Syntax

```
Get-OrchServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Orchestration Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Orchestration Service.

```
1  Get-OrchServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-OrchServiceStatus command returns an object containing the status of the Orchestration Service together with extra diagnostics information.

DBUnconfigured

The Orchestration Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Orchestration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Orchestration Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Orchestration is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Orchestration is connected to a database that is valid, but it does not have the full functionality required so the Orchestration cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Orchestration Service currently in use is incompatible with the version of the Orchestration Service schema on the database. Upgrade the Orchestration Service to a more recent version.

DBOlderVersionThanService

The version of the Orchestration Service schema on the database is incompatible with the version of the Orchestration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Orchestration Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Orchestration Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Orchestration and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Orchestration service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-OrchServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-OrchServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-OrchServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-OrchServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-OrchServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-OrchService | % {
  Remove-OrchServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-OrchEnabledFeatureList

March 11, 2024

Refreshes the Orchestration service's list of enabled features.

Syntax

```
Reset-OrchEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Orchestration Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Orchestration service instance's list of enabled features.

```
Reset-OrchEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-OrchServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Orchestration Service.

Syntax

```
Reset-OrchServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Orchestration Service access permissions and configuration service locations. The Reset-OrchServiceGroupMembership command must be run on at least one instance of the service type (Orch) after installation and registration with the configuration service. Without this operation, the Orchestration services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-OrchServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    OrchServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-OrchServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Orchestration.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-OrchServiceGroupMembership command.

Outputs

Citrix.Orchestration.Sdk.ServiceInstance

Reset-OrchServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Orchestration Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-OrchBackupRestoreValue

March 11, 2024

Sets a backup restore value to int, string or both.

Syntax

```
Set-OrchBackupRestoreValue
   -Name <String>
    [-StringValue <String>]
    [-IntValue <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Sets a backup restore value to int, string or both.

Examples

EXAMPLE 1

Sets the Backup Max Pinned Backups value to 10.

```
Set-OrchBackupRestoreValue -Name MaxPinnedBackups 10
```

Parameters

-Name

Specifies the name of the backup/restore to set.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StringValue

The string value to set. Either a string or int value must be specified.

Type:	String
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IntValue

The int value to set. Either a string or int value must be specified.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-BackupRestoreValue cmdlet returns an object describing the success or failure of the set call.

- Get-OrchBackupRestoreValue
- Get-OrchBackupRestoreValues

Set-OrchDBConnection

March 11, 2024

Configures a database connection for the Orchestration Service.

Syntax

```
Set-OrchDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Orchestration Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-OrchDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-OrchDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Orchestration Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-OrchDBConnection cmdlet returns an object describing the status of the Orchestration Service together with extra diagnostics information. Possible values are:

- OK:

The Orchestration Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Orchestration Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Orchestration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Orchestration Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Orchestration Service currently in use is newer than, and incompatible with, the version of the Orchestration Service schema on the database. Upgrade the Orchestration Service to a more recent version.

- DBOlderVersionThanService:

The version of the Orchestration Service schema on the database is newer than, and incompatible with, the version of the Orchestration Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Orchestration Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Orchestration Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Orchestration Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-OrchDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Orchestration Service.

Syntax

```
Set-OrchDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Orchestration Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Orchestration Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-OrchDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-OrchDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-OrchDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-OrchDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- Set-OrchDBConnection
- Get-Credential

Set-OrchServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-OrchServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-OrchServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                          Value
---                                          -----
property                                     value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-OrchServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Start-OrchRestApi

March 11, 2024

Starts the Orchestration Service REST API.

Syntax

```
Start-OrchRestApi
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Initializes the PowerShell business logic and starts the REST API that is hosted by the selected instance of the Orchestration Service.

Examples

EXAMPLE 1

Starts the Orchestration Service REST API.

```
Start-OrchRestApi
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned. Error Codes

---

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Stop-OrchRestApi

March 11, 2024

Stops the Orchestration Service REST API.

Syntax

```
Stop-OrchRestApi
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Disposes the PowerShell business logic and stops the REST API that is hosted by the selected instance of the Orchestration Service.

Examples

EXAMPLE 1

Stops the Orchestration Service REST API.

```
Stop-OrchRestApi
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned. Error Codes

---

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-OrchDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Orchestration Service.

Syntax

```
Test-OrchDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-OrchDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-OrchDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Orchestration Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-OrchDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Orchestration Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-OrchDBConnection cmdlet returns an object describing the status of the selected Orchestration Service instance that would result if the connection string were used with the Set-OrchDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-OrchDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Orchestration Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Orchestration Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Orchestration Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Orchestration Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Orchestration Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Orchestration Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying

the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like ''High*''-or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company ''citrix''-Product '[X]EN*'
Get-<Noun> -Product ''Xen*''-Company ''CITRIX''
Get-<Noun> -Filter { Company -eq 'Citrix'-and Product -like 'Xen*'}

See about_Quoting_Rules and about_Wildcards for details about PowerShell
handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape
the wildcards using the normal PowerShell escape mechanisms (see
about_Escape_Characters), or switch to a filter expression and the -eq
operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
```

```
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter 'Enabled'# Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled'# Equivalent to 'Enabled -eq $false'

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle"}
Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan

values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid

```
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-SfServerToCluster

March 11, 2024

Adds a new server to an existing cluster.

Syntax

```
Add-SfServerToCluster
   [-StorefrontUrl <Uri>]
   -ClusterId <Guid>
   -ServerName <String>
   [-FarmName <String>]
   [-XmlServices <Uri[]>]
   [-RunAsynchronously <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Adds a new server to an existing cluster. Optionally updates Farm and Storefront Url. After operation succeeds, all servers are configured identically.

Examples

EXAMPLE 1

Adds "NewSfServer"to cluster with id (Guid).

```
Add-SfServerToCluster -ClusterId (Guid) -ServerName NewSfServer -
    RunAsynchronously $true
```

Parameters

-ClusterId

The id of the cluster to perform operation on.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

The name of the server to join to exisiting cluster. The name must be one of the values returned by Get-SfCluster

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named

Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FarmName

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Related Links

- Get-SfCluster
- New-SfCluster
- Remove-SfServerFromCluster
- Set-SfCluster

Get-SfCluster

March 11, 2024

Gets all Storefront clusters present in the site.

Syntax

```
Get-SfCluster
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets all Storefront clusters present in the site. There is one special Cluster with null id that lists the servers that are not part to any cluster (they are available to join any).

Examples

EXAMPLE 1

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.DataModel.Cluster[]

Returns array of clusters available in current deployment.

Related Links

- New-SfCluster
- Add-SfServerToCluster
- Remove-SfServerFromCluster
- Set-SfCluster

Get-SfDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Storefront Service.

Syntax

```
Get-SfDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Storefront Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Storefront Service instance running on controller "controller1.mydomain.net".

```
Get-SfDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Storefront Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the StorefrontService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Storefront Service.

Syntax

```
Get-SfDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Storefront Service database schema, add a new Storefront service to an existing site, remove a Storefront service from a site, or create a database server logon for a Storefront service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Storefront service instance, otherwise the scripts relate to Storefront service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Storefront service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Storefront service roles

If ScriptType is Evict, the returned script contains:

- Removal of Storefront service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Storefront Service and copies it to a file called "C:\StorefrontSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Storefront service schema.

```
Get-SfDBSchema -DatabaseName MySiteDB -ServiceGroupName  MyServiceGroup
    > C:\StorefrontSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Storefront service. This can be used when configuring a mirror server for use.

```
1  Get-SfDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
       StorefrontLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Storefront service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Storefront services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Storefront Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Storefront Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Storefront Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Storefront Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the

required permissions for local services to access the database schema for Storefront services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Storefront Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Storefront Service.

Syntax

```
Get-SfDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Storefront Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Storefront Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Storefront Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Storefront Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Storefront Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-SfServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-SfDBVersionChangeScript -DatabaseName MyDb -TargetVersion
    7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Storefront Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-SfDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Storefront Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Storefront services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-SfServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Related Links

- about_SfStorefrontSnapin
- Get-SfInstalledDBVersion
- Get-SfServiceStatus
- Get-SfDBSchema

Get-SfInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Storefront Service.

Syntax

```
Get-SfInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Storefront Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-SfDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Storefront Service database schema version number.

```
Get-SfInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Storefront Service database schema for which upgrade scripts are supplied.

```
Get-SfInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-SfInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Storefront

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfIsStorefrontInstalled

March 11, 2024

Tells whether StoreFront Services and Privileged Service are installed.

Syntax

```
Get-SfIsStorefrontInstalled
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Examples

EXAMPLE 1

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

bool

True if both StoreFront Services and Privileged Service are installed, false otherwise.

Related Links

Get-SfOptimalGateway

March 11, 2024

Gets the configured optimal gateways for farms.

Syntax

```
Get-SfOptimalGateway
   -SiteId <Int64>
   -ResourcesVirtualPath <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the configured optimal gateways for farms.

Examples

EXAMPLE 1

```
Get-DSOptimalGatewayForFarms -siteId 1 -ResourcesVirtualPath "/Citrix/
    MyStore"
```

Parameters

-SiteId

Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourcesVirtualPath

Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: “/Citrix/Store”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.OptimalGateway

Related Links

- Set-SfOptimalGateway
- Remove-SfOptimalGateway

Get-SfService

March 11, 2024

Gets the service record entries for the Storefront Service.

Syntax

```
Get-SfService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
```

```
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the Storefront Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Storefront Service running in the current service group.

```
Get-SfService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Service

The Get-SfServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-SfServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Storefront Service on the controller.

Syntax

```
Get-SfServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Storefront Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Storefront Service.

```
Get-SfServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfServiceInstance

March 11, 2024

Gets the service instance entries for the Storefront Service.

Syntax

```
Get-SfServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Storefront Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Storefront Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-SfServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.ServiceInstance

The Get-SfServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Sf.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Storefront.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfServiceStatus

March 11, 2024

Gets the current state of the Storefront Service on the controller.

Syntax

```
Get-SfServiceStatus
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables the status of the Storefront Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then

it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Storefront Service.

```
Get-SfServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-SfServiceStatus command returns an object containing the status of the Storefront Service together with extra diagnostics information.

DBUnconfigured

The Storefront Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Storefront is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Storefront is connected to a database that is valid, but it does not have the full functionality required so the Storefront cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

DBOlderVersionThanService

The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Storefront Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Storefront Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Storefront and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Storefront service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfTask

March 11, 2024

Gets the task history for the Storefront Service.

Syntax

```
Get-SfTask
   [[-TaskId] <Guid>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of tasks that have run or are currently running within the Storefront Service.

Examples

EXAMPLE 1

Parameters

-TaskId

Specifies the task identifier to be returned.

Type:	Guid
Position:	2
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

New-SfCluster

March 11, 2024

Creates new Storefront cluster with default set of services.

Syntax

```
New-SfCluster
   [-StorefrontUrl <Uri>]
   -ServerName <String>
   -FarmName <String>
   -XmlServices <Uri[]>
   [-RunAsynchronously <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The server will have a default set of services containing fully-functionaly Storefront server with Authentication, Store, Receiver for Web and Desktop Appliance.

Examples

EXAMPLE 1

Creates a new cluster on server “SfServer”. The server will have a default set of services containing fully-functionaly Storefront server with Authentication, Store, Receiver for Web, Desktop Appliance site and the required infrastructure. The Store service will have a farm named “XdSiteName”that will contain servers farm1 and farm2, whose will be contacted using http on default port 80.

```
New-SfCluster -FarmName "XdSiteName" -XmlServices http://farm1,http://
    farm2 -ServerName SfServer -RunAsynchronously $true
```

Parameters

-ServerName

The name of the server to build a cluster on. The name must be one of the values returned by Get-SfCluster

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FarmName

Name of the farm that will be used within Store service.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port.

Type:	Uri[]

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Related Links

- Get-SfCluster

- Add-SfServerToCluster
- Remove-SfServerFromCluster
- Set-SfCluster

Remove-SfOptimalGateway

March 11, 2024

Removes the optimal gateway for farms configuration.

Syntax

```
Remove-SfOptimalGateway
       -SiteId <Int64>
       -ResourcesVirtualPath <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes the optimal gateway for farms configuration.

Examples

EXAMPLE 1

```
Remove-DSOptimalGatewayForFarms -siteId 1 -ResourcesVirtualPath "/
   Citrix/MyStore"
```

Parameters

-SiteId

Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

Type:	Int64
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourcesVirtualPath

Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: "/Citrix/Store"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- Get-SfOptimalGateway
- Set-SfOptimalGateway

Remove-SfServerFromCluster

March 11, 2024

Removes server from the cluster.

Syntax

```
Remove-SfServerFromCluster
      -ClusterId <Guid>
      [-StorefrontUrl <Uri>]
      -ServerName <String>
      [-FarmName <String>]
      [-XmlServices <Uri[]>]
      [-RunAsynchronously <Boolean>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes server from the cluster and propagates information to other servers. The configuration of the server is wiped out, so the server can be reused.

Examples

EXAMPLE 1

Removes Server "BrokenSfServer"from a Cluster with id (Guid).

```
Remove-SfServerFromCluster -ClusterId (Guid) -ServerName BrokenSfServer
    -RunAsynchronously $true
```

Parameters

-ClusterId

The if of the cluster to perform operation on.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

The name of the server to remove from cluster. The name must be one of the values returned by Get-SfCluster.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FarmName

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

- New-SfCluster
- Add-SfServerToCluster
- Set-SfCluster

Remove-SfServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-SfServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-SfServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-SfServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-SfServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-SfService | % {
  Remove-SfServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-SfTask

March 11, 2024

Removes from the database completed tasks for the Storefront Service.

Syntax

```
Remove-SfTask
       [-TaskId] <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Enables completed tasks that have run within the Storefront Service to be removed from the database.

Examples

EXAMPLE 1

Parameters

-TaskId

Specifies the identifier for the task to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-SfTask command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration service.

OperationDeniedByConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Remove-SfTaskMetadata

March 11, 2024

Removes metadata from the given Task.

Syntax

```
Remove-SfTaskMetadata
      [-TaskId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
```

```
5         [<CitrixCommonParameters>]
6         [<CommonParameters>]
```

```
1 Remove-SfTaskMetadata
2       [-TaskId] <Guid>
3       -Map <PSObject>
4       [-LoggingId <Guid>]
5       [<CitrixCommonParameters>]
6       [<CommonParameters>]
```

```
1 Remove-SfTaskMetadata
2       [-InputObject] <Task[]>
3       -Name <String>
4       [-LoggingId <Guid>]
5       [<CitrixCommonParameters>]
6       [<CommonParameters>]
```

```
1 Remove-SfTaskMetadata
2       [-InputObject] <Task[]>
3       -Map <PSObject>
4       [-LoggingId <Guid>]
5       [<CitrixCommonParameters>]
6       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Task.

Examples

EXAMPLE 1

Remove all metadata from all Task objects.

```
1 Get-SfTask | % {
2   Remove-SfTaskMetadata -Map $_.MetadataMap  }
```

Parameters

-TaskId

Id of the Task

Type: Guid

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “Sys-

tem.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-SfEnabledFeatureList

March 11, 2024

Refreshes the Storefront service's list of enabled features.

Syntax

```
Reset-SfEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Storefront Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Storefront service instance's list of enabled features.

```
Reset-SfEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-SfServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Storefront Service.

Syntax

```
Reset-SfServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Storefront Service access permissions and configuration service locations. The Reset-SfServiceGroupMembership command must be run on at least one instance of the service type (Sf) after installation and registration with the configuration service. Without this operation, the Storefront services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-SfServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    SfServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-SfServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Storefront.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-SfServiceGroupMembership command.

Outputs

Citrix.Storefront.Sdk.ServiceInstance

Reset-SfServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Storefront Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-SfCluster

March 11, 2024

Sets the parameters on the given cluster.

Syntax

```
Set-SfCluster
   [-StorefrontUrl <Uri>]
   -ClusterId <Guid>
   [-FarmName <String>]
   [-XmlServices <Uri[]>]
   [-RunAsynchronously <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Sets the parameters on the given cluster and propagate the changes to all servers within a given cluster.

Examples

EXAMPLE 1

Sets a Storefront Url in a Cluster with id (Guid). Propagates changes to all servers that are part of the cluster.

```
Set-SfCluster -StorefrontUrl http://SfUrl -ClusterId (Guid) -
    RunAsynchronously $true
```

Parameters

-ClusterId

The if of the cluster to perform operation on.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FarmName

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

- New-SfCluster
- Add-SfServerToCluster
- Remove-SfServerFromCluster

Set-SfDBConnection

March 11, 2024

Configures a database connection for the Storefront Service.

Syntax

```
Set-SfDBConnection
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Storefront Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-SfDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-SfDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Storefront Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-SfDBConnection cmdlet returns an object describing the status of the Storefront Service together with extra diagnostics information. Possible values are:

- OK:

The Storefront Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Storefront Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Storefront Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Storefront Service currently in use is newer than, and incompatible with, the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

- DBOlderVersionThanService:

The version of the Storefront Service schema on the database is newer than, and incompatible with, the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Storefront Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Storefront Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Storefront Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-SfDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Storefront Service.

Syntax

```
Set-SfDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfDBCredentials
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Storefront Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Storefront Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-SfDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-SfDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-SfDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-SfDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Set-SfOptimalGateway

March 11, 2024

Set the farms and the optimal gateway to use for launch.

Syntax

```
Set-SfOptimalGateway
   -SiteId <Int64>
   -ResourcesVirtualPath <String>
   -HostNames <String[]>
   -StaUrls <String[]>
   -Farm <String>
   [-StasBypassDuration <TimeSpan>]
   [-StasUseLoadBalancing]
   [-EnableSessionReliability]
   [-UseTwoTickets]
   [-EnabledOnDirectAccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Set the farms and the optimal gateway to use for launch.

Examples

EXAMPLE 1

```
Set-DSOptimalGatewayForFarms -SiteId 1 -ResourcesVirtualPath /Citrix/
    Store -Hostnames @("gateway1.citrix.com:2222") -StaUrls @("https://
    server1.citrix.com/staurl") -StasBypassDuration "00.02:00:00" -
    EnabledOnDirectAccess
```

Parameters

-SiteId

Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourcesVirtualPath

Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: “/Citrix/Store”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-HostNames

Specifies the fully qualified domain name (FQDN) and port of the optimal NetScaler Gateway appliance.

Example1 for standard vServer port 443: gateway.example.com

Example2 for nonstandard vServer port 500: gateway.example.com:500

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StaUrls

Specifies the URLs for XenDesktop, XenApp, and VDI-in-a-Box servers running the Secure Ticket Authority (STA). If using multiple farms, list the STA servers on each using a comma separated list:

Example: "http://xenapp-a.ptd.com/scripts/ctxsta.dll","http://xendesktop-a.ptd.com/scripts/ctxsta.dll"

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Farm

Specificies the set of delivery controllers, as named when they were configured with StoreFront.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StasBypassDuration

Set the time period, in hours, minutes, and seconds, for which an STA is considered unavailable after a failed request.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StasUseLoadBalancing

Set to true: randomly obtains session tickets from all STAs, evenly distributing requests across all the STAs.

Set to false: users are connected to the first available STA in the order in which they are listed in the configuration, minimizing the number of STAs in use at any given time.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableSessionReliability

Set to true: keeps disconnected sessions open while Receiver attempts to reconnect automatically. If you configured multiple STAs and want to ensure that session reliability is always available, set the value of the UseTwoTickets attribute to true to obtain session tickets from two different STAs in case one STA becomes unavailable during the session.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseTwoTickets

Set to true: obtains session tickets from two different STAs in case one STA becomes unavailable during the session.

Set to false: uses only a single STA server.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnabledOnDirectAccess

Set to true: ensures that when local users on the internal network log on to StoreFront directly, connections to their resources are still routed through the optimal appliance defined for the farm.

Set to false: connections to resources are not routed through the optimal appliance for the farm unless users access StoreFront through a NetScaler Gateway.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-SfServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-SfServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-SfServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-SfServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-SfTaskMetadata

March 11, 2024

Adds or updates metadata on the given Task.

Syntax

```
Set-SfTaskMetadata
   [-TaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfTaskMetadata
   [-TaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfTaskMetadata
   [-InputObject] <Task[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfTaskMetadata
   [-InputObject] <Task[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Task objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-SfTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name
   property -Value value

Key                                     Value
```

```
4 ---                                     -----
5 property                                value
```

Parameters

-TaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-SfTaskMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-SfDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Storefront Service.

Syntax

```
Test-SfDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-SfDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-SfDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Storefront Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-SfDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Storefront Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-SfDBConnection cmdlet returns an object describing the status of the selected Storefront Service instance that would result if the connection string were used with the Set-SfDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-SfDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Storefront Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Storefront Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Storefront Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Storefront Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Storefront Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Storefront Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                    # Matches Abc*
Get-<Noun> -Company "Abc`*"                     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}

Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
```

```
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

```
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Confirm-TrustVdaEnrollmentToken

March 11, 2024

This cmdlet will validate or confirm that the provided VDA enrollment token is valid.

Syntax

```
Confirm-TrustVdaEnrollmentToken
        [-Token] <String>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

If the token is valid it will assume the token is being used and therefore it will increment the total number of times the token was used to add a machine by one and update the last used date.

Examples

EXAMPLE 1

Determines if the provided VDA enrollment JWT token is valid.

```
Confirm-TrustVdaEnrollmentToken -Token {
 your vda token here }
```

Parameters

-Token

The JWT token that delegates the ability to enroll VDA machines with a particular machine catalog.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Returns true if the token is valid or false if the token is not valid.

Related Links

Get-TrustDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Trust Service.

Syntax

```
Get-TrustDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Trust Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Trust Service instance running on controller "controller1.mydomain.net".

```
Get-TrustDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Trust Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the TrustService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Trust Service.

Syntax

```
Get-TrustDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Trust Service database schema, add a new Trust service to an existing site, remove a Trust service from a site, or create a database server logon for a Trust service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Trust service instance, otherwise the scripts relate to Trust service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Trust service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Trust service roles

If ScriptType is Evict, the returned script contains:

- Removal of Trust service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Trust Service and copies it to a file called "C:\TrustSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Trust service schema.

```
Get-TrustDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\TrustSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Trust service. This can be used when configuring a mirror server for use.

```
1  Get-TrustDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
       TrustLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Trust service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Trust services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Trust Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Trust Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Trust Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Trust Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the

required permissions for local services to access the database schema for Trust services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Trust Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Trust Service.

Syntax

```
Get-TrustDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Trust Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Trust Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Trust Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Trust Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Trust Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-TrustServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-TrustDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Trust Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-TrustDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Trust Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Trust services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-TrustServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Get-TrustInstalledDBVersion
- Get-TrustServiceStatus
- Get-TrustDBSchema

Get-TrustInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Trust Service.

Syntax

```
Get-TrustInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Trust Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-TrustDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Trust Service database schema version number.

```
Get-TrustInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Trust Service database schema for which upgrade scripts are supplied.

```
Get-TrustInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-TrustInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Trust

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustService

March 11, 2024

Gets the service record entries for the Trust Service.

Syntax

```
Get-TrustService
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns instances of the Trust Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Trust Service running in the current service group.

```
Get-TrustService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.Service

The Get-TrustServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-TrustServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Trust Service on the controller.

Syntax

```
Get-TrustServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Trust Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Trust Service.

```
Get-TrustServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustServiceInstance

March 11, 2024

Gets the service instance entries for the Trust Service.

Syntax

```
Get-TrustServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Trust Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Trust Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1  Get-TrustServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.ServiceInstance

The Get-TrustServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Trust.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Trust.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustServiceKey

March 11, 2024

Gets register ServiceKey configured for this site.

Syntax

```
Get-TrustServiceKey
    [[-Uid] <Int32>]
    [-InstanceId <String>]
    [-InstanceName <String>]
    [-IsTrustService <Boolean>]
    [-LastUpdated <DateTime>]
    [-RotationNeeded <Boolean>]
    [-ServiceName <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves registered ServiceKey matching the specified criteria. If no parameters are specified, all registered ServicesKey will be returned.

Examples

EXAMPLE 1

Gets all service keys.

```
Get-TrustServiceKey
```

EXAMPLE 2

Gets all service keys for a Trust Service.

```
Get-TrustServiceKey -IsTrustService $true
```

EXAMPLE 3

Mark all the service keys whose public key were last updated before October 20, 2015 to rotate their public keys.

```
Get-TrustServiceKey -Filter "LastUpdated -lt '10-20-2015'" | Set-
    TrustServiceKeyRotation
```

EXAMPLE 4

Revoke the previous public key of all service keys that were updated after October 20, 2016.

```
Get-TrustServiceKey -Filter "LastUpdated -gt '10-20-2016'" | Revoke-
    TrustPreviousServiceKey
```

Parameters

-Uid

Get ServiceKey with the specified Unique Identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InstanceId

Get ServiceKey with the specified instance identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-InstanceName

Get ServiceKey with the specified instance name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsTrustService

Get ServiceKey with the specified value of the IsTrustService flag.

If true, only Service Keys for the Trust Service will be returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastUpdated

Get ServiceKey where the public key was last updated at the specified time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RotationNeeded

Get ServiceKey with the specified value of the RotationNeeded flag.

If true, only ServiceKey that need to be rotated will be returned.

If false, only ServiceKey where key rotation is not pending will be returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceName

Get ServiceKey with the specified service name.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Trust.Sdk.ServiceKey

Get-TrustServiceKey returns an object for each matching registered Service Key.

Get-TrustServiceStatus

March 11, 2024

Gets the current state of the Trust Service on the controller.

Syntax

```
Get-TrustServiceStatus
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables the status of the Trust Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Trust Service.

```
Get-TrustServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-TrustServiceStatus command returns an object containing the status of the Trust Service together with extra diagnostics information.

DBUnconfigured

The Trust Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Trust Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Trust Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Trust is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Trust is connected to a database that is valid, but it does not have the full functionality required so the Trust cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Trust Service currently in use is incompatible with the version of the Trust Service schema on the database. Upgrade the Trust Service to a more recent version.

DBOlderVersionThanService

The version of the Trust Service schema on the database is incompatible with the version of the Trust Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Trust Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Trust Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Trust and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Trust service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustVdaEnrollmentToken

March 11, 2024

This cmdlet will get all the metadata records for all the VDA enrollment tokens.

Syntax

```
Get-TrustVdaEnrollmentToken
   [-Id <Guid>]
   [[-TokenName] <String>]
   [-CatalogId <Guid>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This will not return the tokens themselves only the metadata used to create the tokens. The tokens are not stored after they are generated.

Examples

EXAMPLE 1

Get all the metadata records for all the VDA enrollment tokens.

```
Get-TrustVdaEnrollmentToken
```

Parameters

-TokenName

The name used to more easily identify this VDA enrollment token.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Id

The JWT token ID of the VDA enrollment token meta data to retrieve.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CatalogId

The Catalog Id that this VDA enrollment token allows machines to be added to.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.VdaEnrollmentToken[]

The vda enrollment token metadata that matches the provided filters

Related Links

New-TrustBearerToken

March 11, 2024

Creates a new bearer token for the current user.

Syntax

```
New-TrustBearerToken
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new bearer token for the current user. This uses the current Windows identity.

Examples

EXAMPLE 1

Obtains the bearer token and stores it in the $bearerData variable and uses it to authenticate with the Broker.

```
$bearerData = New-TrustBearerToken
New-BrokerDBConnection -BearerToken $bearerData.Token
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Trust.Sdk.BearerTokenData

The bearer token.

Related Links

- about_TrustTrustSnapin

New-TrustVdaEnrollmentToken

March 11, 2024

This cmdlet creates a new VDA enrollment token from the provided metadata.

Syntax

```
New-TrustVdaEnrollmentToken
   -CatalogId <Guid>
   [-ExpirationDate <DateTime>]
   [-HostConnectionId <Guid>]
   [-IssuedToUser <String>]
   [-NotValidBeforeDate <DateTime>]
   -NumMachinesAllowed <Int32>
   [-TokenName] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

Description

VDA enrollment tokens are JWT tokens issued for limited use to add VDA machines to a machine catalog.

Examples

EXAMPLE 1

Creates a VDA enrollment token that allows the bearer to add up to 3 machines to machine catalog ID 30e1a941-cc17-4cc9-a4d7-2a49c7350430 that will expire on 4/1/2023.

```
New-TrustVdaEnrollmentToken -TokenName MyNewVdaToken -ExpirationDate
    4/1/2023 -NotValidBeforeDate 3/20/2023 -NumMachinesAllowed 3 -
    CatalogId 30e1a941-cc17-4cc9-a4d7-2a49c7350430
```

EXAMPLE 2

Creates a VDA registration token that allows the bearer to add up to 3 machines to machine catalog ID 30e1a941-cc17-4cc9-a4d7-2a49c7350430. Since no expiration date or not valid before date were provided this token will expire 14 days after the date it was created.

```
New-TrustVdaEnrollmentToken -TokenName MyNewVdaToken -
    NumMachinesAllowed 3 - CatalogId 30e1a941-cc17-4cc9-a4d7-2
    a49c7350430
```

EXAMPLE 3

Creates a VDA registration token that allows the bearer to add up to 3 machines to machine catalog ID 30e1a941-cc17-4cc9-a4d7-2a49c7350430 that is not valid before 7/4/2023 and will expire on 7/18/2023.

```
New-TrustVdaEnrollmentToken -TokenName MyNewVdaToken -
    NumMachinesAllowed 3 - CatalogId 30e1a941-cc17-4cc9-a4d7-2
    a49c7350430 -NotValidBeforeDate 7/4/2023
```

Parameters

-TokenName

The name used to more easily identify this VDA enrollment token.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CatalogId

The machine catalog Id that this VDA enrollment token allows machines to be added to.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-NumMachinesAllowed

The number of machines this VDA enrollment token allows to be added to the machine catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-ExpirationDate

Optional - The UTC date this VDA enrollment token expires. This will default to creation date or NotValidBeforeDate plus the threshold of 14 days.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HostConnectionId

The HostConnectionId that orchestration service can use to determine how to handle power management.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IssuedToUser

Optional - The user to which this new VDA enrollment token has been issued.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NotValidBeforeDate

Optional - The UTC date before which this VDA enrollment token will not be valid. This will default to the creation date.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.VdaEnrollmentToken

This token result object contains the VDA enrollment token and some additional metadata.

Related Links

Register-TrustServiceKey

March 11, 2024

Creates a new trusted Service Key

Syntax

```
Register-TrustServiceKey
        -ServiceName <String>
        [-InstanceId <String>]
        -PublicKey <String>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Creates a new trusted Service Key. If this is a Service Key with the ServiceName of "ConnectorProxy", it will also result in adding of the corresponding Edge Server.

Examples

EXAMPLE 1

Register DCCHN-Proxy.xd.local ConnectorProxy with the Trust Service using the specified Public Key

```
Register-TrustServiceKey -ServiceName ConnectorProxy -InstanceId DCCHN-Proxy.xd.local -PublicKey PFJTQUtleVZhbHVlPjxNb2R1bHVzPnU2b0lCaFR2NXl...
```

Parameters

-ServiceName

The Name of the Service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PublicKey

The primary public key being registered.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Trust.Sdk.ServiceKey

The newly created Service Key.

Notes

This command should only be needed to register a ConnectorProxy that cannot do so using the installer and repair tool.

Remove-TrustServiceKeyMetadata

March 11, 2024

Removes metadata from the given ServiceKey.

Syntax

```
Remove-TrustServiceKeyMetadata
      [-ServiceKeyUid] <Int32>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceKeyMetadata
      [-ServiceKeyUid] <Int32>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceKeyMetadata
      [-InputObject] <ServiceKey[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceKeyMetadata
       [-InputObject] <ServiceKey[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given ServiceKey.

Examples

EXAMPLE 1

Remove all metadata from all ServiceKey objects.

```
Get-TrustServiceKey | % {
  Remove-TrustServiceKeyMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceKeyUid

Id of the ServiceKey

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceKey[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-TrustServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-TrustServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-TrustService | % {
  Remove-TrustServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-TrustVdaEnrollmentToken

March 11, 2024

This cmdlet will delete the specified VDA enrollment token.

Syntax

```
Remove-TrustVdaEnrollmentToken
      [-InputObject] <VdaEnrollmentToken[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
```

```
5       [<CommonParameters>]
```

```
1 Remove-TrustVdaEnrollmentToken
2       [-Id] <Guid[]>
3       [-LoggingId <Guid>]
4       [<CitrixCommonParameters>]
5       [<CommonParameters>]
```

```
1 Remove-TrustVdaEnrollmentToken
2       [-TokenName] <String[]>
3       [-LoggingId <Guid>]
4       [<CitrixCommonParameters>]
5       [<CommonParameters>]
```

Description

This cmdlet will delete the specified VDA enrollment token metadata from the database making the token useless.

Examples

EXAMPLE 1

Deletes the VDA enrollment token metadata with an ID of 00f1f4e4-ce0c-4255-ae81-17d631d23eb7.

```
1 Remove-TrustVdaEnrollmentToken -Id 00f1f4e4-ce0c-4255-ae81-17d631d23eb7
```

Parameters

-InputObject

Specifies the VDA enrollment token meta data objects to delete

Type:	VdaEnrollmentToken[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

The JWT token ID of the VDA enrollment token to delete.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TokenName

The TokenName of the VDA enrollment token to delete.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-TrustEnabledFeatureList

March 11, 2024

Refreshes the Trust service's list of enabled features.

Syntax

```
Reset-TrustEnabledFeatureList
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Trust Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Trust service instance's list of enabled features.

```
Reset-TrustEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-TrustServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Trust Service.

Syntax

```
Reset-TrustServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Trust Service access permissions and configuration service locations. The Reset-TrustServiceGroupMembership command must be run on at least one instance of the service type (Trust) after installation and registration with the configuration service. Without this operation, the Trust services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-TrustServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    TrustServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-TrustServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-TrustServiceGroupMembership command.

Outputs

Citrix.Trust.Sdk.ServiceInstance

Reset-TrustServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Trust Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Revoke-TrustBearerToken

March 11, 2024

Revokes the user's current bearer token.

Syntax

```
Revoke-TrustBearerToken
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Revokes the user's current bearer token.

Examples

EXAMPLE 1

Revokes any bearer token issued for the current user.

```
Revoke-TrustBearerToken
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- about_TrustTrustSnapin

Revoke-TrustPreviousServiceKey

March 11, 2024

This cmdlet removes the older public key from the service key

Syntax

```
Revoke-TrustPreviousServiceKey
      -ServiceName <String>
      [-InstanceId <String>]
      [-PassThru]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Revoke-TrustPreviousServiceKey
      -ServiceKey <ServiceKey>
      [-PassThru]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet removes the older public key from the service key

Examples

EXAMPLE 1

Revoke the previous public key for the DCCHN-Proxy.xd.local ConnectorProxy service.

```
Revoke-TrustPreviousServiceKey -ServiceName ConnectorProxy -InstanceId
    DCCHN-Proxy.xd.local
```

EXAMPLE 2

Revoke the previous public key of all service keys that were updated after October 20, 2016.

```
Get-TrustServiceKey -Filter "LastUpdated -gt '10-20-2016'" | Revoke-
    TrustPreviousServiceKey
```

Parameters

-ServiceName

The Name of the service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceKey

An existing Service key. Usually the results piped from another command.

Type:	ServiceKey
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceKey

You can pipe the service keys to be updated into this command.

Outputs

None or Citrix.Trust.Sdk.ServiceKey

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a ServiceKey object.

Revoke-TrustVdaEnrollmentToken

March 11, 2024

This cmdlet will mark the specified VDA enrollment token as revoked.

Syntax

```
Revoke-TrustVdaEnrollmentToken
       [-TokenId] <String>
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

If the token is revoked it will no longer be valid. Revoked tokens will eventually be deleted.

Examples

EXAMPLE 1

Marks the VDA enrollment token with an ID of 00f1f4e4-ce0c-4255-ae81-17d631d23eb7 as revoked.

```
Revoke-TrustVdaEnrollmentToken -TokenId 00f1f4e4-ce0c-4255-ae81-17
    d631d23eb7
```

Parameters

-TokenId

The JWT token ID of the VDA enrollment token to revoke.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Set-TrustDBConnection

March 11, 2024

Configures a database connection for the Trust Service.

Syntax

```
Set-TrustDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Trust Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-TrustDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-TrustDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Trust Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-TrustDBConnection cmdlet returns an object describing the status of the Trust Service together with extra diagnostics information. Possible values are:

- OK:

The Trust Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Trust Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Trust Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Trust Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Trust Service currently in use is newer than, and incompatible with, the version of the Trust Service schema on the database. Upgrade the Trust Service to a more recent version.

- DBOlderVersionThanService:

The version of the Trust Service schema on the database is newer than, and incompatible with, the version of the Trust Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Trust Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Trust Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Trust Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-TrustDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Trust Service.

Syntax

```
Set-TrustDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Trust Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Trust Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-TrustDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-TrustDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-TrustDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-TrustDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-TrustServiceKeyMetadata

March 11, 2024

Adds or updates metadata on the given ServiceKey.

Syntax

```
Set-TrustServiceKeyMetadata
   [-ServiceKeyUid] <Int32>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyMetadata
   [-ServiceKeyUid] <Int32>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyMetadata
   [-InputObject] <ServiceKey[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyMetadata
   [-InputObject] <ServiceKey[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given ServiceKey objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the ServiceKey with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-TrustServiceKeyMetadata -ServiceKeyUid 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                          Value
---                                          -----
property                                     value
```

Parameters

-ServiceKeyUid

Id of the ServiceKey

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceKey[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the ServiceKey specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-TrustServiceKeyMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-TrustServiceKeyRotation

March 11, 2024

Mark a service key as needing to be rotated

Syntax

```
Set-TrustServiceKeyRotation
   -ServiceName <String>
   [-InstanceId <String>]
   [-PassThru]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-TrustServiceKeyRotation
   -ServiceKey <ServiceKey>
    [-PassThru]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Mark a service key as needing to be rotated. Key rotation will not happen immediately. Typically, it should take about an hour for the keys to be rotated but it can take longer if the service that owns the key is down or unable to contact the Trust Service.

Use Get-TrustServiceKey and look at the "LastUpdated"and "RotationNeeded"fields to determine when it was last rotated and if the Service Key has already been marked for Rotation.

Examples

EXAMPLE 1

Mark the Service Key for the DCCHN-Proxy.xd.local ConnectorProxy to be rotated.

```
Set-TrustServiceKeyRotation -ServiceName ConnectorProxy -InstanceId
   DCCHN-Proxy.xd.local
```

EXAMPLE 2

Mark all the Service Keys that were last updated before October 20, 2015 to rotate their public keys.

```
Get-TrustServiceKey -Filter "LastUpdated -lt '10-20-2015'" | Set-
   TrustServiceKeyRotation
```

Parameters

-ServiceName

The Name of the Service being effected

Type: String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceKey

An existing Service key. Usually the results piped from another command.

Type:	ServiceKey
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceKey

You can pipe the service keys to be updated into this command.

Outputs

None or Citrix.Trust.Sdk.ServiceKey

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a ServiceKey object.

Set-TrustServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-TrustServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-TrustServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-TrustServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-TrustDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Trust Service.

Syntax

```
Test-TrustDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-TrustDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-TrustDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Trust Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-TrustDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
   Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Trust Service instance.

Type: String

Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-TrustDBConnection cmdlet returns an object describing the status of the selected Trust Service instance that would result if the connection string were used with the Set-TrustDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-TrustDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Trust Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Trust Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Trust Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Trust Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Trust Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Trust Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Unregister-TrustServiceKey

March 11, 2024

Unregister and Revoke the service keys for a specified service from the site.

Syntax

```
Unregister-TrustServiceKey
           -ServiceName <String>
           [-InstanceId <String>]
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

```
Unregister-TrustServiceKey
           -ServiceKey <ServiceKey>
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Unregister and Revoke the service keys for a specified service. If this is a service key with the Service-Name of “ConnectorProxy”, it will also result in the removal of the corresponding Edge Server.

Examples

EXAMPLE 1

Remove the service key for the ConnectorProxy DCCHN-Proxy.xd.local

```
1 Unregister-TrustServiceKey -ServiceName ConnectorProxy -InstanceId
     DCCHN-Proxy.xd.local
```

EXAMPLE 2

Unregister all the service keys associated with DCCHN-DDC1.xd.local

```
1 Get-TrustServiceKey -InstanceId DCCHN-DDC1.xd.local | Unregister-
     TrustServiceKey
```

Parameters

-ServiceName

The Name of the Service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceKey

An existing Service key. Usually the results piped from another command.

Type:	ServiceKey
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceKey

You can pipe the service keys to be updated into this command.

Outputs

None

By default, this cmdlet returns no output.

Update-TrustBearerToken

March 11, 2024

Requests a renewed bearer token.

Syntax

```
Update-TrustBearerToken
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Requests a renewed bearer token.

Examples

EXAMPLE 1

Obtains a bearer token for the current user and immediately refreshes it.

```
$bearerData = New-TrustBearerToken
Update-TrustBearerToken -BearerToken $bearerData.Token
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe the bearer token string into this command.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- about_TrustTrustSnapin

Update-TrustServiceKey

March 11, 2024

Update\Rotate the public key of a service

Syntax

```
Update-TrustServiceKey
      -ServiceName <String>
      [-InstanceId <String>]
      -PublicKey <String>
      [-InstanceName <String>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Updates primary public key for a given service and (optional) instance id, rotating keys accordingly.

Use Get-TrustServiceKey and look at the “LastUpdated”and “RotationNeeded”fields to determine when it was last rotated and if the Service Key needs to be rotated.

Examples

EXAMPLE 1

Rotate the Service Key for the DCCHN-Proxy.xd.local ConnectorProxy.

```
Update-TrustServiceKey -ServiceName ConnectorProxy -InstanceId DCCHN-
   Proxy.xd.local -PublicKey "newKey" -InstanceName "Instance1"
```

Parameters

-ServiceName

The Name of the Service being updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PublicKey

A new Service key.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InstanceId

The instance ID of the service.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InstanceName

The name of the instance for this service.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None or Citrix.Trust.Sdk.ServiceKey

This cmdlet returns a ServiceKey object.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                    # Matches Abc*
Get-<Noun> -Company "Abc`*"                     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}

Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z"}
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2'} # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30'} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30'} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*"}
Get-<Noun> -Filter { Users -contains "Fred*"}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
```

```
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

```
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Get-UserProfileDefinition

March 11, 2024

Gets the high level description of a configuration for profile management, based on a byte array (blob).

Syntax

```
Get-UserProfileDefinition
   [-ByteArray] <Byte[]>
   [-ExcludeUnconfigured]
   [<CommonParameters>]
```

Description

Use this command to convert a configuration byte array into a set of named property settings. The byte array will either have been retrieved from the Broker, or from the New-UserProfileConfiguration cmdlet.

Examples

EXAMPLE 1

The first command creates a fresh configuration set in its default state, and stores it in a Windows PowerShell variable. The second command interprets the new blob, and would output the individual

properties of the default configuration.

```
$blob = New-UserProfileConfiguration

Get-UserProfileDefinition -ByteArray $blob
```

EXAMPLE 2

This command creates a fresh configuration set in its default state, and pipes the resulting byte array through to Get-UserProfileDefinition, which will interpret it and output its individual properties.

```
New-UserProfileConfiguration | Get-UserProfileDefinition
```

Parameters

-ByteArray

Specifies the low-level byte array (blob) to be interpreted.

Type:	Byte[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ExcludeUnconfigured

When this switch is supplied, the returned object will only carry the properties whose values have been explicitly set. Properties whose values are unconfigured will be omitted. When this switch is not supplied, the full set of configuration properties will be returned, and any unconfigured settings will just appear to be set to their default value.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Byte[]

The cmdlet accepts the ByteArray parameter as pipeline input.

Outputs

PSObject

This cmdlet outputs a single PSObject with multiple properties. Each property denotes one setting within the configuration set. The following is a summary of the properties and their data types:

ServiceActive (bool?)

ProcessedGroups (string[])

ExcludedGroups (string[])

ProcessAdmins (bool?)

UserStorePath (string)

PSMidSessionWriteBack (bool?)

OfflineSupport (bool?)

DeleteCachedProfilesOnLogoff (bool?)

ProfileDeleteDelay (int?)

MigrateWindowsProfilesToUserStore (MigrateWindowsProfilesToUserStoreEnum?)

LocalProfileConflictHandling (LocalProfileConflictHandlingEnum?)

TemplateProfilePath (string)

TemplateProfileOverridesLocalProfile (bool?)

TemplateProfileOverridesRoamingProfile (bool?)

TemplateProfileIsMandatory (bool?)

LoadRetries (int?)

ProcessCookieFiles (bool?)

DisableDynamicConfig (bool?)

LogoffRatherThanTempProfile (bool?)

DebugMode (bool?)

LogLevel_Warnings (bool?)

LogLevel_Information (bool?)

LogLevel_FileSystemNotification (bool?)

LogLevel_FileSystemActions (bool?)

LogLevel_RegistryActions (bool?)

LogLevel_RegistryDifference (bool?)

LogLevel_ActiveDirectoryActions (bool?)

LogLevel_PolicyUserLogon (bool?)

LogLevel_Logon (bool?)

LogLevel_Logoff (bool?)

LogLevel_UserName (bool?)

MaxLogSize (int?)

DebugFilePath (string)

ExclusionList (string[])

IncludeListRegistry (string[])

ExclusionListSyncFiles (string[])

ExclusionListSyncDir (string[])

SyncDirList (string[])

SyncFileList (string[])

MirrorFoldersList (string[])

PSEnabled (bool?)

PSAlwaysCache_Enabled (bool?)

PSAlwaysCache (int?)

PSPendingLockTimeout (int?)

PSUserGroups (string[])

CPEnable (bool?)

CPUserGroups (string[])

CPSchemaPathData (string)

CPPathData (string)

CPMigrationFromBaseProfileToCPStore (bool?)

FRAdminAccess (bool?)

FRIncDomainName (bool?)

FRAppDataEnabled (FRAppDataEnum?)

FRAppDataPath (string)

FRDesktopEnabled (FRDesktopEnum?)

FRDesktopPath (string)

FRStartMenuEnabled (FRStartMenuEnum?)

FRStartMenuPath (string)

FRDocumentsEnabled (FRDocumentsEnum?)

FRDocumentsPath (string)

FRPicturesEnabled (FRPicturesEnum?)

FRPicturesPath (string)

FRMusicEnabled (FRMusicEnum?)

FRMusicPath (string)

FRVideosEnabled (FRVideosEnum?)

FRVideosPath (string)

FRFavoritesEnabled (FRFavoritesEnum?)

FRFavoritesPath (string)

FRContactsEnabled (FRContactsEnum?)

FRContactsPath (string)

FRDownloadsEnabled (FRDownloadsEnum?)

FRDownloadsPath (string)

FRLinksEnabled (FRLinksEnum?)

FRLinksPath (string)

FRSearchesEnabled (FRSearchesEnum?)

FRSearchesPath (string)

FRSavedGamesEnabled (FRSavedGamesEnum?)

FRSavedGamesPath (string)

Get-UserProfileManagerServiceAddedCapability

March 11, 2024

Lists the properties that can be configured through user profile configuration.

Syntax

```
Get-UserProfileManagerServiceAddedCapability
   [<CommonParameters>]
```

Description

This command produces an array containing the names of the properties that can be configured as part of a user profile configuration. Any name that occurs in the array can be used as a parameter for the Set-UserProfileDefinition cmdlet.

Examples

EXAMPLE 1

This command creates a list of all the properties that can be set through Set-UserProfileDefinition and stores them in $properties.

```
$properties = Get-UserProfileManagerServiceAddedCapability
```

Parameters

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this command

Outputs

Object[]

The names of the properties that can be configured through user profile configurations

Related Links

- New-UserProfileConfiguration
- Set-UserProfileDefinition

Get-UserProfilePath

March 11, 2024

Gets the path (or paths) at which an individual user's profile is stored.

Syntax

```
Get-UserProfilePath
   -User <String>
   -PathToUserStore <String>
   [<CommonParameters>]
```

Description

Use this cmdlet to search for specific user profile folders, based on a configured store path.

The cmdlet will perform automatic substitutions on all of the dynamic parts of the store path. These substitutions will be made based either on the details of the individual user given, or by enumerating all possible strings that are permitted by the variable in question. The approach taken depends on the variable. User-specific variables such as %USERNAME% will be substituted based on the user. Variables such as !CTX_OSNAME! will be substituted by enumerating the possibilities.

Once all substitutions have been made, the cmdlet will search the user store for any directories that exist, matching the substituted path. All such directories are then reported as outputs of the cmdlet.

Once this cmdlet has been used to locate the profile store, other Windows PowerShell scripts can be written to inspect or manipulate the contents of the profile, provided that such access is allowed by the permissions of the profile store.

Examples

EXAMPLE 1

This command attempts to locate the user profile folder for the user account Fred within the domain FABRIKAM, where the user has been specified as an NT account name. This user's details will be substituted into the profile store path. A likely return result would be \\server\Profiles$\Fred.FABRIKAM.

```
Get-UserProfilePath -PathToUserStore \\server\Profiles$\%USERNAME%.%
    USERDOMAIN% -User FABRIKAM\Fred
```

EXAMPLE 2

This command attempts to locate the user profile folder for the user account Fred within the domain FABRIKAM, where the user has been specified as a User Principal Name (UPN). This user's details will be substituted into the profile store path. Possible return results might be \\server\Profiles$\Fred.FABRIKAM\Win7 or \\server\Profiles$\Fred.FABRIKAM\WinXP.

```
Get-UserProfilePath -PathToUserStore \\server\Profiles$\%USERNAME%.%
    USERDOMAIN%\!CTX_OSNAME! -User Fred@FABRIKAM
```

EXAMPLE 3

This command attempts to locate the user profile folder for the user account whose Security Identifier (SID) has been specified. This user's details will be substituted into the profile store path. Possible return results might be \\server\Profiles$\Fred.FABRIKAM\x86 or \\server\Profiles$\Fred.FABRIKAM\x64.

```
Get-UserProfilePath -PathToUserStore \\server\Profiles$\%USERNAME%.%
    USERDOMAIN%\!CTX_OSBITNESS! -User S
    -1-5-32-1045337234-12924708993-5683276719-19000
```

Parameters

-User

Specifies the user whose profile is to be found within the store. Users can be identified in terms of their account name, UPN or SID.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-PathToUserStore

Specifies the UNC path to the configured profile store.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	True

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The pipeline accepts any valid User parameter, as an account name, UPN or SID.

Outputs

String

The UNC path to the profile folder(s) belonging to the specified user. Each reported path will denote a directory that exists within the store, and will have all of its dynamic elements substituted with static strings.

New-UserProfileConfiguration

March 11, 2024

Creates a new configuration for Citrix Profile Management, with all settings in their default initial state.

Syntax

```
New-UserProfileConfiguration
   [<CommonParameters>]
```

Description

This command returns a byte array (or "blob"), which can be passed to the Get-UserProfileDefinition and Set-UserProfileDefinition commands to inspect and modify a configuration set.

Use this command to bootstrap the configuration process in the case where no configuration policy objects are available in the Broker's database, or when you wish to create a fresh configuration that is separate from any that already exist.

No settings will be explicitly configured in the new configuration set. The properties of the configuration will be based on documented default values. Use Set-UserProfileDefinition to alter the state of any property within the configuration set.

Examples

EXAMPLE 1

The first command creates a fresh configuration set in its default state, and stores it in a Windows PowerShell variable. The second command interprets the new blob, and would output the individual properties of the default configuration.

```
$blob = New-UserProfileConfiguration

Get-UserProfileDefinition -ByteArray $blob
```

EXAMPLE 2

This command creates a fresh configuration set in its default state, and pipes the resulting byte array through to Get-UserProfileDefinition, which will interpret it and output its individual properties.

```
New-UserProfileConfiguration | Get-UserProfileDefinition
```

Parameters

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

The new configuration set, which can be piped directly into Get-UserProfileDefinition to receive the named properties.

New-UserProfileShare

March 11, 2024

Creates a new Windows network share on a nominated computer, making it suitable for use as a profile store.

Syntax

```
New-UserProfileShare
   -ServerName <String>
   -ShareName <String>
   -PathOnServer <String>
```

```
    -UserGroups <String[]>
    -AdminGroups <String[]>
    [<CommonParameters>]
```

Description

Use this command as part of the procedure for creating a new profile store when configuring profile management for first use. A suitable folder is assumed to already exist locally on the nominated computer. If no such folder exists, then you will need to create it on the machine before running this command. This command automates the process of transforming that folder into a published network share with suitable access control for profile management.

When using this command to publish a share, you will need to supply information about the security groups of users who will be storing their profiles on the share. You can also optionally specify security groups who will be given an administrative level of access, should your organisation require this.

Examples

EXAMPLE 1

This command creates a new network share called "Profiles$"on the machine called "ProfileServer". It does this by sharing the folder "C:\ProfileStore", which will already be resident on ProfileServer. The store can be used by all domain users in the FABRIKAM domains. The store (including all of the user profiles that are subsequently stored within it) will also be accessible to the domain administrators. Following successful execution of this command, the network share whose UNC name is "\\ProfileServer\Profiles$"will exist. This makes it possible, for instance, to establish "\\ProfileServer\Profiles$\%USERNAME%.%USERDOMAIN"as a valid store path when configuring profile management.

```
C:PS> New-UserProfileShare -ServerName ProfileServer -ShareName
    Profiles$ -PathOnServer C:\ProfileStore -UserGroups @("FABRIKAM\
    Domain Users") -AdminGroups @("FABRIKAM\Administrators")
```

Parameters

-ServerName

This string specifies the network identity of the computer on which the share is being published.

Type: String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ShareName

This specifies the desired name of the share itself. It is recommended (although not required) that share names end with the "$"character, so that they are excluded from casual enumerations of available shares.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PathOnServer

This string specifies the absolute path of the local directory on the server computer, which will become the shared folder. This path must make sense from the point of view of the server, so it must not be a UNC path. A path might, for example, be of the form "C:\UserProfiles\FinanceDepartment".

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserGroups

This array of strings specifies the names of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Domain Users".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroups

This array of strings specifies the names of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Administrators".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-UserProfileShare

March 11, 2024

Removes a nominated network share.

Syntax

```
Remove-UserProfileShare
      [-Path] <String>
      [<CommonParameters>]
```

Description

This command might be used as part of a final tear-down procedure for a profile store that is no longer needed.

This command will not delete any folders or data from the server computer, nor will it alter any access permissions on the folder. It will only restore the shared folder into an unshared state.

Examples

EXAMPLE 1

This command will unpublish the network share called "Profiles$"on the computer called "Profile-Server". The contents of the folder itself will not be affected. Any required deletion of profile store contents must be performed manually by an appropriate administrator of the folder.

```
C:PS> Remove-UserProfileShare -Path \\ProfileServer\Profiles$
```

Parameters

-Path

This string specifies the full UNC name of the network share to be removed. Since it is a UNC name, it will naturally specify both the name of the server computer and the name of the share to be removed. Consequently, no additional inputs are required.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Repair-UserProfileShare

March 11, 2024

Carries out one or more remedial actions on a profile store.

Syntax

```
Repair-UserProfileShare
      -Path <String>
      [-Mandatory]
      [-RedirectedFolders]
      -UserGroups <String[]>
      -AdminGroups <String[]>
      [<CommonParameters>]
```

```
Repair-UserProfileShare
      -Path <String>
      [-Mandatory]
      [-RedirectedFolders]
      -UserGroupsSids <String[]>
      -AdminGroupsSids <String[]>
      [<CommonParameters>]
```

```
Repair-UserProfileShare
      -Path <String>
      [-Mandatory]
      [-RedirectedFolders]
      [<CommonParameters>]
```

Description

Use this command in situations where the Test-UserProfileShare cmdlet reported one or more fixable faults with the profile store.

The inputs and outputs of this command are identical to those of %5BTest-UserProfileShare%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/UserProfileManager/Test-UserProfileShare.html). The only difference between the two cmdlets is that this cmdlet will attempt to fix the issues, where %5BTest-UserProfileShare%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/UserProfileManager/Test-UserProfileShare.html) will only report them.

Issues that cannot be fixed will be reported as test failures, just as they would with Test-UserProfileShare.

This cmdlet can only be used to fix issues that were claimed to be fixable in the output report from Test-UserProfileShare.

Examples

EXAMPLE 1

This command ensures that the path "\\ProfileServer\Profiles$\%USERAME%.%USERDOMAIN%"is suitable for use as a profile store. This path is syntactically valid, so the cmdlet will check for the existence of the share "\\ProfileServer\Profiles$". Provided that the share exists, it will also ensure that its permissions are configured such that all domain users would be permitted to create profile folders within the store, and that all domain administrators will be permitted to access the store for administrative purposes.

```
C:PS> Repair-UserProfileShare -Path \\ProfileServer\Profiles$\%USERNAME
    %.%USERDOMAIN% -UserGroups @("FABRIKAM\Domain Users") -AdminGroups @
    ("FABRIKAM\Administrators")
```

EXAMPLE 2

This command ensures that the path "\\ProfileServer\Profiles$\FinanceDept\FixedProfile"contains a valid Citrix mandatory profile. This path is syntactically valid, so the cmdlet will check that the share "\\ProfileServer\Profiles$"exists. If it exists, the cmdlet will go on to ensure that its permissions are configured such that all domain users would be permitted to read data from the profile, and that all domain administrators will be permitted to access the profile for administrative purposes.

Additional repair actions will be performed on the contents of the profile to ensure that there is nothing within the profile that might reveal details about the user who logged in to create it.

```
C:PS> Repair-UserProfileShare -Path \\ProfileServer\Profiles$\
    FinanceDept\FixedProfile -UserGroups @("FABRIKAM\Domain Users") -
    AdminGroups @("FABRIKAM\Administrators") -Mandatory
```

Parameters

-Path

This string contains the prospective profile store path to be examined, such as "\\ProfileServer\Profiles$\%USERNAME%.%USERDOMAIN%".

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-UserGroups

This array of strings specifies the names of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Domain Users".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroups

This array of strings specifies the names of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty.

Each string must be specified as a Windows object identifier, such as "FABRIKAM\Administrators".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserGroupsSids

This array of strings specifies the SID of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as security identifier string, such as "S-1-1-0".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroupsSids

This array of strings specifies the SID of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as security identifier string, such as "S-1-5-32-544".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Mandatory

This switch indicates whether the profile store is intended to house a mandatory profiles. Mandatory profile stores are subjected to additional checks.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RedirectedFolders

This switch indicates whether the path indicates the location of redirected folder directories.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

This cmdlet outputs a sequence of objects, each of which has the following properties:

Name - This property indicates the name of the test.

Status - This property indicates whether the repair action succeeded or failed.

Details - This property provides additional information about the test in the case where it has failed. The interpretation of this property depends on the name of the test.

CanFix - In the case where the test has failed, this boolean property indicates whether the problem can be fixed with the Repair-UserProfileShare cmdlet.

Set-UserProfileDefinition

March 11, 2024

Applies one or more modifications to a profile management configuration set.

Syntax

```
Set-UserProfileDefinition
   [-ByteArray] <Byte[]>
   [-ServiceActive <Boolean>]
   [-ProcessedGroups <String[]>]
   [-ExcludedGroups <String[]>]
   [-ProcessAdmins <Boolean>]
   [-UserStorePath <String>]
   [-PSMidSessionWriteBack <Boolean>]
```

```
    [-OfflineSupport <Boolean>]
    [-DeleteCachedProfilesOnLogoff <Boolean>]
    [-ProfileDeleteDelay <Int32>]
    [-MigrateWindowsProfilesToUserStore <
       MigrateWindowsProfilesToUserStoreEnum>]
    [-LocalProfileConflictHandling <LocalProfileConflictHandlingEnum>]
    [-TemplateProfilePath <String>]
    [-TemplateProfileOverridesLocalProfile <Boolean>]
    [-TemplateProfileOverridesRoamingProfile <Boolean>]
    [-TemplateProfileIsMandatory <Boolean>]
    [-LoadRetries <Int32>]
    [-ProcessCookieFiles <Boolean>]
    [-DisableDynamicConfig <Boolean>]
    [-LogoffRatherThanTempProfile <Boolean>]
    [-DebugMode <Boolean>]
    [-LogLevel_Warnings <Boolean>]
    [-LogLevel_Information <Boolean>]
    [-LogLevel_FileSystemNotification <Boolean>]
    [-LogLevel_FileSystemActions <Boolean>]
    [-LogLevel_RegistryActions <Boolean>]
    [-LogLevel_RegistryDifference <Boolean>]
    [-LogLevel_ActiveDirectoryActions <Boolean>]
    [-LogLevel_PolicyUserLogon <Boolean>]
    [-LogLevel_Logon <Boolean>]
    [-LogLevel_Logoff <Boolean>]
    [-LogLevel_UserName <Boolean>]
    [-MaxLogSize <Int32>]
    [-DebugFilePath <String>]
    [-ExclusionList <String[]>]
    [-IncludeListRegistry <String[]>]
    [-ExclusionListSyncFiles <String[]>]
    [-ExclusionListSyncDir <String[]>]
    [-SyncDirList <String[]>]
    [-SyncFileList <String[]>]
    [-MirrorFoldersList <String[]>]
    [-PSEnabled <Boolean>]
    [-PSAlwaysCache_Enabled <Boolean>]
    [-PSAlwaysCache <Int32>]
    [-PSPendingLockTimeout <Int32>]
    [-PSUserGroups <String[]>]
    [-CPEnable <Boolean>]
    [-CPUserGroups <String[]>]
    [-CPSchemaPathData <String>]
    [-CPPathData <String>]
    [-CPMigrationFromBaseProfileToCPStore <Boolean>]
    [-FRAdminAccess <Boolean>]
    [-FRIncDomainName <Boolean>]
    [-FRAppDataEnabled <FRAppDataEnum>]
    [-FRAppDataPath <String>]
    [-FRDesktopEnabled <FRDesktopEnum>]
    [-FRDesktopPath <String>]
    [-FRStartMenuEnabled <FRStartMenuEnum>]
    [-FRStartMenuPath <String>]
```

```
61      [-FRDocumentsEnabled <FRDocumentsEnum>]
62      [-FRDocumentsPath <String>]
63      [-FRPicturesEnabled <FRPicturesEnum>]
64      [-FRPicturesPath <String>]
65      [-FRMusicEnabled <FRMusicEnum>]
66      [-FRMusicPath <String>]
67      [-FRVideosEnabled <FRVideosEnum>]
68      [-FRVideosPath <String>]
69      [-FRFavoritesEnabled <FRFavoritesEnum>]
70      [-FRFavoritesPath <String>]
71      [-FRContactsEnabled <FRContactsEnum>]
72      [-FRContactsPath <String>]
73      [-FRDownloadsEnabled <FRDownloadsEnum>]
74      [-FRDownloadsPath <String>]
75      [-FRLinksEnabled <FRLinksEnum>]
76      [-FRLinksPath <String>]
77      [-FRSearchesEnabled <FRSearchesEnum>]
78      [-FRSearchesPath <String>]
79      [-FRSavedGamesEnabled <FRSavedGamesEnum>]
80      [-FRSavedGamesPath <String>]
81      [<CommonParameters>]
```

Description

Use this cmdlet to edit the configurations for profile management. The cmdlet defines one input parameter for each settable property. Any number of these settings can be modified in a single call to the cmdlet. The cmdlet also requires the low-level byte array blob containing the original configuration set to be modified. It will return an updated byte array with the settings applied. The resulting byte array can then be stored back at the Broker.

Examples

EXAMPLE 1

The first command creates a new user profile configuration in its default state, and stores the byte array in a Windows PowerShell variable. The second command then edits this configuration by setting the ServiceActive property to TRUE (which has the effect of enabling the profile management service), and by setting the path to the profile store. All other settings remain unaffected, and hence in their default state.

```
1  C:PS> $blob = New-UserProfileConfiguration
2
3  C:PS> $updatedBlob = Set-UserProfileDefinition -ByteArray $blob -
       ServiceActive $true -UserStorePath \\ProfileServer\Profiles$\%
       USERNAME%.%USERDOMAIN
```

Parameters

-ByteArray

Specifies the original configuration set that is being modified by this invocation of the command.

Type:	Byte[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceActive

Applies to: both file-based and container-based profile solutions

By default, to facilitate deployment, Profile management does not process logons or logoffs.

Turn on processing by enabling this setting.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, Profile management does not process Windows user profiles in any way.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessedGroups

Applies to: both file-based and container-based profile solutions

Both computer local groups and domain groups (local, global and universal) can be used. Domain groups should be specified in the format: <DOMAIN NAME>\<GROUP NAME>.

If this setting is configured here, Profile management processes only members of these user groups.

If this setting is disabled, Profile management processes all users.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, members of all user groups are processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedGroups

Applies to: both file-based and container-based profile solutions

You can use computer local groups and domain groups (local, global, and universal) to prevent particular user profiles from being processed. Specify domain groups in the form <DOMAIN NAME>\<GROUP NAME>.

If this setting is configured here, Profile management excludes members of these user groups.

If this setting is disabled, Profile management does not exclude any users.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no members of any groups are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessAdmins

Applies to: both file-based and container-based profile solutions

Specifies whether logons of members of the local group "Administrators"are processed by Profile management.

If this setting is disabled, logons by local administrators are not processed by Profile management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, administrators will not be processed.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserStorePath

Applies to: both file-based and container-based profile solutions

Sets the path to the directory in which the user settings (registry changes and synchronized files) are saved (user store).

The path can be an absolute UNC path or a path relative to the home directory.

In both cases, the following types of variables can be used: system environment variables enclosed in percent signs and attributes of the Active Directory user object enclosed in hashes.

Examples: The folder Windows\%ProfileVer% stores the user settings in the subfolder called Windows\W2k3 of the user store (if %ProfileVer% is a system environment variable resolving to W2k3).

\\server\share#SAMAccountName# stores the user settings to the UNC path \\server\share\JohnSmith (if #SAMAccountName# resolves to JohnSmith for the current user).

User environment variables cannot be used, except for %username% and %userdomain%.

If this setting is disabled, the user settings are saved in the Windows subdirectory of the home directory.

If this setting is not configured here, the setting from the .ini file is used.

If this setting is not configured here or in the .ini file, the Windows directory on the home drive is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSMidSessionWriteBack

Applies to: file-based profile solution only

With this setting, files and folders (but not Registry entries) that are modified can be synchronized to the user store in the middle of a session, before logoff.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, active write back is disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OfflineSupport

Applies to: file-based profile solution only

Enables the offline profiles feature. This is intended for computers that are commonly removed from networks, typically laptops or mobile devices not servers or desktops.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, offline profile support is disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeleteCachedProfilesOnLogoff

Applies to: file-based profile solution only

Specifies whether locally cached profiles are deleted after logoff.

If this setting is enabled, a user's local profile cache is deleted after they have logged off. This is recommended for terminal servers.

If this setting is disabled cached profiles are not deleted.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, cached profiles are not deleted.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProfileDeleteDelay

Applies to: file-based profile solution only

Works only if 'Delete locally cached profiles on logoff'is enabled. Sets an optional extension to the delay before locally cached profiles are deleted at logoff. A value of 0 deletes the profiles immediately during logoff processing. Checks take place every minute, so a value of 60 ensures that profiles are deleted between one and two minutes after users have logged off (depending on when the last check

took place). Extending the delay is useful if you know that a process keeps files or the user registry hive open during logoff. With large profiles, this can also speed up logoff.

If this policy is not configured here, the value from the .ini file is used.

If this policy is not configured here or in the .ini file, profiles are deleted immediately.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MigrateWindowsProfilesToUserStore

Applies to: file-based profile solution only

Profile management can migrate existing profiles "on the fly"during logon if the user has no profile in the user store.

The following event takes place during logon: if an existing Windows profile is found and the user does not yet have a Citrix user profile in the user store, the Windows profile is migrated (copied) to the user store on the fly. After this process, the user store profile is used by Profile management in the current and any other session configured with the path to the same user store.

If this setting is enabled, profile migration can be activated for roaming and local profiles (the default), roaming profiles only, local profiles only, or profile migration can be disabled altogether.

If profile migration is disabled and no Citrix user profile exists in the user store, the existing Windows mechanism for creating new profiles is used as in a setup without Profile management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all types of existing profiles are migrated.

Type:	MigrateWindowsProfilesToUserStoreEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LocalProfileConflictHandling

Applies to: file-based profile solution only

This setting configures what Profile management does if both a profile in the user store and a local Windows user profile (not a Citrix user profile) exist.

If this setting is disabled or set to the default value of "Use local profile", Profile management uses the local profile, but does not change it in any way.

If this setting is set to "Delete local profile", Profile management deletes the local Windows user profile, and then imports the Citrix user profile from the user store.

If this setting is set to "Rename local profile", Profile management renames the local Windows user profile (in order to back it up) and then imports the profile from the user store.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, existing local profiles are used.

Type:	LocalProfileConflictHandlingEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfilePath

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfileOverridesLocalProfile

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfileOverridesRoamingProfile

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfileIsMandatory

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoadRetries

Applies to: both file-based and container-based profile solutions

Sets the number of retries when accessing locked files.

If this setting is disabled the default value of five retries is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value of five retries is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessCookieFiles

Applies to: file-based profile solution only

Some deployments leave extra Internet cookies that are not referenced by the file index.dat. The extra cookies left in the file system after sustained browsing can lead to profile bloat. Enable this setting to force processing of index.dat and remove the extra cookies. The setting might slightly increase logoff time. Enable this setting only when you experience the issue.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no processing of index.dat takes place.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisableDynamicConfig

Applies to: both file-based and container-based profile solutions

Profile management 5.x examines its environment and configures itself accordingly. To disable this for troubleshooting or to retain the settings you used in an earlier version, enable this setting.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, automatic configuration is turned on so Profile management settings might change if the environment changes.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffRatherThanTempProfile

Applies to: both file-based and container-based profile solutions

If a problem is encountered when the user logs on (for example, if the user store is unavailable) a temporary profile is provided.

Alternatively, enabling this setting displays an error message and logs the user off.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, a temporary profile is provided.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DebugMode

Applies to: both file-based and container-based profile solutions

Activation of this setting enables debug mode (verbose logging). In debug mode, extensive status information is logged in the log files in "%SystemRoot%\System32\Logfiles\UserProfileManager"or in the location specified by the "Path to log file"policy setting.

If this setting is disabled only errors are logged.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only errors are logged.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Warnings

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Information

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_FileSystemNotification

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_FileSystemActions

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_RegistryActions

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_RegistryDifference

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_ActiveDirectoryActions

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_PolicyUserLogon

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LogLevel_Logon

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Logoff

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_UserName

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxLogSize

Applies to: both file-based and container-based profile solutions

Sets the maximum size of the log file in bytes. If the log file grows beyond this size an existing backup of the file (.bak) is deleted, the log file is renamed to .bak, and a new log file is created.

The log file is created in "%SystemRoot%\System32\Logfiles\UserProfileManager"or in the location specified by the "Path to log file"policy setting.

If this setting is disabled, the default value of 10 MB is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default of 10 MB is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-DebugFilePath

Applies to: both file-based and container-based profile solutions

Sets an alternative path to which the log files are saved.

The path can point to a local drive or a remote, network-based one (a UNC path). Remote paths can be useful in large, distributed environments but they can create significant network traffic, which may be inappropriate for log files. For provisioned, virtual machines with a persistent hard drive, set a local path to that drive. This ensures log files are preserved when the machine restarts. For virtual machines without a persistent hard drive, setting a UNC path allows you to retain the log files but the system account for the machines must have write access to the UNC share. Use a local path for any laptops managed by the offline profiles feature.

Examples: D:\LogFiles\ProfileManagement. \\servername\LogFiles\ProfileManagement

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default location "%SystemRoot%\System32\Logfiles\UserP
is used.

If a UNC path is used for log files then Citrix recommends that an appropriate access control list is applied to the log file folder to ensure that only authorized user or computer accounts can access the stored files.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExclusionList

Applies to: file-based profile solution only

List of registry keys in the HKCU hive that are ignored during logoff.

Example: Software\Policies.

If this setting is disabled, no registry keys are excluded.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no registry keys are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeListRegistry

Applies to: file-based profile solution only

List of registry keys in the HKCU hive that are processed during logoff. Example: Software\Adobe.

If this setting is enabled, only keys on this list are processed.

If this setting is disabled, the complete HKCU hive is processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all of HKCU is processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExclusionListSyncFiles

Applies to: file-based profile solution only

List of files that are ignored during synchronization.

File names should be specified as paths relative to the user profile. Wildcards are allowed. Wildcards in file names are applied recursively while wildcards in folder names are not.

Note: As of Profile Management 7.15, you can use the vertical bar '|'for applying a policy to only the current folder without propagating it to the subfolders.

Examples: Desktop\Desktop.ini ignores the Desktop.ini file in the Desktop folder.

AppData*.tmp ignores all files with the .tmp extension in the AppData folder and its subfolders.

AppData*.tmp| ignores all files with the .tmp extension in the AppData folder.

Downloads*\a.txt ignores a.txt in any immediate subfolder of the Downloads folder. Note that wildcards in folder names are not applied recursively.

If this setting is disabled, no files are excluded.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no files are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExclusionListSyncDir

Applies to: file-based profile solution only

List of directories that are ignored during synchronization.

Folder names should be specified as paths relative to the user profile.

Wildcards are supported but they are not applied recursively.

Examples: Desktop ignores the Desktop folder in the user profile.

Downloads* ignores all immediate subfolders of the Downloads folder.

If this setting is disabled, no folders are excluded.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no folders are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SyncDirList

Applies to: file-based profile solution only

Profile management synchronizes each user's entire profile between the system it is installed on and the user store.

It allows you to include subfolders of excluded folders.

Paths on this list should be relative to the user profile.

Wildcards are supported but they are not applied recursively.

Examples: Desktop\exclude\include specifies the include subfolder of the Desktop\exclude folder.

Desktop\exclude* specifies all immediate subfolders of the Desktop\exclude folder.

Disabling this setting has the same effect as enabling it and configuring an empty list.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only non-excluded folders in the user profile are synchronized.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SyncFileList

Applies to: file-based profile solution only

Profile management synchronizes each user's entire profile between the system it is installed on and the user store.

This setting allows for the inclusion of files below excluded folders.

Paths on this list should be relative to the user profile. Wildcards are allowed. Wildcards in file names are applied recursively while wildcards in folder names are not.

Note: As of Profile Management 7.15, you can use the vertical bar '|'for applying a policy to only the current folder without propagating it to the subfolders.

Examples: AppData\Local\Microsoft\Office\Access.qat specifies a file below a folder excluded in the default configuration.

AppData\Local\MyApp*.cfg specifies all files with the extension .cfg in the profile folder AppData\Local\MyApp and its subfolders.

AppData\Local\MyApp*.cfg| specifies all files with the extension .cfg in the profile folder AppData\Local\MyApp.

Downloads*\b.txt specifies b.txt in any immediate subfolder of the Downloads folder. Note that wildcards in folder names are not applied recursively.

Disabling this setting has the same effect as enabling it and configuring an empty list.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only non-excluded files in the user profile are synchronized.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MirrorFoldersList

Applies to: file-based profile solution only

Profile management can mirror a folder relative to the profile's root folder. Use this setting for files whose contents index data and where separate instances of the data are likely to exist. For example, you can mirror the Internet Explorer cookies folder so that index.dat is synchronized with the cookies that it indexes. Be aware that, in these situations the "last write wins"so files in mirrored folders that have been modified in more than one session are overwritten by the last update, resulting in loss of profile changes.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSEnabled

Applies to: file-based profile solution only

With profile streaming, users'profiles are synchronized on the local computer only when they are needed. Registry entries are cached immediately, but files and folders are only cached when accessed by users.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSAlwaysCache_Enabled

Applies to: file-based profile solution only

Optionally, to enhance the user experience, use this setting with the Profile streaming setting, which imposes a lower limit on the size of files that are streamed. Any files this size or larger are cached as soon as possible after logon. To use the cache entire profile feature, set this limit to zero (which caches all of the profile contents).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSAlwaysCache

Applies to: file-based profile solution only

Optionally, to enhance the user experience, use this setting with the Profile streaming setting, which imposes a lower limit on the size of files that are streamed. Any files this size or larger are cached as soon as possible after logon. To use the cache entire profile feature, set this limit to zero (which caches all of the profile contents).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-PSPendingLockTimeout

Applies to: file-based profile solution only

You can set a timeout period that frees up users' files so they are written back to the user store from the pending area in the event that the user store remains locked when a server becomes unresponsive (for example, when it goes down). Use this setting to prevent bloat in the pending area and to ensure the user store always contains the most up-to-date files.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSUserGroups

Applies to: file-based profile solution only

Enter one or more Windows user groups.

If this setting is enabled, only the profiles of those groups' members are streamed. If this setting is disabled, all user groups are processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all users are processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-CPEnable

Applies to: both file-based and container-based profile solutions

By default, to facilitate deployment, cross-platform settings is disabled.

Turn on processing by enabling this setting.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no cross-platform settings will be applied.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPUserGroups

Applies to: both file-based and container-based profile solutions

Enter one or more Windows user groups.

If this setting is configured, the cross-platform settings feature of Profile management processes only members of these user groups. If this setting is disabled, all user groups are processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all user groups are processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-CPSchemaPathData

Applies to: both file-based and container-based profile solutions

Specify a folder where the definition files are located.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no cross-platform settings will be applied.

Note:

- The folder can be local or it can reside on an SMB file share.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPPathData

Applies to: both file-based and container-based profile solutions

Sets the path to the directory in which users' cross-platform settings are saved (cross-platform settings store).

The path can be an absolute UNC path or a path relative to the home directory.

In both cases, the following types of variables can be used: system environment variables enclosed in percent signs and attributes of the Active Directory user object enclosed in hashes.

User environment variables cannot be used, except for %username% and %userdomain%.

If this setting is disabled, the path Windows\PM_CP is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value Windows\PM_CP is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPMigrationFromBaseProfileToCPStore

Applies to: both file-based and container-based profile solutions

Default: Disabled

Definition files contain a set of definitions that configure an application. If the cross-platform settings store contains a definition with no data, or the cached data in the single-platform profile is newer than the definition's data in the store, Profile management only migrates the data from the single-platform profile to the store if you enable this setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRAdminAccess

Applies to: file-based profile solution only

By default, users are granted exclusive access to the contents of their redirected folders.

Enabling this option allows administrator access to the contents of the users redirected folders.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRIncDomainName

Applies to: file-based profile solution only

Enabling this option will include the %userdomain% environment variable as part of the UNC path.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRAppDataEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the AppData(Roaming) folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.

2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRAppDataEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRAppDataPath

Applies to: file-based profile solution only

Lets you specify how to redirect the AppData(Roaming) folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FRDesktopEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the Desktop folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRDesktopEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRDesktopPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Desktop folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Type:	FRPicturesEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRPicturesPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Pictures folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.

2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRMusicEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the Music folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRMusicEnum
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FRMusicPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Music folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRVideosEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the Videos folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRVideosEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRVideosPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Videos folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRFavoritesEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the Favorites folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. 2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRDownloadsEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRDownloadsPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Downloads folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FRLinksEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the Links folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRLinksEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRLinksPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Links folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRSearchesEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the Searches folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRSearchesEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRSearchesPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Searches folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. 1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

The new configuration set, with all of the given modifications applied.

Test-UserProfileShare

March 11, 2024

Tests a prospective user profile store path for its suitability for use with Citrix Profile Management.

Syntax

```
Test-UserProfileShare
    -Path <String>
    [-Mandatory]
    [-RedirectedFolders]
    -UserGroups <String[]>
    -AdminGroups <String[]>
    [<CommonParameters>]
```

```
Test-UserProfileShare
    [-PathSyntaxOnly]
    -Path <String>
    [-Mandatory]
    [-RedirectedFolders]
    [<CommonParameters>]
```

```
Test-UserProfileShare
    -Path <String>
    [-Mandatory]
```

```
    [-RedirectedFolders]
    -UserGroupsSids <String[]>
    -AdminGroupsSids <String[]>
    [<CommonParameters>]
```

Description

This command can be used as a validation step prior to configuring the profile store path in a production environment, in order to gain confidence that the profile manager and the store will function together correctly.

This command runs a sequence of tests on the nominated path, and reports the results via the output pipeline. The tests are organised into two distinct phases. The first phase examines the syntax of the supplied store path string. The second phase examines the profile store itself, checking that the required network shares exist, and that their permissions are appropriately configured according to best practices. If any faults are discovered with the syntax of the path string, these will be reported via the output pipeline, and the command will halt early without attempting to examine the profile store. The profile store will only be examined if the path is syntactically correct.

This command can be used in combination with the Repair-UserProfileShare cmdlet, which is able to automatically correct some of the problems that are found during inspection of the profile store. Problems with the syntax of the path can never be repaired. Syntactic issues must be fixed by the administrator re-typing the path and testing the store again.

Examples

EXAMPLE 1

This command tests that the path "\\ProfileServer\Profiles$\%USERAME%.%USERDOMAIN%"is suitable for use as a profile store. This path is syntactically valid, so the cmdlet will check for the existence of the share "\\ProfileServer\Profiles$". Provided that the share exists, it will also check that its permissions are configured such that all domain users would be permitted to create profile folders within the store, and that all domain administrators will be permitted to access the store for administrative purposes.

```
C:PS> Test-UserProfileShare -Path \\ProfileServer\Profiles$\%USERNAME
    %.%USERDOMAIN% -UserGroups @("FABRIKAM\Domain Users") -AdminGroups @
    ("FABRIKAM\Administrators")
```

EXAMPLE 2

This command tests that the path "\\ProfileServer\Profiles$\FinanceDept\FixedProfile"contains a valid Citrix mandatory profile. This path is syntactically valid, so the cmdlet will check that the share "\\ProfileServer\Profiles$"exists. If it exists, the cmdlet will go on to check that its permissions are configured such that all domain users would be permitted to read data from the profile, and that all domain administrators will be permitted to access the profile for administrative purposes.

Additional checks will be performed on the contents of the profile to ensure that there is nothing within the profile that might reveal details about the user who logged in to create it.

```
C:PS> Test-UserProfileShare -Path \\ProfileServer\Profiles$\FinanceDept
    \FixedProfile -UserGroups @("FABRIKAM\Domain Users") -AdminGroups @(
    "FABRIKAM\Administrators") -Mandatory
```

Parameters

-PathSyntaxOnly

This switch indicates the the command should only check the syntax of the user store path.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Path

This string contains the prospective profile store path to be examined, such as "\\Profile-Server\Profiles$\%USERNAME%.%USERDOMAIN%".

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-UserGroups

This array of strings specifies the names of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Domain Users".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroups

This array of strings specifies the names of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Administrators".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserGroupsSids

This array of strings specifies the SID of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as security

identifier string, such as “S-1-1-0”.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroupsSids

This array of strings specifies the SID of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as security identifier string, such as “S-1-5-32-544”.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Mandatory

This switch indicates whether the profile store is intended to house a mandatory profiles. Mandatory profile stores are subjected to additional checks.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RedirectedFolders

This switch indicates whether the path indicates the location of redirected folder directories.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

This cmdlet outputs a sequence of objects, each of which has the following properties:

Name - This property indicates the name of the test.

Status - This property indicates whether the test has passed or failed.

Details - This property provides additional information about the test in the case where it has failed. The interpretation of this property depends on the name of the test.

CanFix - In the case where the test has failed, this boolean property indicates whether the problem can be fixed with the Repair-UserProfileShare cmdlet.

about_XD_Filtering

March 11, 2024

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or

descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like ‘‘High*’’-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company ‘‘citrix’’-Product ‘[X]EN*’
Get-<Noun> -Product ‘‘Xen*’’-Company ‘‘CITRIX’’
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{
```

```
6
7    $sessions = @(Get-BrokerSession -Filter {
8    Uid -gt $lastUid  }
9    -MaxRecordCount 1000 -Sortby 'Uid')
```

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

```
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces

quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
```

Get-<Noun> -Filter { StartTime -ge '-0:0:30'} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*"}
Get-<Noun> -Filter { Users -contains "Fred*"}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

XenDesktop PowerShell Module - Site Configuration

Short Description

Describes how to do the initial configuration of a Site using the XenDesktop PowerShell Module.

Command Prefix

All commands in this module have 'XD'in their name.

Long Description

After installing XenDesktop for the first time, the Site must be configured. Site configuration involves:

- Creating the databases that will be used by the Site.
- Instructing the various XenDesktop services to use the databases and making those services aware of each other.
- Licensing the Site and specifying which edition of XenDesktop to use.

Additional Delivery Controllers may be added to the Site once the initial configuration is complete.

Database Creation

There is one main database, namely the Site Configuration Database, and two secondary databases, namely the Configuration Logging Database and the Monitoring Database. These databases may be hosted on the same SQL Server or on dedicated SQL Servers.

The method used to create the databases depends on the SQL Server permissions held by the person configuring the Site, whether or not the databases use default names, and whether or not the databases are hosted on the same SQL Server.

If the person configuring the Site does not have sufficient privilege to create databases and add database logons in the SQL Server, then database creation is a two-stage process:

- Use the Get-XDDatabaseSchema cmdlet to generate one or more SQL scripts that contain commands to create the databases and configure SQL logons.
- The scripts must be executed by a database administrator with suitable privileges on the target SQL Server(s).

If the person configuring the Site has sufficient privilege, database creation is a single-stage process in which the New-XDDatabase cmdlet is used to create the databases and configure SQL logons.

When non-default database names are to be used, or the databases are to be hosted on individual SQL Servers, you must run either Get-XDDatabaseSchema or New-XDDatabase cmdlets once for each database.

Database Mirroring

There are two variations of the New-XDDatabase cmdlet:

- One that is intended for Proof of concept and basic deployments. This variation is defined by the -AllDefaultDatabases switch parameter.
- The other is used to configure a database for each data store (Site, Logging, and Monitoring) individually. Each data store can be configured on different database server with different levels of access (user credentials). It is on these environments that mirroring is expected to be configured because mirroring can be targeted at a specific datastore. For instance; it may be considered that mirroring is not important for the monitoring data store.

When New-XDDatabase is to be used to configure each data store separately an empty database should be created on the database server with mirroring enabled before running New-XDDatabase. The empty database must have a collation which ends with "_CI_AS_KS". In general, it is best to use a collation which ends with "_100_CI_AS_KS ". Once the databases have been configured for mirroring call New-XDDatabase for each data store (See the -DataStore parameter) and supply the principle database server address, the database credentials and the database name. New-XDDatabase will just populate the empty database if it sees that it is there. The mirror server address will be detected automatically and login scripts uploaded to the mirror server to allow the XenDesktop services access to the mirror database upon failover.

If using the "-AllDefaultDatabases"parameter set of these cmdlets the database names will not be known to the user upfront. Mirroring will need to be configured on the databases after they have been created using %5BNew-XDDatabase%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/XenDesktop/New-XDDatabase.html). %5BNew-XDDatabase%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/XenDesktop/New-XDDatabase.html) will return information about the database names once it has completed. To configure mirroring on the databases; go to the SQL server and configure mirroring on the databases in the usual way. The mirror server will also need updating to allow XenDesktop access upon failover. To do this call:

"Get-XDDatabaseSchema -ScriptType AddDatabaseLogOn -DataStore …"

for each datastore. Append the returned scripts together and upload the scripts to the mirror server. If this step is not performed XenDesktop will

not be able to connect to the mirror server. The mirror server address can then be supplied to New-XDSite.

The databases can be created entirely via a manual process too. In which case New-XDDatabse will not be used. Instead call:

"Get-XDDatabaseSchema -ScriptType FullDatabase -DataStore …"

for each data store and upload the resultant script to the database on the principle database server. Configure mirroring on the database if required and call:

"Get-XDDatabaseSchema -ScriptType AddDatabaseLogOn -DataStore …"

and upload the resultant script to the mirror server. This will allow XenDesktop access to the server upon failover.

Once the databases have been created and populated call New-XDSite and supply the full information (Database Name, Database Server Address, and Database Mirror Server Address) for each data store.

Service Initialization

During service initialization the XenDesktop services are instructed to use the databases, Configuration Logging is started and a temporary license is automatically enabled using the New-XDSite cmdlet. If SQL Mirroring is enabled for the databases, the services are also made aware of the SQL Mirror Servers.

The site will run in a grace period until Set-XDLicensing is used to configure licensing.

There are three variations of the New-XDSite cmdlet to handle the following scenarios:

- The databases were created with default names on a single SQL Server.
- The databases were created with non-default names on a single SQL Server.
- The databases were created on individual SQL Servers.

Licensing

The product edition and licensing model of the Site must be set, and details of a Citrix License Server from which licenses can be obtained must be provided. Licensing must be set after running New-XDSite. Use the Set-XDLicensing cmdlet.

Adding Controllers

The method used to add a Controller to an existing Site depends on the SQL Server permissions held by the person adding the Controller.

If the person adding the Controller does not have sufficient privilege to alter content of the databases and add database logons, then Controller addition is a three-stage process:

- The Get-XDDatabaseSchema cmdlet is used to generate one or more SQL scripts that contain commands to alter database content and configure SQL logons.
- The scripts must be executed by a database administrator with suitable privileges on the target SQL Server(s).
- After the scripts have been executed, the Add-XDController cmdlet is used with the DoNotUpdateDatabaseServer switch to configure the XenDesktop services on the new Controller.

If the person adding the Controller has sufficient privilege, the Add-XDController cmdlet is used without the DoNotUpdateDatabaseServer switch to alter database content, configure SQL logons and configure the XenDesktop services on the new Controller.

Removing Controllers

The method used to remove a Controller from a Site depends on the SQL Server permissions held by the person removing the Controller.

If the person removing the Controller does not have sufficient privilege to alter content of the databases and remove database logons, then Controller removal is a three-stage process:

- Use the Remove-XDController cmdlet with the DoNotUpdateDatabaseServer switch to decommission the XenDesktop services on the Controller that is to be removed.
- Use the Get-XDDatabaseSchema cmdlet to generate one or more SQL scripts that contain commands to alter database content and remove SQL logons.
- Execute the scripts on the target SQL Server(s). This must be done by a database administrator with suitable privileges.

If the person removing the Controller has sufficient privilege, the Remove-XDController cmdlet is used without the DoNotUpdateDatabaseServer switch to decommission the XenDesktop services on the new Controller, alter database content and remove SQL logons.

Once a Controller has been removed from a Site, that Controller may be retired or added to another Site.

Changing Secondary Databases

This may be required when, for example, the data contained in the

Monitoring Database Has Grown To Such An Extent That A Dedicated

Sql Server Is Needed. The Method Required To Change The Name Of

One Of The Secondary Databases That Supports Configuration Logging

and Monitoring, or the SQL Server hosting one of those databases, depends on the SQL Server permissions held by the person changing the database.

If the person changing a secondary database does not have sufficient privilege to create databases in the SQL Server hosting the new secondary databases and add database logons, then modification is a three-stage process:

- Use the Get-XDDatabaseSchema cmdlet to generate an SQL script that contains commands to create the secondary database and configure SQL logons.
- Execute the script on the target SQL Server. This must be done by a database administrator with suitable privileges.
- After executing the script, use the Set-XDLogging and/or Set-XDMonitor cmdlets to configure the XenDesktop services in the Site to use the new secondary databases.

If the person changing a secondary database has sufficient privilege to create databases in the SQL Server hosting the new secondary databases and add database logons, then:

- Use the New-XDDatabase cmdlet to create the secondary databases and configure SQL logons.

- Use the Set-XDLogging and/or Set-XDMonitor cmdlets to configure the XenDesktop services in the Site to use the new secondary databases.

Examples

Single Sql Server With Default Database Names, Sql Admin Access And No Sql

Mirroring

You have full administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1'and associate it with the Controller at 'Controller1'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer.

```
# Create the databases
 New-XDDatabase -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -AllDefaultDatabases -SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -AllDefaultDatabases -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer
```

Create A Site Using A Single Sql Server With Default Database Names, Sql Admin

Access And Sql Mirroring

You have full administrative rights on the SQL Server 'SqlServer1'with instance 'Instance1'and want to create a Site called 'Site1'and associate it with the Controller at 'Controller1'. You want to configure the databases for SQL Server Mirroring using 'SqlMirror1'with 'Instance1'. Your Citrix License Server is listening on the non default port 27001 of server CitrixLicenseServer.

```
# Create the databases
 New-XDDatabase -AdminAddress Controller1 -DatabaseServer
SqlServer1\Instance1 -AllDefaultDatabases -SiteName Site1
```

```
#
# Configure your SQL Server Mirror in the normal manner to mirror the
    three
```

```
# default databases
#
```

```
# Create the Site and provide the mirror information
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\Instance1 -DatabaseMirrorServer SqlMirror1\Instance1
-AllDefaultDatabases -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -LicenseServerPort 27001
```

Create A Site Using A Single Sql Server With Default Database Names, Sql Admin Access Under Separate Username And No Sql Mirroring

You have a separate user account with full administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1'and associate it with the Controller at 'Controller1'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
# Construct a Credential object for your SQL Administrator
 $cred = Get-Credential
```

```
# Create the databases
 New-XDDatabase -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -DatabaseCredentials $cred -AllDefaultDatabases
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -AllDefaultDatabases -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition PLT
```

Create A Site Using A Single Sql Server With Non-Default Database Names, Sql Admin Access And No Sql Mirroring

You have full administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1', associate it with the Controller at 'Controller1'and use database names of 'CitrixSiteDb',

‘CitrixLoggingDb’and ‘CitrixMonitorDb’. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have an Enterprise license.

```
# Create the Site Database
New-XDDatabase -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb
-SiteName Site1
```

```
# Create the Logging Database
New-XDDatabase -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
-SiteName Site1
```

```
# Create the Monitor Database
New-XDDatabase -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -SiteDatabaseName CitrixSiteDb -
    LoggingDatabaseName
CitrixLoggingDb -MonitorDatabaseName CitrixMonitorDb -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition ENT
```

Create A Site Using One Sql Server Per Database With Non-Default Database

Names, Sql Admin Access And No Sql Mirroring

You have full administrative rights on the SQL Servers ‘SqlServerSite’, ‘SqlServerLogging’and ‘SqlServerMonitor’with instance ‘SQLEXPRESS’on each SQL Server. You want to create a Site called ‘Site1’, associate it with the Controller at ‘Controller1’and use database names of ‘CitrixSiteDb’, ‘CitrixLoggingDb’and ‘CitrixMonitorDb’. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
# Create the Site Database
New-XDDatabase -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServerSite\SQLEXPRESS -DatabaseName CitrixSiteDb
-SiteName Site1
```

```
# Create the Logging Database
```

```
New-XDDatabase -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServerLogging\SQLEXPRESS -DatabaseName
   CitrixLoggingDb
-SiteName Site1
```

```
# Create the Monitor Database
New-XDDatabase -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServerMonitor\SQLEXPRESS -DatabaseName
   CitrixMonitorDb
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -SiteDatabaseServer
SqlServerSite\SQLEXPRESS -SiteDatabaseName CitrixSiteDb
-LoggingDatabaseServer SqlServerLogging\SQLEXPRESS -LoggingDatabaseName
CitrixLoggingDb -MonitorDatabaseServer SqlServerMonitor\SQLEXPRESS
-MonitorDatabaseName CitrixMonitorDb -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition PLT
```

Create A Site Using One Sql Server Per Database With Non-Default Database

Names, Sql Admin Access And Sql Mirroring

You have full administrative rights on the SQL Servers ‘SqlServerSite’, ‘SqlServerLogging’and ‘SqlServerMonitor’with instance ‘Instance1’on each SQL Server. You want to create a Site called ‘Site1’, associate it with the Controller at ‘Controller1’and use database names of ‘CitrixSiteDb’, ‘CitrixLoggingDb’and ‘CitrixMonitorDb’. You also want to configure the databases for SQL Server Mirroring using ‘SqlMirrorSite’, ‘SqlMirrorLogging’and ‘SqlMirrorMonitor’with instance ‘Instance1’. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
#
# Create the empty databases for each data store and configure
   mirroring
# on those databases.
#
```

```
# Populate the Site Database
New-XDDatabase -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServerSite\Instance1 -DatabaseName CitrixSiteDb
-SiteName Site1
```

```
# Populate the Logging Database
New-XDDatabase -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServerLogging\Instance1 -DatabaseName
    CitrixLoggingDb
-SiteName Site1
```

```
# Populate the Monitor Database
New-XDDatabase -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServerMonitor\Instance1 -DatabaseName
    CitrixMonitorDb
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -SiteDatabaseServer
SqlServerSite\Instance1 -SiteDatabaseMirrorServer SqlMirrorSite\
    Instance1
-SiteDatabaseName CitrixSiteDb -LoggingDatabaseServer
SqlServerLogging\Instance1 -LoggingDatabaseMirrorServer
SqlMirrorLogging\Instance1 -LoggingDatabaseName CitrixLoggingDb
-MonitorDatabaseServer SqlServerMonitor\Instance1
-MonitorDatabaseMirrorServer SqlMirrorMonitor\Instance1
-MonitorDatabaseName CitrixMonitorDb -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition PLT
```

Create A Site Using A Single Sql Server With Non-Default Database Names, No Sql Admin Access And No Sql Mirroring

You have no administrative rights on the SQL Server ‘SqlServer1’with instance ‘SQLEXPRESS’and want to create a Site called ‘Site1’, associate it with the Controller at ‘Controller1’and use database names of ‘CitrixSiteDb’, ‘CitrixLoggingDb’and ‘CitrixMonitorDb’. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
# Get the SQL script to create the Site Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb -
    SiteName
Site1 -ScriptType FullDatabase > C:\siteScript.sql
```

```
# Get the SQL script to create the Logging Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
```

```
-SiteName Site1 -ScriptType FullDatabase > C:\LoggingScript.sql
```

```
# Get the SQL script to create the Monitor Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1 -ScriptType FullDatabase > C:\monitorScript.sql
```

```
#
# Get an individual with suitable privileges to execute the SQL scripts
# 'siteScript.sql', 'loggingScript.sql' and 'monitorScript.sql'on
# 'SqlServer1'
#
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -SiteDatabaseName CitrixSiteDb -
    LoggingDatabaseName
CitrixLoggingDb -MonitorDatabaseName CitrixMonitorDb -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition PLT
```

Determine Applicable Licensing Models And Product Editions

You want to determine the license models and product editions that are applicable to your XenDesktop installation.

```
# Determine your product code
$site = Get-XDSite
$productCode = $site.LicenseInformation.ProductCode
```

```
# Load the Citrix.Configuration.Admin.V2 snapin, as this exposes
    cmdlets to
# retrieve the licensing models and product editions
Add-PSSnapin Citrix.Configuration.Admin.V2
```

```
# Get the applicable licensing models
Get-ConfigLicensingModel -ProductCode $productCode
```

```
# Get the applicable product editions
Get-ConfigProductEdition -ProductCode $productCode
```

Change The Configuration Logging Database

You have full administrative rights on the SQL Server ‘SqlServer2’with instance ‘INSTANCE1’and want to change Configuration Logging for site ‘Site1’to

use a new database called ‘CitrixLoggingDb_New’on that server.

```
# Create the Configuration Logging Database on the new SQL Server
New-XDDatabase -Datastore Logging -SiteName Site1 -DatabaseServer
SqlServer2\INSTANCE1 -DatabaseName CitrixLoggingDb_New
```

```
# Change Configuration Logging to use the new database
Set-XDLogging -DatabaseServer SqlServer2\INSTANCE1 -DatabaseName
CitrixLoggingDb_New
```

Change The Monitoring Database

You have full administrative rights on the SQL Server ‘SqlServer2’with instance ‘INSTANCE1’and want to change Monitoring for site ‘Site1’to use a new database called ‘CitrixMonitorDb_New’on that server.

```
# Create the Monitoring Database on the new SQL Server
New-XDDatabase -Datastore Monitor -SiteName Site1 -DatabaseServer
SqlServer2\INSTANCE1 -DatabaseName CitrixMonitorDb_New
```

```
# Change Monitoring to use the new database
Set-XDMonitor -DatabaseServer SqlServer2\INSTANCE -DatabaseName
CitrixMonitorDb_New
```

Add A Controller To A Site For Which You Have Full Db Admin

You have full administrative rights on the SQL Server that underlies a Site called ‘Site1’. An existing Controller in the Site is ‘Controller1’and you want to add Controller ‘AdditionalController’to the Site.

```
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1
```

Add A Controller To A Site For Which You Have Full Db Admin Under Separate Username

You have a separate user account with full administrative rights on the SQL Server that underlies a Site called ‘Site1’. An existing Controller in the Site is ‘Controller1’and you want to add Controller ‘AdditionalController’to the Site.

```
# Construct a Credential object for your SQL Administrator
 $cred = Get-Credential
```

```
# Add the Controller
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1 -DatabaseCredentials $cred
```

Add A Controller To A Site For Which You Have Full Db Admin Under Separate

Usernames

You have separate user accounts with full administrative rights on the three SQL Servers that underlie a Site called 'Site1'. An existing Controller in the Site is 'Controller1'and you want to add Controller 'AdditionalController' to the Site.

```
# Construct a Credential object for your Site Database SQL
    Administrator
 $credSite = Get-Credential
```

```
# Construct a Credential object for your Logging Database SQL
    Administrator
 $credLogging = Get-Credential
```

```
# Construct a Credential object for your Monitor Database SQL
    Administrator
 $credMonitor = Get-Credential
```

```
# Add the Controller
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1 -SiteDatabaseCredentials $credSite
-LoggingDatabaseCredentials $credLogging -MonitorDatabaseCredentials
$credMonitor
```

Add A Controller To A Site For Which You Have No Db Admin Access

You have no administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'that underlies a Site called 'Site1'. The Site's databases are called 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. An existing Controller in the Site is 'Controller1'and you want to add Controller 'AdditionalController'to the Site.

```
# Get the SQL script that may be used to add permissions for
# 'AdditionalController' to the Site Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb -
    SiteName
Site1 -ScriptType AddController > C:\siteScript.sql
```

```
# Get the SQL scripts that may be used to add permissions for '
# AdditionalController' to the Logging Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
-SiteName Site1-ScriptType AddController > C:\loggingScript.sql
```

```
# Get the SQL script that may be used to add permissions for
# 'AdditionalController' to the Monitor Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1-ScriptType AddController > C:\monitorScript.sql
```

```
#
# Get an individual with suitable privileges to execute the SQL scripts
# 'siteScript.sql', 'loggingScript.sql' and 'monitorScript.sql'on
# 'SqlServer1'
#
```

```
# Add the Controller
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1 -DoNotUpdateDatabaseServer
```

Remove A Controller From A Site For Which You Have Full Db Admin Access

You have full administrative rights on the SQL Server that underlies a Site called ‘Site1’. The Site currently has two Controllers, namely ‘Controller1’and ‘RedundantController’. You want to remove ‘RedundantController’from the Site.

```
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController
```

Remove A Controller From A Site For Which You Have Full Db Admin Under

Separate Username

You have a separate user account with full administrative rights on the SQL Server that underlies a Site called ‘Site1’. The Site currently has two Controllers, namely ‘Controller1’and ‘RedundantController’. You want to remove ‘RedundantController’from the Site.

```
# Construct a Credential object for your SQL Administrator
 $cred = Get-Credential
```

```
# Remove the Controller
```

```
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController -DatabaseCredentials $cred
```

Remove A Controller From A Site For Which You Have Full Db Admin Under

Separate Usernames

You have separate user accounts with full administrative rights on the three SQL Servers that underlie a Site called 'Site1'. The Site currently has two Controllers, namely 'Controller1'and 'RedundantController'. You want to remove 'RedundantController'from the Site.

```
# Construct a Credential object for your Site Database SQL
    Administrator
 $credSite = Get-Credential
```

```
# Construct a Credential object for your Logging Database SQL
    Administrator
 $credLogging = Get-Credential
```

```
# Construct a Credential object for your Monitor Database SQL
    Administrator
 $credMonitor = Get-Credential
```

```
# Remove the Controller
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController -SiteDatabaseCredentials $credSite
-LoggingDatabaseCredentials $credLogging -MonitorDatabaseCredentials
$credMonitor
```

Remove A Controller From A Site For Which You Have No Db Admin Access

You have no administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'that underlies a Site called 'Site1'. The Site's databases are called 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. The Site currently has two Controllers, namely 'Controller1'and 'RedundantController'. You want to remove 'RedundantController'from the Site. 'RedundantController'is in the 'ACME'domain.

```
# Determine the SID of the Controller that is to be removed.
$site = Get-XDSite
$redundantController = $site.Controllers  | Where-Object
{
 $_.MachineName -eq ' ACME\RedundantController ' }

```

```
$redundantControllerSid = $redundantController.Sid
```

```
# Remove the Controller
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController -DoNotUpdateDatabaseServer
```

```
# Get the SQL scripts that may be used to remove permissions for
# 'RedundantController' from the Site Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb -
    SiteName
Site1 -ScriptType RemoveController -ControllerToRemove
$redundantControllerSid > C:\siteScript.sql
```

```
# Get the SQL script that may be used to remove permissions for '
# RedundantController' from the Logging Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
-SiteName Site1-ScriptType RemoveController -ControllerToRemove
$redundantControllerSid > C:\loggingScript.sql
```

```
# Get the SQL script that may be used to remove permissions for
# 'RedundantController' from the Monitor Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1-ScriptType RemoveController -ControllerToRemove
$redundantControllerSid > C:\monitorScript.sql
```

```
#
# Although not necessary, Citrix recommends you get an individual
# with suitable privileges to execute the SQL scripts 'siteScript.sql',
# 'loggingScript.sql' and 'monitorScript.sql'on 'SqlServer1'
```

Add-Xdcontroller

Remove-Xdcontroller

Set-Xdlogging

Set-Xdmonitor

Add-XDController

March 11, 2024

Adds a Delivery Controller to an existing Site.

Syntax

```
Add-XDController
   [-DoNotUpdateDatabaseServer]
   -SiteControllerAddress <String>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
Add-XDController
   -DatabaseCredentials <PSCredential>
   -SiteControllerAddress <String>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
Add-XDController
   -LoggingDatabaseCredentials <PSCredential>
   -MonitorDatabaseCredentials <PSCredential>
   -SiteControllerAddress <String>
   -SiteDatabaseCredentials <PSCredential>
   [-AdminAddress <String>]
```

```
7     [<CommonParameters>]
```

Description

Adds a Controller to an existing Site.

If no credentials are provided and DoNotUpdateDatabaseServer has not been specified, then all database update operations are attempted using the credentials of the user running the cmdlet.

If DatabaseCredentials is provided, then all database operations are attempted using those credentials.

If one or more of SiteDatabaseCredentials, LoggingDatabaseCredentials or MonitorDatabaseCredentials are provided, then all three must be provided. All operations are then attempted using the credentials appropriate to each Database.

Examples

EXAMPLE 1

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined. The permissions for 'MyNewController'will be added automatically to the Database using the implicit credentials of the user running the cmdlet.

```
1 Add-XDController -AdminAddress MyNewController -SiteControllerAddress
     MyExistingController
```

EXAMPLE 2

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined.

The permissions for 'MyNewController'will not be added to the Database. Instead the Get-XDDatabaseSchema cmdlet is used to generate a SQL script that must be given to the database administrator of 'MySQLServer'. The SQL script must be used to add the necessary permissions for 'MyNewController'before Add-XDController is run.

```
1 Get-XDDatabaseSchema -AdminAddress MyNewController -SiteName MySite -
     DatabaseServer MySQLServer -ScriptType AddController > C:\
     addController.sql
2 # Get a database administrator to run addController.sql
3 Add-XDController -AdminAddress MyNewController -SiteControllerAddress
     MyExistingController -DoNotUpdateDatabaseServer
```

EXAMPLE 3

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined.

The credentials contained within '$credential'will be used to add the necessary permissions for 'MyNewController'to the Database.

```
$credential = Get-Credential
Add-XDController -AdminAddress MyNewController -SiteControllerAddress
    MyExistingController -DatabaseCredentials $credential
```

EXAMPLE 4

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined.

The credentials contained within '$credentialSite'will be used to add the necessary permissions for 'MyNewController'to the Site Configuration Database. The credentials contained within '$credentialLogging'will be used to add the necessary permissions for 'MyNewController'to the Configuration Logging Database. The credentials contained within '$credentialMonitor'will be used to add the necessary permissions for 'MyNewController'to the Monitoring Database.

```
$credentialSite = Get-Credential
$credentialLogging = Get-Credential
$credentialMonitor = Get-Credential
Add-XDController -AdminAddress MyNewController -SiteControllerAddress
    MyExistingController -SiteDatabaseCredentials $credentialSite -
    LoggingDatabaseCredentials $credentialLogging -
    MonitorDatabaseCredentials $credentialMonitor
```

Parameters

-DatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Servers associated with the Site Configuration, Configuration Logging and Monitoring Databases.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server associated with the Configuration Logging Database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server associated with the Monitoring Database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server associated with the Site Configuration Database.

Type:	PSCredential
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteControllerAddress

The address of a Controller in the Site to which this Controller is to be joined.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotUpdateDatabaseServer

Results in the permissions associated with the Controller not being automatically added to the Database.

This switch may be useful when the person running the cmdlet does not have sufficient database privilege. The database permissions for the Controller that is to be added must have been applied manually prior to running this cmdlet, otherwise the Controller is not added and an error is returned.

Get-XDDatabaseSchema may be used to generate the SQL script which in turn may be used to add the necessary permissions to the Database.

This parameter results in all supplied credentials being ignored.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In general, the AdminAddress specifies the Controller to which the PowerShell module will connect. However, in this cmdlet, not only is this the address of the Controller to connect to, it is also the Controller that is to be added to this Site.

If the user running this cmdlet does not have privilege to add users to the Database, then use either the DoNotudpateDatabaseServer switch or supply alternative credentials using one or more of the Credential arguments.

The command can fail for the following reasons:

- The Controller is already a member of a Site.
- The DoNotUpdateDatabaseServer parameter was specified, but the permissions for the Controller are not already in the Database. Either add the permissions using Get-XDDatabaseSchema or allow this cmdlet to add the permissions automatically.
- The person running the cmdlet, or the supplied credentials, do not have sufficient privilege to update the Database. Either run this cmdlet as a user that has administrator privilege to the Database, or supply an account with suitable privileges using the PSCredential parameter(s).

Get-XDDatabaseSchema

March 11, 2024

Gets the SQL scripts used to create and manage the Database.

Syntax

```
Get-XDDatabaseSchema
    [-DatabaseName <String>]
    -DatabaseServer <String>
    -DataStore <DataStore>
    [-ScriptType <DatabaseScriptType>]
    -SiteName <String>
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Generates SQL scripts that can be given to a database administrator for execution. Scripts are written to standard output.

A script of type FullDatabase is used to manually create the Database with write access permissions for the Delivery Controller identified by AdminAddress. This script must be generated and executed for each datastore type supported by the Site.

Once the database administrator has executed all scripts of type FullDatabase, run New-XDSite to configure the databases for first use.

Examples

EXAMPLE 1

Gets the script for creating the Site Configuration Database and writes the content to the file "c:\script.sql". This script may be executed on a database server "MyDBServer"for an existing and empty database with name "MySiteDB".

```
Get-XDDatabaseSchema -SiteName MySiteServiceGroup -DataStore Site -
    DatabaseName MySiteDB -DatabaseServer MyDBServer -ScriptType
    FullDatabase > c:\script.sql
```

EXAMPLE 2

Gets the script used to write the access permissions for 'MyNewController'to the Configuration Logging Database. The contents of the script are written to the file "c:\script.sql". This script may be executed on a database server "MyDBServer"for an existing database with name "MyLoggingDB". The Controller can then only be added to the Site by running Add-XDController.

```
Get-XDDatabaseSchema -AdminAddress MyNewController -SiteName
    MySiteServiceGroup -DataStore Logging -DatabaseName MyLoggingDB -
    DatabaseServer MyDBServer -ScriptType AddController > c:\script.sql
```

EXAMPLE 3

Gets the script used to remove the access permissions for a Controller with SID 'S-1-5-21-1234567890-123456789-123456789-1234'from the Monitoring Database. The contents of the script are written to the file "c:\script.sql". This script can be executed only after the Controller has been removed from the Site with Remove-XDController. It may be executed on a database server "MyDBServer"for an existing database with name "MyLoggingDB".

```
Get-XDDatabaseSchema -SiteName MySiteServiceGroup -DataStore Monitor -
    DatabaseName MyMonitorDB -DatabaseServer MyDBServer -ScriptType
    RemoveController -ControllerToRemoveSid S
    -1-5-21-1234567890-123456789-123456789-1234 > c:\script.sql
```

EXAMPLE 4

Gets the script used to add a logon for 'MyExistingController'to the Site Configuration Database for the database mirror server "MyMirrorDBServer". The contents of the script are written to the file "c:\script.sql".

```
Get-XDDatabaseSchema -AdminAddress MyExistingController -SiteName
    MySiteServiceGroup -DataStore Site -DatabaseName MySiteDB -
    DatabaseServer MyMirrorDBServer -ScriptType AddDatabaseLogOn > c:\
    script.sql
```

Parameters

-DatabaseServer

The address of the SQL server on which the generated script will be run.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-DataStore

The datastore type of the script to be generated. There is no default value. Valid values are:

- Site

This corresponds to the Site Configuration Database.

- Logging

This corresponds to the Configuration Logging Database.

- Monitor

This corresponds to the Monitor Database.

Type:	DataStore
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteName

The name of the Site for which the SQL script is to be generated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-DatabaseName

The name for the database of the selected datastore. There is a default name for each database. The default names are listed with their corresponding dataStore types as follows:

- Site

The Site Configuration Database. The default name of this database is Citrix<SiteName>.

- Logging

The Configuration Logging Database. The default name of this database is CitrixConfigLogging<SiteName>.

- Monitor

The Monitoring Database. The default name of this database is CitrixMonitor<SiteName>.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ScriptType

The type of SQL script to be generated. By default, a script of type FullDatabase is generated. Valid types are:

- AddController

This script is used to add a Controller specified by AdminAddress. It updates the specified database with all the access permissions needed by the Controller.

- AddDatabaseLogOn

This script is used to add a logon for a Controller to the specified database server. It is used specifically for configuring SQL Server mirroring, in which the mirror database server must have appropriate logons created for all Controllers in the site.

- FullDatabase

This script is used to create a database corresponding to the specified DataStore parameter. It also updates the database with all the access permissions needed for the Controller.

- RemoveController

This script is used to remove a Controller specified by the ControllerToRemoveSid parameter. It removes the database access permissions previously required by the Controller.

Type:	DatabaseScriptType
Position:	Named
Default value:	FullDatabase
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the content of the generated SQL script.

Notes

When the ScriptType is set to RemoveController, you must specify the dynamic parameter "ControllerToRemoveSid". This specifies the SID of the Controller that is to be removed from the Site. The resultant database script removes the controller's permissions to change the Database data.

If a script of type FullDatabase is generated for a configured Site, the resulting script adds database access permissions for all known Controllers to the database to be created.

If the cmdlet fails, the following error codes can result:

- The datastore was not recognized.
- The database server name could not be resolved.

Get-XDLicensing

March 11, 2024

Get the licensing attributes for a site.

Syntax

```
Get-XDLicensing
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Get the licensing attributes for the site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

Get the licensing attributes of the Site which has a Controller identified by MyController.

```
Get-XDLicensing -AdminAddress MyController
```

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation

A Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation object containing the relevant attributes.

Get-XDLogging

March 11, 2024

Gets the Configuration Logging Database attributes of a Site.

Syntax

```
Get-XDLogging
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Gets the Configuration Logging Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Logging

This includes whether Logging is enabled or not, whether configuration operations may proceed or not, even if the Configuration Logging Database is not available, the language used for Configuration Logging entries, the name of the Configuration Logging Database, the database server for the Configuration Logging Database, the mirror database server for the Configuration Logging Database and whether Integrated Security is enabled or not for the Configuration Logging Database.

Get-XDMonitor

March 11, 2024

Gets the Monitoring Database attributes of a Site.

Syntax

```
Get-XDMonitor
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Gets the Monitoring Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Monitor

This includes the name of the Monitoring Database, the database server for the Monitoring Database, the mirror database server for the Monitoring Database and whether Integrated Security is enabled or not for the Monitoring Database.

Related Links

- Get-XDSite
- Set-XDMonitor

Get-XDSite

March 11, 2024

Gets the attributes of a Site.

Syntax

```
Get-XDSite
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Gets the attributes of the Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

Gets the attributes of the Site which has a Controller identified by MySiteController.

```
Get-XDSite -AdminAddress MySiteController
```

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site

This includes the name of the Site, the Controllers in Site, the Databases supporting the Site, the licensing configuration of the Site and the default Icon for the Site.

New-XDDatabase

March 11, 2024

Creates the specified Database or all Databases.

Syntax

```
New-XDDatabase
   [-AllDefaultDatabases]
   [-DatabaseCredentials <PSCredential>]
   [-DatabaseNamePrefix <String>]
   -DatabaseServer <String>
   -SiteName <String>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
New-XDDatabase
   [-DatabaseCredentials <PSCredential>]
   [-DatabaseName <String>]
   -DatabaseServer <String>
   -DataStore <DataStore>
   -SiteName <String>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

If AllDefaultDatabases is specified, this cmdlet creates all databases using their default names on the specified SQL server. When used in this manner, the cmdlet need only be called once.

If DataStore is specified, this cmdlet creates the specified database on the specified SQL Server. When used in this manner, the cmdlet should be called once per datastore.

This cmdlet creates, but does not configure, the Database. Run New-XDSite to configure the Site to use the Database.

For database mirroring please refer to "about_XenDesktopModule_SiteConfiguration".

Examples

EXAMPLE 1

Creates a Site Configuration Database called 'MySiteDatabase'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    Datastore Site -DatabaseServer MySqlServer\Instance_1 -DatabaseName
    MySiteDatabase
```

EXAMPLE 2

Creates a Configuration Logging Database called 'MyLoggingDatabase'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    Datastore Logging -DatabaseServer MySqlServer\Instance_1 -
    DatabaseName MyLoggingDatabase
```

EXAMPLE 3

Creates a Monitoring Database called 'MyMonitorDatabase'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    Datastore Monitor -DatabaseServer MySqlServer\Instance_1 -
    DatabaseName MyMonitorDatabase
```

EXAMPLE 4

Creates Site Configuration, Configuration Logging and Monitoring Databases called 'MyPrefix-CitrixMySite', 'MyPrefix-CitrixConfigLoggingMySite'and 'MyPrefix-CitrixMonitorMySite'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    AllDefaultDatabases -DatabaseServer MySqlServer\Instance_1 -
    DatabaseNamePrefix  MyPrefix-
```

Parameters

-AllDefaultDatabases

All databases are created with their default names. The default names are listed with their corresponding dataStore types as follows:

- Site

The Site Configuration Database. The default name of this database is Citrix<SiteName>.

- Logging

The Configuration Logging Database. The default name of this database is CitrixConfigLogging<SiteName>.

- Monitor

The Monitoring Database. The default name of this database is CitrixMonitor<SiteName>.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The address of the SQL Server in which the database is to be created. This must include the SQL Instance name.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteName

The name of the Site for which the specified database is to be created.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

The datastore type that is to be created. Valid values are Site, Logging and Monitor.

Type:	DataStore
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server specified by the DatabaseServer parameter. If this parameter is not provided, then the implicit credentials of the user running the cmdlet are used to connect to the SQL Server.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseNamePrefix

The prefix to be added to the default database names when AllDefaultDatabases is specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

The name that should be used for the database of the specified datastore type.

Type:	String
Position:	Named
Default value:	Site = Citrix, Logging = CitrixConfigLogging and Monitor = CitrixMonitor
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Database

One Database object is returned for each datastore type that is created. Each Database object includes the database name, datastore type and SQL Server address.

Notes

If the user running this cmdlet does not have privilege to create databases on the specified SQL Server, then alternative credentials may be provided using the DatabaseCredentials parameter.

The command can fail for the following reasons:

- A connection could not be established with the specified SQL Server.
- The person running the cmdlet, or the supplied credentials, do not have sufficient privilege to create databases on the specified SQL Server. In this situation, use Get-XDDatabaseSchema, instead of New-XDDatabase, to generate SQL database creation scripts that may be given to a database administrator for execution on the SQL Server.

- New-XDSite

New-XDSite

March 11, 2024

Configures the databases for use with a new Site and initializes all of the associated Site services.

Syntax

```
New-XDSite
   [-AllDefaultDatabases]
   [-DatabaseMirrorServer <String>]
   [-DatabaseNamePrefix <String>]
   -DatabaseServer <String>
   -SiteName <String>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
New-XDSite
   [-DatabaseMirrorServer <String>]
   -DatabaseServer <String>
   -LoggingDatabaseName <String>
   -MonitorDatabaseName <String>
   -SiteDatabaseName <String>
   -SiteName <String>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
New-XDSite
```

```
    [-LoggingDatabaseMirrorServer <String>]
    -LoggingDatabaseName <String>
    -LoggingDatabaseServer <String>
    [-MonitorDatabaseMirrorServer <String>]
    -MonitorDatabaseName <String>
    -MonitorDatabaseServer <String>
    [-SiteDatabaseMirrorServer <String>]
    -SiteDatabaseName <String>
    -SiteDatabaseServer <String>
    -SiteName <String>
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Configures the Site for first use. This must be run after the databases have been created. The databases may have been created manually using the scripts generated from Get-XDDatabaseSchema or automatically using New-XDDatabase.

The site will run in a grace period until Set-XDLicensing is used to configure licensing.

For database mirroring please refer to "about_XenDesktopModule_SiteConfiguration".

Examples

EXAMPLE 1

Configures a site called 'MySite'for the Controller 'MyController'. All previously created databases have default names and are hosted on the SQL Server 'MySqlServer\Instance_1'.

```
New-XDSite -AdminAddress MyController -AllDefaultDatabases -
    DatabaseServer MySqlServer\Instance_1 -SiteName MySite
```

EXAMPLE 2

Configures a site called 'MySite'for the Controller 'MyController'. All previously created databases have default names, are hosted on the SQL Server 'MySqlServer'and mirrored on the SQL Server 'MySqlMirror'.

```
New-XDSite -AdminAddress MyController -AllDefaultDatabases -
    DatabaseServer MySqlServer -DatabaseMirrorServer MySqlMirror -
    SiteName MySite
```

EXAMPLE 3

Configures a site called 'MySite'for the Controller 'MyController'. All previously created databases have default names with a prefix of 'MyPrefix-'and are hosted on the SQL Server 'MySqlServer'.

```
New-XDSite -AdminAddress MyController -AllDefaultDatabases -
    DatabaseServer MySqlServer -SiteName MySite -DatabaseNamePrefix
    MyPrefix-
```

EXAMPLE 4

Configures a site called 'MySite'for the Controller 'MyController'. The previously created databases have non-default names of 'LoggingDb'for the Configuration Logging Database, 'MonitorDb'for Monitoring Database and 'SiteDb'for the Site Configuration Database. All databases are hosted on the SQL Server 'MySqlServer'.

```
New-XDSite -AdminAddress MyController -DatabaseServer MySqlServer -
    LoggingDatabaseName LoggingDb -MonitorDatabaseName MonitorDb -
    SiteDatabaseName SiteDb -SiteName MySite
```

EXAMPLE 5

Configures a site called 'MySite'for the Controller 'MyController'.

The previously created databases have non-default names and are hosted on individual SQL Servers. 'LoggingDb'and 'LoggingSqlServer 'for the Configuration Logging Database. 'MonitorDb'and 'MonitorSqlServer'for Monitoring Database. 'SiteDb'and 'SiteSqlServer'for the Site Configuration Database.

```
New-XDSite -AdminAddress MyController -LoggingDatabaseName LoggingDb -
    LoggingDatabaseServer LoggingSqlServer -MonitorDatabaseName
    MonitorDb -MonitorDatabaseServer MonitorSqlServer -SiteDatabaseName
    SiteDb -SiteDatabaseServer SiteSqlServer -SiteName MySite
```

Parameters

-AllDefaultDatabases

Indicates that all the databases that are to be used in this Site were created with their default names.

Type:	SwitchParameter
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

If all databases were created within a single SQL Server, this is the address of that server. This must include the SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteName

The name of the Site that is to be created.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseName

If databases were not created using their default names, this is the name of the Configuration Logging Database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorDatabaseName

If databases were not created using their default names, this is the name of the Monitoring Database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseName

If databases were not created using their default names, this is the name of the Site Configuration Database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseServer

If each database was created on a separate SQL Server, this is the name of the SQL Server hosting the Configuration Logging Database. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorDatabaseServer

If each database was created on a separate SQL Server, this is the name of the SQL Server hosting the Monitoring Database. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseServer

If each database was created on a separate SQL Server, this is the name of the SQL Server hosting the Site Configuration Database. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseMirrorServer

If all databases were created within a single SQL Server and SQL Mirroring has been enabled for those databases, this is the address of the SQL Server that is acting as the Mirror. This must include the SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseNamePrefix

If a name prefix was applied to the default database names during the original creation of the databases, this specifies that name prefix.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseMirrorServer

If each database was created on a separate SQL Server and SQL Mirroring has been enabled for the the Configuration Logging Database, this is the address of the SQL Server that is acting as the mirror. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	If this parameter is not provided, the mirror server is determined by querying the SQL Server hosting the Configuration Logging Database.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorDatabaseMirrorServer

If each database was created on a separate SQL Server and SQL Mirroring has been enabled for the the Monitoring Database, this is the address of the SQL Server that is acting as the mirror. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	If this parameter is not provided, the mirror server is determined by querying the SQL Server that is hosting the Monitoring Database.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseMirrorServer

If each database was created on a separate SQL Server and SQL Mirroring has been enabled for the the Site Configuration Database, this is the address of the SQL Server that is acting as the mirror. This must include any applicable SQL Instance name.

Type:	String
Position:	Named

Default value:	If this parameter is not provided, the mirror server is determined by querying the SQL Server that is hosting the Site Configuration Database.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site

This includes the name of the Site, the Delivery Controllers in Site, the Databases supporting the Site, the metadata associated with the Site, the licensing configuration of the Site, and the default Icon for the Site.

Notes

The parameter set used with this cmdlet is dependent on the manner in which the databases were previously created.

If the databases were created with default names on a single SQL Server, use the following parameter set:

New-XDSite -AllDefaultDatabases -DatabaseServer <String> -SiteName <String> [-DatabaseMirrorServer <String>] [-DatabaseNamePrefix <String>] [-AdminAddress <String>]

If the databases were created with non-default names on a single SQL Server, use the following parameter set:

New-XDSite -DatabaseServer <String> -LoggingDatabaseName <String> -MonitorDatabaseName <String> -SiteDatabaseName <String> -SiteName <String> [-DatabaseMirrorServer <String>] [-AdminAddress <String>]

If the databases were created on seperate SQL Servers, use the following parameter set:

New-XDSite -LoggingDatabaseName <String> -LoggingDatabaseServer <String> -MonitorDatabaseName <String> -MonitorDatabaseServer <String> -SiteDatabaseName <String> -SiteDatabaseServer <String> -SiteName <String> [-LoggingDatabaseMirrorServer <String>] [-MonitorDatabaseMirrorServer <String>] [-SiteDatabaseMirrorServer <String>] [-AdminAddress <String>]

The command can fail for the following reasons:

- The Site associated with the Controller at AdminAddress is already configured.
- One or more of the specified databases could not be found.
- One or more of the specified databases does not have the necessary permissions for the Controller at AdminAddress.

Remove-XDController

March 11, 2024

Removes a Delivery Controller from an existing Site

Syntax

```
Remove-XDController
      -ControllerName <String>
      [-DoNotUpdateDatabaseServer]
      [-AdminAddress <String>]
      [<CommonParameters>]
```

```
Remove-XDController
      -ControllerName <String>
      -DatabaseCredentials <PSCredential>
      [-AdminAddress <String>]
      [<CommonParameters>]
```

```
Remove-XDController
      -ControllerName <String>
      -LoggingDatabaseCredentials <PSCredential>
      -MonitorDatabaseCredentials <PSCredential>
      -SiteDatabaseCredentials <PSCredential>
      [-AdminAddress <String>]
      [<CommonParameters>]
```

Description

Removes a Controller from an existing Site that currently has more than one Controller.

If no credentials are provided and DoNotUpdateDatabaseServer has not been specified, then all database update operations are attempted using the credentials of the user running the cmdlet.

If DatabaseCredentials is provided, then all database operations are attempted using the credentials.

If one or more of SiteDatabaseCredentials, LoggingDatabaseCredentials or MonitorDatabaseCredentials are provided, then all three must be provided. All operations are then attempted using the credentials appropriate to each Database.

Examples

EXAMPLE 1

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined. The permissions associated with 'MyControllerToRemove'will be automatically removed from the Database using the implicit credentials of the user running the cmdlet.

```
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove
```

EXAMPLE 2

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined.

The permissions for 'MyNewController'will not be removed from the Database. Instead the Get-XDDatabaseSchema cmdlet is used to generate a SQL script that may be given to the database administrator of 'MySQLServer'. The SQL script may be used to remove the permissions that previously allowed 'MyControllerToRemove'to manipulate data within the Database.

```
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove -DoNotUpdateDatabaseServer
Get-XDDatabaseSchema -AdminAddress MyExistingController -SiteName
    MySite -DatabaseServer MySQLServer -ScriptType RemoveController -
    ControllerToRemoveSid MyControllerToRemove_SID > C:\removeController
    .sql
# Although not necessary, Citrix recommends you get a database
    administrator to run removeController.sql
```

EXAMPLE 3

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined.

The credentials contained within '$credential'will be used to remove the permissions associated with 'MyControllerToRemove'from the Database.

```
$credential = Get-Credential
```

```
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove -DatabaseCredentials $credential
```

EXAMPLE 4

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined.

The credentials contained within '$credentialSite'will be used to remove the permissions associated with 'MyControllerToRemove'from the Site Configuration Database. The credentials contained within '$credentialLogging'will be used to remove the permissions associated with 'MyControllerToRemove' from the Configuration Logging Database. The credentials contained within '$credentialMonitor'will be used to remove the permissions associated with 'MyControllerToRemove'from the Monitoring Database.

```
$credentialSite = Get-Credential
$credentialLogging = Get-Credential
$credentialMonitor = Get-Credential
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove -SiteDatabaseCredentials $credentialSite -
    LoggingDatabaseCredentials $credentialLogging -
    MonitorDatabaseCredentials $credentialMonitor
```

Parameters

-ControllerName

The name of the Controller that is to be removed. This may be in SID, DNS or SAM name form. This cannot be the same as the Controller identified by AdminAddress.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Servers associated with the Site Configuration, Configuration Logging and Monitoring Databases.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server associated with the Configuration Logging Database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server associated with the Monitoring Database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used to connect to the SQL Server associated with the Site Configuration Database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotUpdateDatabaseServer

Results in the permissions associated with the Controller not being automatically removed from the Database.

This switch may be useful when the person running the cmdlet has insufficient database privilege. The database permissions for the Controller must be removed manually after running this cmdlet.

Get-XDDatabaseSchema may be used to generate the SQL script which in turn may be used to remove the associated permissions from the Database.

This parameter results in all supplied credentials being ignored.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the user running this cmdlet does not have privilege to remove users from the Database, then either use the DoNotudpateDatabaseServer switch or supply alternative credentials using one or more of the Credentials arguments.

This cmdlet cannot be used to remove the last Controller from a Site; use the Remove-XDSite cmdlet instead.

The command can fail for the following reasons:

- The Site has only one Controller. A Site must have multiple Controllers before a Controller can be removed.
- The Controller that is to be removed is not a member of the Site.
- The person running the cmdlet, or the supplied credentials, does not have sufficient privilege to update the Database. Either run this cmdlet as a user that has administrator privilege to the Database, or supply an account with suitable privileges using the PSCredential parameter(s).

Remove-XDSite

March 11, 2024

Removes the XenDesktop Site.

Syntax

```
Remove-XDSite
       [-AdminAddress <String>]
       [<CommonParameters>]
```

Description

This cmdlet can be executed only when there is one remaining Controller in the Site. It removes the Site by removing the last Controller from the Site.

The person running this command must be a the local administrator on the last Controller in this Site.

Examples

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-XDLicensing

March 11, 2024

Changes one or more of the licensing attributes of a Site

Syntax

```
Set-XDLicensing
   [-Force]
   [-LicenseServerAddress <String>]
   [-LicenseServerPort <String>]
   [-LicensingModel <String>]
   [-PassThru]
   [-ProductCode <String>]
   [-ProductEdition <String>]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Changes one or more of the licensing attributes of the Site which has a Controller identified by AdminAddress. When the Citrix License Server address and/or port are specified and Force is not, the new server:port combination will be validated before being changed. Otherwise, no validation is performed.

Examples

EXAMPLE 1

For the Site managed by MyController, changes the License Server to MyLicenseServer:27001.

```
Set-XDLicensing -AdminAddress MyController -LicenseServerAddress
   MyLicenseServer -LicenseServerPort 27001
```

Parameters

-Force

Force the setting of the License Server address and/or port, i.e. do not check that the new server:port combination is valid. This can be used, for example, when the License Server needs to be set but is temporarily unavailable.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseServerAddress

The address of the License Server for this Site. If this parameter is not provided then the License Server address will not be altered.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseServerPort

The port on which the License Server for this Site is listening. If this parameter is not provided then the License Server port will not be altered.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicensingModel

The licensing model for this Site. If this parameter is not provided then the licensing model will not be altered. Use the ProductCode returned from Get-XDSite as input to Get-ConfigLicensingModel to determine the list of valid licensing models.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductCode

The product code for this Site. If this parameter is not provided then the product code will not be altered. Find valid product codes by running Get-ConfigProduct.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductEdition

The product edition for this Site. If this parameter is not provided then the product edition will not be altered. Use the ProductCode returned from Get-XDSite as input to Get-ConfigProductEdition to determine the list of valid product editions.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation object.

Notes

The command can fail for the following reasons:

- The supplied License Server does not support the requested product edition.
- A License Server was not found at the supplied address.

Set-XDLogging

March 11, 2024

Sets the Configuration Logging Database attributes of a Site.

Syntax

```
Set-XDLogging
   [-DatabaseMirrorServer <String>]
   [-DatabaseName <String>]
   [-DatabaseServer <String>]
   [-Enabled <Boolean>]
   [-Locale <String>]
   [-PassThru]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Sets the Configuration Logging Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

For the Site managed by MyController, enables Configuration Logging.

```
Set-XDLogging -AdminAddress MyController -Enabled $true
```

EXAMPLE 2

For the Site managed by MyController, enables Configuration Logging and allows configuration operations to succeed even if the Configuration Logging Database is unavailable. Note that Configuration Logging must be enabled before AllowDisconnectedDatabase can be set to $true.

```
Set-XDLogging -AdminAddress MyController -Enabled $true -
   AllowDisconnectedDatabase $true
```

EXAMPLE 3

For the Site managed by MyController, sets the mirror for the Configuration Logging Database to MySQLMirror.

```
Set-XDLogging -AdminAddress MyController -DatabaseMirrorServer
    MySQLMirror
```

EXAMPLE 4

For the Site managed by MyController, sets the SQL Server for the Configuration Logging Database to MySQLServer and the database name to MyConfigLoggingDatabase.

```
Set-XDLogging -AdminAddress MyController -DatabaseServer MySQLServer -
    DatabaseName MyConfigLoggingDatabase
```

Parameters

-DatabaseMirrorServer

The mirror database server for the Configuration Logging Database. If this parameter is not provided, the mirror server is determined by querying the SQL Server hosting the Configuration Logging Database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

The name of the Configuration Logging Database. If this is omitted, the name is assumed to be the existing Configuration Logging Database name.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The database server for the Configuration Logging Database. If not provided, the server is assumed to be the SQL Server that is hosting the existing Configuration Logging Database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Determines if Configuration Logging is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Locale

The language used for Configuration Logging entries. Supported locales are English, Japanese and Chinese.

Type:	String

Accepted values:	de, en, es, fr, ja, zh-CN
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Logging

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Logging object.

Notes

When Configuration Logging is enabled, the dynamic parameter "AllowDisconnectedDatabase"may be used to permit Configuration operations to proceed even if the Configuration Logging Database is not available.

The command can fail for the following reasons:

- The Configuration Logging Database name and/or database server have not been provided, yet there is no existing database name and/or database server to use as default settings.
- The Controller identfied by AdminAddress does not have the necessary permissions to access the new Configuration Loggging Database or mirror database on the database server.
- The new Configuration Loggging Database or mirror database on the database server is not configured for the Site that is associated with the Controller identified by AdminAddress.

Set-XDMonitor

March 11, 2024

Sets the Monitoring Database attributes of a Site.

Syntax

```
Set-XDMonitor
    [-DatabaseMirrorServer <String>]
    [-DatabaseName <String>]
    [-DatabaseServer <String>]
    [-PassThru]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Sets the Monitoring Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

For the Site managed by MyController, sets the mirror for the Monitoring Database to MySQLMirror.

```
Set-XDMonitor -AdminAddress MyController -DatabaseMirrorServer
    MySQLMirror
```

EXAMPLE 2

For the Site managed by MyController, sets the SQL Server for the Monitoring Database to MySQLServer and the database name to MyMonitorDatabase.

```
Set-XDMonitor -AdminAddress MyController -DatabaseServer MySQLServer -
    DatabaseName MyMonitorDatabase
```

Parameters

-DatabaseMirrorServer

The mirror database server for the Monitoring Database. If this parameter is not provided, the mirror server is determined by querying the SQL Server hosting the Monitoring Database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

The name of the Monitoring Database. If this is omitted, the name is assumed to be the existing Monitoring Database name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The database server for the Monitoring Database. If not provided, the server is assumed to be the SQL Server that is hosting the existing Monitoring Database.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Monitor

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Monitor object.

Notes

The command can fail for the following reasons:

- The Monitoring Database name and/or database server have not been provided, yet there is no existing database name and/or database server to use as default settings.
- The Controller identfied by AdminAddress does not have the necessary permissions to access the new Monitoring Database or mirror database on the database server.
- The new Monitoring Database or mirror database on the database server is not configured for the Site that is associated with the Controller identified by AdminAddress.

Set-XDSiteMetadata

March 11, 2024

Creates or updates metadata key-value pairs for a Site

Syntax

```
Set-XDSiteMetadata
   -DataName <String>
   -DataValue <String>
   [-PassThru]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Creates or updates metadata key-value pairs for a Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

Creates, or if it already exists, updates the metadata key “MyMetadataName”with the value “1234”.

```
Set-XDSiteMetadata -DataName "MyMetadataName" -DataValue "1234"
```

Parameters

-DataName

The name of the metadata member that is to be created/updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DataValue

The value of the metadata member that is to be created/updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

The DataName and DataValue parameters may be piped into this cmdlet by property name.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site object.
