Citrix Virtual Apps and Desktops 2311 SDK

March 11, 2024

> **Note:**
>
> Citrix Virtual Apps and Desktops was formerly XenApp and XenDesktop.
>
> The new product and component names stem from the expanding Citrix portfolio and cloud strategy.

Implementing this transition in our products and their documentation is an ongoing process. Your patience during this transition is appreciated. For more detail about our new names, see https://www.citrix.com/about/citrix-product-guide/.

Citrix Virtual Apps and Desktops provide an SDK based on a number of Microsoft Windows PowerShell cmdlets that allows you to perform the same tasks as you would with the Citrix Studio console, together with tasks you cannot do with Studio alone.

Differences in policy rules

There are differences between the SDK and the Studio console in terms of policy rules. Entitlement and assignment policy rules are independent entities in the SDK; in the console, these entities are not visible as they are seamlessly merged with the Delivery Group. Also, access policy rules are less restrictive in the SDK.

Use the SDK

The SDK comprises of a number of PowerShell cmdlets packaged both as modules and snap-ins. These are installed automatically by the installation wizard when you install the Controller or Studio components.

To access and run the cmdlets:

1. Start a shell in Windows PowerShell.

   To start a shell from the console, click **Studio**, select the PowerShell tab, and click on **Launch PowerShell**.

   You must run the shell or script using an identity that has Citrix administration rights. Although members of the local administrators group on the Controller automatically have full administrative privileges to allow Citrix Virtual Apps and Desktops to be installed, Citrix recommends

that for normal operation, you create Citrix administrators with the appropriate rights, rather than use the local administrators account.

2. To use SDK cmdlets within scripts, set the execution policy in PowerShell. For more information about PowerShell execution policy, see your Microsoft documentation.
3. To use this SDK through the snap-ins, add the snap-ins you require into the PowerShell environment using the **Add-PSSnapin** command in the Windows PowerShell console. **This step is unnecessary if you want to use the cmdlets in this SDK through the modules**.

   V1 and V2 denote the version of the snap-in (Citrix Virtual Apps and Desktops snap-ins are version 2.).

   For example, type:

   ```
   Add-PSSnapin Citrix.ADIdentity.Admin.V2
   ```

   To import all the cmdlets, type:

   ```
   Add-PSSnapin Citrix.*.Admin.V*
   ```

   After importing, you have access to the cmdlets and their associated help.

   For an example of a typical use case, see Get started with the SDK.

Documentation notes

- In this API documentation, some property types are marked with a question mark (?). This notation indicates that those data types are nullable.

about_CitrixCommonParameters

March 11, 2024

Short description

Describes the parameters that can be used with most Citrix DaaS cmdlets.

Long description

You can use the common Citrix parameters with most Citrix DaaS cmdlet, but they might not have an effect on all cmdlets.

Many of these parameters are used internally for passing trace information between processes.

The following list displays the common Citrix parameters.

- **AdminAddress**
- **AdminClientIP**
- **BearerToken**
- **TraceParent**
- **TraceState**
- **VirtualSiteId**

Common Citrix parameter descriptions

-AdminAddress

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Type	String
Position	Named
Default value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Required	False
Accept pipeline input	False
Accept wildcard characters	False

-AdminClientIP

Specifies the Client IP of the calling user.

Type	String
Position	Named
Default value	None
Required	False
Accept pipeline input	False
Accept wildcard characters	True

-BearerToken

Specifies the bearer token assigned to the calling user.

Type	String
Position	Named
Default value	None
Required	False
Accept pipeline input	False
Accept wildcard characters	True

-TraceParent

Specifies the OpenTelemetry distributed tracing trace parent for this cmdlet call.

This property should follow the W3C Trace Context format for a traceparent header.

Note this property will also detect any ambient Activity provided by the caller provided by Activity.Current.

Type	String
Position	Named
Default value	None
Required	False
Accept pipeline input	False
Accept wildcard characters	True

-TraceState

Specifies the OpenTelemetry distributed tracing trace state for this cmdlet call.

This property will be ignored if no TraceParent is specified.

This property should follow the W3C Trace Context format for a tracestate header.

Type	String
Position	Named

Default value	None
Required	False
Accept pipeline input	False
Accept wildcard characters	True

-VirtualSiteId

Specifies the virtual site the PowerShell snap-in will connect to.

Type	String
Position	Named
Default value	None
Required	False
Accept pipeline input	False
Accept wildcard characters	True

Citrix Group Policy Provider

March 11, 2024

The Citrix Group Policy Provider (referred as the 'provider'in the rest of the document) is a Windows PowerShell snap-in that is implemented as a PowerShell provider. For more information on providers, see Microsoft documentation.

Citrix provider supports common provider commands such as the `Get-ChildItem` command and the `Set-ItemProperty` command.

Prerequisites

- Familiarity with Windows providers

Install the Citrix Group Policy Provider

- **For on-premises installations** - The provider is installed as part of the Citrix controller installation when installing Citrix Studio. You can install Citrix Studio on a supported Windows machine.
- **For Citrix Cloud deployments** - The Citrix Remote PowerShell SDK is required. For more information about this SDK, see SDKs and APIs documentation.

Manage policies using the provider

To manage policies using the provider, you must be a Citrix administrator with one of the following privileges:

- Full administrators with default rights to manage policies.
- Custom administrators with the permission to manage and view policies.

To begin managing policies using the provider, you must first load the provider to PowerShell session, which might be a Windows PowerShell console or a script to use the provider. After loading the provider to PowerShell session, you must mount the provider to a drive.

Step 1: Load the provider

To load the provider, navigate to the PowerShell console and run the following command:

```
1     Import-Module Citrix.GroupPolicy.Commands
```

Alternatively, being a PowerShell snap-in, you can also load the provider using the following Add-PsSnapin command:

```
1     Add-PsSnapin Citrix.Common.GroupPolicy
```

> **Note:**
>
> If the provider does not load using the `Import-Module Citrix.GroupPolicy.Commands` or the `Add-PsSnapin Citrix.Common.GroupPolicy` command you might not have the provider installed in your system..

Step 2: Mount the provider

PowerShell providers provide a user interface similar to a file system. At the top of the hierarchy is a drive, which is similar to a file system drive. After the provider is loaded, use commands to mount a provider to a drive so that its objects can be accessed. The four parameters of the command are the following:

- The `-PsProvider` parameter specifies the name of the provider. The value must be specified and must be `CitrixGroupPolicy`.
- The `-Name` parameter specifies the name of the drive.
- The `-Root` parameter specifies the root of the drive in the hierarchy of the provider's object tree. Usually the root of the tree is specified.
- The `-Controller` parameter specifies the Citrix controller to use.

Mount the provider to a drive using the following command:

- On-premises: Use `localhost` to connect to a controller running on the same machine. When a remote host is specified, the remote host must be a Citrix controller and the necessary ports must be open for remotely connecting to the controller. The signed in user must be also an administrator of the remote site. If a remote connection is to be used, the fully qualified domain name (FQDN) of the remote controller with an optional port number must be specified. If no port number is specified, by default port 80 is used. To mount a drive for on-premises deployments, run the following command:

```
New-PsDrive -PsProvider CitrixGroupPolicy -Name GP -Root \ -
   Controller localhost
```

- Cloud: If the controller is a cloud controller, the connection must be made using the Citrix Remote PowerShell SDK. Run the following command to connect to a cloud environment. Before running this command, ensure that you are authenticated using the `Get-XDAuthentication` command or you have set an authentication profile. For example, `Set-XdCredentials`.

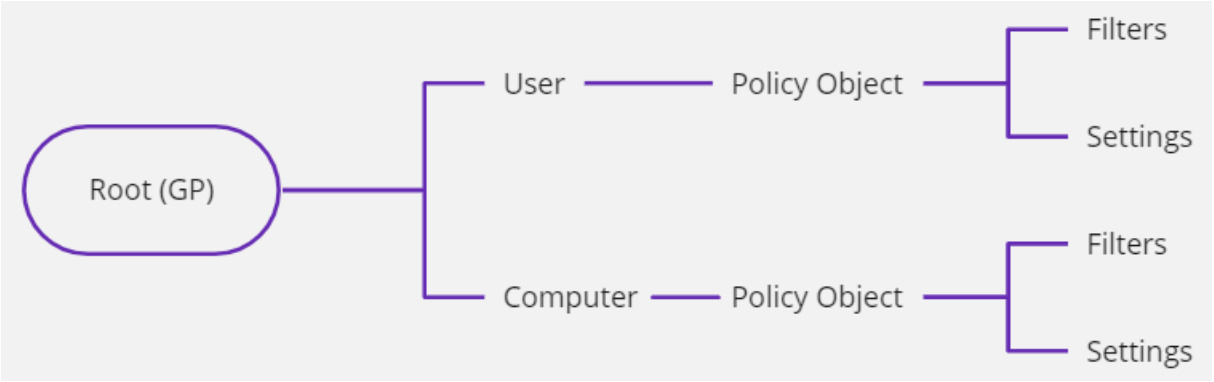
```
New-PsDrive -PsProvider CitrixGroupPolicy -Name GP -Root \ -
   Controller $GLOBAL:XDSDKProxy -BearerToken $GLOBAL:XDAuthToken
```

After the **New-PsDrive** command is successfully run, the complete policy information is created as a file system under the name provided.

```
cd GP:
```

Navigating the object tree

Objects in the provider form a tree. At the top, the root of the tree is the drive root. In the root, there are two nodes named as **Computer** and **User** nodes respectively. The computer policies are stored in the **Computer** node. The user policies are stored in the **User** node.



The definition and difference between computer policies and user policies are listed in the following table:

Computer policy	User policy
Computer policies are policy objects that include only computer settings. Computer settings are settings that are validated for all user connections in the VDAs. Computer settings are applied only at the time of VDA reboots, restart of the Citrix Broker Agent (Citrix Desktop Service), or at 90 minute intervals.	User policies are policy objects that include only user settings. User settings are settings that are validated at every user sign-in or reconnect.

Policy objects are available either in the computer or user node. There is **Settings** and **Filters** available for each policy object.

Policy filters are objects that determine how a policy is applied. The policy engine running on a VDA does the filtering calculation using a set of data called filter evidence. Filter evidence includes data such as the user name and the client name.

The objects in the **Settings** node of a policy node are settings and are organized using categories. Each category node includes subcategories or individual setting objects, which are the leaves of the tree under the **Settings** node. Nodes for all the settings are always defined and they cannot be created or removed. You can only configure a **Settings** node by changing the node's properties.

The objects under the **Filters** node of a policy node are filters, that you can create, modify, and delete.

Create, modify, or delete a policy

Create a policy

To create a computer policy, under the **Computer** node use the **New-Item command**. For example, the following command creates a policy named `Policy123`:

```
PS GP:\Computer\> New-Item Policy123

Name           : Policy123
Description    :
Enabled        : False
Priority       : 7
MergedPriority : 0
PSPath         : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\
    Computer\Policy123
PSParentPath   : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\
    Computer
PSChildName    : Policy123
PSDrive        : GP
PSProvider     : Citrix.Common.GroupPolicy\CitrixGroupPolicy
PSIsContainer  : True
```

After the policy is created, the properties of the policy object are displayed.

Modify a policy

You can only modify the `Description`, `Enabled`, and the `Priority` properties for a policy. Do not set the `MergedPriority` property because only the Citrix Studio uses this property.

To modify a property of a policy, use the `Set-ItemProperty` command. For example, the following command sets the description of the policy to `test policy`:

```
PS GP:\Computer\> Set-ItemProperty -Path Policy123 -Name Description -
    Value "test policy"
PS GP:\Computer\> Get-ItemProperty Policy123

Name           : Policy123
Description    : test policy
Enabled        : False
Priority       : 7
MergedPriority : 0
PSPath         : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\
    Computer\Policy123
PSParentPath   : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\
    Computer
PSChildName    : Policy123
PSDrive        : GP
PSProvider     : Citrix.Common.GroupPolicy\CitrixGroupPolicy
```

To display the result of the `Set-ItemProperty` command, use the `Get-ItemProperty` command.

Delete a policy

To delete an existing policy, use the `Remove-Item` command. The following command removes the policy named `Policy123`:

```
PS GP:\Computer\> Remove-Item Policy123

Confirm
The item at GP:\Computer\Policy123 has children and the Recurse
    parameter was not specified. If you continue, all
children will be removed with the item. Are you sure you want to
    continue?
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (
    default is "Y"): a
PS GP:\Computer\>
```

The policy objects might have child objects. If you try to delete a policy object that has child objects, the child objects are also removed. As a result, the PowerShell needs a confirmation for the removal of all child objects.

To avoid the prompt, you can use the following `-Recurse` parameter:

```
PS GP:\Computer\> Remove-Item Policy123 -Recurse
PS GP:\
Computer\>
```

Select setting for a policy

After a new policy is created, setting objects are automatically created in the new policy. The following example shows the top level settings for a newly created policy:

```
PS GP:\User\> New-Item Policy123

Name           : Policy123
Description    :
Enabled        : False
Priority       : 102
MergedPriority : 0
PSPath         : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123
PSParentPath   : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User
PSChildName    : Policy123
PSDrive        : GP
PSProvider     : Citrix.Common.GroupPolicy\CitrixGroupPolicy
PSIsContainer  : True
```

```
14
15 PS GP:\User\> cd Policy123
16
17 PS GP:\User\Policy123> dir
18 Filters
19 Settings
20 PS GP:\User\Policy123> cd .\Settings\
21
22 PS GP:\User\Policy123\Settings\> dir
23 ICA
24 Receiver
25 UserProfileManager
26 VirtualDesktopAgent
27 PS GP:\User\Policy123\Settings\>
```

There are no individual settings in the top level objects under the **Settings** node. All the objects are container objects created from the categories of the settings. To find the setting that you want to select for your policy, browse the folders, or use the settings reference. For more information about where to find the settings reference and how to use it, see the Setting definitions reference section.

For example, if you want to enable the setting **Readonly clipboard**, you can use the following `Set-ItemProperty` command:

```
1 PS GP:\User\Policy123\Settings\> Set-ItemProperty -Path .\ICA\
     ReadonlyClipboard\ -Name State -Value Enabled
2 PS GP:\User\Policy123\Settings\> Get-ItemProperty -Path .\ICA\
     ReadonlyClipboard\
3 State        : Enabled
4 PSPath       : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
     Policy123\Settings\ICA\ReadonlyClipboard
5 PSParentPath : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
     Policy123\Settings\ICA
6 PSChildName  : ReadonlyClipboard
7 PSDrive      : GP
8 PSProvider   : Citrix.Common.GroupPolicy\CitrixGroupPolicy
```

To display the result of the `Set-ItemProperty` command, use the `Get-ItemProperty` command.

As shown in the example, to select a setting, set the value of the `State` property of the setting to `Enabled`. For settings whose value type is bool, for example, `ReadonlyClipboard`, only the `State` property needs to be set. For settings whose value type is not bool, the `Value` property might need to be set. If the `Value` property is not set, the default value of the setting is used.

> **Note:**
>
> You can only use the internal name of the setting. For many settings, the internal names and the displayed English names are different. To find the correct internal names, use the setting definitions reference section.

PowerShell auto-completion can be used in navigating the settings tree, which saves much typing. Some settings are under several layers of categories.

Setting objects can only be selected by setting the value of the `State` property to `Enabled` or `Allowed`. A setting can only be deselected by setting the value of `State` to `Disabled` or `Prohibited`. Set the value of `State` to `UseDefault` to reset the setting. Setting objects cannot be created or removed.

Deselect a setting for a policy

To deselect a setting, set the `State` property to `Disabled`, `Prohibited`, or `UseDefault` as described in the following command:

```
PS GP:\User\Policy123\Settings\> Set-ItemProperty -Path .\ICA\
    ReadonlyClipboard\ -Name State -Value Disabled
PS GP:\User\Policy123\Settings\> Get-ItemProperty -Path .\ICA\
    ReadonlyClipboard\
State        : Disabled
PSPath       : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123\Settings\ICA\ReadonlyClipboard
PSParentPath : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123\Settings\ICA
PSChildName  : ReadonlyClipboard
PSDrive      : GP
PSProvider   : Citrix.Common.GroupPolicy\CitrixGroupPolicy
```

Create, modify, or delete a filter for a policy

Create a filter for a policy

Filter objects are present in the **Filters** node of a policy. Unlike settings, filters are not prepopulated, except the top level nodes for each filter type. Create a filter object and specify its properties to create a filter for a policy. The following example defines a client name filter:

```
PS GP:\User\Policy123\Filters\ClientName\> New-Item ClientNameFilter1
Synopsis      : Allow - ClientNameFilter1
FilterValue   : ClientNameFilter1
Name          : ClientNameFilter1
FilterType    : ClientName
Mode          : Allow
Enabled       : True
Comment       :
PSPath        : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123\Filters\ClientName\ClientNameFilter1
PSParentPath  : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123\Filters\ClientName
PSChildName   : ClientNameFilter1
```

```
PSDrive       : GP
PSProvider    : Citrix.Common.GroupPolicy\CitrixGroupPolicy
PSIsContainer : False
```

Modify a filter for a policy

You can only modify the `FilterValue`, `Name`, `Mode`, and `Enabled` properties. To modify a filter property, use the `Set-ItemProperty` command. The following command sets the value of the client name filter to `Windows11`:

```
PS GP:\User\Policy123\Filters\ClientName\> Set-ItemProperty
    ClientNameFilter1 -Name FilterValue -Value "Windows11"
PS GP:\User\Policy123\Filters\ClientName\> Get-ItemProperty
    ClientNameFilter1
Synopsis     : Allow - Windows11
FilterValue  : Windows11
Name         : ClientNameFilter1
FilterType   : ClientName
Mode         : Allow
Enabled      : True
Comment      :
PSPath       : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123\Filters\ClientName\ClientNameFilter1
PSParentPath : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123\Filters\ClientName
PSChildName  : ClientNameFilter1
PSDrive      : GP
PSProvider   : Citrix.Common.GroupPolicy\CitrixGroupPolicy
```

Delete a filter for a policy

To remove a filter, use the `Remove-Item` command. No child objects are present under a filter object, which is a leaf node. As a result, no need to use the `-Recurse` switch:

```
PS GP:\User\Policy123\Filters\ClientName\> Remove-Item
    ClientNameFilter1
PS GP:\User\Policy123\Filters\ClientName\>
```

Setting policy priorities

One of the properties of the policy object is Priority, which is an integer. The priority of a policy specifies the precedence in calculating the result of applying all the policies in the site. The priority number is automatically assigned when a new policy is created. The larger the priority number, the lower the priority of the policy.

When a new policy is created, the priority of the policy is assigned to the lowest. This setting means that the priority number of the policy is assigned to one larger than the existing lowest priority number. Priority numbers are 1-based and there are no gaps allowed. This setting means that the largest priority number always is the number of policies. For example, if there are three policies defined, the priority of the next policy will be 4.

Modify policy priorities

To update the priority of a policy, you use the `Set-ItemProperty` command that sets the priority of a policy. For example:

```
PS GP:\User> Get-ItemProperty Policy123
Name           : Policy123
Description    :
Enabled        : False
Priority       : 102
MergedPriority : 0
PSPath         : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123
PSParentPath   : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User
PSChildName    : Policy123
PSDrive        : GP
PSProvider     : Citrix.Common.GroupPolicy\CitrixGroupPolicy

PS GP:\User> Set-ItemProperty Policy123 -Name Priority -Value 10
PS GP:\User> Get-ItemProperty Policy123

Name           : Policy123
Description    :
Enabled        : False
Priority       : 10
MergedPriority : 0
PSPath         : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User\
    Policy123
PSParentPath   : Citrix.Common.GroupPolicy\CitrixGroupPolicy::GP:\User

PSChildName    : Policy123
PSDrive        : GP
PSProvider     : Citrix.Common.GroupPolicy\CitrixGroupPolicy
```

In this example, the newly created `Policy123` is automatically assigned the priority number 102. To move it to priority 10, set the value of `Priority` to 10.

Assigning the priority of a policy changes the priorities of all the policies behind it. In this example, the policy that was at priority 10 is now at priority 11. The policy that had priority number 11 is now at priority number 12, and so on. The priorities of the policies ahead of the new priority value are not changed. This setting means that the priorities of the policies at 1 through 9 are not changed.

In this provider, policy priorities can only be changed one at a time.

Removing a policy results in the policies with lower priorities to get moved up by one.

Priority number cannot be more than the total number of policies. For example, if we have 102 policies, no policy can be set to priority 103 or larger. If the priority of a policy is assigned a number greater than the number of policies available, the priority of the policy is set to the number of existing policies. This behavior is convenient when you want to move a policy to the lowest priority. For example, if there are only 10 policies and if you set the priority of the `Unfiltered` policy to 10000, the priority of the `Unfiltered` policy will be set to 10, which is the lowest priority.

Merge user and computer policies

The provider has the user and computer policies organized separately. But in the policy management consoles (Citrix Studio), there is no distinction between these two types of policies. A computer and a user policy that have the same name are merged in the Citrix Studio as one policy.

The merge is done using the name only. If a computer or user policy does not have a counterpart in the other policy type, it exists as a policy in Citrix Studio, although it has only computer or user settings configured in it.

Merging the user and computer policies of the same name imposes the following requirements to create and edit policies in the provider:

- No priority inversion is allowed. Priority inversion is a condition where the computer and user portions of two policies are in reverse orders. For example, consider we have the user policies `Policy0` and `Policy1` with priority numbers 1 and 2 and the computer policies `Policy0` and `Policy1` with priority numbers 6 and 3. In this example, the priority inversion occurs between `Policy0`and `Policy1`. The policy numbers do not have to be consecutive and they do not have to be the same numbers. If the computer policies `Policy0` and `Policy1` have priorities 3 and 6, there is no priority inversion occurs between `Policy0` and `Policy1`. For the entire set of policies, there must be no priority inversion between any two policies.
- Filters must be consistent. The computer and user portions of the same filter type must have filters that are consistent. Consider a scenario where the user policy `Policy0` has a filter to allow delivery group `Dg0` and the computer policy `Policy0` has a delivery group filter that denies `Dg0`. In this example, there is filter inconsistency between the two portions of `Policy0`.
- Policies must be of the same state. Both the user and computer value of a policy must be set to the same state. They must be both either enabled or disabled.

The Citrix Studio detects these conditions and refuses to display the policies when such a condition exists.

> **Note:**
>
> The `MergedPriority` property is used by Citrix Studio to maintain the priority numbers of the

> merged policies. The provider must not alter the `MergedPriority` property. It is reset every time policies are opened in the Citrix Studio.

Setting definitions reference

Policies are the containers of settings. VDAs validates settings as the configurable values to achieve the desirable effects. In each VDA release, with newly added VDA features, there are new settings that allow Citrix administrators to configure these features.

There are already over 400 settings. Although in the UI, settings can be searched, it's not easy to find the setting that you want to configure in the provider. When you write a script, you might use the Citrix Studio to find the settings. But when you do not have access to the Citrix Studio, you need a different source to navigate the setting hierarchy.

You can find a complete reference of Citrix policy settings in the Policy documentation.

Recommendation on efficient use of the provider

Behind the scenes, the provider automatically saves every change whenever a PowerShell command like `New-Item` or `Set-ItemProperty` is run. The entire policy data is stored as a binary blob. As a result, every change might result in thousands of bytes written to the controller's site database.

If you connect to the local computer or if you have few number of policies, settings, and filters configured, you might not notice any delays. But if you edit a large blob that has dozens of policies and many settings and filters, or if the controller is remote, you might notice delays after a change is made.

The unnecessary saves to the database can be turned off. Set the provider's drive property `AutoWriteBack` value to `$false` to clear the unnecessary saves:

```
PS GP:\User> (Get-PSDrive GP).AutoWriteBack
True
PS GP:\User> (Get-PSDrive GP).AutoWriteBack = $false
PS GP:\User> (Get-PSDrive GP).AutoWriteBack
False
PS GP:\User>
```

After the `AutoWriteBack` is set to `$false`, you must save the changes because changes will not be automatically saved. You can save the changes using the drive's `Save()` method:

```
PS GP:\User> (Get-PSDrive GP).Save()
PS GP:\User>
```

> **Note:**
>
> Turning off auto save is recommended in scripts. It can significantly improve the execution speed

> of the scripts.

FAQ

How do filters get applied?

This question is not just limited to using the provider.

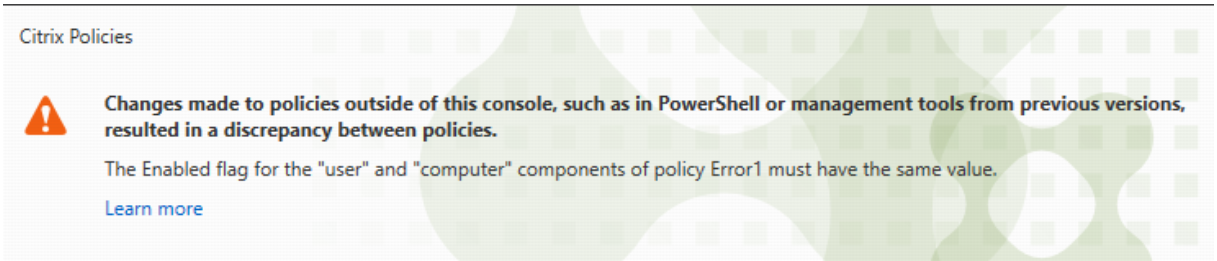
The mode of a filter specifies how a filter must be applied. The value `Allow` means that the policy will be applied if the filter condition is met. The value `Deny` means that the policy will not be applied when the filter condition is met. Among multiple filters of the same type, `Deny` take precedence over `Allow`. For example, consider a scenario when the user `user1` is a member of the users group and a user filter allows user group `users` and another filter denies the user `user1`. In this scenario, when the filters are evaluated, the net result on evaluating the user filters is to not apply the policy if the user is `user1`.

Among filters of the same type, the filters are ANDed together. For example, among all the user filters, the net result of evaluating the filters is when all the filter conditions are met, with the deny filters having precedence over allow filters.

Among filters of different types, the filters are ORed together. For example, consider a scenario where you have some delivery group filters and some user filters and the net result of evaluating the user filters is denying `user1` and allowing the delivery group `dg1`. In this scenario, the policy is applied if the VDA is in `dg1` and only its user policy portions are not applied if `user1` connects to the VDA.

Why errors seen in Citrix Studio after changes are made in provider?

After the policies are updated using the provider, an error appears in the Citrix Studio similar to the following one:



As the error indicated, there is a policy named `Error1` but actually there are two separate policies named `Error1` in the provider. The user policy `Error1` might have the `Enabled` property set to **`true`** and the computer policy `Error1` might have the `Enabled` property set to **`false`**. For more information about policy merge issues, see the Merge user and computer policies section.

After creating the policies, why do policies get deleted when viewing policies in the Citrix Studio?

Empty policies are not allowed in the database to ensure efficiency when policies are evaluated by VDAs. Empty policies are policies without settings. The only exception is the `Unfiltered` policy, which is a built-in policy. It is impossible to create an empty policy in the Citrix Studio. But it is possible to create an empty policy using the provider. Some people might have scripts to create some empty policies temporarily. But if the policies are viewed using Citrix Studio, those policies are deleted and will not be visible in the Citrix Studio. To avoid having your temporary empty policies deleted, do not use the Citrix Studio to view policies while changes are being made.

How to retrieve the policy updates that is done in the Citrix Studio?

You or another user might be modifying policies at the same time. For example, you might have a PowerShell session and also a Citrix Studio session running at the same time. Changes made using the provider are saved to the database immediately (unless `AutoWriteBack` is set to **`false`**). Your changes made through the provider are available after you refresh the Citrix Studio view.

If you update a policy in the Citrix Studio and you want to pick it up in your current PowerShell session, you can use the `Refresh()` command.

```
1 PS GP:\User> (Get-PSDrive GP).Refresh()
```

Getting started with the SDK

March 11, 2024

To create a script, perform the following steps:

1. Use Citrix Studio to perform the operation that you want to script; for example, to create a catalog for a set of Machine Creation Services Machines.
2. Collect the log of SDK operations that Studio made to perform the task.
3. Review the script to understand what each part is doing. This will help you with the customization of your own script. For more information, see the example use case which explains in detail what the script is doing.
4. Convert and adapt the Studio script fragment to turn it into a script that is more consumable. To do this:

- Use variables. Some cmdlets take parameters, such as TaskId. However, it may not be clear where the value used in these parameters comes from because Studio uses values from the result objects from earlier cmdlets.
- Remove any commands that are not required.
- Add some steps into a loop so that these can be easily controlled. For example, add machine creation into a loop so that the number of machines being created can be controlled.

Examples

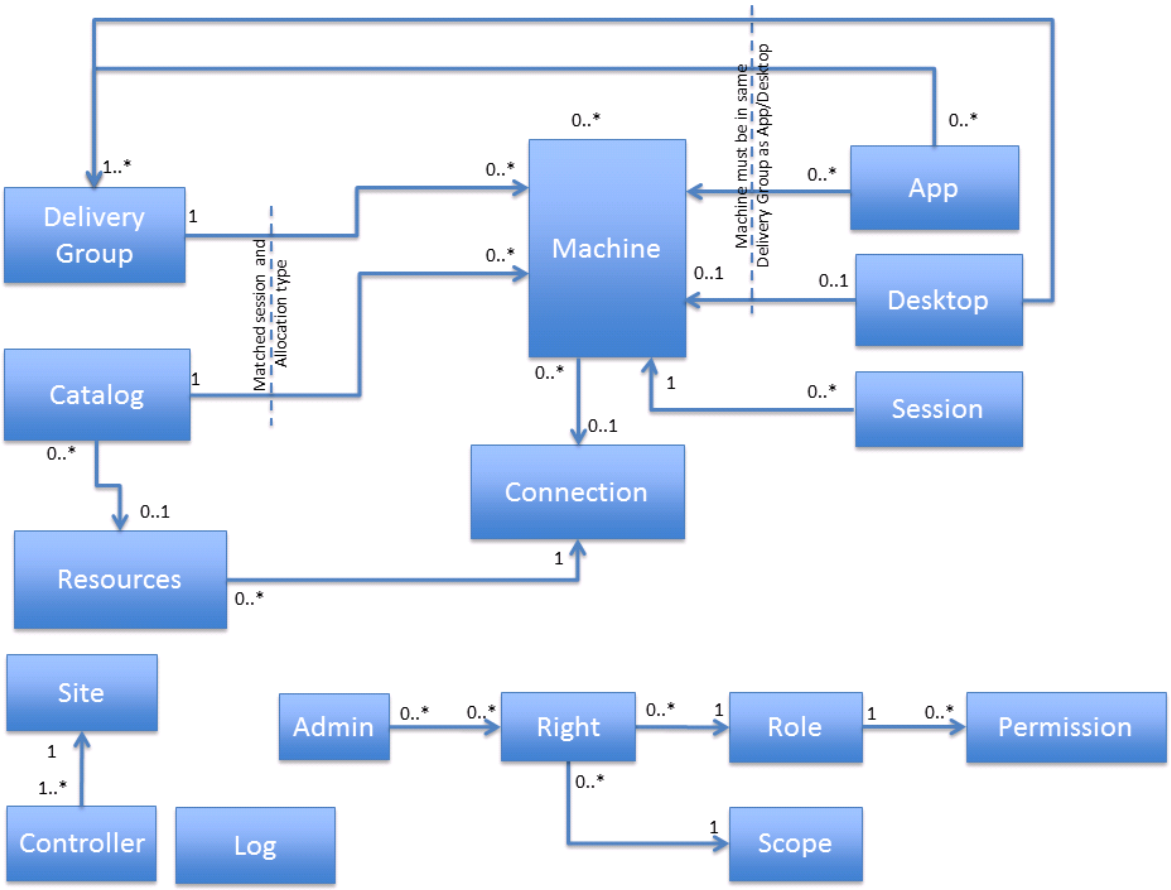
> **Note:**
>
> When creating a script, to ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described above rather than copying and pasting the example scripts.

Examples	Description
Example: Create catalog	Script: create a catalog for a set of Machine Creation Services (MCS) machines
Example: Create and configure a host	Script: create and configure a hosting connection
Example: Create a PvD Desktop	Script: create a Delivery Group containing static desktops
Example: Get load balancing information	Display load index values for Server OS Machines

Understanding the Citrix Virtual Apps and Desktops Administration Model

March 11, 2024

Citrix Virtual Apps and Desktops has an administration model that is defined by a set of objects and their interconnections, as shown in the following illustration.



The following sections describe each object, its responsibilities, characteristics and basic properties.

Connection

A Connection entity provides the details required to establish a connection to the administration point for a virtualization platform. These details are used to provide any power management and provisioning functions that are required. The Connection defines:

- The identity of the connection, which includes a name and an internal ID value (a GUID).
- Type —XenServer, SCVMM or vCenter.
- Username —the account name to use for connections to the hypervisor.
- Password —the password to use for connections to the hypervisor.
- The state of the connection and whether the hypervisor can be communicated with or not.
- Any current alerts raised by the hypervisor.

The password cannot be read back once set and is stored in the database in an encrypted form.

There is one of these entities in the model for each platform definition; however, there will be many connections established to the virtualization platform at run time to service the requirements of the Citrix Virtual Apps and Desktops deployment. These connections can be shared by many Resources entities (see below for further details).

> **Note:**
>
> When setting up a Connection with Citrix Hypervisor, you specify a host or Citrix Hypervisor pool; when setting up a Connection with Microsoft Hyper-V or VMware, you provide details to the management servers (SCVMM or vCenter). Also, when configuring a Connection, you must specify the user name in the correct format, depending on the virtualization solution you're using. If you're setting up a Connection with XenServer, specify a plain user name; for example "username"; for a Connection with VMware or Hyper-V, specify a domain user name; for example "domain\username".

Resources

> **Note:**
>
> This applies only to the creation of new machines when using Machine Creation Services (MCS) or Provisioning Services (PVS).

This setting defines a set of resources within the virtualization platform that are available for the product to consume. This allows the administrator to constrain deployment to a subset of the resources that the platform provides, and enables differing sets of resources to be defined for different purposes. This can control the storage and networking usage of machines provisioned within the site. The Resources entity defines:

- Networks—the networks which are able to be used when provisioning new machines into the virtualization plaform (for PVS, this is the streaming network; only one can be chosen or the first one is used).
- Storage—the storage to use when provisioning new machines into the virtualization platform.

At least one Resources setting must be defined for each Connection object if a provisioning mechanism is to be used. Many Resources settings can be linked to a single Connection.

The connection details are provided by the Connection entity.

> **Note:**
>
> When specifying Resources on a Connection to either SCVMM or vCenter, you select the host or cluster as well as the storage and networking.

Administrator

This defines the person who can administer the product. There can be various administrators of the product, each with a different set of capabilities within the product. The Administrator defines:

- The AD account the administrator is defined by, defined as their name and SID value. This can be an individual user or a security group.
- The rights the administrator has (i.e. what roles are available over which scopes).

Machine

A machine is a representation of a virtual or physical computer that can be used within a site to provide sessions to users. The machine defines:

- Identity of the machine, such as SAM name, DNS name, host (hypervisor) name, IP address, SID, License ID etc.
- Status of the machine, including power state, registration state, Personal vDisk state, load index etc. A summary state value aggregates many of these into a single state value.
- Information about the environment and configuration of the machine, such as version numbers of installed operating systems and Citrix components, including the 'functional level' of the machine.
- Data relating to the most recent activity of the machines, such as the last reason for de-registering, the last power action performed on the machine, the last connection failure etc.
- Maintenance mode and 'WindowsConnectionSetting' states for controlling the enable/disable/drain behavior of the machine.
- Visible user-resource settings for the machine for the assigned desktop case, such as icon, published name etc.
- For multi-session machines (Server OS Machines), aggregate information about the sessions running, such as the number of sessions active, pending etc.
- 'Tag' values associated with an assigned machine.
- Provisioning image information, such as the path to the master image, the provisioning scheme used to create the machine, and whether or not the machine has an updated image pending on its next reboot.

Most of the machine values are exposed by the Broker Service SDK, but items are also exposed by other services, such as the Machine Creation Service (MCS). Other values shown on a per-machine basis are inherited from the Catalog or Delivery Group (if any) that the machine is associated with, or

from the provisioning scheme used to create it. For example, the machine type
which is defined at the Catalog level by a combination of factors such Physical or Virtual, static or random, how user changes are persisted and others. For single-session machines (Desktop OS Machines), information about the session (if any) that is running on the machine is also associated with the machine. This includes connected user identity, session state, protocol in-use and so on. Machines can exist only in the model if they are defined as part of a Catalog; they cannot exist
outside of this concept.

Catalog

A Catalog defines a set of machines that are usually, but not always, expected to be equivalent. Multiple Catalogs can exist within a single deployment, enabling different sets of machines to be built and stored for different purposes. The Catalog defines:

- Catalog type, defined by the values of the following properties:
    1. The provisioning method for the machines (MCS, PVS or manual)
    2. How machines in the Catalog are allocated to users: statically with permanent assignment to users or randomly each time a user requests a resource
    3. Whether the machines are single-session (Desktop OS Machines) or multi-session (Server OS Machines)
    4. Whether the machines are physical or virtual
    5. How user changes to machines are handled, whether they are discarded after the user logs off or preserved locally on the machine or using Personal vDisk
- If the Catalog is to be used for Remote PC users and, if so, which Active Directory (AD) OUs are to be associated with the Catalog, and which Delivery Groups are associated with the Catalog.
- MCS provisioning-associated details (if MCS provisioning is to be used):
    1. Master image for the machines
    2. Memory size and number of CPUs
    3. Personal vDisk disk size, drive letter, and allocation percentages
    4. AD account naming scheme and OU where the machines are created, and a list of already created accounts
- Details of any PVS server associated with the Catalog.
- The functional level expected for machines; machines of lower functional level are not allowed to register with the site.

Also exposed at the Catalog level are some usage values for machines consumed or available in the Catalog.

Delivery Group

The Delivery Group provides details about a collection of machines used to provide desktops and/or applications to an end-user. Many Delivery Groups can be linked to the same Catalog, enabling machines in a Catalog to be distributed in various ways depending on the requirements of different user sets. The Delivery Group defines:

- The allocation type of the machines in the group, indicating whether machines are shared between users (random) or assigned persistently to one or more users (static), and whether the machines are single-session (Desktop OS) or multi-session (Server OS) machines.
- The delivery type of the group, indicating whether the group serves applications only, desktops only, or a mixture of applications and desktops to users.
- Settings controlling the power management of machines in the group, including:
    1. Which hours of the day, on different days of the week, are considered 'peak' time
    2. How many machines to keep running at different hours of the day on different days of the week for random/unassigned machines, including buffer sizes
    3. The timezone to use for evaluating the hours of the day for the above settings
    4. Whether and how assigned machines are power managed
    5. Whether and how to shut down or suspend machines after trigger events, such as user disconnect or logoff
    6. Whether or not the machines are considered corrupted by any sessions run on them and forced to restart to return them back to a clean, known state after each use
- How desktop resources from the group appear to an end-user, including icon used, color depth and name. Also defined is the security level required on the ICA connections for machines in the group. For desktop resources, the number of desktops each user is allowed simultaneously from the group.
- Rules used to establish the availability of these machines to the end users. Rules can factor in, not just the user's identity, but also where the user is connecting from and how, what the state of the client device is, and which remoting protocols are supported.
- Whether the group is enabled or disabled, including setting of maintenance mode.
- Whether the end-user is allowed to reset the machine themselves (for example, using StoreFront).

- 'Tag'values associated with a random/shared group.
- The functional level expected for machines in the group; machines of lower functional level are not allowed to register with the site.
- Whether the group is to be used for Remote PC users, and which Remote PC catalogs are associated with the group.
- A schedule for regularly rebooting multi-session (Server OS) machines at a particular time and day, and settings to control how that reboot is done.

Also associated with Delivery Groups are settings for features such as Profile management and Storefront URL settings, which are separately defined as 'Machine Configuration'objects and associated with one or more Delivery Groups.

> **Note:** The SDK often uses the term 'Desktop Group'to refer to a 'Delivery Group'

Application

This provides details of a seamless (i.e. floating window, separate from a desktop) application that is to be made available to end-users.Typically, each application is associated with a single delivery group, but application definitions can be shared across multiple groups, if required.

Applications can be run either on a remote machine and displayed on the local client desktop, or installed and run on the local client machine with windows overlaid onto a remote desktop. The application defines:

- The type of the application, whether 'HostedOnDesktop'or 'InstalledOnClient'.
- For HostedOnDesktop applications:
    1. The path to the application initial executable to be run on the VDA machine and the command line parameters, if any, to be supplied when the application is started
    2. Optionally, a specific set of users who have access to the application as a subset of users who have access to the Delivery Group(s)
    3. Any application-specific settings to be applied to the application process, including a CPU priority level, whether the application should wait for proxy printers to be created or not, etc.
- For InstalledOnClient applications:
    1. A flag to indicate that the icon for the application is to be fetched from the client device
    2. A flag to specify that extra security measures are to be taken with the arguments supplied to the application

- How the application resource appears to an end-user, including icon used, folder location on the client device, name and whether the shortcut appears in the start menu, desktop or both.
- Any file-type associations for the application, associating file extensions with the application.
- Which Delivery Group(s) it is associated with, along with an optional priority value for choosing between multiple groups.
- Whether the application is enabled and, separately, whether it is visible to end users or not.

Desktop

In Citrix Virtual Apps and Desktops, the Desktop object (which describes both the machine and the session on the machine) is replaced by the Session object and the Machine object, both of which have been expanded to do the work of the Desktop object.

Session

This provides details of a Windows session running on a machine controlled by the site. The session may be one initiated by Citrix Virtual Apps and Desktops, or one that was created by other means, such as a user logging directly onto the machine through the console or over RDP.

The session defines:

- The identity of the machine where the session is running, including machine DNS name, IP address, NetBios name, SID etc.
- The identity of the user who is running the session, including SAM name, UPN, SID, etc.
- The identity of the user who brokered the connection to the session, including SAM name, SID, etc.
- The identity of the endpoint client machine being used to connect to the session, including the device name, IP address, ID.
- The identity of the machine used to request the launch, i.e. the web server from which the launch was made. This includes name and IP address.
- The identity of the machine used to act as a gateway for the session connection, including machine DNS name, IP address.
- Details of significant events in the session, including start time, the time when the session was most recently connected to, brokered to etc.
- The durations of aspects of the most recent session creation or connection, including the time taken to broker the session, time taken to create the session etc.

- The current status of the session, including an overall session state, whether the ICA connection is secured, what protocol is being used.
- The current state of the machine running the session, incuding an overall summary state, power state, etc.
- Details about how the session connection was made, such as whether the session was brokered or connected to autonomously, the session context 'Smart Access'tags in force.
- Whether the session is 'hidden'or not. Sessions can become hidden if certain types of problems are encountered when a user launches an application or desktop.
- The list of brokered applications executing in the session.

The session SDK object also provides information from the related machine, Delivery Group and Catalog SDK objects. This information includes identity information, basic configuration and status information.

Controller

This provides details of the individual Delivery Controller machines in the site. Most of the data is dynamic state data from the running site, rather than configuration settings. The controller shows:

- Which 'site services'are active on each controller.
- The version of the controller components.
- The identity of the controller machine, as fully qualified DNS name, SAM name, SID etc.
- The type and version of the OS of the controller machine.
- Current controller and service status, and most recent activity times.
- Counts of machines registered with the controller.
- Which hypervisor connections are associated with the controller for site service location purposes.

Most of the controller values are exposed from the Broker Service SDK, but other items are exposed from other services, such as the Machine Creation Service.

Site

The Site is a top-level, logical representation of the Citix Virtual Apps and Desktops site, from the perspective of the configuration services running within it. The site contains licensing information, site metadata and the site name, among others.

A Citix Virtual Apps and Desktops installation has only a single configuration site instance. The Site object has the following properties:

- Name
- Controllers —list of controllers in the site
- Databases —list of databases used by the site
- DefaultIconUid
- LicenseInformation
- Metadata

Log

This provides details of the collected configuration logs, which describe the administrator activity on the site since logging was enabled. Administrator read actions are not logged, but any administrator action that changes the configuration or state of the site is included in the log. You can view the log at one of three levels: high-level logs, low-level logs and operation details. Each low-level log is a part of a larger high-level operation which is logged, while operation details describe elements within a single low-level operation. Log items show:

- The identity of the administrator who performed the operation, including the IP address of the machine from which it was performed.
- When the operation took place, both start and end times.
- Whether the operation succeeded or failed for any reason.
- A description of the operation, as a text string and also characterized by operation type, source type, target type etc.
- Details of parameters supplied to the operation.
- Any parent/child relationship in the log hierarchy.
- For changes in configuration, a before and after value for the items changed.

For more information about what is logged, see the Configuration Logging documentation.

Right

This defines a combination of role and the scope over which role permissions are allowed. Permissions defined in the role can be executed by the specified administrator, but only on objects that are directly or indirectly associated with the specified scope. The Right defines:

- The role whose permissions are to be allowed.
- The scope over which the role permissions are to be allowed.

Rights are not SDK objects that can be manipulated separately; they are always associated with a particular Administrator object. A single administrator can have many rights, with the total capability of the administrator being the sum of all their individual rights.

Scope

This defines a named grouping for objects, where objects in the grouping have administrator rights over objects controlled on a role-by-role basis. SDK objects of various types can have scopes directly associated with them, such as Catalogs, Delivery Groups, Connections, Resources etc. These SDK objects have properties that list the scopes that the object has been associated with. Other SDK objects have administrator rights granted by a secondary association with other objects which are directly scoped. For example, Machine objects inherit their scope associations from the Catalogs and Delivery Groups they are members of; Session objects inherit their scope associations from the machines on which the session is running. Some scopes are pre-defined (in practice only the 'All' scope is currently built-in) but you can create other scopes to specify suitable grouping definitions for your particular deployment.

The Scope defines:

- The identity of the scope, which includes a name and an internal ID value (a GUID).
- Whether the scope is built-in or not.

Role

Defines a set of permissions that an administrator can perform. Roles are always granted to administrators with an associated scope; they do not provide rights on their own, although some roles may have general permissions that apply to objects which do not have any scopes associated with them ('unscoped objects'). Some roles are pre-defined, but you can create other custom roles to specify suitable sets of permissions for your
particular deployment. A Role defines:

- The identity of the role, which includes a name and an internal ID value (a GUID)
- Whether the role is built-in or not
- The set of permissions that make up the role

The built-in roles are:

- Full Administrator—can perform all tasks and operations.
- Read Only Administrator—can see all objects in specified scopes, as well as global information, but cannot change anything.

- Machine Catalog Administrator—can create and manage Machine Catalogs and provision machines.
- Delivery Group Administrator—can deliver applications, desktops, and machines; can also manage the associated sessions. Allows creation and managing of Delivery Groups and applications.
- Help Desk Administrator—can view Delivery Groups, and manage the sessions and machines associated with those groups. Allows viewing of end-user resources and limited state change actions for troubleshooting end-user problems, but does not allow most configuration changes.
- Host Administrator—can manage host connections and their associated resource settings.

Permission

Defines a single console-level task or operation that is allowed when the permission is included in a role. Each permission can allow several low-level SDK operations (cmdlets), and a particular low-level SDK operation can be granted by any number of related permissions. A Permission defines:

- The identity of the permision, which includes a name and an internal ID value (a GUID).
- The permission group membersip of the permission. Permission groups collect together permissions relating to a particular functional area.
- The set of low-level SDK operations covered by the permission.

Creating a Catalog

March 11, 2024

The following example shows how to create a catalog for a set of Machine Creation Services (MCS) machines.

Before you begin, make sure you follow the steps detailed in Get started with the SDK.

This document tells you how to use Studio to perform the operation you want to script (in this case, to create a catalog for a set of Machine Creation Services machines) and collect the log of SDK operations that Studio made to perform the task. This output can then be customized to produce a script for automating catalog creation.

> **Note:**
>
> To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script. Line

> breaks have been added to the script for readability.

Understand the script

The following section explains what each part of the script produced by Studio is doing. This will help you with the customization of your own script. Line numbers have been added for readability.

```
1 Start-LogHighLevelOperation -AdminAddress 'ddc.dumdev.internal.citrix.
     com:80' -Source 'Studio' -StartTime 29/05/2023 14:43:08 `
2     -Text 'Create Machine Catalog `'ExampleMachines`''
```

Starts a logged operation and returns a log ID which is supplied to subsequent operations to associate them with the larger task.

```
1 New-BrokerCatalog -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
     AllocationType 'Permanent' -Description 'Example Machines' `
2     -IsRemotePC $False -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 -
        MinimumFunctionalLevel 'L7' -Name 'ExampleMachines' `
3     -PersistUserChanges 'OnPvd' -ProvisioningType 'MCS' -Scope @() -
        SessionSupport 'SingleSession'
```

Creates a Broker catalog. This catalog is populated with machines which are about to be created.

```
1 New-AcctIdentityPool -AdminAddress 'ddc.dumdev.internal.citrix.com:80'
     -AllowUnicode -Domain 'dumdev.internal.citrix.com' `
2     -IdentityPoolName 'ExampleMachines' -LoggingId f39a2792-064a-43eb-97
        c7-397cc1238e46 -NamingScheme 'Example-####' `
3     -NamingSchemeType 'Numeric' -OU 'OU=DUMVMs,DC=dumdev,DC=internal,DC=
        citrix,DC=com' -Scope @()
```

Creates an Identity Pool. This defines the mechanism for creating AD computer accounts. This becomes a container for AD accounts created for the machines that are to be created.

```
1 Set-BrokerCatalogMetadata -AdminAddress 'ddc.dumdev.internal.citrix.com
     :80' -CatalogId 1 `
2     -LoggingId 39a2792-064a-43eb-97c7-397cc1238e46 -Name '
        Citrix_DesktopStudio_IdentityPoolUid' `
3     -Value 'b99aee6d-8772-4dbc-978b-8eb9a26e2407'
```

Sets metadata on the Broker catalog with details of the Identity Pool. This is not essential.

```
1 Test-ProvSchemeNameAvailable -AdminAddress 'ddc.dumdev.internal.citrix.
     com:80' -ProvisioningSchemeName @('ExampleMachines')
```

Checks that the requested name is available. This is not essential.

```
1 New-ProvScheme -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
     CleanOnBoot -HostingUnitName 'SharedNFS' `
```

```
    -IdentityPoolName 'ExampleMachines' -LoggingId f39a2792-064a-43eb-97
       c7-397cc1238e46 `
    -MasterImageVM 'XDHyp:\hostingunits\SharedNFS\BaseVM.vm\Base OS,
       domain joined and activated.snapshot \Pre-reqs installed.snapshot
       \\Updates Applied.snapshot\VDA75-no agent.snapshot\Updated Agent.
       snapshot' `
    -NetworkMapping @{
 0='xdhyp:\hostingunits\SharedNFS\Network0.network' }
  -ProvisioningSchemeName 'ExampleMachines' `
   -RunAsynchronously -Scope @() -UsePersonalVDiskStorage -VMCpuCount 1
       -VMMemoryMB 1024
```

Creates a provisioning scheme object. This is a template for the machines that are to be created. It specifies the hypervisor, network, storage, memory, number of CPUs to be used etc. It takes parameters from the system already set up, such as the HostingUnit name and the path to the VM snapshot to be used for the machines to be created. This command makes a 'consolidated'copy of the VM snapshot being used and, as a result, the process can take time to complete.

In this example, the Studio script specified the -RunAsyncronous flag on this command. This means the command will return control to the administrator before it has completed, so you must wait for it to finish before performing any operations that require it to be complete. If this flag is not specified, the command runs synchronously in-line and control is not returned until the command completes (successfully or otherwise). You can check the status of an asynchronous task using the Get-ProvTask cmdlet. Supply the task ID returned from the operation that started the task; in this case, the New-ProvScheme cmdlet.

```
Set-BrokerCatalog -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
   LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 `
    -Name 'ExampleMachines' -ProvisioningSchemeId 76125e3a-9001-4993-86
       b6-eefc85c87880
```

Updates the BrokerCatalog with the unique Id of the provisioning scheme created above.

```
Add-ProvSchemeControllerAddress -AdminAddress 'ddc.dumdev.internal.
   citrix.com:80' `
    -ControllerAddress @('DDC.dumdev.internal.citrix.com') `
    -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 -
       ProvisioningSchemeName 'ExampleMachines'
```

Adds a set of controller addresses to the provisioning scheme object. This is a list of addresses that the machines created can use to register with a Controller (broker) when deployed. The machines'registration addresses can be supplied in many ways; however, this information is required if the administrator wants to use the 'Allow Machine Creation Service to supply this'in the VDA installer. Changes to this list affect only machines created after the change, not existing machines.

```
Get-AcctADAccount -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
   IdentityPoolUid b99aee6d-8772-4dbc-978b-8eb9a26e2407 `
    -Lock $False -MaxRecordCount 2147483647 -State 'Available'
```

Studio gets a list of available Machine Identities from the Identity Pool so that, if existing accounts have been created in the past but are unused, these can be consumed instead of creating new accounts. Note that this is not required in a script because new accounts can be created instead, provided the script is running in a context that has permissions to do this. However, if the script does not have permissions to create accounts, change the script to consume available accounts (a separate process will be required to provide a pool of accounts into the Identity Pool, before running the script).

```
New-AcctADAccount -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    Count 2 `
    -IdentityPoolUid b99aee6d-8772-4dbc-978b-8eb9a26e2407 -LoggingId
       f39a2792-064a-43eb-97c7-397cc1238e46
```

Creates the required AD computer accounts in Active Directory. The script creates one account but, if required, it can create more using the 'Count'parameter of the command. The accounts are created into the OU defined in the provisioning scheme created above.

```
New-ProvVM -ADAccountName @('DUMDEV\Example-0001\$','DUMDEV\Example
    -0002\$') -AdminAddress 'ddc.dumdev.internal.citrix.com:80' `
    -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 -
       ProvisioningSchemeName 'ExampleMachines' -RunAsynchronously
```

Creates virtual machines, based on the template definition in the provisioning scheme created above. This process may take time to complete.

```
Lock-ProvVM -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 `
     -ProvisioningSchemeName 'ExampleMachines' -Tag 'Brokered' -VMID @('
        0710bb77-d01f-d006-4d67-5472e5cd349f')
```

Locks the provisioned virtual machines and prevents accidental modification of the virtual machine. Consumers of the SDK can use this to indicate that the virtual machine is in use and why it is locked. The script locks the VM with a tag of 'Brokered'to indicate the virtual machine is created and added to a Broker catalog and must not be deleted without first being removed from the catalog. You can set the Tag name to whatever is required.

```
New-BrokerMachine -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    CatalogUid 1 `
    -HostedMachineId '0710bb77-d01f-d006-4d67-5472e5cd349f' `
    -HypervisorConnectionUid 1 -LoggingId f39a2792-064a-43eb-97c7-397
       cc1238e46 `
    -MachineName 'S-1-5-21-3918710733-2340574387-1999698698-109114'
```

Creates a Broker Machine object. These are objects stored in the catalog which join the provisioned machine with the catalog.

```
Start-BrokerMachinePvdImagePrepare -AdminAddress 'ddc.dumdev.internal.
    citrix.com:80' -InputObject @(2) `
    -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46
```

Requests the Broker Service to initiate a preparation operation for Personal vDisk. This is required to allow the machine to initialize the storage for Personal vDisk.

```
Stop-LogHighLevelOperation -AdminAddress 'ddc.dumdev.internal.citrix.com:80' `
   -HighLevelOperationId f39a2792-064a-43eb-97c7-397cc1238e46 -IsSuccessful $true
```

Stops the logged operation begun in the first step and indicates it was successful.

Customize the script

The following section shows how to convert and adapt the Studio output into a script that is more consumable. In addition to using variables and removing commands that are not required, it shows how to add machine creation into a loop so that you can control the number of machines created.

```
[CmdletBinding()]
param
(
    [Parameter(Mandatory=$true)] [string] $hostingUnitPath,
    [Parameter(Mandatory=$true)] [string] $catalogName,
    [string] $catalogDescription,
    [Parameter(Mandatory=$true)] [int] $numVmsToCreate,
    [string] $adminAddress,
    [Parameter(Mandatory=$true)] [string] $namingScheme,
    [string] $OU,
    [Parameter(Mandatory=$true)] [string] $domain,
    [Parameter(Mandatory=$true)] [string] $masterImagePath
)

Set-HypAdminConnection -AdminAddress $adminAddress

$hostingUnit = get-item $hostingUnitPath
$hostConnection = $hostingUnit.hypervisorConnection

$brokerHypConnection = Get-BrokerHypervisorConnection -HypHypervisorConnectionUid $hostConnection.HypervisorConnectionUid

# Start logged operation
$loggingOp = Start-LogHighLevelOperation -AdminAddress $adminAddress -Source 'Scripted' -Text "Create Machine Catalog `'$catalogName`'"

```

Configure support for non-domain joined catalogs

Using the Citrix Virtual Apps and Desktops service, you can create catalogs based on workgroup, or, non-domain joined machines. Creating non-domain joined machines depends on how the account identity pool is created. The account identity pool is the mechanism used by MCS to create and track machine names during catalog provisioning.

For example, in past releases all Active Directory fields were supplied in a single instance:

```
1  New-AcctIdentityPool AllowUnicode -Domain "awsdevexample.local" -
       IdentityPoolName "DedicatedHostCatalog" -NamingScheme "MH-DHost##" `
2      -NamingSchemeType "Numeric" *-OU "CN=Computers,DC= awsdevexample,DC=
           local"* -Scope @() `
3      -ZoneUid "81291221-d2f2-49d2-ab12-bae5bbd0df05"
```

MCS uses a new PoSH parameter, `WorkgroupMachine`, to create a workgroup catalog. Using the same example, noted above, this parameter removes the requirement to specify all the AD-specific parameters, including domain administrator credentials:

```
1  New-AcctIdentityPool AllowUnicode -WorkgroupMachine -IdentityPoolName "
       DedicatedHostCatalog" -NamingScheme "MH-DHOst##" `
2      -NamingSchemeType "Numeric" -Scope @() -ZoneUid "81291221-d2f2-49d2-
           ab12-bae5bbd0df05"
```

> **Note:**
>
> When using the WorkgroupMachine parameter, consider that non-domain joined machine catalogs are only supported through Powershell for all catalog lifecycle events including provisioning, adding/removing machines from the catalog, updating, and power management.

Creating a Catalog

March 11, 2024

The following example shows how to create a catalog for a set of Machine Creation Services (MCS) machines.

Before you begin, make sure you follow the steps detailed in Get started with the SDK.

This document tells you how to use Studio to perform the operation you want to script (in this case, to create a catalog for a set of Machine Creation Services machines) and collect the log of SDK operations that Studio made to perform the task. This output can then be customized to produce a script for automating catalog creation.

> **Note:**
>
> To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script. Line breaks have been added to the script for readability.

Understand the script

The following section explains what each part of the script produced by Studio is doing. This will help you with the customization of your own script. Line numbers have been added for readability.

```
1 Start-LogHighLevelOperation -AdminAddress 'ddc.dumdev.internal.citrix.
     com:80' -Source 'Studio' -StartTime 29/05/2023 14:43:08 `
2     -Text 'Create Machine Catalog `'ExampleMachines`''
```

Starts a logged operation and returns a log ID which is supplied to subsequent operations to associate them with the larger task.

```
1 New-BrokerCatalog -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
     AllocationType 'Permanent' -Description 'Example Machines' `
2     -IsRemotePC $False -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 -
        MinimumFunctionalLevel 'L7' -Name 'ExampleMachines' `
3     -PersistUserChanges 'OnPvd' -ProvisioningType 'MCS' -Scope @() -
        SessionSupport 'SingleSession'
```

Creates a Broker catalog. This catalog is populated with machines which are about to be created.

```
1 New-AcctIdentityPool -AdminAddress 'ddc.dumdev.internal.citrix.com:80'
     -AllowUnicode -Domain 'dumdev.internal.citrix.com' `
2     -IdentityPoolName 'ExampleMachines' -LoggingId f39a2792-064a-43eb-97
        c7-397cc1238e46 -NamingScheme 'Example-####' `
3     -NamingSchemeType 'Numeric' -OU 'OU=DUMVMs,DC=dumdev,DC=internal,DC=
        citrix,DC=com' -Scope @()
```

Creates an Identity Pool. This defines the mechanism for creating AD computer accounts. This becomes a container for AD accounts created for the machines that are to be created.

```
Set-BrokerCatalogMetadata -AdminAddress 'ddc.dumdev.internal.citrix.com
    :80' -CatalogId 1 `
    -LoggingId 39a2792-064a-43eb-97c7-397cc1238e46 -Name '
       Citrix_DesktopStudio_IdentityPoolUid' `
    -Value 'b99aee6d-8772-4dbc-978b-8eb9a26e2407'
```

Sets metadata on the Broker catalog with details of the Identity Pool. This is not essential.

```
Test-ProvSchemeNameAvailable -AdminAddress 'ddc.dumdev.internal.citrix.
    com:80' -ProvisioningSchemeName @('ExampleMachines')
```

Checks that the requested name is available. This is not essential.

```
New-ProvScheme -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    CleanOnBoot -HostingUnitName 'SharedNFS' `
    -IdentityPoolName 'ExampleMachines' -LoggingId f39a2792-064a-43eb-97
       c7-397cc1238e46 `
    -MasterImageVM 'XDHyp:\hostingunits\SharedNFS\BaseVM.vm\Base OS,
       domain joined and activated.snapshot \Pre-reqs installed.snapshot
       \\Updates Applied.snapshot\VDA75-no agent.snapshot\Updated Agent.
       snapshot' `
    -NetworkMapping @{
 0='xdhyp:\hostingunits\SharedNFS\Network0.network' }
  -ProvisioningSchemeName 'ExampleMachines' `
   -RunAsynchronously -Scope @() -UsePersonalVDiskStorage -VMCpuCount 1
       -VMMemoryMB 1024
```

Creates a provisioning scheme object. This is a template for the machines that are to be created. It specifies the hypervisor, network, storage, memory, number of CPUs to be used etc. It takes parameters from the system already set up, such as the HostingUnit name and the path to the VM snapshot to be used for the machines to be created. This command makes a 'consolidated' copy of the VM snapshot being used and, as a result, the process can take time to complete.

In this example, the Studio script specified the -RunAsyncronous flag on this command. This means the command will return control to the administrator before it has completed, so you must wait for it to finish before performing any operations that require it to be complete. If this flag is not specified, the command runs synchronously in-line and control is not returned until the command completes (successfully or otherwise). You can check the status of an asynchronous task using the Get-ProvTask cmdlet. Supply the task ID returned from the operation that started the task; in this case, the New-ProvScheme cmdlet.

```
Set-BrokerCatalog -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 `
    -Name 'ExampleMachines' -ProvisioningSchemeId 76125e3a-9001-4993-86
       b6-eefc85c87880
```

Updates the BrokerCatalog with the unique Id of the provisioning scheme created above.

```
Add-ProvSchemeControllerAddress -AdminAddress 'ddc.dumdev.internal.
    citrix.com:80' `
    -ControllerAddress @('DDC.dumdev.internal.citrix.com') `
    -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 -
       ProvisioningSchemeName 'ExampleMachines'
```

Adds a set of controller addresses to the provisioning scheme object. This is a list of addresses that the machines created can use to register with a Controller (broker) when deployed. The machines' registration addresses can be supplied in many ways; however, this information is required if the administrator wants to use the 'Allow Machine Creation Service to supply this' in the VDA installer. Changes to this list affect only machines created after the change, not existing machines.

```
Get-AcctADAccount -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    IdentityPoolUid b99aee6d-8772-4dbc-978b-8eb9a26e2407 `
    -Lock $False -MaxRecordCount 2147483647 -State 'Available'
```

Studio gets a list of available Machine Identities from the Identity Pool so that, if existing accounts have been created in the past but are unused, these can be consumed instead of creating new accounts. Note that this is not required in a script because new accounts can be created instead, provided the script is running in a context that has permissions to do this. However, if the script does not have permissions to create accounts, change the script to consume available accounts (a separate process will be required to provide a pool of accounts into the Identity Pool, before running the script).

```
New-AcctADAccount -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    Count 2 `
    -IdentityPoolUid b99aee6d-8772-4dbc-978b-8eb9a26e2407 -LoggingId
       f39a2792-064a-43eb-97c7-397cc1238e46
```

Creates the required AD computer accounts in Active Directory. The script creates one account but, if required, it can create more using the 'Count' parameter of the command. The accounts are created into the OU defined in the provisioning scheme created above.

```
New-ProvVM -ADAccountName @('DUMDEV\Example-0001\$','DUMDEV\Example
    -0002\$') -AdminAddress 'ddc.dumdev.internal.citrix.com:80' `
    -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 -
       ProvisioningSchemeName 'ExampleMachines' -RunAsynchronously
```

Creates virtual machines, based on the template definition in the provisioning scheme created above. This process may take time to complete.

```
Lock-ProvVM -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    LoggingId f39a2792-064a-43eb-97c7-397cc1238e46 `
     -ProvisioningSchemeName 'ExampleMachines' -Tag 'Brokered' -VMID @('
        0710bb77-d01f-d006-4d67-5472e5cd349f')
```

Locks the provisioned virtual machines and prevents accidental modification of the virtual machine. Consumers of the SDK can use this to indicate that the virtual machine is in use and why it is locked. The script locks the VM with a tag of 'Brokered' to indicate the virtual machine is created and added to

a Broker catalog and must not be deleted without first being removed from the catalog. You can set the Tag name to whatever is required.

```
New-BrokerMachine -AdminAddress 'ddc.dumdev.internal.citrix.com:80' -
    CatalogUid 1 `
    -HostedMachineId '0710bb77-d01f-d006-4d67-5472e5cd349f' `
    -HypervisorConnectionUid 1 -LoggingId f39a2792-064a-43eb-97c7-397
       cc1238e46 `
    -MachineName 'S-1-5-21-3918710733-2340574387-1999698698-109114'
```

Creates a Broker Machine object. These are objects stored in the catalog which join the provisioned machine with the catalog.

```
Start-BrokerMachinePvdImagePrepare -AdminAddress 'ddc.dumdev.internal.
    citrix.com:80' -InputObject @(2) `
    -LoggingId f39a2792-064a-43eb-97c7-397cc1238e46
```

Requests the Broker Service to initiate a preparation operation for Personal vDisk. This is required to allow the machine to initialize the storage for Personal vDisk.

```
Stop-LogHighLevelOperation -AdminAddress 'ddc.dumdev.internal.citrix.
    com:80' `
    -HighLevelOperationId f39a2792-064a-43eb-97c7-397cc1238e46 -
       IsSuccessful $true
```

Stops the logged operation begun in the first step and indicates it was successful.

Customize the script

The following section shows how to convert and adapt the Studio output into a script that is more consumable. In addition to using variables and removing commands that are not required, it shows how to add machine creation into a loop so that you can control the number of machines created.

```
[CmdletBinding()]
param
(
    [Parameter(Mandatory=$true)] [string] $hostingUnitPath,
    [Parameter(Mandatory=$true)] [string] $catalogName,
    [string] $catalogDescription,
    [Parameter(Mandatory=$true)] [int] $numVmsToCreate,
    [string] $adminAddress,
    [Parameter(Mandatory=$true)] [string] $namingScheme,
    [string] $OU,
    [Parameter(Mandatory=$true)] [string] $domain,
    [Parameter(Mandatory=$true)] [string] $masterImagePath
)

Set-HypAdminConnection -AdminAddress $adminAddress

   -AdminAddress $adminAddress }

Stop-LogHighLevelOperation -IsSuccessful $true -HighLevelOperationId
   $loggingId -AdminAddress $adminAddress
```

Configure support for non-domain joined catalogs

Using the Citrix Virtual Apps and Desktops service, you can create catalogs based on workgroup, or, non-domain joined machines. Creating non-domain joined machines depends on how the account identity pool is created. The account identity pool is the mechanism used by MCS to create and track machine names during catalog provisioning.

For example, in past releases all Active Directory fields were supplied in a single instance:

```
New-AcctIdentityPool AllowUnicode -Domain "awsdevexample.local" -
   IdentityPoolName "DedicatedHostCatalog" -NamingScheme "MH-DHost##" `
   -NamingSchemeType "Numeric" *-OU "CN=Computers,DC= awsdevexample,DC=
      local"* -Scope @() `
   -ZoneUid "81291221-d2f2-49d2-ab12-bae5bbd0df05"
```

MCS uses a new PoSH parameter, `WorkgroupMachine`, to create a workgroup catalog. Using the same example, noted above, this parameter removes the requirement to specify all the AD-specific parameters, including domain administrator credentials:

```
New-AcctIdentityPool AllowUnicode -WorkgroupMachine -IdentityPoolName "
    DedicatedHostCatalog" -NamingScheme "MH-DHOst##" `
    -NamingSchemeType "Numeric" -Scope @() -ZoneUid "81291221-d2f2-49d2-
       ab12-bae5bbd0df05"
```

> **Note:**
>
> When using the WorkgroupMachine parameter, consider that non-domain joined machine catalogs are only supported through Powershell for all catalog lifecycle events including provisioning, adding/removing machines from the catalog, updating, and power management.

Creating a Delivery Group

March 11, 2024

This document provides an example of a script that creates a Delivery Group containing static desktops.

Before you begin, make sure you follow the steps detailed in the Getting started guide, which shows you how to use Studio to perform the operation you want to script and collect the log of SDK operations that Studio made to perform the task. This output can then be customized to produce a script for automating the task.

> **Note:**
>
> To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script.

Understand the script

The following section explains what each part of the script produced by Studio is doing. This will help you with the customization of your own script. Line numbers and line breaks have been added to the script for readability.

```
Start-LogHighLevelOperation -AdminAddress 'test-ddc.mydomain.com:80' -
    Source 'Studio' `
     -StartTime 31/07/2023 10:08:58 -Text 'Create Delivery Group "
        Windows 11 Desktops"'
```

Starts a logged operation and returns a log ID which is supplied to subsequent operations to associate them with the wider task.

```
New-BrokerDesktopGroup -AdminAddress 'test-ddc.mydomain.com:80' -
    ColorDepth 'TwentyFourBit' `
```

```
    -DeliveryType 'DesktopsOnly' -DesktopKind 'Private' -
        InMaintenanceMode $False -IsRemotePC $False `
    -LoggingId 846f2d42-a994-4bce-ab58-be05c8d73b99 -
        MinimumFunctionalLevel 'L7' `
    -Name 'Windows 11 Desktops' -OffPeakBufferSizePercent 10 -
        PeakBufferSizePercent 10 `
    -PublishedName 'Windows 11 Desktops' -Scope @() -SecureIcaRequired
        $False `
    -SessionSupport 'SingleSession' -ShutdownDesktopsAfterUse $False -
        TimeZone 'GMT Standard Time'
```

Creates a new Delivery Group with options collected by the Studio wizard.

```
Add-BrokerMachinesToDesktopGroup -AdminAddress 'test-ddc.mydomain.com
    :80' `
    -Catalog 'Windows 11' -Count 2 -DesktopGroup 'Windows 11 Desktops'
        `
    -LoggingId 846f2d42-a994-4bce-ab58-be05c8d73b99
```

Adds the number of machines requested from the nominated catalog to the new Delivery Group.

```
Set-Variable -Name 'brokerUsers' -Value @('S
    -1-5-21-3291547628-200264090-930806513-1104','S
    -1-5-21-3291547628-200264090-930806513-1105')
Get-BrokerUser -AdminAddress 'test-ddc.mydomain.com:80' -Filter {
 (SID -in $brokerUsers) }
  -MaxRecordCount 2147483647
Remove-Variable -Name 'brokerUsers'
New-BrokerUser -AdminAddress 'test-ddc.mydomain.com:80' -Name 'MYDOMAIN
    \user1'
New-BrokerUser -AdminAddress 'test-ddc.mydomain.com:80' -Name 'MYDOMAIN
    \user2'
```

The above commands are not required, Studio is verifying users.

```
Test-BrokerAssignmentPolicyRuleNameAvailable -AdminAddress 'test-ddc.
    mydomain.com:80' -Name @('Windows 11 Desktops')
```

Studio checks that the policy assignment name is available to use.

```
New-BrokerAssignmentPolicyRule -AdminAddress 'test-ddc.mydomain.com:80'
     -DesktopGroupUid 41 -Enabled $True `
    -IncludedUserFilterEnabled $False -LoggingId 846f2d42-a994-4bce-
        ab58-be05c8d73b99 -MaxDesktops 1 `
    -Name 'Windows 11 Desktops'
```

Create the new policy assignment rule for the Delivery Group. No users are specified here so all control is through the access policy rule.

```
Set-Variable -Name 'brokerUsers' -Value @('S
    -1-5-21-3291547628-200264090-930806513-1104','S
    -1-5-21-3291547628-200264090-930806513-1105')
Get-BrokerUser -AdminAddress 'test-ddc.mydomain.com:80' -Filter {
```

```
 (SID -in $brokerUsers) }
  -MaxRecordCount 2147483647
Remove-Variable -Name 'brokerUsers'
New-BrokerUser -AdminAddress 'test-ddc.mydomain.com:80' -Name 'MYDOMAIN
   \user1'
New-BrokerUser -AdminAddress 'test-ddc.mydomain.com:80' -Name 'MYDOMAIN
   \user2'
```

The above commands are not required, Studio is performing further checks.

```
Test-BrokerAccessPolicyRuleNameAvailable -AdminAddress 'test-ddc.
   mydomain.com:80' -Name @('Windows 11 Desktops\_Direct')
```

Studio tests that the access policy rule name is available to use.

```
New-BrokerAccessPolicyRule -AdminAddress 'test-ddc.mydomain.com:80' -
   AllowedConnections 'NotViaAG' `
    -AllowedProtocols @('HDX','RDP') -AllowRestart $True -
       DesktopGroupUid 41 -Enabled $True `
    -IncludedSmartAccessFilterEnabled $True -IncludedUserFilterEnabled
       $True `
    -IncludedUsers @('MYDOMAIN\user1','MYDOMAIN\user2') `
    -LoggingId 846f2d42-a994-4bce-ab58-be05c8d73b99 -Name 'Windows 11
       Desktops_Direct'
```

Creates the access policy rule for the new desktop for non-NetScaler Gateway connections.

```
Test-BrokerAccessPolicyRuleNameAvailable -AdminAddress 'test-ddc.
   mydomain.com:80' -Name @('Windows 11 Desktops_AG') New-
   BrokerAccessPolicyRule -AdminAddress 'test-ddc.mydomain.com:80' -
   AllowedConnections 'ViaAG' `
    -AllowedProtocols @('HDX','RDP') -AllowRestart $True -
       DesktopGroupUid 41 -Enabled $True `
    -IncludedSmartAccessFilterEnabled $True -IncludedSmartAccessTags @
       () -IncludedUserFilterEnabled $True `
    -IncludedUsers @('MYDOMAIN\user1','MYDOMAIN\user2') -LoggingId 846
       f2d42-a994-4bce-ab58-be05c8d73b99 -Name 'Windows 11 Desktops_AG'
```

Studio repeats this process for NetScaler Gateway connections.

```
Test-BrokerPowerTimeSchemeNameAvailable -AdminAddress 'test-ddc.
   mydomain.com:80' -Name @('Windows 11 Desktops_Weekdays') New-
   BrokerPowerTimeScheme -AdminAddress 'test-ddc.mydomain.com:80' -
   DaysOfWeek 'Weekdays' -DesktopGroupUid 41 `
    -DisplayName 'Weekdays' -LoggingId 846f2d42-a994-4bce-ab58-
       be05c8d73b99 -Name 'Windows 11 Desktops_Weekdays' `
    -PeakHours @($False,$False,$False,$False,$False,$False,$False,$True
       ,$True,$True,$True,$True,$True,$True, $True,$True,$True,
       $True,$False,$False,$False,$False,$False) `
    -PoolSize @(0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0)
Test-BrokerPowerTimeSchemeNameAvailable -AdminAddress 'test-ddc.
   mydomain.com:80' -Name @('Windows 11 Desktops_Weekend')
New-BrokerPowerTimeScheme -AdminAddress 'test-ddc.mydomain.com:80' -
```

```
    DaysOfWeek 'Weekend' -DesktopGroupUid 41 `
 7   -DisplayName 'Weekend' -LoggingId 846f2d42-a994-4bce-ab58-
        be05c8d73b99 -Name 'Windows 11 Desktops_Weekend' `
 8   -PeakHours @($False,$False,$False,$False,$False,$False,$False,$True
        ,$True,$True,$True,$True,$True,$True,$True,$True,$True,$True,
        $True,$False,$False,$False,$False,$False) `
 9   -PoolSize @(0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0)
```

Studio checks that the names for the (optional) weekday and weekend power schemes are available, and adds these.

```
1 Stop-LogHighLevelOperation -AdminAddress 'test-ddc.mydomain.com:80' -
    EndTime 31/07/2023 10:09:05 `
2   -HighLevelOperationId 846f2d42-a994-4bce-ab58-be05c8d73b99 -
        IsSuccessful $True
```

Stops the logged operation, indicating it was successful.

Customize the script

This section shows how to convert and adapt the Studio output into a script that is more consumable.

The script creates a Delivery Group containing Windows 11 desktops. The catalog specified in the parameters must exist already and be populated appropriately (with an allocation type of static). The script is designed to be run from a Powershell command line logged on as a Citrix administrator. No checks are made for permissions; the script will fail if the user does not have the appropriate permissions.

```
 1 <#
 2 Sample usage:
 3 .\CreateDeliveryGroup.ps1 `
 4     -GroupName "Windows 11 Desktops" `
 5     -SrcCatalog "win11-catalog" `
 6     -NumDesktops 2 ``
 7     -Users @('mydomain\user1','mydomain\user2')
 8 #>
 9
10 Param(
11     [Parameter(Mandatory=$true)] [string] $GroupName,
12     [Parameter(Mandatory=$true)] [string] $SrcCatalog,
13     [Parameter(Mandatory=$true)] [int] $NumDesktops,
14     [Parameter(Mandatory=$true)] [array] $Users
15     [string] $AdminAddress
16 )
```

The table explains the parameters used in the script.

Parameter	Description
SrcCatalog	The name of the catalog to be used to create the desktop. Create the catalog by specifying an allocation type of static.
GroupName	The name of the catalog to be used to create the desktop. Create the catalog by specifying an allocation type of static.
NumDesktops	The number of machines to add to the desktop group. If insufficient machines are available, as many as possible are added.
Users	Which users can access the group. This is a list of users or groups; for example, @('mydomain\Domain Users') or @('mydomain\user1','mydomain\user2')

```
Set-HypAdminConnection -AdminAddress $adminAddress
```

Specify the hypervisor admin connection to use. Removes the need for the -AdminAddress for some of the commands.

```
$peakPoolSize = 2
$weekendPoolSizeByHour = new-object int[] 24
$weekdayPoolSizeByHour = new-object int[] 24
9..17 | %{
  $weekdayPoolSizeByHour[$_] = $peakPoolSize  }

$peakHours = (0..23 | %{
  $_ -ge 9 -and $_ -le 17  }
 )
```

This creates 24 element arrays with a 1 or a 0 in each entry. Use these to specify when peak hours are for the power schedules for the Delivery Groups. Elements 9 to 17 (hours starting 09:00 to 17:00) for weekdays are set to 1, others are left at 0. Two unassigned machines are powered up during peak times, if available.

```
$logId = Start-LogHighLevelOperation` -Text "Create desktop group" -
    Source "Create Desktop Group Script"
```

Start a new logged operation. This returns a log ID which is passed into subsequent operations to associate them with the create group task.

```
$grp = New-BrokerDesktopGroup `
    -DesktopKind 'Private' `
    -DeliveryType 'DesktopsOnly' `
```

```
    -LoggingId $logId.Id `
    -Name $GroupName `
    -PublishedName $GroupName `
    -SessionSupport 'SingleSession' `
    -ShutdownDesktopsAfterUse $False

$count = Add-BrokerMachinesToDesktopGroup `
    -Catalog $SrcCatalog `
    -Count $NumDesktops `
    -DesktopGroup \$GroupName `
    -LoggingId $logId.Id

"$count machines added to the desktop group"
```

Create the new Delivery Group, delivering private desktops. The catalog used must have been populated with suitable machines. PublishedName is the name seen by end users; the following uses the same name as the group name.

```
$null = New-BrokerAssignmentPolicyRule `
    -DesktopGroupUid $grp.Uid `
    -IncludedUserFilterEnabled $False `
    -LoggingId $logId.Id `
    -MaxDesktops 1 `
    -Name ($GroupName + '\_AssignRule')
```

Assigned desktops need an assignment policy. Disable user filter so that access is controlled entirely by access policy rules.

```
$null = New-BrokerAccessPolicyRule `
    -AllowedConnections 'NotViaAG' `
    -AllowedProtocols @('HDX','RDP') `
    -AllowRestart $True `
    -DesktopGroupUid $grp.Uid `
    -IncludedSmartAccessFilterEnabled $True `
    -IncludedUserFilterEnabled $True `
    -IncludedUsers $Users `
    -LoggingId $logId.Id `
    -Name ($GroupName + '_Direct')

$null = New-BrokerAccessPolicyRule `
    -AllowedConnections 'ViaAG' `
    -AllowedProtocols @('HDX','RDP') `
    -AllowRestart $True `
    -DesktopGroupUid $grp.Uid `
    -IncludedSmartAccessFilterEnabled $True `
    -IncludedSmartAccessTags @() `
    -IncludedUserFilterEnabled $True `
    -IncludedUsers $Users `
    -LoggingId $logId.Id `
    -Name ($GroupName + '_AG')
```

Specify any access restrictions: allow direct access using NetScaler Gateway, using HDX & RDP proto-

cols. The user can request the desktop be restarted, if necessary.

```
$null = New-BrokerPowerTimeScheme `
    -DaysOfWeek 'Weekdays' `
    -DesktopGroupUid $grp.Uid `
    -DisplayName 'Weekdays' `
    -LoggingId $logId.Id `
    -Name ($GroupName + '_Weekdays') `
    -PeakHours $peakHours `
    -PoolSize $weekdayPoolSizeByHour

$null = New-BrokerPowerTimeScheme `
    -DaysOfWeek 'Weekend' `
    -DesktopGroupUid $grp.Uid `
    -DisplayName 'Weekend' `
    -LoggingId $logId.Id `
    -Name ($GroupName + '_Weekend') `
    -PeakHours $peakHours `
    -PoolSize $weekendPoolSizeByHour
```

Optional: Specify power schedules.

```
Stop-LogHighLevelOperation -HighLevelOperationId $logId.Id -
   IsSuccessful $True
```

Stop configuration logging and indicate if successful or not.

Creating and configuring a hosting connection

March 11, 2024

The following example shows how to create and configure a hosting connection.

Before you begin, make sure you follow the steps detailed in the Getting started guide, which tells you how to use Studio to perform the operation you want to script (in this case, to create a host) and collect the log of SDK operations that Studio made to perform the task. This output can then be customized to produce a script for automating host creation.

> **Note:**
>
> To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script. Line numbers and line breaks have been added to the script for readability.

Understand the script

The following section explains what each part of the script produced by Studio is doing. This will help you with the customization of your own script. Line breaks have been added for readability.

```
Get-LogSite -AdminAddress 'mycontroller.example.com:80'
```

Queries the configuration logging service to retrieve information about the site configuration.

```
Start-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80'
    `
    -Source 'Studio' -StartTime 14/08/2013 14:30:28 -Text 'Create
       Connection `'Example Citrix Hypervisor`''
```

Starts a high-level logging operation with the configuration logging operation within which the rest of the commands will exist. Returns a log ID which is supplied to subsequent operations.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the location of the Host Service that will be used by the configuration cmdlets. Because the Host Service exposes a PowerShell provider, not all of the cmdlets can take an address for the service so this cmdlet sets a default location.

```
New-Item -ConnectionType 'XenServer' -HypervisorAddress @('http://
   hypervisorhost1.example.com') `
    -LoggingId e355ce51-8cbb-400a-ae81-1fdc567239cb -Path @('XDHyp:\
       Connections\Example Citrix Hypervisor') `
    -Scope @() -Password ******** -UserName 'root'
```

Creates a connection to a Citrix Hypervisor host (hypervisorhost1.example.com). This is a non-persistent connection
and is available only to this PowerShell runspace.

```
Stop-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80'
   -EndTime 14/08/2013 14:30:29 `
    -HighLevelOperationId 'e355ce51-8cbb-400a-ae81-1fdc567239cb' -
       IsSuccessful $True
```

Stops the logged operation begun previously and indicates it was successful.

```
Get-LogSite -AdminAddress 'mycontroller.example.com:80'
```

Queries the configuration logging service to retrieve information about the site configuration.

```
Start-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80'
    -Source 'Studio' -StartTime 14/08/2013 14:30:30 `
    -Text 'Update Connection `'Example Citrix Hypervisor`''
```

Starts a new high-level logging operation.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the Host Service address details again (note that this repetition is removed in the optimized script below).

```
Set-Item -HypervisorAddress @('http://hypervisorhost1.example.com','
    http://hypervisorhost2.example.com') `
 -LoggingId 44e15629-6906-4840-a36c-984aaf67be6d -PassThru -Path @('
    XDHyp:\\Connections\\Example Citrix Hypervisor') `
 -Password ******** -UserName 'root'
```

Updates the connection previously created. As there is more than one Citrix Hypervisor server in the pool, it supplies all the addresses to enable High Availability.

```
Stop-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80'
    -EndTime 14/08/2013 14:30:31 `
 -HighLevelOperationId '44e15629-6906-4840-a36c-984aaf67be6d' -
    IsSuccessful \$True
```

Stops the logging operation.

```
Get-LogSite -AdminAddress 'mycontroller.example.com:80'
```

Queries the configuration logging service to retrieve information about the site configuration.

```
Start-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80'
     -Source 'Studio' `
 -StartTime 14/08/2013 14:31:03 `
 -Text 'Create Resources `'Example Resources`' and Persist
    Connection `'Example Citrix Hypervisor`''
```

Starts a new logging operation.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the Host Service address details again.

```
Get-ChildItem -Path @('XDHyp:\Connections')
```

Gets the contents of the host connection to populate the wizard dialogs.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the Host Service address details again.

```
Remove-Item -LoggingId 76caa3f4-df93-4cb2-b78d-6a8824766314 -Path @('
    XDHyp:\Connections\Example Citrix Hypervisor')
```

Removes the temporary connection created in the wizard.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the Host Service address details again.

```
New-Item -ConnectionType 'XenServer' -HypervisorAddress @('http://
    hypervisorhost1.example.com','http://hypervisorhost2.example.com') `
     -LoggingId 76caa3f4-df93-4cb2-b78d-6a8824766314 -Path @('XDHyp:\\
        Connections\\Example Citrix Hypervisor') -Persist `
     -Scope @() -Password ******** -UserName 'root'
```

Recreates the connection as a persistent connection which is written to the database and available to other PowerShell runspaces.

```
New-BrokerHypervisorConnection -AdminAddress 'mycontroller.example.com
    :80' `
     -HypHypervisorConnectionUid a14096ba-5074-44ff-b596-371e345c0449 `
     -LoggingId 76caa3f4-df93-4cb2-b78d-6a8824766314
```

Adds the host connection to the Broker Service.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the Host Service address details again.

```
New-Item -HypervisorConnectionName 'Example Citrix Hypervisor' -
    LoggingId 76caa3f4-df93-4cb2-b78d-6a8824766314 `
     -NetworkPath @('XDHyp:\Connections\Example Citrix Hypervisor\
        Network0.network') `
     -Path @('XDHyp:\HostingUnits\Example Resources') `
     -RootPath 'XDHyp:\Connections\Example Citrix Hypervisor' `
     -StoragePath @('XDHyp:\Connections\Example Citrix Hypervisor\
        Primary OS.storage')
```

Creates the HostingUnit (referred to as Resources in Studio) using the information gathered in step 14.

```
Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'
```

Sets the Host Service address details again.

```
Get-Item -Path @('XDHyp:\Connections\Example Citrix Hypervisor')
```

Retrieves the newly created object.

```
Stop-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80'
    -EndTime 14/08/2013 14:31:07 `
     -HighLevelOperationId '76caa3f4-df93-4cb2-b78d-6a8824766314' -
        IsSuccessful $True
```

Stops the logged operation begun previously and indicates if it was successful.

Customize the script

The following section shows how to convert and adapt the Studio output into a script that is more consumable. The following script has been simplified so that, instead of creating a temporary host connection in the process of acquiring information in the wizards as in the Studio script above, a persistent connection is created. Information is then queried from within this to create the HostingUnit (Resources). Note that the LoggingId and HypHyperConnectionUid details are different.

Line breaks have been added for readability.

```
$loggingOp = Start-LogHighLevelOperation -AdminAddress $adminAddress -Source 'Scripted' -Text "Create Connection '$connectionName'"
$loggingId = $loggingOp.Id

Set-HypAdminConnection -AdminAddress 'mycontroller.example.com:80'

New-Item -ConnectionType 'XenServer' -HypervisorAddress @('http://hypervisorhost1.example.com','http://hypervisorhost2.example.com')`
    -LoggingId $loggingId -Path @('XDHyp:\\Connections\\Example Citrix Hypervisor') -Persist -Scope @() `
    -Password 'XenServerPassword' -UserName 'root'

Get-ChildItem -Path @('XDHyp:\Connections')

New-BrokerHypervisorConnection -AdminAddress 'mycontroller.example.com:80' `
    -HypHypervisorConnectionUid a14096ba-5074-44ff-b596-371e345c0449 `
    -LoggingId $loggingId

New-Item -HypervisorConnectionName 'Example Citrix Hypervisor' -LoggingId $loggingId `
    -NetworkPath @('XDHyp:\Connections\Example Citrix Hypervisor\Network0.network') `
    -Path @('XDHyp:\HostingUnits\Example Resources') `
    -RootPath 'XDHyp:\Connections\Example Citrix Hypervisor' `
    -StoragePath @('XDHyp:\Connections\Example Citrix Hypervisor\PrimaryOS.storage')

Stop-LogHighLevelOperation -AdminAddress 'mycontroller.example.com:80' -HighLevelOperationId $loggingId -IsSuccessful $True
```

Getting load balancing information

March 11, 2024

You can use Server OS Machines to deliver cost-effective applications and desktops hosted on server operating systems to multiple users.

To load balance Server OS Machines in a deployment, you use Citrix policies. There are several load balancing policy settings for enabling and configuring load management between servers delivering Windows Server OS machines. For more information, see the load management policy settings reference documentation. You work with policies through Studio or the Group Policy Management Console in Windows; see the Policies documentation for details.

To see the load, you can use either the Citrix Director or Studio consoles, or the PowerShell SDK. The following example shows how to use the PowerShell SDK to display the load.

> **Note:**
>
> If you've used previous versions of Citrix Virtual Apps and Desktops, you may be familiar with the **qfarm/load** command. This tool is no longer available, but you can use PowerShell to display similar output as shown in the example below.

Example: Get load index values

To display a list of machines with their calculated/measured load index values, together with counts of sessions running on them:

1. Start a shell in PowerShell. For more information, see Citrix Virtual Apps and Desktops SDK.
2. Type:

```
Get-BrokerMachine -SessionSupport MultiSession -Property 'DnsName','
    LoadIndex','SessionCount'
```

> **Note:**
>
> Load index values go up to 10000. They indicate VDA machine load calculated from the configured sources, such as number of sessions. A value of 10000 indicates a fully loaded VDA machine; the broker will not send another user session to that machine.

For more information and examples, see the cmdlet help for the Get-BrokerMachine cmdlet and About topics such as about_broker_filtering.

about_AcctADIdentitySnapIn

March 11, 2024

Topic

about_AcctADIdentitySnapin

Short Description

The Active Directory Identity Service PowerShell snap-in provides administrative functions for the Active Directory Identity Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Acct'.

Long Description

The Active Directory Identity Service PowerShell snap-in enables both local and remote administration of the Active Directory Identity Service. It provides facilities to store details about Active Directory computer accounts that the Machine Creation Service can use.

The snap-in provides two main entities:

Identity

A representation of an Active Directory computer account that reflects the state of the account within the context of the Machine Creation Service. When an account is created by or imported into the Active Directory Identity Service, the account password is stored. Once the account is consumed by the Machine Creation Service, the password is discarded. For accounts registered with the Active Directory Identity Service, identities hold the following additional state information.

Available

The Active Directory account is registered with the service, the password for the account is known, and the account is available to be consumed by another service. Accounts that are successfully created with the New-AcctADAccount command or imported using the Add-AcctADAccount command are initially assigned this state.

InUse

The Active Directory account is registered and has been consumed by another service. The password for the account is no longer known to the service.

Error

The Active Directory account is registered, but is missing, disabled, or locked within Active Directory. Accounts that are not successfully created with the New-AcctADAccount command or imported using the Add-AcctADAccount command appear in this state. Use the Update-AcctADAccount and Repair-AcctADAccount commands to resolve issues with accounts in this state.

Tainted

The Active Directory account is registered and has been released by all the consuming services, but cannot be made available for use as the password is no longer known. Use the Repair-AcctADAccount command to reset account passwords and restore the account state to 'Available'.

Identities can also be marked as 'Locked'by the Machine Creation Service to indicate that they are in use and must not be changed. These services are also responsible for unlocking the Active Directory accounts when they no longer require exclusive access. In some cases, an account may remain locked if a task is unexpectedly stopped. Use the Unlock-AcctADAccount command to manually unlock the account if necessary.

Identity Pool

Containers for identities that can be configured with all the information required for new Active Directory accounts to be created. Alternatively, identity pools can be populated by importing accounts that already exist in Active Directory. All accounts registered with the Active Directory Identity Service must be placed into one of these containers. An identity can belong to more than one identity pool, but the state of the identity cannot be different in each pool. For example, an identity that is in use will be marked 'InUse'in all the identity pools of which it is part.

To avoid conflicting changes, identity pools can also be marked as 'Locked' during operations that modify the content of a pool. These operations are also responsible for unlocking the identity pool. In some cases, a pool may remain locked if a task is unexpectedly stopped. Use the Unlock-AcctIdentityPool command to manually unlock the pool if necessary.

Active Directory Permissions

Certain commands provided by the Active Directory Identity Service PowerShell snap-in require permissions for Active Directory operations. By default, the user account executing the command will be used to check for permissions. Active Directory credentials for an account with permissions may also be specified using the -ADUsername and -ADPassword parameters if necessary.

Account Creation (using the New-AcctADAccount command)

To use PowerShell to create new Active Directory accounts, the command must be run using an account with sufficient permissions in the required Active Directory container (specified by the identity pool organizational unit parameter) for accounts to be created.

Import Accounts (using the Add-AcctADAccount command)

There are two modes for this operation: situations where the Active Directory account passwords are known and situations where the passwords are not known.

If the account passwords are known, the accounts can be imported without the need for administrative permissions in Active Directory. The accounts are imported and the password provided is used to change the existing password.

If the passwords are not known, the command must be run using an account that has permissions to reset the password for the accounts.

Account Removal (using the Remove-AcctADAccount command)

By default, the Remove-AcctADAccount command will only remove accounts from the AD Identity Service database without needing permissions to modify Active Directory accounts.

An optional parameter 'RemovalOption'can be set to modify the Active Directory accounts. If set to 'Disable'or 'Delete', the command must be run with sufficient permissions to disable or delete the account from Active Directory.

about_AcctADIdentitySnapIn

Topic

about_AcctADIdentitySnapin

Short Description

The Active Directory Identity Service PowerShell snap-in provides administrative functions for the Active Directory Identity Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Acct'.

Long Description

The Active Directory Identity Service PowerShell snap-in enables both local and remote administration of the Active Directory Identity Service. It provides facilities to store details about Active Directory computer accounts that the Machine Creation Service can use.

The snap-in provides two main entities:

Identity

A representation of an Active Directory computer account that reflects the state of the account within the context of the Machine Creation Service. When an account is created by or imported into the Active Directory Identity Service, the account password is stored. Once the account is consumed by the Machine Creation Service, the password is discarded. For accounts registered with the Active Directory Identity Service, identities hold the following additional state information.

Available

The Active Directory account is registered with the service, the password for the account is known, and the account is available to be consumed by another service. Accounts that are successfully created with the New-AcctADAccount command or imported using the Add-AcctADAccount command are initially assigned this state.

InUse

The Active Directory account is registered and has been consumed by another service. The password for the account is no longer known to the service.

Error

The Active Directory account is registered, but is missing, disabled, or locked within Active Directory. Accounts that are not successfully created with the New-AcctADAccount command or imported using the Add-AcctADAccount command appear in this state. Use the Update-AcctADAccount and Repair-AcctADAccount commands to resolve issues with accounts in this state.

Tainted

The Active Directory account is registered and has been released by all the consuming services, but cannot be made available for use as the password is no longer known. Use the Repair-AcctADAccount command to reset account passwords and restore the account state to 'Available'.

Identities can also be marked as 'Locked' by the Machine Creation Service to indicate that they are in use and must not be changed. These services are also responsible for unlocking the Active Directory accounts when they no longer require exclusive access. In some cases, an account may remain locked if a task is unexpectedly stopped. Use the Unlock-AcctADAccount command to manually unlock the account if necessary.

Identity Pool

Containers for identities that can be configured with all the information required for new Active Directory accounts to be created. Alternatively, identity pools can be populated by importing accounts that already exist in Active Directory. All accounts registered with the Active Directory Identity Service must be placed into one of these containers. An identity can belong to more than one identity pool, but the state of the identity cannot be different in each pool. For example, an identity that is in use will be marked 'InUse' in all the identity pools of which it is part.

To avoid conflicting changes, identity pools can also be marked as 'Locked' during operations that modify the content of a pool. These operations are also responsible for unlocking the identity pool. In some cases, a pool may remain locked if a task is unexpectedly stopped. Use the Unlock-AcctIdentityPool command to manually unlock the pool if necessary.

Active Directory Permissions

Certain commands provided by the Active Directory Identity Service PowerShell snap-in require permissions for Active Directory operations. By default, the user account executing the command will be used to check for permissions. Active Directory credentials for an account with permissions may also be specified using the -ADUsername and -ADPassword parameters if necessary.

Account Creation (using the New-AcctADAccount command)

To use PowerShell to create new Active Directory accounts, the command must be run using an account with sufficient permissions in the required Active Directory container (specified by the identity pool organizational unit parameter) for accounts to be created.

Import Accounts (using the Add-AcctADAccount command)

There are two modes for this operation: situations where the Active Directory account passwords are known and situations where the passwords are not known.

If the account passwords are known, the accounts can be imported without the need for administrative permissions in Active Directory. The accounts are imported and the password provided is used to change the existing password.

If the passwords are not known, the command must be run using an account that has permissions to reset the password for the accounts.

Account Removal (using the Remove-AcctADAccount command)

By default, the Remove-AcctADAccount command will only remove accounts from the AD Identity Service database without needing permissions to modify Active Directory accounts.

An optional parameter 'RemovalOption'can be set to modify the Active Directory accounts. If set to 'Disable'or 'Delete', the command must be run with sufficient permissions to disable or delete the account from Active Directory.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying

the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell
handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape
the wildcards using the normal PowerShell escape mechanisms (see
about_Escape_Characters), or switch to a filter expression and the -eq
operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
```

```
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan

values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid

```
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-AcctADAccount

March 11, 2024

Import existing Active Directory (AD) computer accounts for use in the AD Identity Service.

Syntax

```
Add-AcctADAccount
   [-IdentityPoolName] <String>
   -ADAccountName <String[]>
   [-Password <String>]
   [-SecurePassword <SecureString>]
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AcctADAccount
   -IdentityPoolUid <Guid>
   -ADAccountName <String[]>
   [-Password <String>]
   [-SecurePassword <SecureString>]
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for Active Directory (AD) computer accounts that already exist in AD to be used by the Citrix AD Identity Service and other Citrix Machine Creation Services.

All aspects of this command that need to make modifications to the accounts in AD will do so using the account that the PowerShell runspace is using. This means that if the passwords need resetting for the accounts, the user performing the operation in PowerShell must have sufficient privileges in AD for this operation to complete successfully. If the current user does not have sufficient privileges, the ADUserName and ADPassword parameters may be used instead.

The following rules apply to the importing of AD accounts:

If the current account password is supplied, the cmdlet will attempt to change the password so that it is known only to the Citrix Identity Service. This uses password change operations and does not need AD account administration permissions.

If the current password is not supplied, the cmdlet will attempt to reset the password for the AD account so that it is known only to the Citrix Identity Service. This requires the user to have enough privileges in AD to reset the account passwords.

Imported accounts in a disabled or locked state in AD are imported with the account marked in an error state.

If the identity pool into which accounts are being imported does not have a domain set, the domain of the identity pool will be set to the domain of the first account imported.

Examples

EXAMPLE 1

Import the two accounts (account and account2) from AD into the identity Pool called “MyPool”

```
Add-AcctADAccount -IdentityPoolName MyPool -ADAccountName "Domain\
    account","Domain\account2" -OutVariable result

SuccessfulAccounts                SuccessfulAccountsCount
    FailedAccountsCount    FailedAccounts
------------------                -----------------------
    -------------------    --------------
{
 domain\account, domain\account2 }
  2                             0                      {
  }

$result.SuccessfulAccounts

```

```
ADAccountGuid           : 473f5534-48ac-4baf-831f-376c5b813b60
ADAccountName           : domain\account
ADAccountSid            : S-1-5-21-1315084875-1285793635-2418178940-2644
AccountDisabled         : False
AccountLocked           : False
Domain                  : Domain.com
DomainControllerHint    :
Lock                    : False
State                   : Available
TenantId                :
DeviceManagementType    : None
IdentityType            : ActiveDirectory
VdaHostId               :
WorkgroupMachine        : False
TrustServiceInstanceId  :

ADAccountGuid           : 7f23cdaa-072f-4eab-bca5-c2b18cd30c06
ADAccountName           : domain\account2
ADAccountSid            : S-1-5-21-1315084875-1285793635-2418178940-2645
AccountDisabled         : False
AccountLocked           : False
Domain                  : Domain.com
DomainControllerHint    :
Lock                    : False
State                   : Available
TenantId                :
DeviceManagementType    : None
IdentityType            : ActiveDirectory
VdaHostId               :
WorkgroupMachine        : False
TrustServiceInstanceId  :
```

Parameters

-IdentityPoolName

The name of the identity pool in which the accounts are to be imported.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ADAccountName

The name of the AD account to be imported. AD accounts are accepted in the following formats:

- Fully qualified DN e.g. CN=MyComputer,OU=Computers,DC=MyDomain,DC=Com
- UPN format e.g `MyComputer@MyDomain.Com`
- Domain qualified e.g MyDomain\MyComputer

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool in which the accounts are to be imported.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Password

The current password for the computer account.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SecurePassword

The current password for the account (provided in a Secure String class).

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADUserName

The username for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADPassword

The matching password for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	SecureString

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AccountOperationDetailedSummary

The Add-AcctADAccount returns an object that contains the following properties:

- SuccessfulAccountsCount <int>

  The number of accounts that were added successfully

- FailedAccountsCount <int>

  The number of accounts that were not added.

- FailedAccounts <Citrix.XDPowerShell.AccountError[]>

  The list of accounts that failed to be added. Each one has the following properties:

  - ADAccountName <string>
  - ADAccountSid <String>
  - ErrorReason <ADIdentityStatus>

    This can be one of the following:

    * UnableToConvertDomain
    * UnableToAccessAccountProperties
    * IdentityNotLocatedInDomain
    * UnableToAccessAccountProperties
    * IdentityDuplicateObjectExists
    * IdentityObjectLocked
    * IdentityObjectInUse
    * FailedToConnectToDomainController
    * FailedToExecuteSearchInAD
    * FailedToAccessComputerAccountInAD
    * FailedToSetPasswordInAD
    * FailedToChangePasswordInAD
    * ADServiceDatabaseError
    * ADServiceDatabaseNotConfigured

        * ADServiceStatusInvalidDb
    - DiagnosticInformtion <Exception>

      Any other error information

- SuccessfulAccounts <Citrix.ADIdentity.Sdk.Identity[]>

  The list of accounts that were successfully added. Each one has the following properties:

    - ADAccountGuid <Guid>

      The unique identifier for the account.
    - ADAccountName <string>

      The name of the account.
    - ADAccountSid <string>

      The SID for the account.
    - AccountDisabled <bool>

      Whether or not the account is disabled in AD.
    - AccountLocked <bool>

      Whether or not the account is locked in AD.
    - Domain <string>

      The domain for the account.
    - DomainControllerHint <string>
    - Lock <bool>

      Whether or not the account is locked (in the database, not AD).
    - State <Citrix.ADIdentity.Sdk.ADIdentityState>

      The state for the account. This can be:

        * Available

          The account is not used.
        * InUse

          The account is in use.
        * Error

          The account is in error (i.e. the account is locked or disabled in AD).

    * Tainted

      The account is no longer used, but the password is no longer known.

  - TenantId <Guid>

    The identity of the tenant associated with this account.

  - DeviceManagementType <string>

    The device management type.

  - IdentityType <string>

    The identity type.

  - VdaHostId <Guid>

    The ID of the VDA associated with this account.

  - WorkgroupMachine <bool>

    Whether or not the account is a workgroup account (not domain-joined).

  - TrustServiceInstanceId <string>

    The trust service ID of the machine.

Notes

To maintain maximum security when using the command programmatically, Citrix recommends you use the 'SecurePassword'property instead of the 'Password'property.

In the case of failure, the following errors can result:

- IdentityPoolAlreadyLocked

  The specified identity pool was locked by another operation.

- IdentityPoolNotFound

  The specified identity pool was not found.

- IdentityDuplicateObjectExists

  The specified AD account already exists for the identity pool.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- ServiceStatusInvalidDb

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- CommunicationError

  An error occurred while communicating with the service.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the Citrix Virtual Apps and Desktops logs.

Add-AcctAzureADSecurityGroupMember

March 11, 2024

Adds an Azure AD security group to an assigned security group.

Syntax

```
Add-AcctAzureADSecurityGroupMember
   [-AccessToken] <String>
   [-GroupId] <String>
   [-RefGroupId] <String>
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to add a Citrix-created device security group as a member to an assigned security group.

Examples

EXAMPLE 1

Adds the security group of a device as a direct member to an assigned security group.

```
Add-AcctAzureADSecurityGroupMember -AccessToken $accessToken -GroupId
   $groupId -RefGroupId $refGroupId"
True
```

Parameters

-AccessToken

Access token of Microsoft Graph API. Make sure grant consent to following permissions:

- Group.ReadWrite.All
- GroupMember.ReadWrite.All

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

The assigned security group's ID.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RefGroupId

The device security group's ID.

Type:	String
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result:

- PartialData

  Only a subset of the available data was returned.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- CommunicationError

  An error occurred while communicating with the service.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

- AzureADTenantIdMismatchAzureADAccessToken

  Mismatch between the given AzureADTenantID and TenantID in Azure AD AccessToken.

Add-AcctIdentityPoolScope

March 11, 2024

Add the specified identity pool(s) to the given scope(s).

Syntax

```
Add-AcctIdentityPoolScope
   [-Scope] <String[]>
   -InputObject <IdentityPool[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AcctIdentityPoolScope
   [-Scope] <String[]>
   -IdentityPoolUid <Guid[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AcctIdentityPoolScope
   [-Scope] <String[]>
   -IdentityPoolName <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-AcctIdentityPoolScope command is used to associate one or more identity pool objects with given scope(s).

To add an identity pool to a scope you need permission to change the scopes of the identity pool and permission to add objects to all of the scopes you have specified.

When attempting to add an identity pool to a scope it is already associated with, no change will be made.

The identity pools may be specified using the unique identifier, name, or as a powershell object.

Examples

EXAMPLE 1

Adds a single identity pool to the 'Finance'scope.

```
Add-AcctIdentityPoolScope Finance -IdentityPoolUid 6702C5D0-C073-4080-
   A0EE-EC74CB537C52
```

EXAMPLE 2

Adds a single identity pool to the multiple scopes.

```
Add-AcctIdentityPoolScope Finance,Marketing -IdentityPoolUid 6702C5D0-
    C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Adds all visible identity pool objects to the 'Finance'scope.

```
Get-AcctIdentityPool | Add-AcctIdentityPoolScope Finance
```

EXAMPLE 4

Adds identity pool objects with a name starting with an 'A'to the 'Finance'scope.

```
Add-AcctIdentityPoolScope Finance -IdentityPoolName A*
```

Parameters

-Scope

Specifies the scopes to add the objects to.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

The identity pool objects to be added.

Type:	IdentityPool[]

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pools to be added.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pools to be added.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Add-AcctServiceAccountScope

March 11, 2024

Add the specified service account(s) to the given scope(s).

Syntax

```
Add-AcctServiceAccountScope
   [-Scope] <String[]>
   -InputObject <ServiceAccount[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AcctServiceAccountScope
   [-Scope] <String[]>
   -ServiceAccountUid <Guid[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-AcctServiceAccountScope command is used to associate one or more service account objects with given scope(s).

To add a service account to a scope you need permission to change the scopes of the service account and permission to add objects to all of the scopes you have specified.

When attempting to add a service account to a scope it is already associated with, no change will be made.

The service accounts may be specified using the unique identifier, name, or as a powershell object.

Examples

EXAMPLE 1

Adds a single service account to the 'Finance'scope.

```
Add-AcctServiceAccountScope -Scope Finance -ServiceAccountUid 17631afc
   -2e4c-491e-b0aa-f979a80e32c1
```

EXAMPLE 2

Adds a single service account to the multiple scopes.

```
Add-AcctServiceAccountScope Finance,Marketing -ServiceAccountUid 17631
    afc-2e4c-491e-b0aa-f979a80e32c1
```

EXAMPLE 3

Adds all visible service account objects to the 'Finance'scope.

```
Get-AcctServiceAccount | Add-AcctServiceAccountScope Finance
```

Parameters

-Scope

Specifies the scopes to add the objects to.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

The service account objects to be added.

Type:	ServiceAccount[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ServiceAccountUid

The unique identifier for the service accounts to be added.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Copy-AcctIdentityPool

March 11, 2024

Copies an identity pool and any contained accounts to a new identity pool

Syntax

```
Copy-AcctIdentityPool
    [-IdentityPoolName] <String>
    [-NewIdentityPoolName] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Copy-AcctIdentityPool
    -IdentityPoolUid <Guid>
    [-NewIdentityPoolName] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to copy an identity pool.

The new identity pool will contain all the accounts that were in the original pool and will have the same domain and OU set. The naming scheme will be unset and the StartCount will be set to 1.

Examples

EXAMPLE 1

Copies the identity pool named "MyPool"to a new pool named "NewPool". Note that the NamingScheme is empty and the StartCount is set to 1.

```
Copy-AcctIdentityPool -IdentityPoolName MyPool -NewIdentityPoolName
    NewPool

AvailableAccounts    : 0
DeviceManagementType : None
Domain               : MyDomain.com
ErrorAccounts        : 0
IdentityContent      :
IdentityPoolName     : NewPool
IdentityPoolUid      : 2c94daf3-bf67-4e67-a7a2-d402e8f04e73
IdentityType         : ActiveDirectory
InUseAccounts        : 0
Lock                 : False
MetadataMap          : {
  }

NamingScheme         :
NamingSchemeType     : None
OU                   :
ResourceLocationId   :
StartCount           : 1
TaintedAccounts      : 0
WorkgroupMachine     : False
ZoneUid              :
Scopes               :
TenantId             :
```

Parameters

-IdentityPoolName

The name of the identity pool that is to be copied.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool that is to be copied.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewIdentityPoolName

The name of the new identity pool.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityPool

This object provides details of the identity pool and contains the following information:

- AvailableAccounts <int>

  The number of existing accounts (AcctADAccount objects) in the 'Available'state (not in 'InUse' , 'Tainted', or 'Error').

- DeviceManagementType <string>

  The device management type. Can be Intune, IntuneWithCitrixTags, or None by default.

- Domain <string>

  The Active Directory domain (in FQDN format) that accounts in the pool belong to.

- ErrorAccounts <int>

  The number of existing AD accounts in the 'Error'state.

- IdentityContent <string>

  JSON formatted metadata containing Azure AD tenant and Azure AD security group information associated with this identity pool.

- IdentityPoolName <string>

  The name of the identity pool.

- IdentityPoolUid <GUID>

  The unique identifier for the identity pool.

- IdentityType <string>

  The identity type.

- InUseAccounts <int>

  The number of existing AD accounts in the 'InUse'state.

- Lock <bool>

  Indicates if the identity pool is locked.

- MetadataMap <IDictionary[string, string];>

  The metadata associated with this identity pool arranged in key value pairs.

- NamingScheme <string>

  The naming scheme for the identity pool.

- NamingSchemeType <string>

  The naming scheme type for the identity pool. This can be one of the following:

  - Numeric

    Naming scheme uses numeric indexes.

- Alphabetic

  Naming scheme uses alphabetic indexes.

- OU <string>

  The Active Directory distinguished name for the OU in which accounts for this identity pool will be created.

- ResourceLocationId <GUID>

  The UID that corresponds to the resource location (DaaS only).

- StartCount <int>

  The next index to be used when creating an account in the identity pool.

- TaintedAccounts <int>

  The number of existing AD accounts in the 'Tainted' state.

- WorkgroupMachine <bool>

  If this is true, the identity pool can have an IdentityType of 'AzureAD' or 'Workgroup'.
  If this is false, the identity pool can have an IdentityType of 'ActiveDirectory' or 'HybridAzureAD'.

- ZoneUid <GUID>

  The UID that corresponds to the Zone in which AD accounts are created.

- Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

  The administration scopes associated with this identity pool.

- TenantId <GUID>

  Identity of the Citrix tenant associated with this identity pool.
  Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure, the following errors can result:

- IdentityPoolDuplicateObjectExists

  An identity pool with the same name exists already.

- IdentityPoolObjectNotFound

  The identity pool to be modified could not be located.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- ServiceStatusInvalidDb

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- CommunicationError

  An error occurred while communicating with the service.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Export-AcctIdentityPool

March 11, 2024

Exports an identity pool.

Syntax

```
Export-AcctIdentityPool
      [-IdentityPoolName] <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Export-AcctIdentityPool
      -IdentityPoolUid <Guid>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to export an identity pool and contained AD accounts to a JSON encoded string. Any accounts that have not yet been used by MCS will not be exported.

Examples

EXAMPLE 1

Exports the identity pool named "MyPool". This pool contains accounts that have not been used yet, so they are not exported.

```
Export-AcctIdentityPool -IdentityPoolName MyPool

{
 "IdentityPoolName":"MyPool","NamingScheme":"Acc###","NamingSchemeType"
    :2,"StartCount":7,"OU":"","Domain":"MyDomain.com","Lock":false,"
    TenantId":null,"ResourceLocationId":null,"ZoneUid":null,"
    WorkgroupMachine":false,"IdentityType":"ActiveDirectory","
    IdentityContent":null,"DeviceManagementType":"None","Accounts":[] }
```

EXAMPLE 2

Exports the identity pool named "MyPool". This pool contains accounts that have been used, so they are exported.

```
Export-AcctIdentityPool -IdentityPoolName MyPool

{
 "IdentityPoolName":"MyPool","NamingScheme":"Acc###","NamingSchemeType"
    :2,"StartCount":3,"OU":"","Domain":"MyDomain.com","Lock":false,"
    TenantId":null,"ResourceLocationId":"59e9d28d-f46b-434a-97c2-995
    da9e120d7","ZoneUid":"c5282cd0-6526-4f83-b1bd-6ea2d46a7c59","
    WorkgroupMachine":false,"IdentityType":"ActiveDirectory","
    IdentityContent":null,"DeviceManagementType":"None","Accounts":[{
```

```
5   "AccountSid":"S-1-5-21-4215727520-1727542857-3748865654-1404","
       AccountGuid":"85a82962-cbb2-4c74-aa2c-9502890e554b","Domain":"
       MyDomain.com","State":2,"AccountName":"MyDomain\\Acc001$","
       DomainControllerName":"
       v2_bnMtZGMubmljaG9sYXNzdS5sb2NhbDo1OWU5ZDI4ZC1mNDZiLTQzNGEtOTdjMi05OTVkYTllMT
       =","TimeCreated":"2022-10-20T16:48:04.55" }
6   ,{
7   "AccountSid":"S-1-5-21-4215727520-1727542857-3748865654-1405","
       AccountGuid":"984a0fb8-ef0d-49d3-8720-3602878bc843","Domain":"
       MyDomain.com","State":2,"AccountName":"MyDomain\\ExportAcc002$","
       DomainControllerName":"
       v2_bnMtZGMubmljaG9sYXNzdS5sb2NhbDo1OWU5ZDI4ZC1mNDZiLTQzNGEtOTdjMi05OTVkYTllMT
       =","TimeCreated":"2022-10-20T16:48:05.58" }
8   ] }
```

Parameters

-IdentityPoolName

The name of the identity pool.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-IdentityPoolUid

The unique identifier for the identity pool.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

A JSON encoded version of the identity pool and the ADAccounts that are part of the identity pool.

Notes

In the case of failure, the following errors can result:

- PartialData

  Only a subset of the available data was returned.
- CouldNotQueryDatabase

  The query required to get the database was not defined.
- PermissionDenied

  The user does not have administrative rights to perform this operation.
- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error
- CommunicationError

  An error occurred while communicating with the service.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Get-AcctADAccount

March 11, 2024

Gets the Active Directory (AD) accounts stored in the AD Identity Service.

Syntax

```
Get-AcctADAccount
   [-ADAccountSid <String>]
   [-Domain <String>]
   [-IdentityPoolName <String>]
   [-State <ADIdentityState>]
   [-Lock <Boolean>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-AcctADAccount
    [-ADAccountSid <String>]
    [-Domain <String>]
    [-IdentityPoolUid <Guid>]
    [-State <ADIdentityState>]
    [-Lock <Boolean>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to locate the Active Directory (AD) accounts stored within the AD Identity Service and view the state of the accounts.

Examples

EXAMPLE 1

Return all the AD accounts that are registered in the AD Identity Service.

```
Get-AcctADAccount

ADAccountGuid          : a33f54f8-4944-4537-93c9-a04f0b889378
ADAccountName          : MyDomain\ACC001
ADAccountSid           : S-1-5-21-1315084875-1285793635-2418178940-2684
AccountDisabled        : False
AccountLocked          : False
Domain                 : MyDomain.com
DomainControllerHint   :
    v2_ZGMubXlkb21haW4uY29tOjU5ZTlkMjhkLWY0NmItNDM0YS05N2MyLTk5NWRhOWUxMjBkNw
    ==
Lock                   : False

```

EXAMPLE 2

Return all the AD accounts that are registered in the AD Identity Service in the identity pool named "MyPool"that are not locked.

```
Get-AcctADAccount -IdentityPoolName MyPool -Lock $false
```

EXAMPLE 3

Return all the AD accounts that are registered in the AD Identity Service in the identity pool named "MyPool"or an identity pool with a name starting with 'p'. For full details of the advanced filtering aspects of this command see about_Acct_Filtering.

```
Get-AcctADAccount -Filter {
 IdentityPoolName -Like "p*" -or IdentityPoolName -eq "MyPool" }
```

Parameters

-ADAccountSid

The AD Account SID of the account.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Domain

The domain of the account (this is in dns format).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-State

The current state of the identity stored in the AD Identity Service for the AD account.

Type:	ADIdentityState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Lock

Indicates if the account is locked in the AD Identity Service.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Acct_Filtering for details.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Acct_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool to which the account is registered.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-IdentityPoolUid

The unique identifier for the identity pool that the account is registered to.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityInPool

The Get-AcctADAccount returns an object that contains the following parameters:

- IdentityPoolName <string>

  The name of the containing identity pool.

- IdentityPoolUid <GUID>

  The unique identifier for the containing identity pool.

- ADAccountGuid <GUID>

  The unique identifier for the account.

- ADAccountName <string>

  The name of the account.

- ADAccountSid <string>

  The SID for the account.

- AccountDisabled <bool>

  Whether or not the account is disabled in AD.

- AccountLocked <bool>

  Whether or not the account is locked in AD.

- Domain <string>

  The domain for the account.

- DomainControllerHint <string>

  The base 64 encoded hint for the domain controller location.

- Lock <bool>

  Whether or not the account is locked (in the database, not AD).

- State <string>

  The state for the account. This can be:

- TenantId <GUID>

  The identity of the tenant associated with this account.

- DeviceManagementType <string>

  The device management type.

- IdentityType <string>

  The identity type.

- VdaHostId <GUID>

  The ID of the VDA associated with this account.

- WorkgroupMachine <bool>

  Whether or not the account is a workgroup account (not domain-joined).

- TrustServiceInstanceId <string>

  The trust service ID of the machine.

Notes

In the case of failure the following errors can result:

- PartialData

  Only a subset of the available data was returned.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- CommunicationError

  An error occurred while communicating with the service.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Get-AcctAzureADSecurityGroup

March 11, 2024

Retrieve the security groups in specific Azure tenant.

Syntax

```
Get-AcctAzureADSecurityGroup
    [-AccessToken] <String>
    [-GroupId <String>]
    [-Name <String>]
    [-SearchString <String>]
    [-Assigned <Boolean>]
    [-Dynamic <Boolean>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to retrieve the Azure AD security groups of specific Azure tenant.

Examples

EXAMPLE 1

Gets Azure AD security groups with the object id of “e17d1c86-efgh-efgh-efgh-97e22c7bd96c”.

```
Get-AcctAzureADSecurityGroup -AccessToken $accessToken -GroupId "
    e17d1c86-efgh-efgh-efgh-97e22c7bd96c"

MembershipRule : (device.displayName -match "AzureADMC[0-9]{
 3 }
 $")
Name : SecurityGroupOfAzureADMachineCatalog
ObjectId  : e17d1c86-efgh-efgh-efgh-97e22c7bd96c
Type : Dynamic
```

EXAMPLE 2

Gets AzureAD security group with the name of “ABCD”.

```
Get-AcctAzureADSecurityGroup -AccessToken $accessToken -Name "
    SecurityGroupOfAzureADMachineCatalog"

MembershipRule : (device.displayName -match "AzureADMC[0-9]{
 3 }
 $")
```

```
Name : SecurityGroupOfAzureADMachineCatalog
ObjectId  : e17d1c86-efgh-efgh-efgh-97e22c7bd96c
Type : Dynamic
```

EXAMPLE 3

Gets AzureAD security group with name contains of “ABCD”.

```
Get-AcctAzureADSecurityGroup -AccessToken $accessToken -SearchString "
    SecurityGroup"

MembershipRule : (device.displayName -match "AzureADMC[0-9]{
 3 }
 $")
Name : SecurityGroupOfAzureADMachineCatalog
ObjectId  : e17d1c86-efgh-efgh-efgh-97e22c7bd96c
Type : Dynamic
```

EXAMPLE 4

Gets all AzureAD assigned security groups.

```
Get-AcctAzureADSecurityGroup -AccessToken $accessToken -AssignedOnly

MembershipRule : (device.displayName -match "AzureADMC[0-9]{
 3 }
 $")
Name : SecurityGroupOfAzureADMachineCatalog
ObjectId  : e17d1c86-efgh-efgh-efgh-97e22c7bd96c
Type : Assigned
```

Parameters

-AccessToken

Access token of Microsoft Graph API. Make sure grant consent to following permissions:

- Group.Read.All

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	True

-GroupId

The ObjectId of an AzureAD security group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Name

The Name of the AzureAD security group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SearchString

The search expression of the AzureAD security group display name.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Assigned

Specify only assigned AzureAD security group will retrieve.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Dynamic

Specify only dynamic AzureAD security group will retrieve.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AzureADSecurityGroup

This object provides details of an object of the Azure AD security group and contains the following information:

- MembershipRule <string>

  The membershipRule of AzureAD security group.

- Name <string>

  The name of AzureAD security group.

- ObjectId <Guid>

  The unique Object Id of the AzureAD security group.

- Type <string>

  The type of AzureAD security group.

Notes

The parameter GroupId will take priority over other parameters.

When all parameters are empty, it will return all assigned security groups under current tenant id that encoded in assess token.

In the case of failure, the following errors can result:

- PartialData

  Only a subset of the available data was returned.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- CommunicationError

  An error occurred while communicating with the service.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs

Get-AcctAzureADSecurityGroupMember

March 11, 2024

Retrieves all the security group members of a specific security group.

Syntax

```
Get-AcctAzureADSecurityGroupMember
    [-AccessToken] <String>
    [-GroupId] <String>
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to retrieve all the security group members from a specific Azure AD group.

Examples

EXAMPLE 1

Retrieves all the security group members of a specific Azure AD security group.

```
Get-AcctAzureADSecurityGroupMember -AccessToken $accessToken -
    AzureADTenantId $azureADTenantId -GroupId $gid -Top 10"

MembershipRule : (device.displayName -match "AzureADMC[0-9]{
 3 }
 $")
Name : SecurityGroupOfAzureADMachineCatalog
ObjectId  : e17d1c86-efgh-efgh-efgh-97e22c7bd96c
Type : Dynamic
```

Parameters

-AccessToken

Access token of Microsoft Graph API. Make sure grant consent to following permissions:

- Group.Read.All
- GroupMember.Read.All

Type: String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-GroupId

Specifies the ID of a group in Azure AD.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AzureADSecurityGroup

This object provides details of an object of the Azure AD security group and contains the following information:

- MembershipRule <string>

  The membershipRule of AzureAD security group.

- Name <string>

  The name of AzureAD security group.

- ObjectId <Guid>

  The unique Object Id of the AzureAD security group.

- Type <string>

  The type of AzureAD security group.

Notes

In the case of failure the following errors can result:

- PartialData

  Only a subset of the available data was returned.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- CommunicationError

  An error occurred while communicating with the service.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

- AzureADTenantIdMismatchAzureADAccessToken

  Mismatch between the given AzureADTenantID and TenantID in Azure AD AccessToken.

Get-AcctDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the ADIdentity Service.

Syntax

```
Get-AcctDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected ADIdentity Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ADIdentity SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the ADIdentity Service instance running on controller "controller1.mydomain.net".

```
Get-AcctDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current ADIdentity Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the ADIdentityService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AcctDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix ADIdentity Service.

Syntax

```
Get-AcctDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix ADIdentity Service database schema, add a new ADIdentity service to an existing site, remove a ADIdentity service from a site, or create a database server logon for a ADIdentity service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected ADIdentity service instance, otherwise the scripts relate to ADIdentity service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ADIdentity SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to ADIdentity service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to ADIdentity service roles

If ScriptType is Evict, the returned script contains:

- Removal of ADIdentity service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix ADIdentity Service and copies it to a file called "C:\ADIdentitySchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a ADIdentity service schema.

```
Get-AcctDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\ADIdentitySchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the ADIdentity service. This can be used when configuring a mirror server for use.

```
Get-AcctDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    ADIdentityLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new ADIdentity service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the ADIdentity services that share the same database instance and are con-

sidered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix ADIdentity Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a ADIdentity Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a ADIdentity Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the ADIdentity Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for ADIdentity services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the ADIdentity Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AcctDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix ADIdentity Service.

Syntax

```
Get-AcctDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix ADIdentity Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix ADIdentity Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix ADIdentity Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix ADIdentity Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix ADIdentity Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-AcctServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-AcctDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix ADIdentity Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-AcctDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix ADIdentity Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any ADIdentity services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AcctServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AcctIdentityPool

March 11, 2024

Gets a list of existing identity pools.

Syntax

```
Get-AcctIdentityPool
   [[-IdentityPoolName] <String>]
   [-IdentityPoolUid <Guid>]
   [-Lock <Boolean>]
   [-ScopeId <Guid>]
   [-ScopeName <String>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to retrieve a list of existing identity pools.

Examples

EXAMPLE 1

Gets all the identity pools.

```
Get-AcctIdentityPool

AvailableAccounts    : 1
DeviceManagementType : None
Domain               : MyDomain.com
ErrorAccounts        : 0
IdentityContent      :
IdentityPoolName     : MyPool1
IdentityPoolUid      : 22072d9e-6a8f-494b-a5bc-2ef18ca4b915
IdentityType         : ActiveDirectory
InUseAccounts        : 2
Lock                 : False
MetadataMap          : {
  }

NamingScheme         : Acc####

ZoneUid              :
Scopes               :
TenantId             :
```

Parameters

-IdentityPoolName

The name of the identity pool.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-IdentityPoolUid

The unique identifier for the identity pool.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Lock

Whether the identity pool is locked or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeId

Gets only results with a scope matching the specified scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets only results with a scope matching the specified scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Acct_Filtering for details.

Type:	Int32
Position:	Named
Default value:	250

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Acct_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Acct_Filtering for details.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityPool

This object provides details of the identity pool and contains the following information:

- AvailableAccounts <int>

  The number of existing accounts (AcctADAccount objects) in the 'Available'state (not in 'InUse', 'Tainted', or 'Error').

- DeviceManagementType <string>

  The device management type. Can be Intune, IntuneWithCitrixTags, or None by default.

- Domain <string>

  The Active Directory domain (in FQDN format) that accounts in the pool belong to.

- ErrorAccounts <int>

  The number of existing AD accounts in the 'Error'state.

- IdentityContent <string>

  JSON formatted metadata containing Azure AD tenant and Azure AD security group information associated with this identity pool.

- IdentityPoolName <string>

  The name of the identity pool.

- IdentityPoolUid <GUID>

  The unique identifier for the identity pool.

- IdentityType <string>

  The identity type.

- InUseAccounts <int>

  The number of existing AD accounts in the 'InUse'state.

- Lock <bool>

  Indicates if the identity pool is locked.

- MetadataMap <IDictionary[string, string];>

  The metadata associated with this identity pool arranged in key value pairs.

- NamingScheme <string>

  The naming scheme for the identity pool.

- NamingSchemeType <string>

  The naming scheme type for the identity pool. This can be one of the following:

  - Numeric

    Naming scheme uses numeric indexes.

  - Alphabetic

    Naming scheme uses alphabetic indexes.

- OU <string>

  The Active Directory distinguished name for the OU in which accounts for this identity pool will be created.

- ResourceLocationId <GUID>

  The UID that corresponds to the resource location (DaaS only).

- StartCount <int>

  The next index to be used when creating an account in the identity pool.

- TaintedAccounts <int>

  The number of existing AD accounts in the 'Tainted'state.

- WorkgroupMachine <bool>

  If this is true, the identity pool can have an IdentityType of 'AzureAD'or 'Workgroup'.
  If this is false, the identity pool can have an IdentityType of 'ActiveDirectory'or 'HybridAzureAD'.

- ZoneUid <GUID>

  The UID that corresponds to the Zone in which AD accounts are created.

- Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

  The administration scopes associated with this identity pool.

- TenantId <GUID>

  Identity of the Citrix tenant associated with this identity pool.
  Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure the following errors can result:

- PartialData

  Only a subset of the available data was returned.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- CommunicationError

  An error occurred while communicating with the service.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Get-AcctInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the ADIdentity Service.

Syntax

```
Get-AcctInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix ADIdentity Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-AcctDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix ADIdentity Service database schema version number.

```
Get-AcctInstalledDBVersion
```

EXAMPLE 2

Get the versions of the ADIdentity Service database schema for which upgrade scripts are supplied.

```
Get-AcctInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-AcctInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the ADIdentity

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Get-AcctDBSchema

Get-AcctScopedObject

March 11, 2024

Gets the details of the scoped objects for the ADIdentity Service.

Syntax

```
Get-AcctScopedObject
   [-ScopeId <Guid>]
   [-ScopeName <String>]
   [-ObjectType <ScopedObjectType>]
   [-ObjectId <String>]
   [-ObjectName <String>]
   [-Description <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Examples

EXAMPLE 1

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

```
Get-AcctScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Parameters

-ScopeId

Gets scoped object entries for the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ScopeName

Gets scoped object entries with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectType

Gets scoped object entries for objects of the given type.

Type:	ScopedObjectType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ObjectId

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectName

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Gets scoped object entries for objects with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.ScopedObject

The Get-AcctScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Get-AcctService

March 11, 2024

Gets the service record entries for the ADIdentity Service.

Syntax

```
Get-AcctService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the ADIdentity Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the ADIdentity Service running in the current service group.

```
Get-AcctService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.Service

The Get-AcctServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-AcctServiceAccount

March 11, 2024

Gets a list of existing service accounts.

Syntax

```
Get-AcctServiceAccount
    [-ServiceAccountUid <Guid>]
    [-IdentityProviderUid <Guid>]
    [-IsHealthy <Boolean>]
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to retrieve a list of existing service accounts.

Examples

EXAMPLE 1

Gets all the service accounts.

```
Get-AcctServiceAccount

ServiceAccountUid             : 440b77c3-9935-49b2-a696-01914dcffcbe
IdentityProviderIdentifier    : d1b46f6b-ad4c-4fcc-bb79-8e3c8fd813e8
IdentityProviderType          : AzureAD
SecretExpiryTime              : 9/8/2029 8:00:00 PM
AccountId                     : deb0811e-4839-4cce-87d3-8f36b31c2934
Capabilities                  : {
 AzureArcResourceManagement }

FailureReason                 :
IsHealthy                     : True
Scopes                        : {
 Scope1 }

TenantId                      :

ServiceAccountUid             : 2eccb0ec-a760-44ad-a36d-e0928b4d7926
IdentityProviderIdentifier    : d1b46f6b-ad4c-4fcc-bb79-8e3c8fd813e8
IdentityProviderType          : AzureAD
SecretExpiryTime              : 9/8/2099 8:00:00 PM
AccountId                     : ac14e785-cdb2-4e18-9240-8b49583b11a2
```

```
Capabilities                  : {
 AzureADDeviceManagement }

FailureReason                 :
IsHealthy                     : True
Scopes                        :
TenantId                      :
```

EXAMPLE 2

Gets the service account specified by uid 2eccb0ec-a760-44ad-a36d-e0928b4d7926.

```
Get-AcctServiceAccount -ServiceAccountUid 2eccb0ec-a760-44ad-a36d-
    e0928b4d7926

ServiceAccountUid             : 2eccb0ec-a760-44ad-a36d-e0928b4d7926
IdentityProviderIdentifier    : d1b46f6b-ad4c-4fcc-bb79-8e3c8fd813e8
IdentityProviderType          : AzureAD
SecretExpiryTime              : 9/8/2099 8:00:00 PM
AccountId                     : ac14e785-cdb2-4e18-9240-8b49583b11a2
Capabilities                  : {
 AzureADDeviceManagement }

FailureReason                 :
IsHealthy                     : True
Scopes                        :
TenantId                      :
```

Parameters

-ServiceAccountUid

The unique identifier for the service account.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IdentityProviderUid

The unique identifier for the identity provider that associates with the service account.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsHealthy

Whether the service account is healthy or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeId

Gets only results with a scope matching the specified scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets only results with a scope matching the specified scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Acct_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Acct_Filtering for details.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Acct_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Acct_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.ServiceAccount

This object provides details of the service account and contains the following information:

- ServiceAccountUid <GUID>

  The unique identifier of the service account.

- SecretExpiryTime <Datetime>

  The expiration time for the secret of the service account.

- AccountId <string>

  The identifier for the service account. E.g. Azure application ID if the service account is with Azure AD as identity provider.

- IdentityProviderIdentifier <string>

  The identifier of the identity provider that the service account belongs to. E.g. Azure AD tenant ID.

- IdentityProviderType <string>

  The type of the identity provider of the service account. Can be AzureAD or ActiveDirectory.

- IsHealthy <bool>

  Indicates if the service account is healthy.

- Capabilities <string[]>

  Capabilities of the service account. Can be AzureArcResourceManagement.

- FailureReason <string>

  The reason why the service account becomes unhealthy.

- Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

  The administration scopes associated with this identity pool.

- TenantId <GUID>

  Identity of the Citrix tenant associated with this identity pool.
  Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure the following errors can result:

- PartialData

  Only a subset of the available data was returned.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- CommunicationError

  An error occurred while communicating with the service.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Get-AcctServiceAddedCapability

March 11, 2024

Gets any added capabilities for the ADIdentity Service on the controller.

Syntax

```
Get-AcctServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the ADIdentity Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the ADIdentity Service.

```
Get-AcctServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_AcctADIdentitySnapin

Get-AcctServiceInstance

March 11, 2024

Gets the service instance entries for the ADIdentity Service.

Syntax

```
Get-AcctServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the ADIdentity Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the ADIdentity Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-AcctServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.ServiceInstance

The Get-AcctServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Acct.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.ADIdentity.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AcctServiceStatus

March 11, 2024

Gets the current state of the ADIdentity Service on the controller.

Syntax

```
Get-AcctServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the ADIdentity Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the ADIdentity Service.

```
1 Get-AcctServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-AcctServiceStatus command returns an object containing the status of the ADIdentity Service together with extra diagnostics information.

DBUnconfigured

The ADIdentity Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the ADIdentity Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ADIdentity Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The ADIdentity is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The ADIdentity is connected to a database that is valid, but it does not have the full functionality required so the ADIdentity cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the ADIdentity Service currently in use is incompatible with the version of the ADIdentity Service schema on the database. Upgrade the ADIdentity Service to a more recent version.

DBOlderVersionThanService

The version of the ADIdentity Service schema on the database is incompatible with the version of the ADIdentity Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The ADIdentity Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the ADIdentity Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the ADIdentity and the database has been lost for an extended period of time, or has failed due to a configuration problem. The ADIdentity service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Import-AcctIdentityPool

March 11, 2024

Imports an identity pool in the site

Syntax

```
Import-AcctIdentityPool
      -IdentityPoolData <String>
      [-Scope <String[]>]
      [-ZoneUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to import an identity pool from another site that has been exported using Export-AcctIdentityPool. Any AD accounts in the exported identity pool will be imported as well.

Examples

EXAMPLE 1

Import the identity pool defined in the variable $identityPoolData. This variable should be created using Export-AcctIdentityPool (potentially on a different site). The imported identity pool contains any accounts that were exported with the identity pool.

```
Import-AcctIdentityPool -IdentityPoolData $identityPoolData
        c:\PS> Get-AcctIdentityPool -IdentityPoolName MyPool

          AvailableAccounts    : 0
          DeviceManagementType : None
          Domain               : MyDomain.com
          ErrorAccounts        : 0
          IdentityContent      :
          IdentityPoolName     : MyPool
          IdentityPoolUid      : 5a2ac1c4-b183-4796-a984-163b645c6ca4
          IdentityType         : ActiveDirectory
          InUseAccounts        : 2
          Lock                 : False
          MetadataMap          : {
  }
```

```
16

26              TenantId              :
```

Parameters

-IdentityPoolData

Specifies the identity pool to import in the form of a JSON encoded string.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Scope

The administration scopes to be applied to the new identity pool.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

The UID that corresponds to the Zone in which these AD accounts will be created. This is only intended to be used for Citrix Cloud Delivery Controllers.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityPool

This object provides details of the identity pool and contains the following information:

- AvailableAccounts <int>

  The number of existing accounts (AcctADAccount objects) in the 'Available'state (not in 'InUse', 'Tainted', or 'Error').

- DeviceManagementType <string>

  The device management type. Can be Intune, IntuneWithCitrixTags, or None by default.

- Domain <string>

  The Active Directory domain (in FQDN format) that accounts in the pool belong to.

- ErrorAccounts <int>

  The number of existing AD accounts in the 'Error'state.

- IdentityContent <string>

  JSON formatted metadata containing Azure AD tenant and Azure AD security group information associated with this identity pool.

- IdentityPoolName <string>

  The name of the identity pool.

- IdentityPoolUid <GUID>

  The unique identifier for the identity pool.

- IdentityType <string>

  The identity type.

- InUseAccounts <int>

  The number of existing AD accounts in the 'InUse'state.

- Lock <bool>

  Indicates if the identity pool is locked.

- MetadataMap <IDictionary[string, string];>

  The metadata associated with this identity pool arranged in key value pairs.

- NamingScheme <string>

  The naming scheme for the identity pool.

- NamingSchemeType <string>

  The naming scheme type for the identity pool. This can be one of the following:

  - Numeric

    Naming scheme uses numeric indexes.

  - Alphabetic

    Naming scheme uses alphabetic indexes.

- OU <string>

  The Active Directory distinguished name for the OU in which accounts for this identity pool will be created.

- ResourceLocationId <GUID>

  The UID that corresponds to the resource location (DaaS only).

- StartCount <int>

  The next index to be used when creating an account in the identity pool.

- TaintedAccounts <int>

  The number of existing AD accounts in the 'Tainted'state.

- WorkgroupMachine <bool>

  If this is true, the identity pool can have an IdentityType of 'AzureAD'or 'Workgroup'.
  If this is false, the identity pool can have an IdentityType of 'ActiveDirectory'or 'HybridAzureAD'.

- ZoneUid <GUID>

  The UID that corresponds to the Zone in which AD accounts are created.

- Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

  The administration scopes associated with this identity pool.

- TenantId <GUID>

  Identity of the Citrix tenant associated with this identity pool.
  Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure, the following errors can result.

Error Codes

CouldNotQueryDatabase

The query required to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

New-AcctADAccount

March 11, 2024

Creates Active Directory (AD) computer accounts in the specified identity pool.

Syntax

```
New-AcctADAccount
   [-IdentityPoolName] <String>
   -Count <Int32>
   [-StartCount <Int32>]
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Parallelism <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AcctADAccount
   [-IdentityPoolName] <String>
   -ADAccountName <String[]>
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Parallelism <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AcctADAccount
   -IdentityPoolUid <Guid>
   -Count <Int32>
   [-StartCount <Int32>]
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Parallelism <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AcctADAccount
   -IdentityPoolUid <Guid>
   -ADAccountName <String[]>
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Parallelism <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to create new Active Directory (AD) computer accounts and register them in an already existing identity pool.

The accounts are created using the information stored in the identity pool. This provides the account name (via the Naming Scheme property and Start Count), domain, and OU.

The user performing the operation in PowerShell must have sufficient privileges in AD to create the new computer accounts. If the current user does not have sufficient privileges, the ADUserName and ADPassword parameters may be used instead.

The AD account names will pad the index to use all the space specified in the identity pool naming scheme (e.g. "acc###"will become "acc001"). However, if the index overflows the available space the cmdlet expands the format to use the next incremental number (e.g. "acc###"will become "acc1000" if the index is 10000, which cannot fit into the three '#'placeholders). If this expanded name exceeds the 15 character name limit, the accounts are not created.

There can be only one creation process running for a specific identity pool at any one time. Attempting to start another account creation process while an existing one is executing results in an error being returned.

Examples

EXAMPLE 1

Creates two new AD accounts and registers them in the identity pool called "MyPool".

```
New-AcctADAccount -IdentityPoolName MyPool -Count 2 -OutVariable result

SuccessfulAccounts                SuccessfulAccountsCount
   FailedAccountsCount    FailedAccounts

```

Parameters

-IdentityPoolName

The name of the identity pool in which accounts will be created.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Count

The number of accounts to create.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountName

The AD account names to be created. These are just the simple machine account names (e.g. MyVM001).

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool in which accounts will be created.

Type:	Guid

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartCount

The start index for the create process.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADUserName

The username for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADPassword

The matching password for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Parallelism

Gets or sets the maximum number of threads to create AD accounts in parallel. Range 1-60 with default of 20.

Type:	Int32
Position:	Named
Default value:	20
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AccountOperationDetailedSummary

The New-AcctADAccount returns an object that contains the following properties:

- SuccessfulAccountsCount <int>

  The number of accounts that were added successfully

- FailedAccountsCount <int>

  The number of accounts that were not added.

- FailedAccounts <Citrix.XDPowerShell.AccountError[]>

  The list of accounts that failed to be added. Each one has the following properties:

  - ADAccountName <string>
  - ADAccountSid <String>
  - ErrorReason <ADIdentityStatus>

    This can be one of the following:

    * IdentityDuplicateObjectExists

      An identity with the same SID already exists.

* ADServiceDatabaseError

  An error occurred in the service while attempting a database operation.

* ADServiceDatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

* ADServiceStatusInvalidDb

  An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

* FailedToConnectToDomainController

  Contacting Active Directory failed.

* FailedToGetOrganizationUnitInAD

  Failed to access the OU in Active Directory.

* FailedToGetDefaultComputerContainerInAD

  Failed to access the default computers container in Active Directory.

* FailedToCreateComputerAccountInAD

  Failed to create the computer account in Active Directory.

* FailedToAccessComputerAccountInAD

  Failed to read the newly created computer account in Active Directory.

* FailedToGetSidFromAD

  Failed to get the SID for the created account from Active Directory.

* FailedToSetSamAccountNameInAD

  Failed to set the SAM account name in Active Directory for the account created.

* FailedToSetUserAccountControlInAD

  Failed to set the user account controller properties for the account created in Active Directory.

* FailedToSaveChangeInAD

  Failed to save the changes made to the created computer account in Active Directory.

* FailedToSetPasswordInAD

  Failed to set the password for the created computer account in Active Directory.

        * FailedToEnableAccountInAD

          Failed to enable the newly created computer account in Active Directory.

        * ComputerNameAlreadyInUseInAD

          The computer name for the computer to create is in use in Active Directory.

        * FailedToGetDistinguishedNameInAD

          Failed to get the distinguished name for the created computer account in ActiveDirectory.

        * FailedToSetDnsHostNameInAD

          Failed to set the Dns Host Name property for the created computer account in ActiveDirectory.

        * FailedToSetDisplayNameInAD

          Failed to set the DisplayName property for the created computer account in ActiveDirectory.

        * FailedToWriteServicePrincipalNameInAD

          Failed to set the ServicePrincipalName property for the created computer account in ActiveDirectory.

    - DiagnosticInformtion <Exception>

      Any other error information

- SuccessfulAccounts <Citrix.ADIdentity.Sdk.Identity[]>

  The list of accounts that were successfully added. Each one has the following properties:

    - ADAccountGuid <Guid>

      The unique identifier for the account.

    - ADAccountName <string>

      The name of the account.

    - ADAccountSid <string>

      The SID for the account.

    - AccountDisabled <bool>

      Whether or not the account is disabled in AD.

    - AccountLocked <bool>

      Whether or not the account is locked in AD.

- Domain <string>

  The domain for the account.

- DomainControllerHint <string>
- Lock <bool>

  Whether or not the account is locked (in the database, not AD).

- State <Citrix.ADIdentity.Sdk.ADIdentityState>

  The state for the account. This can be:

  * Available

    The account is not used.

  * InUse

    The account is in use.

  * Error

    The account is in error (i.e. the account is locked or disabled in AD).

  * Tainted

    The account is no longer used, but the password is no longer known.

- TenantId <Guid>

  The identity of the tenant associated with this account.

- DeviceManagementType <string>

  The device management type.

- IdentityType <string>

  The identity type.

- VdaHostId <Guid>

  The ID of the VDA associated with this account.

- WorkgroupMachine <bool>

  Whether or not the account is a workgroup account (not domain-joined).

- TrustServiceInstanceId <string>

  The trust service ID of the machine.

Notes

In the case of failure the following errors can result:

- NamingSchemeNotSpecifiedForIdentityPool

  No naming scheme is defined in the specified identity pool.

- IdentityPoolObjectNotFound

  The specified identity pool was not located.

- IdentityPoolAlreadyLocked

  The specified identity pool is locked.

- PermissionDenied

  The user does not have administrative rights to perform this operation.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- ServiceStatusInvalidDb

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- CommunicationError

  An error occurred while communicating with the service.

- ExceptionThrown

  An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

New-AcctIdentityPool

March 11, 2024

Creates a new identity pool.

Syntax

```
New-AcctIdentityPool
   -IdentityPoolName <String>
   [-NamingScheme <String>]
   [-NamingSchemeType <ADIdentityNamingScheme>]
   [-OU <String>]
   [-Domain <String>]
   [-AllowUnicode]
   [-IdentityType <String>]
   [-DeviceManagementType <String>]
   [-StartCount <Int32>]
   [-Scope <String[]>]
   [-TenantId <Guid>]
   [-ZoneUid <Guid>]
   [-AzureADSecurityGroupName <String>]
   [-AzureADAccessToken <String>]
   [-AzureADTenantId <Guid>]
   [-ServiceAccountUid <Guid[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AcctIdentityPool
   -IdentityPoolName <String>
   [-NamingScheme <String>]
   [-NamingSchemeType <ADIdentityNamingScheme>]
   [-AllowUnicode]
   [-WorkgroupMachine]
   [-IdentityType <String>]
   [-DeviceManagementType <String>]
   [-StartCount <Int32>]
   [-Scope <String[]>]
   [-TenantId <Guid>]
   [-ZoneUid <Guid>]
   [-AzureADSecurityGroupName <String>]
   [-AzureADAccessToken <String>]
```

```
    [-AzureADTenantId <Guid>]
    [-ServiceAccountUid <Guid[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to create identity pools that can be used to store AD computer accounts.

The naming scheme, naming scheme type, and domain must be specified if the identity pool is to be used to create new accounts.

Each identity pool is tied to a single domain. All the identities in an identity pool belong to the same domain. If the domain is not specified by a parameter to this command the domain will be set when an account is imported into it.

Examples

EXAMPLE 1

Create a new identity pool from which accounts can be created in the domain called "MyDomain.com" using a numeric scheme of the format Acc####. The first account created from this identity pool will be named Acc0001 and placed in the OU named "MyOU".

New AD accounts can be imported into this pool too, but must be from the Domain "MyDomain.com" .

```
New-AcctIdentityPool -IdentityPoolName MyPool -NamingScheme Acc#### -
    Domain MyDomain.com -NamingSchemeType Numeric -OU "CN=MyOU,DC=
    MyDomain,DC=com"

AvailableAccounts    : 0
DeviceManagementType : None
Domain               : MyDomain.com
ErrorAccounts        : 0
IdentityContent      :
IdentityPoolName     : MyPool
IdentityPoolUid      : 22072d9e-6a8f-494b-a5bc-2ef18ca4b915
IdentityType         : ActiveDirectory
InUseAccounts        : 0
Lock                 : False
MetadataMap          : {
  }

NamingScheme         : Acc####
```

```
NamingSchemeType     : Numeric
OU                   : CN=MyOU,DC=MyDomain,DC=com
ResourceLocationId   :
StartCount           : 1
TaintedAccounts      : 0

TaintedAccounts      : 0
WorkgroupMachine     : True
ZoneUid              :
Scopes               : {
  }

TenantId             :
```

EXAMPLE 3

Create a new identity pool named “AzureADIdentityPool”using the AzureAD identity type. Accounts created in this pool are joined to Azure Active Directory, and Microsoft Intune is used for device man-

agement.

```
New-AcctIdentityPool -IdentityPoolName AzureADIdentityPool -
    DeviceManagementType Intune -IdentityType AzureAD -NamingScheme
    AzureAD-### -NamingSchemeType Numeric -WorkgroupMachine

AvailableAccounts    : 0
DeviceManagementType : Intune
Domain               :
ErrorAccounts        : 0
IdentityContent      :
IdentityPoolName     : AzureADIdentityPool
IdentityPoolUid      : a0208d3f-7467-4cec-b6cb-b3e14560e1e7
IdentityType         : AzureAD
InUseAccounts        : 0
Lock                 : False
MetadataMap          : {
  }

NamingScheme         : AzureAD-###
NamingSchemeType     : Numeric
OU                   :
ResourceLocationId   :
StartCount           : 1
TaintedAccounts      : 0
WorkgroupMachine     : True
ZoneUid              :
Scopes               : {
  }

TenantId             :
```

EXAMPLE 4

Create a new identity pool named “HybridAzureADIdentityPool”using the HybridAzureAD identity type. Accounts created in this pool are joined to both the domain “IZONE.CLOUD”and Azure Active Directory.

```
New-AcctIdentityPool -IdentityPoolName HybridAzureADIdentityPool -
    IdentityType HybridAzureAD -NamingScheme HAAD-### -NamingSchemeType
    Numeric -Domain izone.cloud -OU "CN=Computers,DC=izone,DC=cloud"

AvailableAccounts    : 0
DeviceManagementType : None
Domain               : IZONE.CLOUD
ErrorAccounts        : 0
IdentityContent      :
IdentityPoolName     : HybridAzureADIdentityPool
IdentityPoolUid      : d08ffd26-6600-46d9-b649-786f201082b3
IdentityType         : HybridAzureAD
InUseAccounts        : 0
```

```
Lock                 : False
MetadataMap          : {
  }

NamingScheme         : HAAD-###
NamingSchemeType     : Numeric
OU                   : CN=Computers,DC=izone,DC=cloud
ResourceLocationId   :
StartCount           : 1
TaintedAccounts      : 0
WorkgroupMachine     : False
ZoneUid              :
Scopes               : {
  }

TenantId             :
```

Parameters

-IdentityPoolName

The name of the identity pool. This must not contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-WorkgroupMachine

Indicates whether the accounts created should be part of a workgroup rather than a domain.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-NamingScheme

Defines the template name for AD accounts created in the identity pool. The scheme can consist of fixed characters and a variable part defined by '#' characters. There can be only one variable region defined. The number of '#' characters defines the minimum length of the variable region. For example, a naming scheme of H#### could create accounts called H0001, H0002 (for a numeric scheme type) or HAAAA, HAAAB (for an alphabetic type).

Citrix recommends that you define a naming scheme that will not clash with accounts which already exist in AD; account creation will fail if a clash occurs.

There are restrictions on what constitutes a valid computer name:

Minimum name length: 2 (DNS)

Maximum name length: 15 bytes (NetBIOS)

The following characters are not allowed in a computer name:

backslash (\)

slash mark (/)

colon (:)

asterisk (*)

question mark (?)

quotation mark (")

less than sign (<)

greater than sign (>)

vertical bar (|)

comma (,)

tilde (~)

exclamation point (!)

at sign (@)

number sign (#)

dollar sign ($)

percent (%)

caret (^)

ampersand (&)

apostrophe (‘)

parenthesis (())

braces ({})

underscore (_)

The following names are reserved and must not be used at the end of the naming scheme:

-GATEWAY

-GW

-TAC

Names must not start with a period (NetBIOS).

Names must not be composed entirely of numbers (NetBIOS).

Names must not contain a blank or space characters (DNS).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NamingSchemeType

The type of naming scheme. This can be Numeric or Alphabetic. This defines the format of the variable part of the AD account names that will be created.

Type:	ADIdentityNamingScheme
Position:	Named
Default value:	Numeric
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AllowUnicode

Allow the naming scheme to have characters other than alphanumeric characters.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityType

The type of identity type. This can be ActiveDirectory, AzureAD, HybridAzureAD, or Workgroup.

Type:	String
Accepted values:	ActiveDirectory, AzureAD, HybridAzureAD, Workgroup
Position:	Named
Default value:	ActiveDirectory
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeviceManagementType

The type of device management type. This can be Intune, IntuneWithCitrixTags, or None.

Type:	String

Accepted values:	Intune, IntuneWithCitrixTags, None
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartCount

Specifies the next number to be used when creating new AD accounts in the identity pool.

Type:	Int32
Position:	Named
Default value:	1
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Scope

The administration scopes to be applied to the new identity pool.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Specifies identity of tenant associated with identity pool. Must always be specified in multitenant sites, must not be specified otherwise.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

The UID that corresponds to the Zone in which these AD accounts will be created. This is only intended to be used for Citrix Cloud Delivery Controllers.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADSecurityGroupName

The name of AzureAD security group. This is only intended to be used when IdentityType is “AzureAD” or “HybridAzureAD”.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADAccessToken

The access token of Microsoft Graph API. Must be specified if “AzureADSecurityGroupName”is specified to create Azure AD security group, and IdentityType is “AzureAD”or “HybridAzureAD”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADTenantId

The tenantId of AzureAD. Must be specified if “AzureADSecurityGroupName”is specified to create Azure AD security group, and IdentityType is “AzureAD”or “HybridAzureAD”.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceAccountUid

Specify the UID of the service account that associates with the identity pool.

Type:	Guid[]

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OU

The OU that computer accounts will be created in. If this is not specified, accounts are created into the default account container specified by AD. This is the 'Computers'container for out-of-the-box installations of AD. The OU must be a valid AD container of the domain specified for the pool.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Domain

The AD domain name for the pool. Specify this in FQDN format; for example, MyDomain.com.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityPool

This object provides details of the identity pool and contains the following information:

AvailableAccounts <int>

The number of existing accounts (AcctADAccount objects) in the 'Available'state (not in 'InUse', 'Tainted', or 'Error').

DeviceManagementType <string>

The device management type. Can be Intune, IntuneWithCitrixTags, or None by default.

Domain <string>

The Active Directory domain (in FQDN format) that accounts in the pool belong to.

ErrorAccounts <int>

The number of existing AD accounts in the 'Error' state.

IdentityContent <string>

JSON formatted metadata containing Azure AD tenant and Azure AD security group information associated with this identity pool.

IdentityPoolName <string>

The name of the identity pool.

IdentityPoolUid <GUID>

The unique identifier for the identity pool.

IdentityType <string>

The identity type.

InUseAccounts <int>

The number of existing AD accounts in the 'InUse' state.

Lock <bool>

Indicates if the identity pool is locked.

MetadataMap <IDictionary[string, string];>

The metadata associated with this identity pool arranged in key value pairs.

NamingScheme <string>

The naming scheme for the identity pool.

NamingSchemeType <string>

The naming scheme type for the identity pool. This can be one of the following:

Numeric - naming scheme uses numeric indexes

Alphabetic - naming scheme uses alphabetic indexes

OU <string>

The Active Directory distinguished name for the OU in which accounts for this identity pool will be created.

ResourceLocationId <GUID>

The UID that corresponds to the resource location (DaaS only).

StartCount <int>

The next index to be used when creating an account in the identity pool.

TaintedAccounts <int>

The number of existing AD accounts in the 'Tainted' state.

WorkgroupMachine <bool>

If this is true, the identity pool can have an IdentityType of 'AzureAD' or 'Workgroup'.

If this is false, the identity pool can have an IdentityType of 'ActiveDirectory' or 'HybridAzureAD'.

ZoneUid <GUID>

The UID that corresponds to the Zone in which AD accounts are created.

Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

The administration scopes associated with this identity pool.

TenantId <GUID>

Identity of the Citrix tenant associated with this identity pool.

Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure, the following errors can result.

Error Codes

UnableToConvertDomainName

Unable to convert domain name to DNS format.

NamingSchemeNotEnoughCharacters

Naming scheme does not have enough characters specified.

NamingSchemeTooManyCharacters

Naming scheme has too many characters specified.

NamingSchemeIllegalCharacter

Naming scheme contains illegal characters.

NamingSchemeMayNotStartWithPeriod

Naming scheme starts with a period (.) character.

NamingSchemeMayNotBeAllNumbers

Naming scheme contains only numbers.

NamingSchemeMissingNumericSpecifications

Naming scheme does not contain any variable specification (i.e. no '#'characters are specified).

NamingSchemeHasMoreThanOneSetOfHashes

Naming scheme has more than one variable region (i.e. there are '#'characters separated by other characters).

IdentityPoolDuplicateObjectExists

An identity pool with the same name already exists.

IdentityPoolOUInvalid

Identity pool OU invalid as it does not exist.

IdentityPoolOUOfWrongDomain

Identity pool OU invalid as it refers to a different domain to the domain specified for the pool.

InvalidIdentityPoolParameterCombination

Caused by either of the following validation errors:

- If an OU is specified then a domain must also be specified.
- NamingScheme, NamingSchemeType and Domain must all be present if any of these are specified.

OUNotReachable

Domain is not reachable. Check if the domain exists in any zones and if the domain contains the specified OU.

OUParameterRequiresDomain

If an OU is specified then a domain must also be specified.

NamingSchemeAndNamingSchemeTypeMustBeUsedTogether

NamingScheme and NamingSchemeType must be used together.

NamingSchemeIllegalComputerName

The naming scheme supplied is not valid.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

AzureADAccessTokenMustBeSpecified

Must specify “AzureADAccessToken”parameter to operate AzureAD security group.

AzureADSecurityGroupNotSupportCurrentIdentityType

Current IdentityType not support AzureAD security group.

AzureADSecurityGroupMustBeSpecified

Must specify AzureAD security group.

AzureADTenantIdMustBeSpecified

AzureAD TenantId must be specified.

AzureADTenantIdInIdentityContentMismatchAzureADAccessToken

The TenantId extracted from AccessToken must be the same as specified TenantId in IdentityContent.

AzureADTenantIdMismatchAzureADAccessToken

The given AzureADTenantId mismatchs TenantId contained in AzureAD AccessToken.

CurrentIdentityTypeRequiresWorkgroupMachine

Current IdentityType requires WorkgroupMachine.

DomainNotRequiredForAzureADAndWorkgroup

Domain not required for AzureAD and Workgroup.

FailedToCreateAzureADSecurityGroup

An error occured in the service while creating AzureAD security group.

FailedToDeleteAzureADSecurityGroup

An error occured in the service while deleting AzureAD security group.

NamingSchemeAndDomainMustBeUsedTogetherForActiveDirectoryOrHybridAzureAD

NamingScheme and Domain must be used together for ActiveDirectory or HybridAzureAD.

NewAzureADSecurityGroupWithoutFailureButNoGroupResultReturned

No result returned when create AzureAD security group though doesn't get error when execute cmdlet.

IntuneEnrollRequiresAzureADJoinedOrHybridAzureADJoined

Intune enroll requires AzureAD Joined or Hybrid AzureAD Joined.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

New-AcctServiceAccount

March 11, 2024

Creates a new service account.

Syntax

```
New-AcctServiceAccount
   -IdentityProviderType <String>
   -IdentityProviderIdentifier <String>
   -AccountId <String>
   -AccountSecret <SecureString>
   -SecretExpiryTime <DateTime>
   [-Capabilities <String[]>]
   [-Scope <String[]>]
   [-TenantId <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to create service accounts that can be used to store credential to access identity provider like Azure AD.

Each service account is tied to a single identity provider.

Examples

EXAMPLE 1

Create a new service account to access AzureAD with AzureArcResourceManagement capability.

```
New-AcctServiceAccount -IdentityProviderType AzureAD -
   IdentityProviderIdentifier f439f4c0-fcd8-4fe6-95b8-71e7e49dc8c6 -
   AccountId ac14e785-cdb2-4e18-9240-8b49583b11a2 -AccountSecret
   $password -SecretExpiryTime 2024-09-09 -Capabilities '
   AzureArcResourceManagement'

ServiceAccountUid             : 17631afc-2e4c-491e-b0aa-f979a80e32c1
IdentityProviderIdentifier    : f439f4c0-fcd8-4fe6-95b8-71e7e49dc8c6
IdentityProviderType          : AzureAD
SecretExpiryTime              : 9/9/2024 8:00:00 PM
AccountId                     : ac14e785-cdb2-4e18-9240-8b49583b11a2
Capabilities                  : {
 AzureArcResourceManagement }

FailureReason                 :
IsHealthy                     : True
Scopes                        : {
  }

TenantId                      :
```

EXAMPLE 2

Create a new service account to access ActiveDirectory.

```
New-AcctServiceAccount -IdentityProviderType ActiveDirectory -
    IdentityProviderIdentifier test.local -AccountId test\svcacct_1 -
    AccountSecret $password -SecretExpiryTime 2024-09-09

ServiceAccountUid             : ad24284e-ba3d-4504-80db-9ac6640de533
IdentityProviderIdentifier    : test.local
IdentityProviderType          : ActiveDirectory
SecretExpiryTime              : 9/9/2024 8:00:00 PM
AccountId                     : test\svcacct_1
Capabilities                  :
FailureReason                 :
IsHealthy                     : True
Scopes                        : {
  }

TenantId                      :
```

Parameters

-IdentityProviderType

The type of the identity provider that associates with this service account. Can be AzureAD or ActiveDirectory.

Type:	String
Accepted values:	ActiveDirectory, AzureAD
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityProviderIdentifier

The identifier of the given identity provider. E.g. Azure AD tenant id if 'IdentityProviderType'is AzureAD.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AccountId

The identifier for the service account. E.g. Azure application (client) id if 'IdentityProviderType'is AzureAD.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AccountSecret

The secret for the service account. E.g. Azure application (client) secret if 'IdentityProviderType'is AzureAD. The secret will be encrypted and stored in database.

Type:	SecureString
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SecretExpiryTime

The secret expiration time for the service account.

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Capabilities

The capabilities for the service account.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Scope

The administration scopes to be applied to the new service account.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Specifies identity of tenant associated with service account. Must always be specified in multi-tenant sites, must not be specified otherwise.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.ServiceAccount

This object provides details of the service account and contains the following information:

ServiceAccountUid <GUID> The unique identifier of the service account. SecretExpiryTime <Datetime> The expiration time for the secret of the service account. AccountId <string> The identifier for the service account. E.g. Azure application ID if the service account is with Azure AD as identity provider. IdentityProviderIdentifier <string> The identifier of the identity provider that the service account belongs to. E.g. Azure AD tenant ID. IdentityProviderType <string> The type of the identity provider of the service account. Can be AzureAD or ActiveDirectory. IsHealthy <bool> Indicates if the service account is healthy. Capabilities <string[]> Capabilities of the service account. Can be AzureArcResourceManagement. FailureReason <string> The reason why the service account becomes unhealthy. Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]> The administration scopes associated with this identity pool. TenantId <GUID> Identity of the Citrix tenant associated with this identity pool. Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure, the following errors can result.

Error Codes

IdentityProviderTypeDoesNotMatch

The specified identity provider type doesn't match the existing identity provider for the given tenant.

ServiceAccountDuplicateObjectExists

Duplicate object exists.

UnsupportedIdentityProviderType

The specified identity provider type is not supported.

InvalidServiceAccountCapabilities

One or more specified service account capabilities are not supported.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Remove-AcctADAccount

March 11, 2024

Removes Active Directory (AD) computer accounts from an identity pool.

Syntax

```
Remove-AcctADAccount
      [-IdentityPoolName] <String>
      -ADAccountName <String[]>
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
      [-RemovalOption <ADIdentityRemoveAccountOption>]
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctADAccount
      [-IdentityPoolName] <String>
      -ADAccountSid <String[]>
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
      [-RemovalOption <ADIdentityRemoveAccountOption>]
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctADAccount
      -IdentityPoolUid <Guid>
      -ADAccountName <String[]>
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
      [-RemovalOption <ADIdentityRemoveAccountOption>]
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctADAccount
      -IdentityPoolUid <Guid>
      -ADAccountSid <String[]>
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
      [-RemovalOption <ADIdentityRemoveAccountOption>]
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove Active Directory (AD) accounts from an identity pool. This only removes the AD account from the identity pool within the AD Identity Service. Options for removing (or dis-

abling) the account in AD are available if necessary.

All aspects of this command that need to make modifications to the accounts in AD will use the account that the runspace is using. This means that if an account is to be removed from AD or disabled, the user performing the operation in PowerShell must have sufficient privileges in AD for this operation to complete successfully. If the current user does not have sufficient privileges, the ADUserName and ADPassword parameters may be used instead.

If the option to remove the account from AD or to disable it in AD is specified, the AD operation must succeed for the account to be removed from the Citrix AD Identity Service database. Use caution when using the Force parameter because this allows removal of accounts that are in the 'inUse'state, which may result in the machines becoming unusable.

Examples

EXAMPLE 1

Removes two accounts (account and account2) from the identity pool called "MyPool", leaving the AD accounts untouched.

```
Remove-AcctADAccount -IdentityPoolName MyPool -ADAccountName "Domain\
    account","domain\account2"

    SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
    -----------------------       -------------------    --------------
                          2                         0    {
}
```

EXAMPLE 2

Removes two accounts (account and account2) from the identity pool called "MyPool"(and from AD).

```
Remove-AcctADAccount -IdentityPoolName MyPool -RemovalOption Delete -
    ADAccountName "Domain\account","domain\account2"

    SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
    -----------------------       -------------------    --------------
                          2                         0    {
}
```

EXAMPLE 3

Removes two accounts (account and account2) from the identity pool called “MyPool”, leaving the AD accounts untouched. The accounts are removed regardless of whether they are in the ‘inUse’state or not.

```
Remove-AcctADAccount -IdentityPoolName MyPool -ADAccountName "Domain\
    account","domain\account2" -Force

SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
-----------------------       -------------------    --------------
                      2                         0    {
  }
```

EXAMPLE 4

Shows failure of removal of one of two accounts and how to retrieve the failure reason.

```
Remove-AcctADAccount -IdentityPoolName MyPool -ADAccountName "Domain\
    account","domain\account2" -OutVariable result

SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
-----------------------       -------------------    --------------
1                                                1    {
 account2 }

$result[0].FailedAccounts

ADAccountName                 ADAccountSid           ErrorReason
-------------                 -------------          ------------
Domain\account2               account2
    IdentityObjectLocked
```

EXAMPLE 5

Removes one account (S-1-5-21-1315084875-1285793635-2418178940-2685) from the identity pool called “MyPool”, leaving the AD accounts untouched.

```
Remove-AcctADAccount -IdentityPoolName MyPool -ADAccountSid S
    -1-5-21-1315084875-1285793635-2418178940-2685

SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
-----------------------       -------------------    --------------
1                                                0    {
  }
```

Parameters

-IdentityPoolName

The name of the identity pool from which accounts are to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountName

The name of the AD account to be removed. AD accounts are accepted in the following formats: Fully qualified DN e.g. CN=MyComputer,OU=Computers,DC=MyDomain,DC=Com; UPN format e.g `MyComputer@MyDomain.Com`; Domain qualified e.g MyDomain\MyComputer.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountSid

The SID for the AD account to be removed.

Type:	String[]
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool from which accounts are to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ADUserName

The username for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADPassword

The matching password for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	SecureString

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemovalOption

Defines the behavior relating to the AD account.

None - Do not attempt to remove the account from AD Delete - Attempt to remove the account from AD Disable - Attempt to disable the account in AD

Type:	ADIdentityRemoveAccountOption
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Indicates if accounts that are marked as ‘in-use’can be removed.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AccountOperationSummary

The remove-AcctADAccout command returns an object with the following parameters; SuccessfulAccountsCount <int>

The number of accounts that were removed successfully.

FailedAccountsCount <int>

The number of accounts that were not removed.

FailedAccounts <Citrix.ADIdentity.Sdk.AccountError[]>

The list of accounts that failed to be removed. Each one has the following parameters:

ADAccountName <string>

ADAccountSid <String>

ErrorReason <ADIdentityStatus>

This can be one of the following

UnableToConvertDomain

IdentityNotLocatedInDomain

IdentityNotInIdentityPool

IdentityObjectInUse

IdentityObjectLocked

ADServiceDatabaseError

ADServiceDatabaseNotConfigured

ADServiceStatusInvalidDb

FailedToConnectToDomainController

FailedToDisableAccountInAD

FailedToDeleteAccountInAD

FailedToExecuteSearchInAD

FailedToAccessComputerAccountInAD

DiagnosticInformtion <Exception>

Any other error information

Notes

In the case of failure, the following errors can result.

Error Codes

IdentityPoolNotFound

The specified identity pool was not found.

IdentityPoolAlreadyLocked

The specified identity pool was locked by another operation.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Remove-AcctIdentityPool

March 11, 2024

Removes identity pools.

Syntax

```
Remove-AcctIdentityPool
      [-IdentityPoolName] <String>
      [-AzureADAccessToken <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPool
      -IdentityPoolUid <Guid>
      [-AzureADAccessToken <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove identity pools. The identity pool must be emptied of any AD accounts that it contains before it can be removed.

Examples

EXAMPLE 1

Removes the identity pool named “MyPool”.

```
c:\Remove-AcctIdentityPool -IdentityPoolName MyPool
```

Parameters

-IdentityPoolName

The name of the identity pool to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADAccessToken

The access token of Microsoft Graph API. Must be specified if “SecurityGroup”is managed by Citrix.

Make sure grant consent to following permissions:

- Group.ReadWrite.All
- GroupMember.ReadWrite.All

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

IdentityPoolObjectNotFound

The specified identity pool could not be located.

UnableToRemoveDueToAssociatedAccounts

The identity pool is not empty.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

AzureADTenantIdInIdentityContentMismatchAzureADAccessToken

The TenantId extracted from AccessToken must be the same as specified TenantId in IdentityContent.

FailedToDeleteAzureADSecurityGroup

An error occured in the service while deleting Azure AD security group.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the Citrix Virtual Apps and Desktops logs.

Remove-AcctIdentityPoolMetadata

March 11, 2024

Removes metadata from the given identity pool.

Syntax

```
Remove-AcctIdentityPoolMetadata
      [-IdentityPoolUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolMetadata
      [-IdentityPoolUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolMetadata
      [-IdentityPoolName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolMetadata
      [-IdentityPoolName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolMetadata
      [-InputObject] <IdentityPool[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolMetadata
      [-InputObject] <IdentityPool[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given identity pool.

The identity pools may be specified using the unique identifier, name, or as a powershell object.

Examples

EXAMPLE 1

Remove the metadata property “metadataName”from the identity pool “MyPool”.

```
Remove-AcctIdentityPoolMetadata -IdentityPoolName MyPool -Name
   metadataName
```

EXAMPLE 2

Removes the metadata properties “metadataName1”and “metadataName2”from the identity “MyPool”. Note that the values of the properties DO NOT have to match “val1”and “val2”.

```
Remove-AcctIdentityPoolMetadata -IdentityPoolName MyPool -Map (@{
 "metadataName1" = "val1"; "metadataname2" = "val2" }
 )
```

EXAMPLE 3

Remove all metadata from all identity pool objects.

```
Get-AcctIdentityPool | % {
  Remove-AcctIdentityPoolMetadata -Map $_.MetadataMap  }
```

Parameters

-IdentityPoolUid

The unique identifier for the identity pool from which metadata is to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool from which metadata is to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects from which the metadata is to be removed.

Type:	IdentityPool[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-AcctIdentityPoolScope

March 11, 2024

Remove the specified identity pool(s) from the given scope(s).

Syntax

```
Remove-AcctIdentityPoolScope
      [-Scope] <String[]>
      -InputObject <IdentityPool[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolScope
      [-Scope] <String[]>
      -IdentityPoolUid <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctIdentityPoolScope
      [-Scope] <String[]>
      -IdentityPoolName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-AcctIdentityPoolScope command is used to remove one or more identity pool objects from the given scope(s).

To remove a identity pool from a scope you need permission to change the scopes of the identity pool.

If the identity pool is not in a specified scope, that scope will be silently ignored.

The identity pools may be specified using the unique identifier, name, or as a powershell object.

Examples

EXAMPLE 1

Removes a single identity pool from the 'Finance'scope.

```
Remove-AcctIdentityPoolScope Finance -IdentityPoolUid 6702C5D0-C073
    -4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Removes a single identity pool from multiple scopes.

```
Remove-AcctIdentityPoolScope Finance,Marketing -IdentityPoolUid 6702
    C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Removes all visible identity pool objects from the 'Finance'scope.

```
Get-AcctIdentityPool | Remove-AcctIdentityPoolScope Finance
```

EXAMPLE 4

Removes identity pool objects with a name starting with an 'A'from the 'Finance'scope.

```
Remove-AcctIdentityPoolScope Finance -IdentityPoolName A*
```

Parameters

-Scope

Specifies the scopes to remove the objects from.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-InputObject

The identity pool objects to be removed.

Type:	IdentityPool[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pools to be removed.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pools to be removed.

Type:	String[]
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-AcctServiceAccount

March 11, 2024

Removes a service account.

Syntax

```
Remove-AcctServiceAccount
      -ServiceAccountUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove a service account.

Examples

EXAMPLE 1

Removes the service account specified by uid 17631afc-2e4c-491e-b0aa-f979a80e32c1.

```
c:\Remove-AcctServiceAccount -ServiceAccountUid 17631afc-2e4c-491e-b0aa
   -f979a80e32c1
```

Parameters

-ServiceAccountUid

The unique identifier for the service account to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

ServiceAccountObjectNotFound

The specified service account could not be located.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the Citrix Virtual Apps and Desktops logs.

Remove-AcctServiceAccountScope

March 11, 2024

Remove the specified service account(s) from the given scope(s).

Syntax

```
Remove-AcctServiceAccountScope
      [-Scope] <String[]>
      -InputObject <ServiceAccount[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctServiceAccountScope
      [-Scope] <String[]>
      -ServiceAccountUid <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-AcctServiceAccountScope command is used to remove one or more service account objects from the given scope(s).

To remove a service account from a scope you need permission to change the scopes of the service account.

If the service account is not in a specified scope, that scope will be silently ignored.

The service accounts may be specified using the unique identifier, name, or as a powershell object.

Examples

EXAMPLE 1

Removes a single service account from the 'Finance'scope.

```
Remove-AcctServiceAccountScope Finance -ServiceAccountUid 17631afc-2e4c
    -491e-b0aa-f979a80e32c1
```

EXAMPLE 2

Removes a single service account from multiple scopes.

```
Remove-AcctServiceAccountScope Finance,Marketing -ServiceAccountUid
    17631afc-2e4c-491e-b0aa-f979a80e32c1
```

EXAMPLE 3

Removes all visible service account objects from the 'Finance'scope.

```
Get-AcctServiceAccount | Remove-AcctServiceAccountScope Finance
```

Parameters

-Scope

Specifies the scopes to remove the objects from.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-InputObject

The service account objects to be removed.

Type:	ServiceAccount[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ServiceAccountUid

The unique identifier for the service accounts to be removed.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-AcctServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-AcctServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AcctServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-AcctService | % {
  Remove-AcctServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Rename-AcctIdentityPool

March 11, 2024

Renames an identity pool.

Syntax

```
Rename-AcctIdentityPool
      [-IdentityPoolName] <String>
      [-NewIdentityPoolName] <String>
      [-PassThru]
```

```
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Rename-AcctIdentityPool
       -IdentityPoolUid <Guid>
       [-NewIdentityPoolName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to change the name of an existing identity pool.

Examples

EXAMPLE 1

Renames an existing identity pool called “oldName”to be called “newName”.

```
Rename-AcctIdentityPool -IdentityPoolName oldName -NewIdentityPoolName
    newName
```

Parameters

-IdentityPoolName

The name of the identity pool to be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool to be renamed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewIdentityPoolName

The new name for the identity pool. This must be a name which is not used by an existing identity pool, and it must not contain any of the following characters \/;:#.*?=<>|[]()’””

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PassThru

Defines whether or not the command returns a result showing the new state of the updated provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	SwitchParameter
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityPool

This object provides details of the identity pool and contains the following information:

AvailableAccounts <int>

The number of existing accounts (AcctADAccount objects) in the 'Available'state (not in 'InUse', 'Tainted', or 'Error').

DeviceManagementType <string>

The device management type. Can be Intune, IntuneWithCitrixTags, or None by default.

Domain <string>

The Active Directory domain (in FQDN format) that accounts in the pool belong to.

ErrorAccounts <int>

The number of existing AD accounts in the 'Error'state.

IdentityContent <string>

JSON formatted metadata containing Azure AD tenant and Azure AD security group information associated with this identity pool.

IdentityPoolName <string>

The name of the identity pool.

IdentityPoolUid <GUID>

The unique identifier for the identity pool.

IdentityType <string>

The identity type.

InUseAccounts <int>

The number of existing AD accounts in the 'InUse' state.

Lock <bool>

Indicates if the identity pool is locked.

MetadataMap <IDictionary[string, string];>

The metadata associated with this identity pool arranged in key value pairs.

NamingScheme <string>

The naming scheme for the identity pool.

NamingSchemeType <string>

The naming scheme type for the identity pool. This can be one of the following:

Numeric - naming scheme uses numeric indexes

Alphabetic - naming scheme uses alphabetic indexes

OU <string>

The Active Directory distinguished name for the OU in which accounts for this identity pool will be created.

ResourceLocationId <GUID>

The UID that corresponds to the resource location (DaaS only).

StartCount <int>

The next index to be used when creating an account in the identity pool.

TaintedAccounts <int>

The number of existing AD accounts in the 'Tainted' state.

WorkgroupMachine <bool>

If this is true, the identity pool can have an IdentityType of 'AzureAD' or 'Workgroup'.

If this is false, the identity pool can have an IdentityType of 'ActiveDirectory' or 'HybridAzureAD'.

ZoneUid <GUID>

The UID that corresponds to the Zone in which AD accounts are created.

Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

The administration scopes associated with this identity pool.

TenantId <GUID>

Identity of the Citrix tenant associated with this identity pool.

Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure the following errors can result.

Error Codes

IdentityPoolObjectNotFound

The specified identity pool could not be located.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Repair-AcctADAccount

March 11, 2024

Resets the Active Directory (AD) password for the given accounts.

Syntax

```
Repair-AcctADAccount
      [-Password <String>]
      [-SecurePassword <SecureString>]
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
      [-Force]
      [-ResetOnly]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Repair-AcctADAccount
      -ADAccountName <String[]>
      [-Password <String>]
      [-SecurePassword <SecureString>]
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
      [-Force]
      [-ResetOnly]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Repair-AcctADAccount
      -ADAccountSid <String[]>
      [-Password <String>]
      [-SecurePassword <SecureString>]
      [-ADUserName <String>]
      [-ADPassword <SecureString>]
```

```
        [-Force]
        [-ResetOnly]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This provides the ability to repair accounts in the 'Tainted'state by synchronizing the account password stored in Active Directory (AD) with the password stored in the AD Identity Service. If successful, this results in the account state being reset to 'Available'so it can be consumed by other Machine Creation Services.

If the current account password is not supplied using the Password or SecurePassword Parameters, this requires the user who initiated the runspace to have the required permissions in AD to reset the AD account password. If the current user does not have sufficient privileges, the ADUserName and ADPassword parameters may be used instead.

If the current account password is supplied then this command will use the password change operation which does not require any elevated permissions in AD.

Examples

EXAMPLE 1

Repairs the tainted accounts account and account2. After the repair operation, there are no more tainted accounts.

```
Get-AcctADAccount -State Tainted | Select-Object ADAccountName

ADAccountName
-------------
Domain\account
Domain\account2

Repair-AcctADAccount -ADAccountName "Domain\account","Domain\account2"

SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
-----------------------       -------------------    --------------
                      2                         0    {
  }

Get-AcctADAccount -State Tainted
```

Parameters

-ADAccountName

The names of the AD accounts that are to be repaired. AD accounts are accepted in the following formats: Fully qualified DN e.g. CN=MyComputer,OU=Computers,DC=MyDomain,DC=Com; UPN format e.g `MyComputer@MyDomain.Com`; Domain qualified e.g MyDomain\MyComputer.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountSid

The SID(s) of the accounts that are to be repaired.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-Password

The current password for the computer account.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SecurePassword

The current password for the account (provided in a Secure String class).

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADUserName

The username for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADPassword

The matching password for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	SecureString

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Indicates whether accounts that are marked as ‘in-use’can be repaired or not.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResetOnly

Indicates whether only resetting machine password and trust keys without updating the states to ‘Available’if the accounts that are marked as ‘InUse’. This parameter will be sliently ignored by the accounts which states are not ‘InUse’.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AccountOperationSummary

The Repair-AcctADAccout command returns an object with the following parameters: SuccessfulAccountsCount <int>

The number of accounts that were repaired successfully.

FailedAccountsCount <int>

The number of accounts that were not repaired.

FailedAccounts <Citrix.ADIdentity.Sdk.AccountError[]>

The list of accounts that failed to be repaired. Each one has the following parameters:

ADAccountName <string>

ADAccountSid <String>

ErrorReason <ADIdentityStatus>

This can be one of the following

UnableToConvertDomain

IdentityNotLocatedInDomain

IdentityNotFound

IdentityObjectInUse

IdentityObjectLocked

ADServiceDatabaseError

ADServiceDatabaseNotConfigured

ADServiceStatusInvalidDb

FailedToConnectToDomainController

FailedToExecuteSearchInAD

FailedToAccessComputerAccountInAD

FailedToSetPasswordInAD

FailedToChangePasswordInAD

DiagnosticInformtion <Exception>

Any other error information

Notes

In the case of failure, the following errors can result.

Error Codes

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

- Get-AcctADAccount

Repair-AcctIdentity

March 11, 2024

Repair the given identity accounts in identity pool.

Syntax

```
Repair-AcctIdentity
      -Target <String>
      [-PrivilegedUserName <String>]
      [-PrivilegedUserPassword <SecureString>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Repair-AcctIdentity
      -IdentityAccountName <String[]>
      -Target <String>
      [-PrivilegedUserName <String>]
      [-PrivilegedUserPassword <SecureString>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Repair-AcctIdentity
      -IdentityAccountId <String[]>
      -Target <String>
      [-PrivilegedUserName <String>]
      [-PrivilegedUserPassword <SecureString>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This provides the ability to repair accounts in the identity pool that behave abnormal without changing the current states of the accounts. Unlike "Repair-AcctADAccount", this command will not reset 'Tainted'accounts and make them to be 'Available'in the identity pool.

Examples

EXAMPLE 1

Repairs userCertificate attributes for the Hybrid Azure AD joined identity accounts in the identity pool "MyIdentityPool".

```
Get-AcctADAccount -IdentityPoolName "MyIdentityPool" | Repair-
    AcctIdentity -Target UserCertificate

SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
-----------------------       -------------------    --------------
                      2                         0    {
```

```
6    }
```

Parameters

-IdentityAccountName

The names of the identity accounts that are to be repaired. AD based identity accounts are accepted in the following formats: Fully qualified DN e.g. CN=MyComputer,OU=Computers,DC=MyDomain,DC=Com; UPN format e.g `MyComputer@MyDomain.Com`; Domain qualified e.g MyDomain\MyComputer.

Type:	String[]
Aliases:	ADAccountName
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityAccountId

The ID(s) of the identity accounts that are to be repaired. For AD based identity account, it should be SID

Type:	String[]
Aliases:	ADAccountSid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-Target

The target to be repaired. It can be either ‘IdentityInfo’or ‘UserCertificate’. Specifies ‘IdentityInfo ‘to repair account password and trust key pair. Specifies ‘UserCertificate’to repair userCertificate for

Hybrid Azure AD joined identities.

Type:	String
Accepted values:	IdentityInfo, UserCertificate
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivilegedUserName

The username for an user account in the identity provider (e.g. AD or Azure AD) with Write Permissions. This parameter must be used if the current user does not have the necessary privileges to modify accounts in identity provider.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivilegedUserPassword

The matching password for an user account in the identity provider (e.g. AD or Azure AD) with Write Permissions. This parameter must be used if the current user does not have the necessary privileges to modify accounts in identity provider.

Type:	SecureString
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AccountOperationSummary

The Repair-AcctIdentity command returns an object with the following parameters: SuccessfulAccountsCount <int>

The number of accounts that were repaired successfully.

FailedAccountsCount <int>

The number of accounts that were not repaired.

FailedAccounts <Citrix.ADIdentity.Sdk.AccountError[]>

The list of accounts that failed to be repaired. Each one has the following parameters:

ADAccountName <string>

ADAccountSid <String>

ErrorReason <ADIdentityStatus>

This can be one of the following

UnableToConvertDomain

IdentityNotLocatedInDomain

IdentityNotFound

IdentityObjectInUse

IdentityObjectLocked

ADServiceDatabaseError

ADServiceDatabaseNotConfigured

ADServiceStatusInvalidDb

FailedToConnectToDomainController

FailedToExecuteSearchInAD

FailedToAccessComputerAccountInAD

FailedToSetPasswordInAD

FailedToChangePasswordInAD

DiagnosticInformtion <Exception>

Any other error information

Notes

In the case of failure, the following errors can result.

Error Codes

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Reset-AcctEnabledFeatureList

March 11, 2024

Refreshes the ADIdentity service's list of enabled features.

Syntax

```
Reset-AcctEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix ADIdentity Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ADIdentity SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected ADIdentity service instance's list of enabled features.

```
Reset-AcctEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-AcctServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the ADIdentity Service.

Syntax

```
Reset-AcctServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload ADIdentity Service access permissions and configuration service locations. The Reset-AcctServiceGroupMembership command must be run on at least one instance of the service type (Acct) after installation and registration with the configuration service. Without this operation, the ADIdentity services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AcctServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    AcctServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-AcctServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.ADIdentity.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-AcctServiceGroupMembership command.

Outputs

Citrix.ADIdentity.Sdk.ServiceInstance

Reset-AcctServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the ADIdentity Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AcctADAccountUserCert

March 11, 2024

Set userCertificate for the given Active Directory (AD) accounts.

Syntax

```
Set-AcctADAccountUserCert
   [-IdentityPoolName] <String>
   -ADAccountName <String[]>
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Force]
   [-BatchSize <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctADAccountUserCert
   [-IdentityPoolName] <String>
   -ADAccountSid <String[]>
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Force]
   [-BatchSize <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctADAccountUserCert
   [-IdentityPoolName] <String>
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-AllAccounts]
   [-Force]
   [-BatchSize <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctADAccountUserCert
   -IdentityPoolUid <Guid>
   -ADAccountName <String[]>
   [-ADUserName <String>]
   [-ADPassword <SecureString>]
   [-Force]
   [-BatchSize <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctADAccountUserCert
   -IdentityPoolUid <Guid>
   -ADAccountSid <String[]>
```

```
    [-ADUserName <String>]
    [-ADPassword <SecureString>]
    [-Force]
    [-BatchSize <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AcctADAccountUserCert
   -IdentityPoolUid <Guid>
    [-ADUserName <String>]
    [-ADPassword <SecureString>]
    [-AllAccounts]
    [-Force]
    [-BatchSize <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to set the userCertificate attribute for given accounts in Active Directory (AD).

The user performing the operation in PowerShell must have sufficient privileges in AD to set the userCertificate attribute. If the current user does not have sufficient privileges, the ADUserName and ADPassword parameters may be used instead.

Examples

EXAMPLE 1

Set userCertificate for two accounts (account and account2) in the identity pool called “MyPool”.

```
Set-AcctADAccountUserCert -IdentityPoolName MyPool -ADAccountName "
   Domain\account","Domain\account2"

SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
-----------------------       -------------------    --------------
2                          0    {
  }
```

EXAMPLE 2

Set userCertificate for two accounts (account and account2) in the identity pool called “MyPool”. The accounts are set regardless of whether they are in the ‘inUse’state or not.

```
Set-AcctADAccountUserCert -IdentityPoolName MyPool -ADAccountName "
    Domain\account","Domain\account2" -Force

  SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
  -----------------------       -------------------    --------------
  2                          0    {
  }
```

EXAMPLE 3

Shows failure of setting of one of two accounts and how to retrieve the failure reason.

```
Set-AcctADAccountUserCert -IdentityPoolName MyPool -ADAccountName "
    Domain\account","Domain\account2" -OutVariable result

  SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
  -----------------------       -------------------    --------------
  1                                                 1    {
 account2 }

  C:\PS>$result[0].FailedAccounts

ADAccountName                 ADAccountSid           ErrorReason
-------------                 -------------          ------------
Domain\account2               account2
    IdentityObjectLocked
```

EXAMPLE 4

Set userCertificate for one account (S-1-5-21-1315084875-1285793635-2418178940-2685) in the identity pool called “MyPool”.

```
Set-AcctADAccountUserCert -IdentityPoolName MyPool -ADAccountSid S
    -1-5-21-1315084875-1285793635-2418178940-2685

  SuccessfulAccountsCount       FailedAccountsCount    FailedAccounts
  -----------------------       -------------------    --------------
  1                                                 0    {
  }
```

Parameters

-IdentityPoolName

The name of the identity pool containing the accounts to have userCertificate set.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountName

The AD account name to be set with userCertificate.

Active Directory accounts are accepted in the following formats:

Fully qualified DN e.g. CN=MyComputer,OU=Computers,DC=MyDomain,DC=Com;

UPN format e.g `MyComputer@MyDomain.Com`;

Domain qualified e.g MyDomain\MyComputer.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountSid

The SID for the AD account to be set with userCertificate.

Type:	String[]

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AllAccounts

Indicates if all accounts should be set with userCertificate.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier of the identity pool containing the accounts to have userCertificate set.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ADUserName

The username for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ADPassword

The matching password for an AD user account with Write Permissions. This parameter must be used if the current user does not have the necessary privileges.

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Indicates if accounts that are marked as 'in-use'can be set with userCertificate.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BatchSize

Specifies the number of accounts to set user certificate in one batch to AD Identity Service.

Type:	Int32
Position:	Named
Default value:	50
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.AccountOperationSummary

The Set-AcctADAccountUserCert command returns an object with the following parameters: SuccessfulAccountsCount <int>

The number of accounts that were successfully set with userCertificate.

FailedAccountsCount <int>

The number of accounts that were failed to set with userCertificate.

FailedAccounts <Citrix.ADIdentity.Sdk.AccountError[]>

The list of accounts that failed to be set with userCertificate. Each one has the following parameters:

ADAccountName <string>

ADAccountSid <String>

ErrorReason <ADIdentityStatus>

This can be one of the following:

IdentityObjectNotFound

IdentityObjectLocked

IdentityObjectInUse

IdentityPoolObjectNotFound

ADServiceDatabaseError

ADServiceDatabaseNotConfigured

ADServiceStatusInvalidDb

FailedToConnectToDomainController

FailedToGenerateDeviceKeyPair

FailedToAccessComputerAccountInAD

UnauthorizedToWriteUserCertificateInAD

DiagnosticInformation <Exception>

Any other error information

Notes

In the case of failure, the following errors can result.

Error Codes

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Set-AcctDBConnection

March 11, 2024

Configures a database connection for the ADIdentity Service.

Syntax

```
Set-AcctDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix ADIdentity Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ADIdentity SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-AcctDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-AcctDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the ADIdentity Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-AcctDBConnection cmdlet returns an object describing the status of the ADIdentity Service together with extra diagnostics information. Possible values are:

- OK:

The ADIdentity Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the ADIdentity Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the ADIdentity Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the ADIdentity Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the ADIdentity Service currently in use is newer than, and incompatible with, the version of the ADIdentity Service schema on the database. Upgrade the ADIdentity Service to a more recent version.

- DBOlderVersionThanService:

The version of the ADIdentity Service schema on the database is newer than, and incompatible with, the version of the ADIdentity Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the ADIdentity Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the ADIdentity Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the ADIdentity Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AcctDBCredentials

March 11, 2024

Configures the database server SQL credentials for the ADIdentity Service.

Syntax

```
Set-AcctDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix ADIdentity Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional ADIdentity Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ADIdentity SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-AcctDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-AcctDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-AcctDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-AcctDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-AcctIdentityPool

March 11, 2024

Update parameters of an identity pool.

Syntax

```
Set-AcctIdentityPool
   [-IdentityPoolName] <String>
   [-NamingScheme <String>]
   [-NamingSchemeType <ADIdentityNamingScheme>]
   [-OU <String>]
   [-Domain <String>]
   [-AllowUnicode]
   [-PassThru]
   [-StartCount <Int32>]
   [-ZoneUid <Guid>]
   [-AzureADSecurityGroupName <String>]
   [-AzureADAccessToken <String>]
   [-AzureADTenantId <Guid>]
   [-ServiceAccountUid <Guid[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctIdentityPool
   -IdentityPoolUid <Guid>
   [-NamingScheme <String>]
   [-NamingSchemeType <ADIdentityNamingScheme>]
   [-OU <String>]
   [-Domain <String>]
```

```
    [-AllowUnicode]
    [-PassThru]
    [-StartCount <Int32>]
    [-ZoneUid <Guid>]
    [-AzureADSecurityGroupName <String>]
    [-AzureADAccessToken <String>]
    [-AzureADTenantId <Guid>]
    [-ServiceAccountUid <Guid[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to modify the parameters of an identity pool.

Examples

EXAMPLE 1

Changes the start count and naming scheme of the identity pool named ‘poolName’so that the next account generated will be AC0100 (assuming that account does not already exist).

```
Set-AcctIdentityPool -IdentityPoolName poolName -StartCount 100 -
    NamingScheme AC####
```

Parameters

-IdentityPoolName

The name of the identity pool that is to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool that is to be modified.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NamingScheme

The new naming scheme that is to be used for the identity pool.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NamingSchemeType

The new naming scheme type that is to be used for the identity pool. This can be Numeric or Alphabetic.

Type:	ADIdentityNamingScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OU

The new OU to be used for the identity pool. All accounts created after this is set are created in this AD container. This will not move existing accounts. The OU must be a valid AD container of the domain specified for the pool.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Domain

The new Active Directory domain that is to be used for the identity pool. All new accounts will be created in this domain, but will not affect existing accounts. The domain can be specified in either long or short form (i.e. domain or domain.com).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowUnicode

Updates the definition of the allowed characters in a naming scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Defines whether the command returns the new state of the identity pool or not.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartCount

Specifies the next number to be used when creating new AD accounts in the identity pool.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

The UID that corresponds to the Zone in which these AD accounts will be created. This is only intended to be used for Citrix Cloud Delivery Controllers.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADSecurityGroupName

The name of Azure AD security group. This is only intended to be used when IdentityType is “AzureAD” or “HybridAzureAD”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADAccessToken

The access token of Microsoft Graph API. Must be specified if “IdentityType”is “HybridAzureAD”or “AzureAD”.

Make sure grant consent to following permissions:

- Group.ReadWrite.All
- GroupMember.ReadWrite.All

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADTenantId

The tenantId of AzureAD. Must be specified if “AzureADSecurityGroupName”is specified to create AzureAD security group, and IdentityType is “AzureAD”or “HybridAzureAD”.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceAccountUid

Specify the UID of the service account that associates with the identity pool.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.IdentityPool

This object provides details of the identity pool and contains the following information:

AvailableAccounts <int>

The number of existing accounts (AcctADAccount objects) in the 'Available'state (not in 'InUse', 'Tainted', or 'Error').

DeviceManagementType <string>

The device management type. Can be Intune, IntuneWithCitrixTags, or None by default.

Domain <string>

The Active Directory domain (in FQDN format) that accounts in the pool belong to.

ErrorAccounts <int>

The number of existing AD accounts in the 'Error'state.

IdentityContent <string>

JSON formatted metadata containing Azure AD tenant and Azure AD security group information associated with this identity pool.

IdentityPoolName <string>

The name of the identity pool.

IdentityPoolUid <GUID>

The unique identifier for the identity pool.

IdentityType <string>

The identity type.

InUseAccounts <int>

The number of existing AD accounts in the 'InUse' state.

Lock <bool>

Indicates if the identity pool is locked.

MetadataMap <IDictionary[string, string];>

The metadata associated with this identity pool arranged in key value pairs.

NamingScheme <string>

The naming scheme for the identity pool.

NamingSchemeType <string>

The naming scheme type for the identity pool. This can be one of the following:

Numeric - naming scheme uses numeric indexes

Alphabetic - naming scheme uses alphabetic indexes

OU <string>

The Active Directory distinguished name for the OU in which accounts for this identity pool will be created.

ResourceLocationId <GUID>

The UID that corresponds to the resource location (DaaS only).

StartCount <int>

The next index to be used when creating an account in the identity pool.

TaintedAccounts <int>

The number of existing AD accounts in the 'Tainted' state.

WorkgroupMachine <bool>

If this is true, the identity pool can have an IdentityType of 'AzureAD'or 'Workgroup'.

If this is false, the identity pool can have an IdentityType of 'ActiveDirectory'or 'HybridAzureAD'.

ZoneUid <GUID>

The UID that corresponds to the Zone in which AD accounts are created.

Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]>

The administration scopes associated with this identity pool.

TenantId <GUID>

Identity of the Citrix tenant associated with this identity pool.

Not applicable (always blank) in non-multitenant sites.

AzureADSecurityGroupName <string>

Associate an AzureAD security group to the identity pool. When the identity pool Associated an AzureAd device security

group, the option will update the name of the associated Azure AD security group.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidIdentityPoolParameterCombination

Caused by either of the following validation errors:

- If an OU is specified then a domain must also be specified.
- NamingScheme, NamingSchemeType and Domain must all be present if any of them are specified.

OUParameterRequiresDomain

If an OU is specified then a domain must also be specified.

OUNotReachable

Domain is not reachable. Check if the domain exists in any zones and if the domain contains the specified OU.

NamingSchemeAndNamingSchemeTypeMustBeUsedTogether

NamingScheme and NamingSchemeType must be used together.

NamingSchemeIllegalComputerName

The naming scheme supplied is not valid.

UnableToConvertDomainName

Unable to convert domain name to DNS format.

NamingSchemeNotEnoughCharacters

Naming scheme does not have enough characters specified.

NamingSchemeTooManyCharacters

Naming scheme has too many characters specified.

NamingSchemeIllegalCharacter

Naming scheme contains illegal characters.

NamingSchemeMayNotStartWithPeriod

Naming scheme starts with a period (.) character.

NamingSchemeMayNotBeAllNumbers

Naming scheme contains only numbers.

NamingSchemeMissingNumericSpecifications

Naming scheme does not contain any variable specification (i.e. no '#'characters are specified).

NamingSchemeHasMoreThanOneSetOfHashes

Naming scheme has more than one variable region (i.e. there are '#'characters separated by other characters).

IdentityPoolDuplicateObjectExists

An identity pool with the same name exists already.

IdentityPoolObjectNotFound

The identity pool to be modified could not be located.

IdentityPoolOUInvalid

Identity pool OU invalid as it does not exist.

IdentityPoolOUOfWrongDomain

Identity pool OU invalid as it refers to a different domain to the domain specified for the pool.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

AzureADAccessTokenMustBeSpecified

Must specify “AzureADAccessToken”parameter to operate AzureAD security group.

AzureADSecurityGroupNotSupportCurrentIdentityType

Current IdentityType not support AzureAD security group.

AzureADSecurityGroupMustBeSpecified

Must specify AzureAD security group.

AzureADSecurityGroupMembershipRulesMoreThanFiveExpressions

AzureAD security group membership rules more than five expressions.

AzureADSecurityGroupMembershipRuleExceedsMaximumLength

AzureAD security group membership rule exceeds maximum length.

AzureADSecurityGroupMembershipNeedsMatchRules

AzureAD security group membership needs match rules.

AzureADSecurityGroupMembershipRulesPrepareFailed

AzureAD security group membership rules prepare failed.

AzureADTenantIdMismatchAzureADAccessToken

The given AzureADTenantId mismatchs TenantId contained in AzureAD AccessToken.

CurrentIdentityTypeRequiresWorkgroupMachine

Current IdentityType requires WorkgroupMachine.

DomainNotRequiredForAzureADAndWorkgroup

Domain not required for AzureAD and Workgroup.

FailedToUpdateAzureADSecurityGroup

Failed to update AzureAD security group.

NamingSchemeAndDomainMustBeUsedTogetherForActiveDirectoryOrHybridAzureAD

NamingScheme and Domain must be used together for ActiveDirectory or HybridAzureAD.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Set-AcctIdentityPoolMetadata

March 11, 2024

Adds or updates metadata on the given identity pool.

Syntax

```
Set-AcctIdentityPoolMetadata
   [-IdentityPoolUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctIdentityPoolMetadata
   [-IdentityPoolUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctIdentityPoolMetadata
   [-IdentityPoolName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctIdentityPoolMetadata
   [-IdentityPoolName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctIdentityPoolMetadata
   [-InputObject] <IdentityPool[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctIdentityPoolMetadata
   [-InputObject] <IdentityPool[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given identity pool objects.

The identity pools may be specified using the unique identifier, name, or as a powershell object.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the identity pool with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AcctIdentityPoolMetadata -IdentityPoolUid 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value
```

Parameters

-IdentityPoolUid

The unique identifier for the identity pool to which metadata is to be added.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool to which metadata is to be added.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Identity pool objects to which the metadata is to be added.

Type:	IdentityPool[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the identity pool specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Type:	PSObject

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AcctIdentityPoolMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-AcctServiceAccount

March 11, 2024

Update parameters of a service account.

Syntax

```
Set-AcctServiceAccount
   -ServiceAccountUid <Guid>
   [-AccountId <String>]
   [-AccountSecret <SecureString>]
   [-SecretExpiryTime <DateTime>]
   [-Capabilities <String[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to modify the parameters of a service account.

Examples

EXAMPLE 1

Changes the AccountId for service account specified by uid 17631afc-2e4c-491e-b0aa-f979a80e32c1.

```
Set-AcctServiceAccount -ServiceAccountUid 17631afc-2e4c-491e-b0aa-
    f979a80e32c1 -AccountId deb0811e-4839-4cce-87d3-8f36b31c2934

                    ServiceAccountUid            : 17631afc-2e4c-491e-
                        b0aa-f979a80e32c1
                    IdentityProviderIdentifier   : f439f4c0-fcd8-4fe6
                        -95b8-71e7e49dc8c6
                    IdentityProviderType         : AzureAD
                    SecretExpiryTime             : 9/8/2024 8:00:00 PM
                    AccountId                    : deb0811e-4839-4cce
                        -87d3-8f36b31c2934
                    Capabilities                 : {
 AzureArcResourceManagement }

                    FailureReason                :
                    IsHealthy                    : True
                    Scopes                       : {
  }

                    TenantId                     :
```

EXAMPLE 2

Changes the AccountSecret for service account specified by uid ad24284e-ba3d-4504-80db-9ac6640de533.

```
Set-AcctServiceAccount -ServiceAccountUid ad24284e-ba3d-4504-80db-9
    ac6640de533 -AccountSecret $newPassword

ServiceAccountUid            : ad24284e-ba3d-4504-80db-9ac6640de533
IdentityProviderIdentifier   : test.local
IdentityProviderType         : ActiveDirectory
SecretExpiryTime             : 9/8/2024 8:00:00 PM
AccountId                    : test\svcacct_1
Capabilities                 :
FailureReason                :
IsHealthy                    : True
Scopes                       : {
```

```
12    }
13
14  TenantId                    :
```

Parameters

-ServiceAccountUid

The unique identifier for the service account that is to be modified.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AccountId

The identifier for the service account.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AccountSecret

The secret for the service account. E.g. Azure application (client) secret if 'IdentityProviderType'is AzureAD. The secret will be encrypted and stored in database.

Type:	SecureString

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecretExpiryTime

The secret expiration time for the service account.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Capabilities

The capabilities for the service account.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ADIdentity.Sdk.ServiceAccount

This object provides details of the service account and contains the following information:

ServiceAccountUid <GUID> The unique identifier of the service account. SecretExpiryTime <Date-time> The expiration time for the secret of the service account. AccountId <string> The identifier for the service account. E.g. Azure application ID if the service account is with Azure AD as identity provider. IdentityProviderIdentifier <string> The identifier of the identity provider that the service

account belongs to. E.g. Azure AD tenant ID. IdentityProviderType <string> The type of the identity provider of the service account. Can be AzureAD or ActiveDirectory. IsHealthy <bool> Indicates if the service account is healthy. Capabilities <string[]> Capabilities of the service account. Can be AzureArcResourceManagement. FailureReason <string> The reason why the service account becomes unhealthy. Scopes <Citrix.ADIdentity.Sdk.ScopeReference[]> The administration scopes associated with this identity pool. TenantId <GUID> Identity of the Citrix tenant associated with this identity pool. Not applicable (always blank) in non-multitenant sites.

Notes

In the case of failure, the following errors can result.

Error Codes

ServiceAccountObjectNotFound

The specified service account could not be located.

InvalidServiceAccountCapabilities

One or more specified service account capabilities are not supported.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Set-AcctServiceAccountCapabilityEffectiveScope

March 11, 2024

Sets effective scope for a capability of the service account.

Syntax

```
Set-AcctServiceAccountCapabilityEffectiveScope
   -ServiceAccountUid <Guid>
   [-Capability <String>]
   [-EffectiveScope <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to set effective scope for a capability of the service account.

Examples

EXAMPLE 1

Set the effective scope for the capability AzureArcResourceManagement of service account specified by uid 17631afc-2e4c-491e-b0aa-f979a80e32c1 to a specific subscription 04b4abae-a80a-47c2-8156-daa28145e4fa.

```
c:\Set-AcctServiceAccountCapabilityEffectiveScope -ServiceAccountUid
    17631afc-2e4c-491e-b0aa-f979a80e32c1 -Capability
    AzureArcResourceManagement -EffectiveScope 04b4abae-a80a-47c2-8156-
    daa28145e4fa
```

Parameters

-ServiceAccountUid

The unique identifier for the service account.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Capability

The capability for the service account to be set.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EffectiveScope

The effective scope for the capability of the service account to be set. Effective scope is the scope that the capability applies to.

For Azure AD, it can be the subscription id within the Azure AD tenant.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

ServiceAccountObjectNotFound

The specified service account could not be located.

ServiceAccountCapabilityNotFound

The specified service account capability is not found.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the Citrix Virtual Apps and Desktops logs.

Set-AcctServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-AcctServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AcctServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AcctServiceMetadata
    [-InputObject] <Service[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-AcctServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AcctServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-AcctDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix ADIdentity Service.

Syntax

```
Test-AcctDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
```

```
5       [<CommonParameters>]
```

```
1 Test-AcctDBConnection
2     [-DBConnection] <String>
3     [-Credentials] <PSCredential>
4     [-LoggingId <Guid>]
5     [<CitrixCommonParameters>]
6     [<CommonParameters>]
```

```
1 Test-AcctDBConnection
2     [-DBConnection] <String>
3     [-Login] <String>
4     [-Password] <SecureString>
5     [-LoggingId <Guid>]
6     [<CitrixCommonParameters>]
7     [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix ADIdentity Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ADIdentity SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1 Test-AcctDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
     Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix ADIdentity Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-AcctDBConnection cmdlet returns an object describing the status of the selected ADIdentity Service instance that would result if the connection string were used with the Set-AcctDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-AcctDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the ADIdentity Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the ADIdentity Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The ADIdentity Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The ADIdentity Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the ADIdentity Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the ADIdentity Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-AcctIdentityPoolNameAvailable

March 11, 2024

Checks to ensure that the proposed name for an identity pool is unused.

Syntax

```
Test-AcctIdentityPoolNameAvailable
    [-IdentityPoolName] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Checks to ensure that the proposed name for an identity pool is unused. This check is done without regard for scoping of existing identity pools, so the names of identity pools under inaccessible administrative scopes are also checked.

Examples

EXAMPLE 1

Tests whether the identity pool names "MyPool", "NewPool", and "UnusedPool"are available. The output indicates that only "UnusedPool"is available.

```
Test-AcctIdentityPoolNameAvailable -IdentityPoolName MyPool, NewPool,
   UnusedPool

Name       Available
----       ---------
MyPool         False
NewPool        False
UnusedPool      True
```

Parameters

-IdentityPoolName

The name or names of the identity pool(s) to be tested.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

object[]

An array of PSObjects that pair the name and availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Unlock-AcctADAccount

March 11, 2024

Unlocks Active Directory (AD) accounts within the AD Identity Service.

Syntax

```
Unlock-AcctADAccount
       -ADAccountName <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Unlock-AcctADAccount
       -ADAccountSid <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to unlock Active Directory (AD) accounts within the AD Identity Service. An AD account is marked as locked in the AD Identity Service while the Machine Creation Services (MCS) are processing tasks relating to the account. If these tasks are forcibly stopped, an account can remain locked despite no longer being processed. This command resolves this issue, but use it with caution because unlocking an account that MCS expects to be locked can result in an MCS operation being cancelled. Use this command only when MCS has locked an account for use in a provisioning operation and the operation has failed without unlocking the account.

Note: The lock state in Active Directory is unrelated to the lock state in the AD Identity service. This command does NOT make any changes to the account information stored in Active Directory, only the AD Identity Service database.

Examples

EXAMPLE 1

Unlocks the AD account called "Domain\account".

```
Unlock-AcctADAccount -ADAccountName Domain\account
```

EXAMPLE 2

Unlocks all the locked AD accounts.

```
Get-AcctADAccount -Filter {
 Lock -eq $true }
  | Unlock-AcctADAccount
```

Parameters

-ADAccountName

The name of the AD account to be unlocked.

AD account name is accepted in the following formats:

Fully qualified DN e.g. CN=MyComputer,OU=Computers,DC=MyDomain,DC=Com;

UPN format e.g `MyComputer@MyDomain.Com`;

Domain qualified e.g MyDomain\MyComputer.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountSid

The SID of the AD account to be unlocked.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.ADIdentity.Sdk.IdentityInPool

You can pipe an object containing a parameter called ‘ADAccountSID’to unlock-AcctADAccount.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

IdentityNotLocatedInDomain

The specified AD account could not be located in Active Directory.

IdentityObjectNotFound

The identity could not be found.

IdentityAlreadyUnlocked

The identity is not locked.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Unlock-AcctIdentityPool

March 11, 2024

Unlocks identity pools.

Syntax

```
Unlock-AcctIdentityPool
       [-IdentityPoolName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Unlock-AcctIdentityPool
       -IdentityPoolUid <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to unlock the specified identity pool. Identity pools are locked automatically when being updated (e.g. when new accounts are being created). The pool must never be left in a locked state; this command allows recovery from an error should one ever occur. Use this command with caution, as unlocking an identity pool which is supposed to be locked may result in unexpected behavior.

Examples

EXAMPLE 1

Unlocks the identity pool called "MyPool", setting the Lock field to false.

```
Unlock-AcctIdentityPool -IdentityPool MyPool
```

EXAMPLE 2

Unlocks all the locked identity pools.

```
Get-AcctIdentityPool -Filter {
 Lock -eq $true }
  | Unlock-AcctIdentityPool
```

Parameters

-IdentityPoolName

The name of the identity pool to be unlocked.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool to be unlocked.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.ADIdentity.Sdk.IdentityPool

You can pipe an object containing a parameter called 'IdentityPoolName' to unlock-AcctIdentityPool.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

IdentityPoolObjectNotFound

The specified identity pool could not be located.

IdentityPoolAlreadyUnlocked

The specified identity pool is not locked.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

Update-AcctADAccount

March 11, 2024

Updates the state of Active Directory (AD) accounts.

Syntax

```
Update-AcctADAccount
      [-IdentityPoolName] <String>
      [-AllAccounts]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Update-AcctADAccount
      -IdentityPoolUid <Guid>
      [-AllAccounts]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to synchronize the state of the Active Directory (AD) accounts stored in the AD Identity Service with the AD accounts themselves. By default, this checks all accounts marked as 'error' to

determine if accounts are still in an error state (i.e. disabled or locked). If you specify the 'AllAccounts' option, it checks all accounts regardless of error state and updates their status.

Examples

EXAMPLE 1

Checks the status of accounts in the identity pool MyPool that are currently in the Error state, marking them as Available, InUse, Tainted or Error as appropriate.

```
1 Update-AcctADAccount -IdentityPoolName MyPool
```

EXAMPLE 2

Checks the status of all accounts in the identity pool MyPool marking them as Available, InUse, Tainted or Error as appropriate.

```
1 Update-AcctADAccount -IdentityPoolName MyPool -AllAccounts
```

Parameters

-IdentityPoolName

The name of the identity pool of the AD accounts that are to be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier for the identity pool of the AD accounts that are to be updated.

Type:	Guid

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AllAccounts

Indicates if all accounts should be updated or only the ones marked as in error.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the Citrix Virtual Apps and Desktops logs.

about_AnalyticsAnalyticsSnapIn

March 11, 2024

Topic

about_AnalyticsAnalyticsSnapIn

Short Description

The Analytics PowerShall snap-in provides administrative functions for the Analytics Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Analytics'.

Long Description

The Analytics Service PowerShell snap-in enables both local and remote administration of the Analytics Service.

The Analytics Service collects Citrix CEIP data about the DDC. For more information about CEIP, see http://more.citrix.com/XD-CEIP.

This snap-in provides commands for a Citrix administrator to enable a data collection, import the collection data points file, and query the current status of the Analytics database configuration and service.

For more information on the Analytics Service, see the help top about Analytics Service.

Use the command 'Get-Command -Module Citrix.Analytics.Admin.V1'to see a complete list of commands supported by this snap-in.

For usage of each command, use the Get-Help command to display the help text for each command.

In addition to pre-programed schedules hard-coded in the Analytics Service, administrators can use the Set-AnalyticsSite command to trigger immediate data collection and upload. The registry string value HKLM/Software/Citrix/XDServices/Analytics/DoOperation can be specified to indicate the type of collection to be performed upon the execution of the Set-AnalyticsSite command. If the data stored in this registry value is set to 'Collect', then upon issuance of the command 'Set-AnalyticsSite -Enabled $true', the Analytics Service starts a collection immediately. The result of the collection is a .zip file, whose location is stored in the the registry value 'DoOperationResult'. The collected result is not uploaded to the Citrix CEIP site.

If the value of 'DoOperation'is 'CollectAndUpload', then a collection is performed and the result is also uploaded to the Citrix CEIP site.

If the value of 'DoOperation'is 'CollectSite', then only site data is collected. For detailed list of site data, refer to the 'Scope'parameter for each data point in the DataPoints.xml file, which can be found under C:\Program Files\Citrix\XenDesktopPoshSDK\Module\Citrix.XenDesktop.Admin.V1\Citrix.XenDesktop.Admin.

If the value of 'DoOperation'is 'CollectHost', then only host data is collected, as specified in the data points file.

The data points file can be imported using the Import-AnalyticsDataDefinition file. The file must be a file signed by Citrix.

When running, the Analytics Service periodically collects data using the latest data point file stored in the DDC database. The collection runs at approximately every 30 minutes to perform data collection. Each collection runs for 5 to 10 minutes, depending on the size of data to be collected. The service has been optimized so that minimal system resources are used to do the data collection.

If collection results are not uploaded immediately, they can be manually uploaded. If they are not manually uploaded, they will be periodically packaged and uploaded by the Analytics Service. If for any reason an upload fails, the Service will try again but not before doubling the amount of time between the most recent to successful uploads. If upload keeps failing, very soon the Service will wait a very long time to attempt the next upload. The time can be weeks or months. A system reboot resets the upload wait time.

The collection and upload algorithm and schedules are hard-coded in the Service and cannot be changed.

about_Analytics_Filtering

March 11, 2024

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or

descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like ‘‘High*’’-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company ‘‘citrix’’-Product ‘[X]EN*’
Get-<Noun> -Product ‘‘Xen*’’-Company ‘‘CITRIX’’
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{
```

```
6
7    $sessions = @(Get-BrokerSession -Filter {
8    Uid -gt $lastUid  }
9    -MaxRecordCount 1000 -Sortby 'Uid')
```

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Get-AnalyticsDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Analytics Service.

Syntax

```
Get-AnalyticsDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Analytics Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Analytics SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Analytics Service instance running on controller "controller1.mydomain.net".

```
Get-AnalyticsDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Analytics Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the AnalyticsService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AnalyticsDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Analytics Service.

Syntax

```
Get-AnalyticsDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Analytics Service database schema, add a new Analytics service to an existing site, remove a Analytics service from a site, or create a database server logon for a Analytics service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Analytics service instance, otherwise the scripts relate to Analytics service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Analytics SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Analytics service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Analytics service roles

If ScriptType is Evict, the returned script contains:

- Removal of Analytics service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Analytics Service and copies it to a file called "C:\AnalyticsSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Analytics service schema.

```
Get-AnalyticsDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\AnalyticsSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Analytics service. This can be used when configuring a mirror server for use.

```
Get-AnalyticsDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    AnalyticsLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Analytics service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Analytics services that share the same database instance and are con-

sidered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Analytics Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Analytics Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Analytics Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Analytics Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Analytics services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Analytics Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AnalyticsDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Analytics Service.

Syntax

```
Get-AnalyticsDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Analytics Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Analytics Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Analytics Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Analytics Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Analytics Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-AnalyticsServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-AnalyticsDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Analytics Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-AnalyticsDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Analytics Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shut down during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Analytics services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AnalyticsServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Get-AnalyticsInstalledDBVersion
- Get-AnalyticsServiceStatus
- Get-AnalyticsDBSchema

Get-AnalyticsInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Analytics Service.

Syntax

```
Get-AnalyticsInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Analytics Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-AnalyticsDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Analytics Service database schema version number.

```
Get-AnalyticsInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Analytics Service database schema for which upgrade scripts are supplied.

```
Get-AnalyticsInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-AnalyticsInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Analytics

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AnalyticsService

March 11, 2024

Gets the service record entries for the Analytics Service.

Syntax

```
Get-AnalyticsService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the Analytics Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Analytics Service running in the current service group.

```
Get-AnalyticsService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Analytics_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Analytics_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Analytics.Sdk.Service

The Get-AnalyticsServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-AnalyticsServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Analytics Service on the controller.

Syntax

```
Get-AnalyticsServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Analytics Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Analytics Service.

```
Get-AnalyticsServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AnalyticsServiceInstance

March 11, 2024

Gets the service instance entries for the Analytics Service.

Syntax

```
Get-AnalyticsServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Analytics Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Analytics Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-AnalyticsServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Analytics.Sdk.ServiceInstance

The Get-AnalyticsServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Analytics.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Analytics.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AnalyticsServiceStatus

March 11, 2024

Gets the current state of the Analytics Service on the controller.

Syntax

```
Get-AnalyticsServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Analytics Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will

return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Analytics Service.

```
Get-AnalyticsServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-AnalyticsServiceStatus command returns an object containing the status of the Analytics Service together with extra diagnostics information.

DBUnconfigured

The Analytics Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Analytics Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Analytics Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Analytics is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Analytics is connected to a database that is valid, but it does not have the full functionality required so the Analytics cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Analytics Service currently in use is incompatible with the version of the Analytics Service schema on the database. Upgrade the Analytics Service to a more recent version.

DBOlderVersionThanService

The version of the Analytics Service schema on the database is incompatible with the version of the Analytics Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Analytics Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Analytics Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Analytics and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Analytics service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AnalyticsSite

March 11, 2024

This cmdlet returns the site configuration for the Analytics Service/Customer Experience Improvement Program. Details are available at http://more.citrix.com/XD-CEIP

Syntax

```
Get-AnalyticsSite
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The configuration will be contained in the Site object that is returned. The Site object has two properties, Enabled, and DataDefinitionVersion. If Enabled is True, then site is participating in the Citrix Experience Improvement Program.

Examples

EXAMPLE 1

This retrieves the Analytics Site configuration.

```
Get-AnalyticsSite

DataDefinitionVersion                          Enabled
---------------------                          -------
1.0.0                                          False
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Analytics.Sdk.Site

The site object with configuration properties.

- about_AnalyticsAnalyticsSnapin

Import-AnalyticsDataDefinition

March 11, 2024

This imports a new data definition file for the Analytics Service/Customer Experience Improvement Program.

Syntax

```
Import-AnalyticsDataDefinition
      -DataDefinition <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The DataDefinition file defines what data should be collected and sent to Citrix. Only Citrix signed DataDefinition files can be imported. An error occurs if the file is not signed properly.

Examples

EXAMPLE 1

This imports a new DataDefinition file.

```
1 Import-AnalyticsDataDefinition -DataDefinition c:\SignedDataDefinition.
    xml
```

Parameters

-DataDefinition

The path to a new DataDefinition file

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- about_AnalyticsAnalyticsSnapin

Remove-AnalyticsServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-AnalyticsServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AnalyticsServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AnalyticsServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AnalyticsServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-AnalyticsService | % {
  Remove-AnalyticsServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-AnalyticsEnabledFeatureList

March 11, 2024

Refreshes the Analytics service's list of enabled features.

Syntax

```
Reset-AnalyticsEnabledFeatureList
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Analytics Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Analytics SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Analytics service instance's list of enabled features.

```
1  Reset-AnalyticsEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-AnalyticsServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Analytics Service.

Syntax

```
Reset-AnalyticsServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Analytics Service access permissions and configuration service locations. The Reset-AnalyticsServiceGroupMembership command must be run on at least one instance of the service type (Analytics) after installation and registration with the configuration service. Without this operation, the Analytics services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AnalyticsServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    AnalyticsServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-AnalyticsServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Analytics.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-AnalyticsServiceGroupMembership command.

Outputs

Citrix.Analytics.Sdk.ServiceInstance

Reset-AnalyticsServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Analytics Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AnalyticsDBConnection

March 11, 2024

Configures a database connection for the Analytics Service.

Syntax

```
Set-AnalyticsDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Analytics Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Analytics SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-AnalyticsDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-AnalyticsDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Analytics Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-AnalyticsDBConnection cmdlet returns an object describing the status of the Analytics Service together with extra diagnostics information. Possible values are:

- OK:

The Analytics Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Analytics Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Analytics Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Analytics Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Analytics Service currently in use is newer than, and incompatible with, the version of the Analytics Service schema on the database. Upgrade the Analytics Service to a more recent version.

- DBOlderVersionThanService:

The version of the Analytics Service schema on the database is newer than, and incompatible with, the version of the Analytics Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Analytics Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Analytics Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Analytics Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AnalyticsDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Analytics Service.

Syntax

```
Set-AnalyticsDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AnalyticsDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Analytics Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Analytics Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Analytics SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-AnalyticsDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-AnalyticsDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-AnalyticsDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-AnalyticsDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-AnalyticsServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-AnalyticsServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AnalyticsServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AnalyticsServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AnalyticsServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AnalyticsServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AnalyticsServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AnalyticsSite

March 11, 2024

This sets the site configuration for the Analytics Service/Customer Experience Improvement Program. Details are available at http://more.citrix.com/XD-CEIP

Syntax

```
Set-AnalyticsSite
    [-Enabled <Boolean>]
    [-NewSite <Site>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this cmdlet to opt-in to the Citrix Experience Improvement Program. For advanced users it can also take a new Citrix.Analytics.Sdk.Site object using the -NewSite parameter.

Examples

EXAMPLE 1

This enables the Citrix Experience Improvement Program. To disable use $false instead.

```
Set-AnalyticsSite -Enabled $true
```

Parameters

-Enabled

This enables or disables the Citrix Experience Improvement Program functionality.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NewSite

New site object, if you wish to supply the a whole Site object.

Type:	Site
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Test-AnalyticsDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Analytics Service.

Syntax

```
Test-AnalyticsDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AnalyticsDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AnalyticsDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Analytics Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Analytics SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-AnalyticsDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Analytics Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-AnalyticsDBConnection cmdlet returns an object describing the status of the selected Analytics Service instance that would result if the connection string were used with the Set-AnalyticsDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-AnalyticsDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Analytics Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Analytics Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Analytics Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Analytics Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Analytics Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Analytics Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                  # Matches Abc*
Get-<Noun> -Company "Abc`*"                   # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter 'Enabled'# Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled'# Equivalent to 'Enabled -eq $false'

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle"}
Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for

objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings

formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-AppLibIsolationGroupPackage

March 11, 2024

Adds an App-V package to an Isolation Group.

Syntax

```
Add-AppLibIsolationGroupPackage
   [-IsolationGroupUid] <Int32>
   -AppVPackageUid <Int32>
   -OrderNumber <Int32>
   [-ExplicitInclusion <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Adds the App-V package to the specified Isolation Group.

Examples

EXAMPLE 1

Adds the App-V package with the unique identifier to the specified isolation group.

```
Add-AppLibIsolationGroupPackage -Uid 4 -IsolationGroupUid 15 -
   ExplicitInclusion $true -OrderNumber 1
```

Parameters

-IsolationGroupUid

The AppLibrary's internal unique identifier of the Isolation Group to contain the package.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppVPackageUid

The AppLibrary's internal unique identifier of the App-V package.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OrderNumber

The order number within the Isolation Group.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-ExplicitInclusion

Indicates whether the package is explicitly included in the delivery group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.IsolationGroupPackage

An object representing the IsolationGroupPackage.

Get-AppLibAppAttachApplicationsPolicy

March 11, 2024

Gets the updated policy for the list of applications passed

Syntax

```
Get-AppLibAppAttachApplicationsPolicy
    [[-AppIdentifierList] <String[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet should be used to get policy for published app attach applications. The input should be a list of app attach application identifiers list

Examples

EXAMPLE 1

Gets the updated policy for the list of applications passed

```
$appIdentifiers = "4345-fr23320-df","45234-sdewr-gfgf","785ddf-vcvxdsf-dfdf"
Get-AppLibAppAttachApplicationsPolicy -AppIdentifierList $appIdentifiers
```

Parameters

-AppIdentifierList

List of App attach application identifiers

Type:	String[]
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

byte array containing the updated policy

Notes

Pass in the App Identifiers as a comma separated string

Get-AppLibAppVApplication

March 11, 2024

Gets the details of an App-V application held in the application library.

Syntax

```
Get-AppLibAppVApplication
    [[-Uid] <Int32>]
    [-Name <String>]
    [-AppVPackageUid <Int32>]
    [-Description <String>]
    [-RetrieveIcon <Boolean>]
    [-RetrievePolicy <Boolean>]
    [-RetrieveUsers <Boolean>]
    [-RetrieveMetadata <Boolean>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The application library holds the information required to find and launch an App-V application on a client VDA.

Examples

EXAMPLE 1

Gets the details for all of the App-V applications in the library.

```
Get-AppLibAppVApplication
```

EXAMPLE 2

Gets the details of the App-V application named MyApp.

```
Get-AppLibAppVApplication -Name "MyApp"
```

EXAMPLE 3

Gets the details of all of the App-V applications in the specified package.

```
Get-AppLibAppVApplication -AppVPackageUid 15
```

EXAMPLE 4

Gets the details of all App-V applications without the metadata

```
Get-AppLibAppVApplication -RetrieveMetadata $false
```

Parameters

-Uid

The AppLibrary's internal UID of the App-V application.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

The name of the application in the the App-V package.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AppVPackageUid

The AppLibrary's internal UID of the App-V package that contains the application.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A description of the application.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RetrieveIcon

A switch to indicate whether to return the application's icon data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RetrievePolicy

A switch to indicate whether to return the application's policy blob

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RetrieveUsers

A switch to indicate whether to return the application's associated users

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RetrieveMetadata

A switch to indicate whether to return the application's metadata

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.AppVApplication

An object representing the details required to launch the App-V application.

Notes

Pass in the App-V application's UID to retrieve a single application.

Pass in a package UID to retrieve all of the applications in that package.

Call the cmdlet without any parameters to retrieve all of the applications in the library.

Get-AppLibAppVApplicationInfo

March 11, 2024

Enumerates information for a given application in a given package

Syntax

```
Get-AppLibAppVApplicationInfo
   -PackageGuid <String>
   -ApplicationId <Int32>
   [-LibraryId <Int32>]
   [-Property <String[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to query application information about single admin appv package. Currently only fetching filetype associations is supported. See example

Examples

EXAMPLE 1

Fetches all the file type associations for the given application

```
Get-AppLibAppVApplicationInfo -PackageGuid "7796B8F3-713A-446F-840D-18
    E5171AB21A" -ApplicationId 14
```

Parameters

-PackageGuid

The package Guid

Type:	String
Aliases:	packageId
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ApplicationId

The AppV application Id

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LibraryId

The Application Library Id

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Property

The property parameter is reserved for future use. Currently only FileTypeAssociations are supported.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Object with required information wihtin object as properties

Notes

Currently only fetching file type associations are supported.

Get-AppLibAppVApplicationsPolicy

March 11, 2024

Gets the updated policy for the list of applications passed

Syntax

```
Get-AppLibAppVApplicationsPolicy
    [[-AppIdentifierList] <String[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet should be used to get policy for published single admin App-V applications. The input should be a list of App-V application identifiers list

Examples

EXAMPLE 1

Gets the updated policy for the list of applications passed

```
$appIdentifiers = "4345-fr23320-df","45234-sdewr-gfgf","785ddf-vcvxdsf-
    dfdf"
Get-AppLibAppVApplicationsPolicy -AppIdentifierList $appIdentifiers
```

Parameters

-AppIdentifierList

List of App-V application identifiers

Type:	String[]
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

byte array containing the updated policy

Notes

Pass in the App Identifiers as a comma separated string

Get-AppLibAppVPackage

March 11, 2024

Gets the details of an App-V package held in the application library.

Syntax

```
Get-AppLibAppVPackage
   [[-Uid] <Int32>]
   [-Name <String>]
   [-LibraryUid <Int32>]
   [-Description <String>]
   [-RetrieveIcon <Boolean>]
   [-RetrieveMetadata <Boolean>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-AppLibAppVPackage
   [[-Uid] <Int32>]
   [-Name <String>]
   [-LibraryUid <Int32>]
   [-Description <String>]
   [-RetrieveIcon <Boolean>]
   -RetrieveApplicationPolicy <Boolean>
   -RetrieveApplicationData <Boolean>
   [-RetrieveMetadata <Boolean>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
```

```
17      [<CitrixCommonParameters>]
18      [<CommonParameters>]
```

Description

The application library holds the information about App-V packages, their location on the network, and the applications they contain.

Examples

EXAMPLE 1

Gets the details of all of the App-V packages in the AppLibrary.

```
1  Get-AppLibAppVPackage
```

EXAMPLE 2

Gets the details of the App-V package named MyPackage.

```
1  Get-AppLibAppVPackage -Name "MyPackage"
```

EXAMPLE 3

Gets the details of all of the App-V packages in the specified library.

```
1  Get-AppLibAppVPackage -libraryUid 1
```

EXAMPLE 4

Gets the details of the App-V package named MyPackage, including it and its containing application's icon data.

```
1  Get-AppLibAppVPackage -Name "MyPackage" -RetrieveIcon $true
```

EXAMPLE 5

Gets the details of the App-V package named MyPackage, including it and its containing application and their policy data.

```
Get-AppLibAppVPackage -Name "MyPackage" -RetrieveApplicationData $true
    -RetrieveApplicationPolicy $true
```

EXAMPLE 6

Gets the details of the App-V package named MyPackage. Here we are setting the retrieveMedata flag to false, so that package info will be returned without metadata

```
Get-AppLibAppVPackage -Name "MyPackage" -RetrieveMetadata $false
```

Parameters

-RetrieveApplicationPolicy

A switch to indicate whether to return the package application's policy data data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RetrieveApplicationData

A switch to indicate whether to return the package applications.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-Uid

The AppLibrary's internal UID of the App-V package.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

The name of the App-V package.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LibraryUid

The AppLibrary's internal UID of the specific library that holds details of the App-V package.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A description of the App-V package and its contents.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RetrieveIcon

A switch to indicate whether to return the package's icon data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RetrieveMetadata

A switch to indicate whether to return the package metadata

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.AppVPackage

An object representing the details needed to identify an App-V package.

Notes

Pass in the App-V package's UID to retrieve a single App-V package.

Pass in a library UID to retrieve all af the packages in that library.

Call the cmdlet without any parameters to retrieve all of the packages in the AppLibrary.

Get-AppLibAppVServer

March 11, 2024

Gets the details of an App-V Server created in the application library.

Syntax

```
Get-AppLibAppVServer
    [-Uid <Int32>]
    [-ManagementServer <String>]
    [-PublishingServer <String>]
    [-RetrievePolicy <Boolean>]
    [-RetrievePackageIds <Boolean>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The application library holds the information about App-V Servers and their associated policies

Examples

EXAMPLE 1

Gets the details of all of the App-V servers in the AppLibrary.

```
Get-AppLibAppVServer
```

EXAMPLE 2

Gets the details of the App-V server with Uid 1.

```
Get-AppLibAppVServer -Uid 1
```

EXAMPLE 3

Gets the details of the App-V server with Uid 1, including it and its containing policy data.

```
Get-AppLibAppVServer -Uid 1 -RetrievePolicy $true
```

EXAMPLE 4

Gets the details of the App-V server with given Management Server and Publishing server urls, including it and its containing policy data.

```
Get-AppLibAppVServer -ManagementServer http://AppVSrv.company.local -
    PublishingServer http://AppVSrv.company.local:8001 -RetrievePolicy
    $true
```

Parameters

-Uid

Uid of the App-V server.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ManagementServer

Management Server Url of the App-V server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)

Accept wildcard characters:	True

-PublishingServer

Publishing Server Url of the App-V server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-RetrievePolicy

A switch to indicate whether to return the servers policy data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RetrievePackageIds

A switch to indicate whether to return the server package Ids.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.AppVServer

An object representing the details needed to identify an App-V server.

Notes

Pass in the App-V server's UID to retrieve a single App-V server.

Call the cmdlet without any parameters to retrieve all of the servers in the AppLibrary.

Get-AppLibDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the AppLibrary Service.

Syntax

```
Get-AppLibDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected AppLibrary Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a AppLibrary SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the AppLibrary Service instance running on controller "controller1.mydomain.net".

```
Get-AppLibDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current AppLibrary Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the AppLibraryService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AppLibDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix AppLibrary Service.

Syntax

```
Get-AppLibDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix AppLibrary Service database schema, add a new AppLibrary service to an existing site, remove a AppLibrary service from a site, or create a database server logon for a AppLibrary service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected AppLibrary service instance, otherwise the scripts relate to AppLibrary service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a AppLibrary SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to AppLibrary service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to AppLibrary service roles

If ScriptType is Evict, the returned script contains:

- Removal of AppLibrary service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix AppLibrary Service and copies it to a file called "C:\AppLibrarySchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a AppLibrary service schema.

```
Get-AppLibDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\AppLibrarySchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the AppLibrary service. This can be used when configuring a mirror server for use.

```
Get-AppLibDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    AppLibraryLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new AppLibrary service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the AppLibrary services that share the same database instance and are

considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix AppLibrary Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a AppLibrary Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a AppLibrary Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the AppLibrary Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for AppLibrary services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the AppLibrary Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AppLibDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix AppLibrary Service.

Syntax

```
Get-AppLibDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix AppLibrary Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix AppLibrary Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix AppLibrary Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix AppLibrary Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix AppLibrary Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-AppLibServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-AppLibDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix AppLibrary Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-AppLibDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix AppLibrary Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any AppLibrary services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AppLibServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AppLibFlexAppApplicationsPolicy

March 11, 2024

Gets the updated policy for the list of applications passed

Syntax

```
Get-AppLibFlexAppApplicationsPolicy
    [[-AppIdentifierList] <String[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet should be used to get policy for published FlexApp applications. The input should be a list of FlexApp application identifiers list

Examples

EXAMPLE 1

Gets the updated policy for the list of applications passed

```
$appIdentifiers = "ac4c2abf-457b-43e2-9141-432546b13d7a","eb95c4ab-aa01
    -495e-aa19-13b435d0fd54","edead135-abcd-4b1b-8dc6-f46b402695c5"
Get-AppLibFlexAppApplicationsPolicy -AppIdentifierList $appIdentifiers
```

Parameters

-AppIdentifierList

List of FlexApp application identifiers

Type:	String[]
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

byte array containing the updated policy

Notes

Pass in the App Identifiers as a comma separated string

Related Links

Get-AppLibInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the AppLibrary Service.

Syntax

```
Get-AppLibInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix AppLibrary Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-AppLibDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix AppLibrary Service database schema version number.

```
1 Get-AppLibInstalledDBVersion
```

EXAMPLE 2

Get the versions of the AppLibrary Service database schema for which upgrade scripts are supplied.

```
1 Get-AppLibInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-AppLibInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the AppLibrary

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AppLibIsolationGroup

March 11, 2024

Gets the details of an isolation group held in the application library.

Syntax

```
Get-AppLibIsolationGroup
   [-IncludePolicy <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-AppLibIsolationGroup
   [[-IsolationGroupUid] <Int32>]
   [-IncludePolicy <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-AppLibIsolationGroup
   [[-Name] <String>]
   [-IncludePolicy <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The application library holds the information about isolation groups, their location on the network and the packages they contain.

Examples

EXAMPLE 1

Gets the details for all of the isolation groups in the AppLibrary.

```
Get-AppLibIsolationGroup
```

EXAMPLE 2

Gets the details of the isolation group named MyIsolationGroup.

```
Get-AppLibIsolationGroup -Name "MyIsolationGroup"
```

EXAMPLE 3

Gets the details for the isolation with a Uid of 5.

```
Get-AppLibIsolationGroup -IsolationGroupUid 5
```

EXAMPLE 4

Gets the details for the isolation with a Uid of 5 and also returns the Citrix Group Policy data that defines the object.

```
Get-AppLibIsolationGroup -IsolationGroupUid 5 -IncludePolicy $true
```

Parameters

-IsolationGroupUid

The App Library's internal unique identifier of the isolation group.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-Name

The name of the isolation group to fetch.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-IncludePolicy

The option to retrieve the Isolation Group policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.IsolationGroup

An object representing the details needed to identify an isolation group.

Notes

Pass in the isolation group's uid to retreive a single isolation group.

Pass in a library uid to retrieve all of the isolation groups in that library.

Call the cmdlet without any parameters to retieve all of the isolation groups in the AppLibrary.

Related Links

Get-AppLibIsolationGroupPackage

March 11, 2024

Gets the details of an App-V package of an Isolation Group.

Syntax

```
Get-AppLibIsolationGroupPackage
    [[-IsolationGroupUid] <Int32>]
    [-AppVPackageUid <Int32>]
    [-ExplicitInclusion <Boolean>]
    [-OrderNumber <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves the App-V package of the specified Isolation Group.

Examples

EXAMPLE 1

Gets the details of the App-V package with the unique identifier in the specified isolation group.

```
Get-AppLibIsolationGroupPackage -AppVPackageUid 4 -IsolationGroupUid 15
```

EXAMPLE 2

Gets the details for all of the App-V packages in the specified isolation group.

```
Get-AppLibIsolationGroupPackage -IsolationGroupUid 15
```

Parameters

-IsolationGroupUid

The AppLibrary's internal unique identifier of the Isolation Group which contains the package.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-AppVPackageUid

The AppLibrary's internal unique identifier of the App-V package.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExplicitInclusion

Indicates whether the package is explicitly included in the delivery group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-OrderNumber

The order number within the Isolation Group (if the package belongs to an Isolation Group).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or

descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.IsolationGroupPackage

An object representing the details of an App-V package in an Isolation Group.

Related Links

Get-AppLibLibrary

March 11, 2024

Gets the details of a library maintained by the AppLibrary service.

Syntax

```
Get-AppLibLibrary
   [-Uid <Int32>]
   [[-Name] <String>]
   [-Description <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
```

```
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The AppLibrary service maintains information about various libraries. Network locations that are monitored for changes to the App-V packages are stored there.

Examples

EXAMPLE 1

Gets the details of all of the libraries maintained by the AppLibrary service.

```
Get-AppLibLibrary
```

EXAMPLE 2

Gets the details of the library named Manual.

```
Get-AppLibLibrary -Name "Manual"
```

EXAMPLE 3

Gets the details of the specified library.

```
Get-AppLibLibrary -Uid 1
```

Parameters

-Name

The name of the application library.

Type: String

Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Uid

The AppLibrary's internal UID of the library.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A description of the application library.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.Library

An object representing the details required to maintain a library of App-V applications.

Notes

Pass in a library UID to retrieve only that specific library.

Call the cmdlet without any parameters to retrieve all of the libraries maintained by the AppLibrary service.

The 'Manual'library is not actively monitored and is designed to be managed by the user for ad-hoc storage of packages in unstructured locations.

Get-AppLibMsixApplicationsPolicy

March 11, 2024

Gets the updated policy for the list of applications passed

Syntax

```
Get-AppLibMsixApplicationsPolicy
   [[-AppIdentifierList] <String[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet should be used to get policy for published Msix applications. The input should be a list of Msix application identifiers list

Examples

EXAMPLE 1

Gets the updated policy for the list of applications passed

```
$appIdentifiers = "ac4c2abf-457b-43e2-9141-432546b13d7a","eb95c4ab-aa01
    -495e-aa19-13b435d0fd54","edead135-abcd-4b1b-8dc6-f46b402695c5"
Get-AppLibMsixApplicationsPolicy -AppIdentifierList $appIdentifiers
```

Parameters

-AppIdentifierList

List of Msix application identifiers

Type:	String[]
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

byte array containing the updated policy

Notes

Pass in the App Identifiers as a comma separated string

Related Links

Get-AppLibPackageDiscovery

March 11, 2024

Gets information about the package discovery sessions that are currently being run by the AppLibrary Service

Syntax

```
Get-AppLibPackageDiscovery
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-AppLibPackageDiscovery
   -Id <Guid>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-AppLibPackageDiscovery
   -DiscoveryProfileUid <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

A package discovery object has information about the state and progress of the discovery session

Examples

EXAMPLE 1

Gets information about all of the package discovery sessions that are being managed by the AppLibrary service

```
Get-AppLibPackageDiscovery
```

EXAMPLE 2

Gets information about a particular package discovery session which matches the specified Id

```
Get-AppLibPackageDiscovery -Id 1
```

Parameters

-Id

The unique identifier of a running (or recently completed) package discovery session

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoveryProfileUid

The package discovery profile to filter the discovery sessions with

Type:	Int32
Position:	Named
Default value:	0
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Unique identifier

Outputs

Citrix.AppLibrary.Sdk.PackageDiscoveryProfile

Information about the state of the package discovery session

Related Links

- New-AppLibPackageDiscoveryProfile
- Get-AppLibPackageDiscoveryProfile
- Set-AppLibPackageDiscoveryProfile
- Remove-AppLibPackageDiscoveryProfile

Get-AppLibPackageDiscoveryProfile

March 11, 2024

Gets the package discovery profiles that are defined in the AppLibrary

Syntax

```
Get-AppLibPackageDiscoveryProfile
    [-Uid <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

A package discovery can be used by the AppLibrary Service to automatically (or periodically) search for application packages to import into the AppLibrary

Examples

EXAMPLE 1

Gets all the package discovery profiles that are defined in the AppLibrary Service

```
Get-AppLibPackageDiscoveryProfile
```

EXAMPLE 2

Gets a particular package discovery profile which matches the specified Uid

```
Get-AppLibPackageDiscoveryProfile -Uid 1
```

Parameters

-Uid

The unique identifier of a particular package discovery profile to return

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Int32

Numerical data

Outputs

Citrix.AppLibrary.Sdk.PackageDiscoveryProfile

Information about how, where and when the package discovery will be run

Get-AppLibService

March 11, 2024

Gets the service record entries for the AppLibrary Service.

Syntax

```
Get-AppLibService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the AppLibrary Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the AppLibrary Service running in the current service group.

```
Get-AppLibService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.Service

The Get-AppLibServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-AppLibServiceAddedCapability

March 11, 2024

Gets any added capabilities for the AppLibrary Service on the controller.

Syntax

```
Get-AppLibServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the AppLibrary Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the AppLibrary Service.

```
Get-AppLibServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AppLibServiceConfigurationData

March 11, 2024

Gets configuration data for the service.

Syntax

```
Get-AppLibServiceConfigurationData
    [-Name <String[]>]
    [-Value <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to determine the configuration parameters for the service

Examples

EXAMPLE 1

Get the Configuration data for the service.

```
Get-AppLibConfigurationData

Name                : DeltaDiskDelete.timeDelay
Value               : 10
```

Parameters

-Name

The Configuration data item Name .

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Value

The Configuration data item value.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_AppLib_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32

Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_AppLib_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.ServiceConfigurationData

This object provides details of the configuration data and contains the following information:

Name <string>

The Name for the configuration item.

Value <string>

The value for the configuration item.

Notes

In the case of failure the following errors can be produced.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-AppLibServiceInstance

March 11, 2024

Gets the service instance entries for the AppLibrary Service.

Syntax

```
Get-AppLibServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the AppLibrary Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the AppLibrary Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-AppLibServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.ServiceInstance

The Get-AppLibServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always AppLib.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.AppLibrary.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Get-AppLibServiceStatus
- Reset-AppLibServiceGroupMembership

Get-AppLibServiceStatus

March 11, 2024

Gets the current state of the AppLibrary Service on the controller.

Syntax

```
Get-AppLibServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the AppLibrary Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the AppLibrary Service.

```
1  Get-AppLibServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-AppLibServiceStatus command returns an object containing the status of the AppLibrary Service together with extra diagnostics information.

DBUnconfigured

The AppLibrary Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the AppLibrary Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the AppLibrary Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The AppLibrary is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The AppLibrary is connected to a database that is valid, but it does not have the full functionality required so the AppLibrary cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the AppLibrary Service currently in use is incompatible with the version of the AppLibrary Service schema on the database. Upgrade the AppLibrary Service to a more recent version.

DBOlderVersionThanService

The version of the AppLibrary Service schema on the database is incompatible with the version of the AppLibrary Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The AppLibrary Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the AppLibrary Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the AppLibrary and the database has been lost for an extended period of time, or has failed due to a configuration problem. The AppLibrary service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

New-AppLibAppVAppPublishedEvent

March 11, 2024

Records telemetry information

Syntax

```
New-AppLibAppVAppPublishedEvent
   -ApplicationUid <Int32>
   -ApplicationName <String>
   -RepositoryTypeValue <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Indicates that a packaged application is published to a delivery group.

Examples

EXAMPLE 1

Tracks that fact that BBC Ticker was published from a Microsoft App-V Server package repository

```
New-AppLibAppVAppPublishedEvent -ApplicationName "BBC Ticker" -
   RepositoryTypeValue 0 -ApplicationUid 23
```

EXAMPLE 2

Tracks that fact that BBC Ticker was published from a Citrix AppLibrary package repository

```
New-AppLibAppVAppPublishedEvent -ApplicationName "Notepad" -
    RepositoryTypeValue 1 -ApplicationUid 23
```

Parameters

-ApplicationUid

The broker application Uid

Type:	Int32
Position:	Named
Default value:	None - This is a mandatory parameter
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationName

The application name

Type:	String
Position:	Named
Default value:	None - This is a mandatory parameter
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RepositoryTypeValue

Indicates the source location of the application

Type:	Int32
Position:	Named
Default value:	None - This is a mandatory parameter
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

Telemetry information is sent annonymously to CEIP (Customer Experiance Improvement Program) when the user has opted into the service.

Only the information specified in the parameters are sent to CEIP

This command is intended for internal use only.

RepositoryTypeValue(0) = Microsoft App-V Server (Dual Admin)

RepositoryTypeValue(1) = App-V Single Admin

RepositoryTypeValue(2) = MSIX

RepositoryTypeValue(3) = MSIX AppAttach

RepositoryTypeValue(4) = FlexApp

- New-AppLibAppVPackageRepositoryEvent

New-AppLibAppVPackage

March 11, 2024

Adds a new package to the library.

Syntax

```
New-AppLibAppVPackage
   -LibraryUid <Int32>
   -Path <String>
   [-RetrieveIcon <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AppLibAppVPackage
   -Path <String>
   -AppManifestXml <String>
   -AppManifestIcons <System.Collections.Generic.Dictionary`2[System.
      String,System.Byte[]]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AppLibAppVPackage
   -Path <String>
   [-RetrieveIcon <Boolean>]
   -AppManifestXml <String>
   -AppManifestIcons <System.Collections.Generic.Dictionary`2[System.
      String,System.Byte[]]>
   -ManagementServer <String>
   -PublishingServer <String>
   -PackageProperties <System.Collections.Generic.Dictionary`2[System.
      String,System.Object]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The package and the applications that make it up are added to the library.

Examples

EXAMPLE 1

Adds the package at the specified network location to the library by interrogating the packge file and extrcting the neccesary informaion

```
New-AppLibAppVPackage -LibraryUid 1 -Path "\\NetworkStorage.enterprise.
   com\Managed App-V Packages\Package.appv"
```

EXAMPLE 2

Adds the package at the specified network location to the library by interpreting only the supplied AppManifest Xml when no physical access to the package is possible.

```
New-AppLibAppVPackage -Path "\\NetworkStorage.enterprise.com\Managed
    App-V Packages\Package.appv" -AppManifestXml $AppManifestxml -
    AppManifestIcons $DictinaryOfIcons
```

Parameters

-LibraryUid

The UID of the library to which the package is added.

Type:	Int32
Aliases:	Uid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Path

The full path to the package on the network share.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AppManifestXml

The Package's AppManifest Xml

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AppManifestIcons

A dictionary containing data for icons containied in te package keyed by their path in the AppManifest Xml

Type:	System.Collections.Generic.Dictionary‘2[System.String,Syste
Position	Named
Default value	None
Required	True
Accept pipeline input	False
Accept wildcard characters	False

-ManagementServer

Fully qualified domain name of the machine hosting Microsoft App-V Management Server

Type	String
Position	Named
Default value	None
Required	True
Accept pipeline input	True (ByPropertyName)
Accept wildcard characters	True

-PublishingServer

Url of App-V publishing server

Type	String
Position	Named
Default value	None
Required	True
Accept pipeline input	True (ByPropertyName)
Accept wildcard characters	True

-PackageProperties

Extracted AppV Package properties

Type	System.Collections.Generic.Dictionary‘2[System.String,Syste
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RetrieveIcon

A switch to indicate whether to return the package and applications’ icon data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.AppVPackage

An object representing the details of the the new package.

Notes

If supplied, the value of the LibraryUid parameter must be 1. No other values are supported.

When a package is added to the library and a record of that package already exists, the existing package is updated with the details of the new package. A package is considered as already existing when the following are true: 1) The PackageGuid and VersionGuid are the same as the existing package and the Path is the same or different. 2) The Path is the same as the existing package and the PackageGuid and/or VersionGuid are the same or different.

New-AppLibAppVPackageRepositoryEvent

March 11, 2024

Records telemetry information

Syntax

```
New-AppLibAppVPackageRepositoryEvent
   [-RepositoryType <Int32>]
   [-PackageCount <Int32>]
   [-Location <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Indicates that an App-V package repository is added to Citrix Studio.

Examples

EXAMPLE 1

Records that a Microsoft App-V Server was used in Citrix Studio and that it contains 32 packages located at "`http://appvserver.acme.com:9000`"

```
New-AppLibAppVPackageRepositoryEvent -RepositoryType 1 -PackageCount 32
    -Location "http://appvserver.acme.com:9000"
```

EXAMPLE 2

Records that the internal Citrix AppLibrary was used in Citrix Studio and that it contains 32 packages.

```
New-AppLibAppVPackageRepositoryEvent -RepositoryType 2 -PackageCount 32
    -Location "AppLibrary"
```

Parameters

-RepositoryType

Indicates the source location of the application

Type:	Int32
Position:	Named
Default value:	None - This is a mandatory parameter
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PackageCount

The number of packages in the repository

Type:	Int32
Position:	Named
Default value:	None - This is a mandatory parameter
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Location

The location(URL) of the package repository

Type:	String
Position:	Named
Default value:	None - This is a mandatory parameter
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

Unique identifier for this repository source

Notes

Telemetry information is sent annonymously to CEIP (Customer Experiance Improvement Program) when the user has opted into the service.

Only the information specified in the parameters are sent to CEIP

This command is intended for internal use only. The user is not able to add new package repositories to the system.

RepositoryTypeValue(0) = Microsoft App-V Server (Dual Admin)

RepositoryTypeValue(1) = App-V Single Admin

RepositoryTypeValue(1) = App-V Single Admin

New-AppLibIsolationGroup

March 11, 2024

Adds a new isolation group into the library

Syntax

```
New-AppLibIsolationGroup
   [-LibraryUid] <Int32>
   [-Name] <String>
   [-Description <String>]
   [-Version <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The isolation group will be added to the library

Examples

EXAMPLE 1

Adds the isolation group to the specified library

```
New-AppLibIsolationGroup -LibraryUid 1 -Name "MyIsolationGroup" -
   Description "Some description here" -Version "1.0.0.1"
```

Parameters

-LibraryUid

The unique identifier of the library to which the isolation group will be added

Type:	Int32
Aliases:	Uid
Accepted values:	1, 3, 4
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

The name of the isolation group.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

The description of the isolation group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Version

The version of the isolation group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.IsolationGroup

An object representing the details of the new isolation group.

Notes

If supplied, the value of the LibraryUid parameter must be 1. No other values are supported.

New-AppLibPackageDiscovery

March 11, 2024

Starts a new package discovery session running on a VDA chosen from the specified desktop group

Syntax

```
New-AppLibPackageDiscovery
   -DiscoveryProfileUid <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AppLibPackageDiscovery
   -DesktopGroupUid <Int32>
   -Path <String>
   [-Recurse <Boolean>]
   [-DiscoverAppV <Boolean>]
   [-DiscoverMsix <Boolean>]
   [-DiscoverAppAttach <Boolean>]
   [-DiscoverFlexApp <Boolean>]
   [-CleanupAbsentPackages <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AppLibPackageDiscovery
   -DesktopGroupUid <Int32>
   -ManagementServer <String>
   -PublishingServer <String>
   [-Username <String>]
   [-Password <SecureString>]
   [-CleanupAbsentPackages <Boolean>]
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

A package discovery object has information about the state and progress of the discovery session

Examples

EXAMPLE 1

Initiates a new package discovery session that will discover packages in the specified folder and its subfolder tree

```
$BrokerDesktopGroup = Get-BrokerDesktopGroup -Name 'Package Discovery
    Group'
New-AppLibPackageDiscovery -DesktopGroupUid $BrokerDesktopGroup.Uid -
    Path "\\FileServer.company.com\AppVShare" -Recurse $true
```

EXAMPLE 2

Initiates a new package discovery session according to the options specified in the stored package discovery profile

```
$PackageDiscoveryProfile = Get-PackageDiscoveryProfile -Uid 1
New-AppLibPackageDiscovery -DiscoveryProfileUid
    $PackageDiscoveryProfile.Uid
```

Parameters

-DiscoveryProfileUid

The Uid of the package discovery profile to use when determining the parameters for the discovery session

Type:	Int32
Position:	Named
Default value:	0
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

The Uid of the desktop group from which the broker will select a VDA to run the discovery

Type:	Int32
Position:	Named
Default value:	0
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Path

The UNC path of the shared network folder (or file) location where the discovery will start

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ManagementServer

The URL of the App-V Management Server where the discovery will take place

Type:	String
Position:	Named
Default value:	Null

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishingServer

The URL of the App-V Publishing Server that will be used to publish the discovered packages

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Recurse

A value indicating whether the discovery will search through the child folder tree from the discovery root.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverAppV

A value indicating whether the discovery will include App-V packages

Type:	Boolean

Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverMsix

A value indicating whether the discovery will include Msix packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverAppAttach

A value indicating whether the discovery will include AppAttach packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverFlexApp

A value indicating whether the discovery will include FlexApp packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CleanupAbsentPackages

A value indicating whether the discovery should attempt to remove packages from the library that were not present in the discovery location

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Username

The username of the App-V server administrator

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password of the App-V server administrator

Type:	SecureString
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.PackageDiscovery

Informaton about the discovery session that was initiated

Notes

The discovery root path and a pair of Management and Publishing servers are mutually exclusive. I.e. a discovery session will run against either a network folder or an App-V Management and Publishing server

New-AppLibPackageDiscoveryProfile

March 11, 2024

Creates a new package discovery profile in the AppLibrary

Syntax

```
New-AppLibPackageDiscoveryProfile
   -Name <String>
   -DesktopGroupUid <Int32>
   -Path <String>
```

```
    [-Recurse <Boolean>]
    [-DiscoverAppV <Boolean>]
    [-DiscoverMsix <Boolean>]
    [-DiscoverAppAttach <Boolean>]
    [-DiscoverFlexApp <Boolean>]
    [-AutomateDiscovery <Boolean>]
    [-AutoDiscoveryPeriod <String>]
    [-AutoDiscoveryCadence <Int32>]
    [-CleanupAbsentPackages <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
New-AppLibPackageDiscoveryProfile
   -Name <String>
   -DesktopGroupUid <Int32>
   -ManagementServer <String>
   -PublishingServer <String>
   -Username <String>
   -Password <SecureString>
   [-AutomateDiscovery <Boolean>]
   [-AutoDiscoveryPeriod <String>]
   [-AutoDiscoveryCadence <Int32>]
   [-CleanupAbsentPackages <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The package discovery profile tells the AppLibrary service where to look for packages to autmatically inport to the AppLibrary, what types of packages should be included and how often the discovery should be done

Examples

EXAMPLE 1

Creates a new package discovery profile that will be automatically run once per day by the AppLibrary Service

```
New-AppLibPackageDiscoveryProfile -Name "App-V Package Share" -
    DesktopGroupUid $BrokerDesktopGroup.Uid -Path "\\FileServer.company.
    com\AppVShare" -Recurse $true -AutomateDiscovery $true -
    AutoDiscoveryPeriod "Day" AutoDiscoveryCadence "1"
```

EXAMPLE 2

Creates a new package discovery profile that will target an App-V Management and Publishing server, but will not run automatically

```
1 $SecurePassword = ConvertTo-SecureString -String "password" -
     AsPlainText -Force
2 New-AppLibPackageDiscoveryProfile -Name "App-V Server" -DesktopGroupUid
      $BrokerDesktopGroup.Uid -ManagementServer "http://AppVServer.
     company.com" -PublishingServer "http://AppVServer.company.com:8001"
     -Username "AppVServer\Username" -Password $SecurePassword -
     AutomateDiscovery $false
```

Parameters

-Name

The name of the package discovery profile

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

The Uid of the desktop group from which the broker will select a VDA to run the discovery

Type:	Int32
Position:	Named
Default value:	0
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Path

The UNC path of the shared network folder (or file) location where the discovery will start

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ManagementServer

The URL of the App-V Management Server where the discovery will take place

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishingServer

The URL of the App-V Publishing Server that will be used to publish the discovered packages

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Username

The username of the App-V server administrator

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password of the App-V server administrator

Type:	SecureString
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Recurse

A value indicating whether the discovery will search through the child folder tree from the discovery root

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverAppV

A value indicating whether the discovery will include App-V packages

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverMsix

A value indicating whether the discovery will include Msix packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverAppAttach

A value indicating whether the discovery will include AppAttach packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DiscoverFlexApp

A value indicating whether the discovery will include FlexApp packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomateDiscovery

A value indicating whether the discovery will run automatically according to the configured discovery cadence

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoDiscoveryPeriod

The period of time to measure the discovery cadence in E.g. Hours, Days or Weeks.

Type:	String
Position:	Named
Default value:	Day
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoDiscoveryCadence

The minimum number of periods that should elaps between discovery sessions

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CleanupAbsentPackages

A value indicating whether the discovery should attempt to remove packages from the library that were not present in the discovery location

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.PackageDiscoveryProfile

An object representing the configured discovery profile

Notes

The discovery root path and pair of Management and Publishing servers are mutually exclusive. I.e. a discovery session will run against either a network folder or an App-V Management and Publishing server

Setting a discovery cadence of 0 (on any period) is equivilent to setting AutomateDiscovery to False

Remove-AppLibAppVApplicationMetadata

March 11, 2024

Removes metadata from the given AppVApplication.

Syntax

```
Remove-AppLibAppVApplicationMetadata
      [-AppVApplicationUid] <Int32>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVApplicationMetadata
      [-AppVApplicationUid] <Int32>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVApplicationMetadata
      [-AppVApplicationName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVApplicationMetadata
      [-AppVApplicationName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVApplicationMetadata
      [-InputObject] <AppVApplication[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVApplicationMetadata
      [-InputObject] <AppVApplication[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVApplicationMetadata
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given AppVApplication.

Examples

EXAMPLE 1

Removes the metadata item named ‘Custom Data’from the specified AppVApplication object.

```
Remove-AppLibAppVApplicationMetadata -AppVApplicationUid 1 -Name "
    Custom Data"
```

EXAMPLE 2

Remove all metadata from all AppVApplication objects.

```
Get-AppLibAppVApplication | % {
  Remove-AppLibAppVApplicationMetadata -Map $_.MetadataMap  }
```

Parameters

-AppVApplicationUid

Id of the AppVApplication

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-AppVApplicationName

Name of the AppVApplication

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects from which the metadata is to be removed.

Type:	AppVApplication[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_AppLibAppLibrarySnapin
- Set-AppLibAppVApplicationMetadata

Remove-AppLibAppVPackage

March 11, 2024

Removes an App-V package from the library that is holding it

Syntax

```
Remove-AppLibAppVPackage
      [-Uid] <Int32>
      [-ServerUid <Int32>]
      [-Purge <Boolean>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove an App-V package from the application library.

Removing a package from the library optionally only marks it as not existing. In this case, re-adding the package later will restore the reference.

Examples

EXAMPLE 1

Permanently removes the specified package from the library including its associated applications and metadata.

```
Remove-AppLibAppVPackage -Uid 5
```

EXAMPLE 2

Permanently removes the specified package from the library including its associated applications and metadata.

```
Remove-AppLibAppVPackage -Uid 5 -Purge $true
```

EXAMPLE 3

Removes the specified package from the library that holds it by marking it as non-existing, but leaving associated records and metadata in place.

```
1  Remove-AppLibAppVPackage -Uid 5 -Purge $false
```

Parameters

-Uid

The App Library's internal unique identifier of the App-V package.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ServerUid

Unique Identifier for AppVServer.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-Purge

Indicates whether the package should be removed from the database. The default is true. Setting this parameter to false will leave the package and all of its associated applications and metadata in place but in a dormant state. This data will then be reactivated if the same package is ever re-added.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can result.

Error Codes

UnknownObject

No package was found for the given uid. DatabaseError

An error occurred in the service while attempting a database operation. DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured. DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons. PermissionDenied

You do not have permission to execute this command. AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service. CommunicationError

There was a problem communicating with the remote service. ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AppLibAppVPackageMetadata

March 11, 2024

Removes metadata from the given AppVPackage.

Syntax

```
Remove-AppLibAppVPackageMetadata
      [-AppVPackageUid] <Int32>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVPackageMetadata
      [-AppVPackageUid] <Int32>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVPackageMetadata
      [-AppVPackageName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVPackageMetadata
      [-AppVPackageName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVPackageMetadata
      [-InputObject] <AppVPackage[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibAppVPackageMetadata
      [-InputObject] <AppVPackage[]>
```

```
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AppLibAppVPackageMetadata
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given AppVPackage.

Examples

EXAMPLE 1

Removes the metadata item named ‘Custom Data’from the specified AppVPackage object.

```
Remove-AppLibAppVPackageMetadata -AppVPAckageUid 1 -Name "Custom Data"
```

EXAMPLE 2

Remove all metadata from all AppVPackage objects.

```
Get-AppLibAppVPackage | % {
  Remove-AppLibAppVPackageMetadata -Map $_.MetadataMap  }
```

Parameters

-AppVPackageUid

Id of the AppVPackage

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-AppVPackageName

Name of the AppVPackage

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects from which the metadata is to be removed.

Type:	AppVPackage[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AppLibAppVServer

March 11, 2024

Removes an App-V server information

Syntax

```
Remove-AppLibAppVServer
       [-Uid] <Int32>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove an App-V server, associated packages and applications.

Examples

EXAMPLE 1

Removes the specified AppVServer, associated packages and applications from DDC

```
1  Remove-AppLibAppVServer -Uid 5
```

Parameters

-Uid

Id of AppVServer.

Type:	Int32
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-AppLibIsolationGroup

March 11, 2024

Removes an isolation group from the library

Syntax

```
Remove-AppLibIsolationGroup
      [-IsolationGroupUid] <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The isolation group will be removed from the library that is holding it

Examples

EXAMPLE 1

Removes the specified isolation group from the application library that holds it.

```
Remove-AppLibIsolationGroup -IsolationGroupUid 5
```

Parameters

-IsolationGroupUid

The isolation group's internal unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-AppLibIsolationGroupMetadata

March 11, 2024

Removes metadata from the given IsolationGroup.

Syntax

```
Remove-AppLibIsolationGroupMetadata
      [-IsolationGroupUid] <Int32>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibIsolationGroupMetadata
      [-IsolationGroupUid] <Int32>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibIsolationGroupMetadata
      [-IsolationGroupName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibIsolationGroupMetadata
      [-IsolationGroupName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibIsolationGroupMetadata
      [-InputObject] <IsolationGroup[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibIsolationGroupMetadata
      [-InputObject] <IsolationGroup[]>
```

```
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AppLibIsolationGroupMetadata
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given IsolationGroup.

Examples

EXAMPLE 1

Removes the metadata item named 'Custom Data'from the specified IsolationGroup object.

```
Remove-AppLibIsolationGroupMetadata -IsolationGroupUid 1 -Name "Custom
    Data"
```

EXAMPLE 2

Remove all metadata from all IsolationGroup objects.

```
Get-AppLibIsolationGroup | % {
  Remove-AppLibIsolationGroupMetadata -Map $_.MetadataMap  }
```

Parameters

-IsolationGroupUid

Id of the IsolationGroup

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IsolationGroupName

Name of the IsolationGroup

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects from which the metadata is to be removed.

Type:	IsolationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AppLibIsolationGroupPackage

March 11, 2024

Removes an AppV package from an isolation group

Syntax

```
Remove-AppLibIsolationGroupPackage
      [-IsolationGroupUid] <Int32>
      -AppVPackageUid <Int32>
      [-LoggingId <Guid>]
```

```
5         [<CitrixCommonParameters>]
6         [<CommonParameters>]
```

Description

Removes the App-V package with the unique identifier in the specified isolation group

Examples

EXAMPLE 1

Removes the App-V package with the unique identifier in the specified isolation group.

```
1  Remove-AppLibIsolationGroupPackage -IsolationGroupUid 4 -AppVPackageUid
       15
```

Parameters

-IsolationGroupUid

The isolation group's internal unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-AppVPackageUid

The unique identifier of the package within the isolation group.

Type:	Int32
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-AppLibLibraryMetadata

March 11, 2024

Removes metadata from the given Library.

Syntax

```
Remove-AppLibLibraryMetadata
      [-LibraryUid] <Int32>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibLibraryMetadata
      [-LibraryUid] <Int32>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibLibraryMetadata
      [-LibraryName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibLibraryMetadata
      [-LibraryName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibLibraryMetadata
```

```
        [-InputObject] <Library[]>
        -Name <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AppLibLibraryMetadata
        [-InputObject] <Library[]>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AppLibLibraryMetadata
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Library.

Examples

EXAMPLE 1

Removes the metadata item named ‘Custom Data’from the specified Library object.

```
Remove-AppLibLibraryMetadata -LibraryUid 1 -Name "Custom Data"
```

EXAMPLE 2

Remove all metadata from all Library objects.

```
Get-AppLibLibrary | % {
  Remove-AppLibLibraryMetadata -Map $_.MetadataMap  }
```

Parameters

-LibraryUid

Id of the Library

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LibraryName

Name of the Library

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects from which the metadata is to be removed.

Type:	Library[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AppLibPackageDiscoveryProfile

March 11, 2024

Removes a package discovery profile from the AppLibrary service

Syntax

```
Remove-AppLibPackageDiscoveryProfile
      [-Uid] <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The package discovery profile will be removed from the AppLibrary service

Examples

EXAMPLE 1

Removes the specified package discovery profile from the AppLibrary service

```
Remove-AppLibPackageDiscoveryProfile -Uid 5
```

Parameters

-Uid

The package discovery profile's internal unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-AppLibServiceConfigurationData

March 11, 2024

Removes configuration data from the service.

Syntax

```
Remove-AppLibServiceConfigurationData
       [[-Name] <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove data from the AppLibrary Service configuration data.

Examples

EXAMPLE 1

Removes the configuration data item with name “MyName”.

```
Remove-AppLibServiceConfigurationData -Name "MyName"
```

Parameters

-Name

The name of the configuration data item to remove.

Type: String

Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Remove-AppLibServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-AppLibServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AppLibServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
```

```
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-AppLibService | % {
  Remove-AppLibServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

Reset-AppLibEnabledFeatureList

March 11, 2024

Refreshes the AppLibrary service's list of enabled features.

Syntax

```
Reset-AppLibEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix AppLibrary Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a AppLibrary SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected AppLibrary service instance's list of enabled features.

```
Reset-AppLibEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-AppLibServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the AppLibrary Service.

Syntax

```
Reset-AppLibServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload AppLibrary Service access permissions and configuration service locations. The Reset-AppLibServiceGroupMembership command must be run on at least one instance of the service type (AppLib) after installation and registration with the configuration service. Without

this operation, the AppLibrary services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AppLibServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    AppLibServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-AppLibServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.AppLibrary.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-AppLibServiceGroupMembership command.

Outputs

Citrix.AppLibrary.Sdk.ServiceInstance

Reset-AppLibServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the AppLibrary Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AppLibAppVApplicationMetadata

March 11, 2024

Adds or updates metadata on the given AppVApplication.

Syntax

```
Set-AppLibAppVApplicationMetadata
   [-AppVApplicationUid] <Int32>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVApplicationMetadata
   [-AppVApplicationUid] <Int32>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVApplicationMetadata
   [-AppVApplicationName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVApplicationMetadata
   [-AppVApplicationName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVApplicationMetadata
```

```
    [-InputObject] <AppVApplication[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AppLibAppVApplicationMetadata
    [-InputObject] <AppVApplication[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given AppVApplication objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the AppVApplication with the Uid 5.

```
Set-AppLibAppVApplicationMetadata -AppVApplicationUid 5 -Name property
    -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-AppVApplicationUid

Id of the AppVApplication

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

Accept wildcard characters:	False

-AppVApplicationName

Name of the AppVApplication

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	AppVApplication[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the AppVApplication specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AppLibAppVApplicationMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AppLibAppVPackageMetadata

March 11, 2024

Adds or updates metadata on the given AppVPackage.

Syntax

```
Set-AppLibAppVPackageMetadata
   [-AppVPackageUid] <Int32>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVPackageMetadata
   [-AppVPackageUid] <Int32>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVPackageMetadata
   [-AppVPackageName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVPackageMetadata
   [-AppVPackageName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVPackageMetadata
   [-InputObject] <AppVPackage[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibAppVPackageMetadata
   [-InputObject] <AppVPackage[]>
```

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given AppVPackage objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the AppVPackage with the Uid 5.

```
Set-AppLibAppVPackageMetadata -AppVPackageUid 5 -Name property -Value
    value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-AppVPackageUid

Id of the AppVPackage

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-AppVPackageName

Name of the AppVPackage

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	AppVPackage[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the AppV-Package specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AppLibAppVPackageMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AppLibDBConnection

March 11, 2024

Configures a database connection for the AppLibrary Service.

Syntax

```
Set-AppLibDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix AppLibrary Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a AppLibrary SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-AppLibDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-AppLibDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the AppLibrary Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-AppLibDBConnection cmdlet returns an object describing the status of the AppLibrary Service together with extra diagnostics information. Possible values are:

- OK:

The AppLibrary Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the AppLibrary Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the AppLibrary Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the AppLibrary Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the AppLibrary Service currently in use is newer than, and incompatible with, the version of the AppLibrary Service schema on the database. Upgrade the AppLibrary Service to a more recent version.

- DBOlderVersionThanService:

The version of the AppLibrary Service schema on the database is newer than, and incompatible with, the version of the AppLibrary Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the AppLibrary Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the AppLibrary Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the AppLibrary Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AppLibDBCredentials

March 11, 2024

Configures the database server SQL credentials for the AppLibrary Service.

Syntax

```
Set-AppLibDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix AppLibrary Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional AppLibrary Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a AppLibrary SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-AppLibDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-AppLibDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-AppLibDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-AppLibDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-AppLibIsolationGroup

March 11, 2024

Updates an isolation group in the library

Syntax

```
Set-AppLibIsolationGroup
   [-IsolationGroupUid] <Int32>
   [-Name <String>]
   [-Description <String>]
   [-Version <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The isolation group will be updated with the new properties

Examples

EXAMPLE 1

Updates only the name for the specified isolation group.

```
Set-AppLibIsolationGroup -IsolationGroupUid 58 -Name "MyIsolationGroup"
```

EXAMPLE 2

Updates only the description for the specified isolation group.

```
Set-AppLibIsolationGroup -IsolationGroupUid 58 -Description "Some
    description here"
```

EXAMPLE 3

Updates only the version for the specified isolation group.

```
Set-AppLibIsolationGroup -IsolationGroupUid 58 -Version "1.0.0.1"
```

EXAMPLE 4

Updates the name, description and version for the specified isolation group.

```
Set-AppLibIsolationGroup -IsolationGroupUid 58 -Name "MyIsolationGroup"
     -Description "Some description here" -Version "1.0.0.1"
```

Parameters

-IsolationGroupUid

The AppLibrary's internal unique identifier of the Isolation Group.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

The name of the isolation group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

The description of the isolation group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Version

The version of the isolation group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

At least one of the name, description and version parameters must be supplied.

Set-AppLibIsolationGroupMetadata

March 11, 2024

Adds or updates metadata on the given IsolationGroup.

Syntax

```
Set-AppLibIsolationGroupMetadata
   [-IsolationGroupUid] <Int32>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibIsolationGroupMetadata
   [-IsolationGroupUid] <Int32>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibIsolationGroupMetadata
   [-IsolationGroupName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibIsolationGroupMetadata
   [-IsolationGroupName] <String>
   -Map <PSObject>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AppLibIsolationGroupMetadata
    [-InputObject] <IsolationGroup[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AppLibIsolationGroupMetadata
    [-InputObject] <IsolationGroup[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given IsolationGroup objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the IsolationGroup with the Uid of 5.

```
Set-AppLibIsolationGroupMetadata -IsolationGroupUid 5 -Name property -
    Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-IsolationGroupUid

Id of the IsolationGroup

Type: Int32

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-IsolationGroupName

Name of the IsolationGroup

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	IsolationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the IsolationGroup specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AppLibIsolationGroupMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AppLibIsolationGroupPackage

March 11, 2024

Updates an App-V package's settings in an Isolation Group.

Syntax

```
Set-AppLibIsolationGroupPackage
   [-IsolationGroupUid] <Int32>
   -AppVPackageUid <Int32>
   -OrderNumber <Int32>
   -ExplicitInclusion <Boolean>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Updates an App-V package's settings in the specified Isolation Group.

Examples

EXAMPLE 1

Updates the App-V package with the unique identifier in the specified isolation group.

```
Set-AppLibIsolationGroupPackage -IsolationGroupUid 4 -AppVPackageUid 15
    -OrderNumber 1 -ExplicitInclusion $true
```

Parameters

-IsolationGroupUid

The AppLibrary's internal unique identifier of the Isolation Group to contain the package.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppVPackageUid

The AppLibrary's internal unique identifier of the App-V package.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OrderNumber

The order number within the Isolation Group.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-ExplicitInclusion

Indicates whether the package is explicitly included in the delivery group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-AppLibLibraryMetadata

March 11, 2024

Adds or updates metadata on the given Library.

Syntax

```
Set-AppLibLibraryMetadata
   [-LibraryUid] <Int32>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibLibraryMetadata
   [-LibraryUid] <Int32>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibLibraryMetadata
   [-LibraryName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibLibraryMetadata
   [-LibraryName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibLibraryMetadata
   [-InputObject] <Library[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibLibraryMetadata
   [-InputObject] <Library[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Library objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Library with the Uid 1.

```
Set-AppLibLibraryMetadata -LibraryUid 1 -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-LibraryUid

Id of the Library

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-LibraryName

Name of the Library

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Library[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Library specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AppLibLibraryMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AppLibPackageDiscoveryProfile

March 11, 2024

Updates a package discovery profile defined in the AppLibrary with the specified new details

Syntax

```
Set-AppLibPackageDiscoveryProfile
   -Uid <Int32>
   [-Name <String>]
   [-DesktopGroupUid <Int32>]
```

```
    -Path <String>
    [-Recurse <Boolean>]
    [-DiscoverAppV <Boolean>]
    [-DiscoverMsix <Boolean>]
    [-DiscoverAppAttach <Boolean>]
    [-DiscoverFlexApp <Boolean>]
    [-AutomateDiscovery <Boolean>]
    [-AutoDiscoveryPeriod <String>]
    [-AutoDiscoveryCadence <Int32>]
    [-CleanupAbsentPackages <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AppLibPackageDiscoveryProfile
   -Uid <Int32>
    [-Name <String>]
    [-DesktopGroupUid <Int32>]
    [-Recurse <Boolean>]
    [-ManagementServer <String>]
    [-PublishingServer <String>]
    [-Username <String>]
    [-Password <SecureString>]
    [-AutomateDiscovery <Boolean>]
    [-AutoDiscoveryPeriod <String>]
    [-AutoDiscoveryCadence <Int32>]
    [-CleanupAbsentPackages <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

A package discovery can be used by the AppLibrary Service to automatically (or periodically) search for application packages to import into the AppLibrary

Examples

EXAMPLE 1

Updates the package discovery profile with a Uid of 1 with the supplied values

```
Set-PackageDiscoveryProfile -Uid 1 Name "App-V Package Shere" -
    DesktopGroupUid $BrokerDesktopGroup.Uid -Path "\\FileServer.company.
    com\AppVShare" -Recurse $true -AutomateDiscovery $true -
    AutoDiscoveryPeriod "Day" AutoDiscoveryCadence "1"
```

EXAMPLE 2

Updates the package discovery profile by changing the properties on the object and passing it to the pipeline

```
$PackageDiscoveryProfile = Get-PackageDiscoveryProfile -Uid 1
$PackageDiscoveryProfile.AutoDiscoveryPeriod = "Hour"
$PackageDiscoveryProfile.AutoDiscoveryCadence "6"
$PackageDiscoveryProfile | Set-PackageDiscoveryProfile
```

Parameters

-Uid

The Uid of the package discovery profile that will be updated with the new details

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Path

The UNC path of the shared network folder (or file) location where the discovery will start

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Name

The name of the package discovery profile

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

The Uid of the desktop group from which the broker will select a VDA to run the discovery

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DiscoverAppV

A value indicating whether the discovery will include App-V packages

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DiscoverMsix

A value indicating whether the discovery will include Msix packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DiscoverAppAttach

A value indicating whether the discovery will include AppAttach packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DiscoverFlexApp

A value indicating whether the discovery will include FlexApp packages

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutomateDiscovery

A value indicating whether the discovery will run automatically according to the configured discovery cadence

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoDiscoveryPeriod

The period of time to measure the discovery cadence in E.g. Hours, Days or Weeks

Type:	String
Position:	Named
Default value:	Day
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AutoDiscoveryCadence

The number of periods that should elaps between discovery sessions

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CleanupAbsentPackages

A value indicating whether the discovery should attempt to remove packages from the library that were not present in the discovery location

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ManagementServer

The URL of the App-V Management Server where the discovery will take place

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PublishingServer

The URL of the App-V Publishing Server that will be used to publish the discovered packages

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Username

The username of the App-V server administrator

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password of the App-V server administrator

Type:	SecureString
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Recurse

A value indicating whether the discovery will search through the child folder tree from the discovery root

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-AppLibServiceConfigurationData

March 11, 2024

Sets the value for the given key in the service configuration data.

Syntax

```
Set-AppLibServiceConfigurationData
   [-Name] <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored for the AppLibrary Service.

Examples

EXAMPLE 1

Set data with a name of 'customProperty1'and value of 'value2'to the service configuration.

```
Set-AppLibServiceConfigurationData -Name "customProperty1" -Value "
   value2"

Name                           Value
--------                       -----
customProperty1                value2
```

Parameters

-Name

Specifies the key name of the metadata to be added. The key must be unique.

The Name cannot contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the name. If the name already exists, its value is updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.AppLibrary.Sdk.ServiceConfigurationData

Set-AppLibServiceConfigurationData returns an object containing the new definition of the configuration.

Name <string>

Specifies the name for the item of data.

Value <string>

Specifies the value of the data.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Set-AppLibServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-AppLibServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AppLibServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AppLibServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AppLibServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-AppLibDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix AppLibrary Service.

Syntax

```
Test-AppLibDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AppLibDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AppLibDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix AppLibrary Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a AppLibrary SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Test-AppLibDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix AppLibrary Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-AppLibDBConnection cmdlet returns an object describing the status of the selected AppLibrary Service instance that would result if the connection string were used with the Set-AppLibDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-AppLibDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the AppLibrary Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the AppLibrary Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The AppLibrary Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The AppLibrary Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the AppLibrary Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the AppLibrary Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

ConvertTo-CtxAppVLauncherArg

March 11, 2024

Returns a string containing information to send to the App-V Launcher. You can plug this string directly into the Virtual Delivery Agent (VDA) to launch App-V applications.

Syntax

```
ConvertTo-CtxAppVLauncherArg
          [-AppVPublishingServer] <String>
          [-PackageId] <String>
          [-AppId] <String>
          -SeqLoc <String>
          [-CmdLineArg <String>]
          -TargetInPackage <Boolean>
          -ApplicationName <String>
          [<CommonParameters>]
```

```
ConvertTo-CtxAppVLauncherArg
          [-LauncherPath]
          [<CommonParameters>]
```

Description

Returns a string containing information to send to the App-V Launcher. You can plug this string directly into the Virtual Delivery Agent (VDA) to launch App-V applications.

Examples

EXAMPLE 1

Converts the arguments provided into a cmdlet to launch Beyond Compare from the appv-pubsrv Publishing Server on the VDA.

```
ConvertTo-CtxAppVLauncherArg -AppVPublishingServer "http://appv-pubsrv.
    mydomain.com:8082" -PackageId "1bcb6993-10b1-4659-b9d4-
    e809e10cecdf_5" -AppId "[{
 ProgramFilesX86 }
 ]\Beyond Compare 3\BCompare.exe" -SeqLoc "\\10.105.32.199\share\App-V\
     Firefox.appv" -TargetInPackage $true
```

EXAMPLE 2

Gets the Citrix App-V Launcher path.

```
ConvertTo-CtxAppVLauncherArg -LauncherPath
```

Parameters

-AppVPublishingServer

The Url including the port number, of the publishing Server which is serving the application.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-AppId

The AppId of the specific application for which CtxAppVLauncher argugents is required.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PackageId

The PackageId of the package to which the application belongs.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SeqLoc

The sequence location of the package.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetInPackage

Pass this as $true if TargetInPackage field is “true”in the Manifest file for the particular App Id.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LauncherPath

Gets the Citrix Launcher path. The Citrix Launcher is a component installed on the VDA.

Type:	SwitchParameter
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ApplicationName

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CmdLineArg

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Get-CtxAppVApplication

March 11, 2024

Enumerates all published App-V applications for a given Management Server.

Syntax

```
Get-CtxAppVApplication
    [-AppVManagementServer] <String>
    [<CommonParameters>]
```

Description

Queries a given Management Server and fetches all published applications for that server. Applications that are published but have no user entitlements are not displayed by this cmdlet.

Examples

EXAMPLE 1

Displays all applications available from the Management Server “appv-mansrv”.

```
Get-CtxAppVApplication -AppVManagementServer "appv-mansrv"
```

Parameters

-AppVManagementServer

Machine name of the App-V Management Server.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can’t pipe objects to this cmdlet.

Outputs

Citrix.VirtApp.Studio.PowerShellManager.AppVServerApplication

Related Links

Get-CtxAppVApplicationInfo

March 11, 2024

Enumerates information for a given application in a given package for a given Management Server.

Syntax

```
Get-CtxAppVApplicationInfo
   -AppVManagementServer <String>
    [[-Property] <String[]>]
    [-AppId] <String>
    [-PackageId] <String>
    [<CommonParameters>]
```

```
Get-CtxAppVApplicationInfo
   -AppVManagementServer <String>
    [[-Property] <String[]>]
    [-InputObject] <AppVServerApplication[]>
    [<CommonParameters>]
```

Description

Queries a given Management Server and fetches the requested information for a given application.

Examples

EXAMPLE 1

Fetches all application information for the ‘Beyond Compare 3’application from the appv-mansrv Management Server.

```
Get-CtxAppVApplicationInfo -AppVManagementServer "appv-mansrv" -AppId "
   [{
 ProgramFilesX86 }
 ]\Beyond Compare 3\BCompare.exe"  -PackageId "1bcb6993-10b1-4659-b9d4-
    e809e10cecdf_5"
```

EXAMPLE 2

Fetches only information about FTA and user entitlements for the Beyond Compare 3 application from the appv-mansrv Management Server.

```
Get-CtxAppVApplicationInfo -AppVManagementServer "appv-mansrv" -AppId "
    [{
 ProgramFilesX86 }
 ]\Beyond Compare 3\BCompare.exe"  -PackageId "1bcb6993-10b1-4659-b9d4-
    e809e10cecdf_5" -Property @('FTA','USERS')
```

EXAMPLE 3

Pipelines the output of Get-CtxAppVApplication to Get-CtxAppVApplicationInfo to get the application properties of all the published applications on the appv-mansrv Management Server.

```
Get-CtxAppVApplication -AppVManagementServer "appv-mansrv" | Get-
    CtxAppVApplicationInfo -AppVManagementServer "appv-mansrv"
```

Parameters

-AppId

The AppId of the specific application for which information is required.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PackageId

The PackageId of the package to which the application belongs.

Type:	String
Position:	3

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

AppVServerApplication objects for which information is required.

Type:	AppVServerApplication[]
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Property

An array of the names of the property values to be pupulated in the returned data.

Type:	String[]
Position:	4
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppVManagementServer

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.VirtApp.Studio.PowerShellManager.AppVAppData

Get-CtxAppVPackagesEnabledCount

March 11, 2024

Syntax

```
Get-CtxAppVPackagesEnabledCount
   -AppVManagementServer <String>
   [<CommonParameters>]
```

Description

Description

Examples

Parameters

-AppVManagementServer

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

Outputs

Int32

Get-CtxAppVServer

March 11, 2024

Returns URLs for App-V Publishing and Management Servers contained in a Citrix App-V policy. Returned values are in string format.

Syntax

```
Get-CtxAppVServer
   -ByteArray <Byte[]>
   [-ConsumedByStudio <Boolean>]
   [<CommonParameters>]
```

Description

Returns URLs for App-V Publishing and Management Servers contained in a Citrix App-V policy. Returned values are in string format.

Examples

EXAMPLE 1

Returns Publishing Server URL , Management Server URL configured in given policy

```
System.Management.Automation.PSObject[]
```

Parameters

-ByteArray

Specifies the Citrix App-V policy created using the New-CtxAppVServer cmdlet.

Type:	Byte[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-ConsumedByStudio

If set to “true”, outputs URLs for the App-V Publishing and Management Servers. If set to “false”, outputs both the URL and settings for the App-V Publishing Server.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

Get-CtxAppVServerSetting

March 11, 2024

Returns settings for the specified App-V Publishing Server.

Syntax

```
Get-CtxAppVServerSetting
   -AppVPublishingServer <String>
   [<CommonParameters>]
```

Description

Returns settings for the specified App-V Publishing Server. For more information about these settings, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Examples

EXAMPLE 1

This example returns settings associated with `http://appv-pubsrv.mydomain.com:8082` in the following format:

GlobalRefreshEnabled: false

GlobalRefreshOnLogon: false

GlobalRefreshInterval: 0

GlobalRefreshIntervalUnit: Day

UserRefreshEnabled: true

UserRefreshOnLogon: false

UserRefreshInterval: 0

UserRefreshIntervalUnit: Hour

```
1  Get-CtxAppVServerSetting -AppVPublishingServer http://appv-pubsrv.
       mydomain.com:8082
```

Parameters

-AppVPublishingServer

The full URL (including port number) of the Publishing Server for which settings are to be returned.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	True

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.VirtApp.Studio.Commands.AppVServerSetting

Publishing Server settings. These settings are:

GlobalRefreshEnabled

GlobalRefreshOnLogon

GlobalRefreshInterval

GlobalRefreshIntervalUnit

UserRefreshEnabled

UserRefreshOnLogon

UserRefreshInterval

UserRefreshIntervalUnit

Related Links

New-CtxAppVServer

March 11, 2024

Creates a new Citrix App-V policy containing the specified App-V Management and Publishing Server URLs.

Syntax

```
New-CtxAppVServer
   -PublishingServer <String>
   -ManagementServer <String>
   [-UserRefreshEnabled <Boolean>]
   [-UserRefreshOnLogOn <Boolean>]
   [-UserRefreshInterval <Int32>]
   [-UserRefreshIntervalUnit <RefreshInterval>]
   [-GlobalRefreshEnabled <Boolean>]
   [-GlobalRefreshOnLogOn <Boolean>]
   [-GlobalRefreshInterval <Int32>]
   [-GlobalRefreshIntervalUnit <RefreshInterval>]
   [<CommonParameters>]
```

Description

Creates a new Citrix App-V policy containing the specified App-V Management and Publishing Server URLs. Additionally, accepts Publishing Server settings that control how and when automatic refresh occurs on the VDA.

Examples

EXAMPLE 1

Creates a new Citrix Policy for Management Server appv-mansrv & Publishing Server: appv-pubsrv on port 8082.

Default Publishing Server setting is used for `http://appv-pubsrv.mydomain.com:8082`

Default values for Publishing Server settings are:

GlobalRefreshEnabled = false

GlobalFreshOnLogon = false

GlobalIntervalRefreshInterval = 0

GlobalRefreshIntervalUnit = Day

UserRefreshEnabled = true

UserRefreshOnLogon = true

UserIntervalRefreshInterval = 0

GlobalRefreshIntervalUnit = Day

```
New-CtxAppVServer -ManagementServer http://appv-mansrv.mydomain.com -
    PublishingServer http://appv-pubsrv.mydomain.com:8082
```

EXAMPLE 2

Creates a new Citrix Policy for Management Server AppV-Mgmt-Server:8080 & Publishing Server: AppV-Mgmt-Server:8082. User specified Publishing Server settings are used for AppV-Mgmt-Server:8082

Following values are used to configure Publishing Server appv-pubsrv

GlobalRefreshEnabled = True

GlobalRefreshOnLogon = True

GlobalIntervalRefreshInterval = 2

GlobalRefreshIntervalUnit = Hour

UserRefreshEnabled = true

UserRefreshOnLogon = true

UserIntervalRefreshInterval = 3

GlobalRefreshIntervalUnit = Hour

```
New-CtxAppVServer -ManagementServer http://appv-mansrv.mydomain.com -
    PublishingServer http://appv-pubsrv.mydomaain.com:8082 -
    GlobalRefreshEnabled $true -GlobalRefreshOnLogon $true -
    GlobalRefreshInterval 2 -GlobalRefreshIntervalUnit Hour -
    UserRefreshEnabled $true -UserRefreshOnLogon $true -
    UserRefreshInterval 3 -UserRefreshIntervalUnit Hour
```

Parameters

-ManagementServer

The URL of the Management Server to add to the Citrix policy.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	True

-PublishingServer

The URL (including the port number) of the Publishing Server to add to the Citrix policy.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshEnabled

Enables a refresh of packages published to user groups either at user logon or at a specified interval. For more information, see the App-V 5.0 documentation at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshInterval

Specifies the frequency at which to initiate a refresh of packages published to user groups. This can be either days or hours, as specified by the UserRefreshIntervalUnit setting. For more information, see the App-V 5.0 documentation at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshInterval

Specifies the frequency at which to initiate a refresh of packages published to user groups. This can be either days or hours, as specified by the UserRefreshIntervalUnit setting. For more information, see the App-V 5.0 documentation at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshIntervalUnit

Specifies the unit for the UserRefreshInterval setting. This can be set to either Hours (0) or Days (1). For more information, see the App-V 5.0 documentation at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	RefreshInterval
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshEnabled

Enables a refresh of packages published to machine groups either at user logon or at a specified interval. For more information, see the App-V 5.0 documentation at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshInterval

Specifies the frequency at which to initiate a refresh of packages published to machine groups. This can be either days or hours, as specified by the GlobalRefreshIntervalUnit setting. Please refer to App-V 5.0 documentation for details. http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshIntervalUnit

Specifies the unit for the GlobalRefreshInterval setting. This can be set to either Hours (0) or Days (1). Please refer to App-V 5.0 documentation for details. http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	RefreshInterval
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshOnLogOn

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshOnLogOn

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Set-CtxAppVServerSetting

March 11, 2024

Specifies the App-V Publishing Server settings to use on the VDA. These settings determine whether or not the App-V Client can automatically initiate a publishing refresh on certain events such as user logon or at specified intervals.

Syntax

```
Set-CtxAppVServerSetting
   -AppVPublishingServer <String>
    [-UserRefreshEnabled <Boolean>]
    [-UserRefreshOnLogon <Boolean>]
    [-UserRefreshInterval <Int32>]
    [-UserRefreshIntervalUnit <RefreshInterval>]
    [-GlobalRefreshEnabled <Boolean>]
    [-GlobalRefreshOnLogon <Boolean>]
    [-GlobalRefreshInterval <Int32>]
    [-GlobalRefreshIntervalUnit <RefreshInterval>]
    [<CommonParameters>]
```

Description

Specifies the App-V Publishing Server settings to use on the VDA. These settings determine whether or not the App-V Client can automatically initiate a publishing refresh on certain events such as user

logon or at specified intervals. Please refer to Microsoft App-V 5.0 documentation for more details on these settings : http://technet.microsoft.com/en-us/library/jj687745.aspx

Examples

EXAMPLE 1

```
Set-CtxAppVServerSetting -AppVPublishingServer http://appv-pubsrv.
    mydomain.com:8082 -GlobalRefreshEnabled $true -GlobalRefreshOnLogon
    $true -GlobalRefreshInterval 2 -GlobalRefreshIntervalUnit Hour -
    UserRefreshEnabled $true -UserRefreshOnLogon $true -
    UserRefreshInterval 3 -UserRefreshIntervalUnit Hour
```

Parameters

-AppVPublishingServer

The full URL (including port number) of the Publishing Server for which settings are to be set.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-UserRefreshEnabled

Enables a refresh of packages published to user groups either at user logon or at a specified interval. For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshOnLogon

Specifies whether or not to initiate a refresh of packages published to user groups on every user logon. For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshInterval

Specifies the frequency at which to initiate a refresh of packages published to user groups. This can be either days or hours, as specified by the UserRefreshIntervalUnit setting. For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserRefreshIntervalUnit

Specifies the unit for the UserRefreshInterval setting. This can be set to either Hours (0) or Days (1). For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	RefreshInterval
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshEnabled

Enables a refresh of packages published to machine groups either at user logon or at a specified interval. For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshOnLogon

Specifies whether or not to initiate a refresh of packages published to machine groups on every user logon. For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshInterval

Specifies the frequency at which to initiate a refresh of packages published to machine groups. This can be either days or hours, as specified by the GlobalRefreshIntervalUnit setting. For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GlobalRefreshIntervalUnit

Specifies the unit for the GlobalRefreshInterval setting. This can be set to either Hours (0) or Days (1). For more information, see the App-V documentation on the Microsoft website at http://technet.microsoft.com/en-us/library/jj687745.aspx

Type:	RefreshInterval
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Test-CtxAppVServer

March 11, 2024

Tests the given URL for the presence of App-V Management and Publishing servers.

Syntax

```
Test-CtxAppVServer
    -AppVManagementServer <String>
    [<CommonParameters>]
```

```
Test-CtxAppVServer
    -AppVPublishingServer <String>
    [<CommonParameters>]
```

Description

Tests the given URL for the presence of App-V Management and Publishing Servers.

Examples

EXAMPLE 1

Tests whether “appv-mansrv”is a Management Server or not. The name can, but does not need to be specified as a Fully Qualified Domain Name (FQDN). No port number is required.

```
Test-CtxAppVServer -AppVManagementServer "appv-mansrv"
```

EXAMPLE 2

Tests whether “http://appv-pubsrv.mydomanin.com:8082”is a Publishing Server or not. Specify the full URL address, including FQDN and port number, of the Publishing Server.

```
Test-CtxAppVServer -AppVPublishingServer "http://appv-pubsrv.mydomanin.
    com:8082"
```

Parameters

-AppVManagementServer

Machine name of the App-V Management Server.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AppVPublishingServer

The URL (including the port number) of the App-V Publishing Server.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Topic

Citrix Broker SDK - Access Policy

Short Description

Controls client-connection-based access to desktop groups.

Long Description

The site's access policy defines rules controlling a user's access to desktop groups. Access checks are based on details of the user's connection from their user device to the site. Think of the access policy informally as a connection-based firewall.

The access policy comprises a set of rules. Each rule:

- Relates to a single desktop group.
- Contains a set of connection filters and access right controls.

Multiple rules can apply to the same desktop group.

By default, users have no access to any desktop group within a site. A user gains access to a group when their connection's details match the connection filters of one or more rules in the access policy.

The access policy also grants control rights over desktop and application sessions. For example, it can specify which protocols are allowed for a connection from a given endpoint, and whether the user can restart their machine.

To use a resource published by a site, the user must have both access to the desktop group that contains it, and an entitlement to use the resource. Entitlements are typically granted by the site entitlement and assignment policies; see about_Broker_Policies for more information.

Access Policy Rules

A single access policy rule relates to a single specified desktop group and comprises a set of connection filters and access right grants as described below.

Each rule can be individually enabled or disabled. A disabled rule is ignored when the access policy is evaluated.

Connection Filters Overview

The connection filters in an access policy rule comprise the following:

- Local/remote client (SmartAccess) filters
- Client IP address filters
- Client name filters

- User filters

All filters have an include and exclude form that can be individually enabled or disabled. For a rule to be considered when the access policy is evaluated, at least one connection include filter must be enabled. By default, all filters, both include and exclude, are disabled.

The detailed behavior of connection filters is covered later.

Access Right Controls Overview

The access right controls in an access policy rule comprise the following:

- Allowed protocols
- Whether machine restart, or programmatic session logoff, is allowed

The detailed behavior of access right controls is covered later.

Details Of Connection Filters

To gain access to a desktop group the user's connection must match the filter criteria of at least one access policy rule for that group.

To match a rule, a connection must match all the rule's enabled include connection filters and must not match any of the rule's enabled exclude filters. That is, entries in exclude filters take priority.

Because all rules are evaluated independently, if an exclude filter match prevents a connection gaining access to a desktop group through one rule, the connection may still gain access to the same group through a different rule.

The filters are described in pairs below, but within a single rule a match against any exclude filter prevents a connection from gaining access through that rule irrespective of which include filters within the rule were also matched.

Smartaccess Filters

SmartAccess filters allow filtering based on whether the client is directly connected (for example over a local area network (LAN)) or through Access Gateway. For connections through Access Gateway further filtering can be

performed based on the tags supplied from Access Gateway itself. The key properties of SmartAccess filters are:

- AllowedConnections (include filter: Filtered, NotViaAG, ViaAG)

  This property controls the behavior of the include filter. The default value is Filtered. The possible values are as follows:

  - Filtered (default)

    The filter matches any user connection not through Access Gateway. In addition, the filter may match user connections through Access Gateway subject to the following: if the IncludedSmartAccessTags property is empty, any such connection matches. However, if the property is not empty at least one SmartAccess tag from the filter property must match a SmartAccess tag supplied with the user's connection.

  - NotViaAG

    The filter matches only user connections not through Access Gateway. The contents of the IncludedSmartAccessTags property are ignored.

  - ViaAG

    The filter matches only user connections through Access Gateway. If the IncludedSmartAccessTags property is empty, any such connection matches. However, if the property is not empty at least one SmartAccess tag from the filter property must match a SmartAccess tag supplied with the user's connection.

  - AnyViaAG

    The filter matches only user connections through Access Gateway. The contents of the IncludedSmartAccessTags property are ignored. The behaviour of AnyViaAG is therefore the same as using ViaAG with an empty IncludedSmartAccessTags property.

  The IncludedSmartAccessTags property referred to above forms part of the include filter and is used if AllowedConnections is set to Filtered or ViaAG. It comprises a simple list of Access Gateway tags that are matched against those provided in the user's connection details.

- ExcludedSmartAccessTags (exclude filter)

  A simple list of Access Gateway tags that are matched against those provided in the user's connection details. If any tag in the list

matches one supplied with the user's connection, the user's connection does not match the access policy rule containing the filter.

The exclude filter has no setting corresponding to the AllowedConnections property so its behavior is determined only by the ExcludedSmartAccessTags property.

SmartAccess filters are typically used to control local (through a LAN) and remote (through Access Gateway) access to a site. A common model is to define two access policy rules rules for a group, one for local access and one for remote. The remote rule might impose restrictions on the user device having appropriate antivirus software installed, and potentially exclude certain user groups who would be allowed access over the corporate LAN (see USER FILTERS below).

Client Ip Filters

Client IP filters allow filtering based on the IP address of the user's device. The key properties of client IP filters are:

- IncludedClientIPs (include filter)

  A simple list of numeric IP address ranges that are matched against the user device. The filter matches if the device address falls within any of the ranges in the list.

- ExcludedClientIPs (exclude filter)

  A simple list of numeric IP address ranges that are matched against the user device. If any entry matches the device address, the user's connection does not match the access policy rule containing the filter.

An IP address range in these filters can be specified as a simple IP address or as a range using a conventional subnet mask.

Client Name Filters

Client name filters allow filtering based on the name of the user's device. The key properties of client name filters are:

- IncludedClientNames (include filter)

  A simple list of names that are matched against the user device. The filter matches if the device name matches any value in the list.

- ExcludedClientNames (exclude filter)

  A simple list of device names that are matched against the user device. If any entry matches the device name, the user's connection does not match the access policy rule containing the filter.

Note: The form of the device name presented to the site depends on the site configuration. For example, by default in these filters you cannot use the form of the name presented by Web Interface.

User Filters

User filters allow filtering based on the identity of the user. The key properties of user filters are:

- AllowedUsers (include filter: Filtered, AnyAuthenticated, Any)

  This property controls the behavior of the include filter. The default value is Filtered. The possible values are as follows:

  - Filtered (default)

    The filter matches if the user's logon token contains one or more users or user groups matching those specified in the IncludedUsers property. The IncludedUsers property is a simple list of users or user groups and is used only when the AllowedUsers property is set to Filtered.

  - AnyAuthenticated

    The filter matches any authenticated Microsoft Windows user. The contents of the IncludedUsers property are ignored.

  - Any

    The filter matches any user. The contents of the IncludedUsers property are ignored. In the current implementation this value is handled in the same way as AnyAuthenticated.

- ExcludedUsers (exclude filter)

  A simple list of users or user groups. If any entry matches one in the user's logon token, the user's connection does not match the access policy rule containing the filter.

  The exclude filter has no setting corresponding to the AllowedUsers property so its behavior is determined only by the ExcludedUsers property.

Details Of Access Right Controls

The access right controls of an access policy rule determine rights that the user has over any desktop or application session that they obtain from the rule's desktop group.

The rights apply only if the user's connection matches the connection filters of a rule, and only if the user also has an entitlement to a desktop or application session from the associated desktop group.

The following properties define the access rights:

- AllowedProtocols

  A simple list of communication protocols over which connections can be made to resources published by the desktop group. For example, use this to restrict protocols with high bandwidth requirements to connections originating from a LAN.

- AllowRestart

  For single-session power-managed machines, allows the user to restart the machine (the machine is powered off using the capabilities of its hypervisor). For multi-session machines the user's session is simply logged off.

For a given connection, if multiple rules result in access being granted to a session from a desktop group, the user's rights are the combined rights of all the rules that matched for that group. The allowed protocol lists from all the rules are combined, and the user is granted restart rights if any one rule has AllowRestart set.

Topic

Citrix Broker SDK - Access Policy

Short Description

Controls client-connection-based access to desktop groups.

Long Description

The site's access policy defines rules controlling a user's access to desktop groups. Access checks are based on details of the user's connection from their user device to the site. Think of the access policy informally as a connection-based firewall.

The access policy comprises a set of rules. Each rule:

- Relates to a single desktop group.
- Contains a set of connection filters and access right controls.

Multiple rules can apply to the same desktop group.

By default, users have no access to any desktop group within a site. A user gains access to a group when their connection's details match the connection filters of one or more rules in the access policy.

The access policy also grants control rights over desktop and application sessions. For example, it can specify which protocols are allowed for a connection from a given endpoint, and whether the user can restart their machine.

To use a resource published by a site, the user must have both access to the desktop group that contains it, and an entitlement to use the resource. Entitlements are typically granted by the site entitlement and assignment policies; see about_Broker_Policies for more information.

Access Policy Rules

A single access policy rule relates to a single specified desktop group and comprises a set of connection filters and access right grants as described below.

Each rule can be individually enabled or disabled. A disabled rule is ignored when the access policy is evaluated.

Connection Filters Overview

The connection filters in an access policy rule comprise the following:

- Local/remote client (SmartAccess) filters
- Client IP address filters
- Client name filters
- User filters

All filters have an include and exclude form that can be individually enabled or disabled. For a rule to be considered when the access policy is evaluated, at least one connection include filter must be enabled. By default, all filters, both include and exclude, are disabled.

The detailed behavior of connection filters is covered later.

Access Right Controls Overview

The access right controls in an access policy rule comprise the following:

- Allowed protocols
- Whether machine restart, or programmatic session logoff, is allowed

The detailed behavior of access right controls is covered later.

Details Of Connection Filters

To gain access to a desktop group the user's connection must match the filter criteria of at least one access policy rule for that group.

To match a rule, a connection must match all the rule's enabled include connection filters and must not match any of the rule's enabled exclude filters. That is, entries in exclude filters take priority.

Because all rules are evaluated independently, if an exclude filter match prevents a connection gaining access to a desktop group through one rule, the connection may still gain access to the same group through a different rule.

The filters are described in pairs below, but within a single rule a match against any exclude filter prevents a connection from gaining access through that rule irrespective of which include filters within the rule were also matched.

Smartaccess Filters

SmartAccess filters allow filtering based on whether the client is directly connected (for example over a local area network (LAN)) or through Access Gateway. For connections through Access Gateway further filtering can be performed based on the tags supplied from Access Gateway itself. The key properties of SmartAccess filters are:

- AllowedConnections (include filter: Filtered, NotViaAG, ViaAG)

  This property controls the behavior of the include filter. The default value is Filtered. The possible values are as follows:

  - Filtered (default)

    The filter matches any user connection not through Access Gateway. In addition, the filter may match user connections through Access Gateway subject to the following: if the IncludedSmartAccessTags property is empty, any such connection matches. However, if the property is not empty at least one SmartAccess tag from the filter property must match a SmartAccess tag supplied with the user's connection.

  - NotViaAG

The filter matches only user connections not through Access Gateway. The contents of the IncludedSmartAccessTags property are ignored.

- ViaAG

  The filter matches only user connections through Access Gateway. If the IncludedSmartAccessTags property is empty, any such connection matches. However, if the property is not empty at least one SmartAccess tag from the filter property must match a SmartAccess tag supplied with the user's connection.

- AnyViaAG

  The filter matches only user connections through Access Gateway. The contents of the IncludedSmartAccessTags property are ignored. The behaviour of AnyViaAG is therefore the same as using ViaAG with an empty IncludedSmartAccessTags property.

The IncludedSmartAccessTags property referred to above forms part of the include filter and is used if AllowedConnections is set to Filtered or ViaAG. It comprises a simple list of Access Gateway tags that are matched against those provided in the user's connection details.

- ExcludedSmartAccessTags (exclude filter)

  A simple list of Access Gateway tags that are matched against those provided in the user's connection details. If any tag in the list matches one supplied with the user's connection, the user's connection does not match the access policy rule containing the filter.

  The exclude filter has no setting corresponding to the AllowedConnections property so its behavior is determined only by the ExcludedSmartAccessTags property.

SmartAccess filters are typically used to control local (through a LAN) and remote (through Access Gateway) access to a site. A common model is to define two access policy rules rules for a group, one for local access and one for remote. The remote rule might impose restrictions on the user device having appropriate antivirus software installed, and potentially exclude certain user groups who would be allowed access over the corporate LAN (see USER FILTERS below).

Client Ip Filters

Client IP filters allow filtering based on the IP address of the user's device. The key properties of client IP filters are:

- IncludedClientIPs (include filter)

  A simple list of numeric IP address ranges that are matched against the user device. The filter matches if the device address falls within any of the ranges in the list.

- ExcludedClientIPs (exclude filter)

  A simple list of numeric IP address ranges that are matched against the user device. If any entry matches the device address, the user's connection does not match the access policy rule containing the filter.

An IP address range in these filters can be specified as a simple IP address or as a range using a conventional subnet mask.

Client Name Filters

Client name filters allow filtering based on the name of the user's device. The key properties of client name filters are:

- IncludedClientNames (include filter)

  A simple list of names that are matched against the user device. The filter matches if the device name matches any value in the list.

- ExcludedClientNames (exclude filter)

  A simple list of device names that are matched against the user device. If any entry matches the device name, the user's connection does not match the access policy rule containing the filter.

Note: The form of the device name presented to the site depends on the site configuration. For example, by default in these filters you cannot use the form of the name presented by Web Interface.

User Filters

User filters allow filtering based on the identity of the user. The key properties of user filters are:

- AllowedUsers (include filter: Filtered, AnyAuthenticated, Any)

  This property controls the behavior of the include filter. The default value is Filtered. The possible values are as follows:

  - Filtered (default)

    The filter matches if the user's logon token contains one or more users or user groups matching those specified in the IncludedUsers property. The IncludedUsers property is a simple list of users or user groups and is used only when the AllowedUsers property is set to Filtered.

  - AnyAuthenticated

    The filter matches any authenticated Microsoft Windows user. The contents of the IncludedUsers property are ignored.

  - Any

    The filter matches any user. The contents of the IncludedUsers property are ignored. In the current implementation this value is handled in the same way as AnyAuthenticated.

- ExcludedUsers (exclude filter)

  A simple list of users or user groups. If any entry matches one in the user's logon token, the user's connection does not match the access policy rule containing the filter.

  The exclude filter has no setting corresponding to the AllowedUsers property so its behavior is determined only by the ExcludedUsers property.

Details Of Access Right Controls

The access right controls of an access policy rule determine rights that the user has over any desktop or application session that they obtain from the rule's desktop group.

The rights apply only if the user's connection matches the connection filters of a rule, and only if the user also has an entitlement to a desktop or application session from the associated desktop group.

The following properties define the access rights:

- AllowedProtocols

A simple list of communication protocols over which connections can be made to resources published by the desktop group. For example, use this to restrict protocols with high bandwidth requirements to connections originating from a LAN.

- AllowRestart

  For single-session power-managed machines, allows the user to restart the machine (the machine is powered off using the capabilities of its hypervisor). For multi-session machines the user's session is simply logged off.

For a given connection, if multiple rules result in access being granted to a session from a desktop group, the user's rights are the combined rights of all the rules that matched for that group. The allowed protocol lists from all the rules are combined, and the user is granted restart rights if any one rule has AllowRestart set.

about_Broker_Applications

March 11, 2024

Topic

Citrix Broker SDK - Applications

Short Description

Describes how to publish and manage hosted applications.

Long Description

Published applications allow your users to launch applications as if they were installed on their devices when in fact they are hosted remotely. The applications are normally launched in a seamless window, meaning that users see only the application window and not an additional desktop.

Published applications are hosted on either desktop operating systems or server operating systems. Applications are published to users and desktop groups. As such, conceptually they exist "on top"of desktop groups, which are themselves built on top of catalogs. See about_Broker_Concepts for more information on catalogs.

There are three types of applications:

- HostedOnDesktop - application runs on a remote machine and is displayed on the local client desktop.
- InstalledOnClient - application is installed and run on the local client machine and has its window overlaid on to a remote desktop.
- PublishedContent - application refers to actual content (using a URL or UNC). File type associations determine what application is run to view the content

Hosting Applications

There are three main ways of hosting an application: using a private single-session VDI desktop, a shared single-session VDI desktop, and on shared multi-session server operating systems.

An application hosted on a shared single-session VDI desktop, when launched, is hosted on a random machine within the desktop group. An application hosted on a private single-session VDI desktop ensures that when a user launches the application it is always hosted on the same machine. An

application hosted on shared multi-session server operating systems ensures that when a user launches the application it is always hosted on one of the least loaded servers in the desktop group.

You control how the application is hosted based on the kind of desktop group that you choose. Shared desktop groups randomly select a machine, and these desktop groups can only be created from catalogs with a Random AllocationType. On the other hand, private desktop groups host the application on the same machine for that user every time, and these desktop group types can only be created from catalogs with a Permanent AllocationType.

User Access & Assignment

Users are not assigned an application directly, but instead they are required to first have access to the desktop groups on which the applications are published through access policy rules.

With shared desktop groups, access to a published application also needs an application entitlement policy rule. An application entitlement policy rule defines the set of users who are allowed per-session access to desktops in a specified desktop group.

With private desktop groups, access to a published application also needs an application assignment policy rule. An application assignment policy rule defines the set of users who are allowed access to a single application session in a desktop group.

Users are assigned private machines in one of two ways: pre-assigned or assign-on-first-use. Pre-assigned means that individual user accounts have been specified for the machines within that desktop group. A single machine can only have a single user account (not a group account) assigned to it, and likewise a user can only be assigned a single machine within a desktop group.

Assign-on-first-use requires less configuration. Machines are assigned to users the first time they log on. Rather than allocating users directly to machines, instead users are assigned to the private desktop group, either through individual user accounts or through user group accounts. Then, when a user assigned to the desktop group logs on, a machine is automatically allocated to them.

User Visibility

Users can be further filtered by configuring the visibility filter on top of the application. This restricts the application to a subset of the users that were granted access by the access policy and entitlement/assignment policy rules on the desktop group.

Multiple Desktop Groups

You can publish an application to multiple desktop groups, which have to be of the same kind. Generally, an application that is published only to private desktop groups is referred to as a "private application". An application that is only published to shared desktop groups is referred to as a "shared application".

Application Groups

An application group is a group of applications. Applications may be published either by adding them directly to a desktop group, or they may first be assigned to an application group, which may then be added to a desktop group. Adding an application group to a desktop group publishes all of the application group's applications to that desktop group in a single operation. The set of machines on which the application group's applications can be launched may then be restricted further by tagging the desired machines and setting the application group's RestrictToTag property.

Grouping applications together allows for them to be administered as a single unit. For example:

- Moving an application group to a different desktop group has the same effect as moving each of the applications, without the need to move each application individually.
- Disabling an application group disables each application in the group.
- Application groups have a visibility filter that applies to every application within the group (see 'User visibility' above).

Application groups may be configured to allow or disallow session sharing with applications published by other application groups. For example, you may have a particular set of applications that do not interoperate well with certain other applications that are installed on the same machines - for example, two different versions of the same software suite, or two different

versions of the same web browser. You may prefer not to allow the user to launch both versions in the same session.

In such a case, an application group can be created for each version of the software suite, and the applications for each version of the software suite added to the corresponding application group. If session sharing is disabled for each of the application groups, then the user will be able to run applications of the same version in the same session, and can still run other applications at the same time - but not in the same session. If the user launches one of the different-versioned applications, which are in a different application group, or launches any application that is not contained in an application group, then that application is launched in a new session.

IMPORTANT. The session sharing feature of application groups is not intended to be a security sandboxing feature. In addition to not being foolproof, it cannot prevent users from launching applications into their sessions through other means (e.g. through Windows Explorer).

An application may be a member of more than one application group. In that case, it inherits settings from all of the application groups of which it is a member. For example, an application is only disabled if all of the application groups to which it is assigned are disabled, or if the application itself is disabled.

However, if application or application group visiblity filters are used, then it is recommended that each application be a member of at most one application group, and that visibility filters are used either on applications, or on application groups, but not both. This is because it is not generally possible for the system to combine multiple visibility filters in such as way that they can consistently be enforced.

An application may also be a member of both an application group and a desktop group at the same time. However, this is not recommended, because the additional complexity can make it harder for the administrator to predict how machines are allocated to users. It is recommended that each application be published either via application groups, or via desktop groups, but not both.

Application groups may not be published via private desktop groups.

Application groups are purely an administrative concept. They are not visible to end users.

Licensing

Hosted applications need the appropriate licenses to exist on the license server to be functional.

Naming

Applications have three names that identify them: the Name, BrowserName and the PublishedName. The Name is unique for each application, is not visible to the user, and is primarily used for administrative purpose. The BrowserName is unique across the entire site, and is primarily used internally. The PublishedName is not unique and is the name seen by end users who have access to this application.

When creating an application, you only need to specify the Name. If no BrowserName is specified one is automatically generated. If no PublishedName is specified by default it is the same as the Name.

The following special characters are not allowed in the Name, BrowserName or the PublishedName properties: \ / ; : # . * ? = < > | [ ] ( ) ‘“

In addition the ‘ character is not allowed in the Name property.

To change the PublishedName or BrowserName of an application you must use the Set-BrokerApplication cmdlet.

To change the Name of an application you must use the Rename-BrokerApplication cmdlet.

Optional

You can configure file-type associations for applications, so that if a user double-clicks a document icon on their device, a published application automatically starts. For more information, see the help for New-BrokerConfiguredFTA.

You can apply tags to applications as another convenient way to further organize (and search for) applications. For more information, see the help for New-BrokerTag.

Cmdlets

New-BrokerApplication

Creates an application for publishing after the needed desktop groups, access policy and entitlement/assignment policy rules have been created.

Add-BrokerApplication

Adds one or more applications to a desktop group.

Get-BrokerApplication

Gets one or more applications.

Remove-BrokerApplication

Deletes one or more applications or it can be used to delete just the association of an application to a desktop group.

Rename-BrokerApplication

Changes the Name of an application.

Set-BrokerApplication

Changes the settings of application objects, except their names.

Examples

Shared Application (Singlesession)

You have created a catalog with a Random AllocationType and SingleSession SessionSupport. It contains two machines called worker1 and worker2, both in the ACME domain. You publish an application with shared hosting as follows:

```
Write-Host "Create a desktop group, and add machines to it"
$dg = New-BrokerDesktopGroup "Shared Application Group"
-DesktopKind Shared -DeliveryType AppsOnly -SessionSupport '
    SingleSession'
$m1 = Get-BrokerMachine -MachineName "ACME\worker1"
$m2 = Get-BrokerMachine -MachineName "ACME\worker2"
Add-BrokerMachine $m1 -DesktopGroup $dg
Add-BrokerMachine $m2 -DesktopGroup $dg
Write-Host "Create access policy rule for desktop group"
New-BrokerAccessPolicyRule -Name "Shared Application Group - Allow
    Everyone Access"
-Enabled $true -DesktopGroupUid $dg.Uid -IncludedUserFilterEnabled
    $true
-AllowedProtocols @("HDX") -AllowedUsers AnyAuthenticated
Write-Host "Create application entitlement policy for desktop group"
New-BrokerAppEntitlementPolicyRule -Name "Shared Application Group -
    App Entitlement"
-IncludedUsers 'ACME\Domain Users' -DesktopGroupUid $dg.Uid -Enabled
    $true
```

```
Write-Host "Create an application"
New-BrokerApplication -Name "Notepad" -PublishedName "Notepad"
-CommandLineExecutable "notepad.exe" -DesktopGroup $dg.Uid
```

In turn, this set of commands: creates a shared single session desktop group for applications delivery; adds two machines (from a catalog with a Random AllocationType and SingleSession SessionSupport) to the desktop group; creates access policy and application entitlement policy rules; creates an application; specifies its name, the executable, and links the application to the desktop group that will host it.

Shared Application (Multisession)

You have created a catalog with a Random AllocationType and MultiSession SessionSupport. It contains one machine called worker1 in the ACME domain. You publish an application with shared hosting as follows:

```
Write-Host "Create a desktop group, and add machines to it"
$dg = New-BrokerDesktopGroup "Shared Application Group"
-DesktopKind Shared -DeliveryType AppsOnly -SessionSupport '
    MultiSession'
$m1 = Get-BrokerMachine -MachineName "ACME\worker1"
Add-BrokerMachine $m1 -DesktopGroup $dg
Write-Host "Create access policy rule for desktop group"
New-BrokerAccessPolicyRule -Name "Shared Application Group - Allow
    Everyone Access"
-Enabled $true -DesktopGroupUid $dg.Uid -IncludedUserFilterEnabled
    $true
-AllowedProtocols @("HDX") -AllowedUsers AnyAuthenticated
Write-Host "Create application entitlement policy for desktop group"
New-BrokerAppEntitlementPolicyRule -Name "Shared Application Group -
    App Entitlement"
-IncludedUsers 'ACME\Domain Users' -DesktopGroupUid $dg.Uid -Enabled
    $true
Write-Host "Create an application"
New-BrokerApplication -Name "Notepad" -PublishedName "Notepad"
-CommandLineExecutable "notepad.exe" -DesktopGroup $dg.Uid
```

In turn, this set of commands: creates a shared multi session desktop group for applications delivery; adds one machine (from a catalog with a Random AllocationType and MultiSession SessionSupport) to the desktop group; creates access policy and application entitlement policy rules; creates an application; specifies its name, the executable, and links the application to the desktop group that will host it.

Private Pre-Assigned Application

You have a catalog with a Permanent AllocationType and SingleSession SessionSupport. It contains two machines called worker1 and worker2, both in the ACME domain. You publish an application with private hosting using pre-assigned machines as follows:

```
Write-Host "Create a desktop group, and add machines to it"
$dg = New-BrokerDesktopGroup "Private App G1" -DesktopKind Private
-DeliveryType AppsOnly -SessionSupport 'SingleSession'
$m1 = Get-BrokerMachine -MachineName "ACME\worker1"
$m2 = Get-BrokerMachine -MachineName "ACME\worker2"
Add-BrokerMachine $m1 -DesktopGroup $dg
Add-BrokerMachine $m2 -DesktopGroup $dg
Write-Host "Setting access policy rule for desktop group"
New-BrokerAccessPolicyRule -Name "Private App G1 - Allow Everyone
    Access"
-Enabled $true -DesktopGroupUid $dg.Uid -IncludedUserFilterEnabled
    $true
-AllowedProtocols @("HDX") -AllowedUsers AnyAuthenticated
Write-Host "Pre-Assign users to the machines"
Add-BrokerUser "ACME\user1" -Machine $m1
Add-BrokerUser "ACME\user2" -Machine $m2
Write-Host "Create an application"
New-BrokerApplication -Name "Notepad" -PublishedName "Notepad"
-CommandLineExecutable "notepad.exe" -DesktopGroup $dg.Uid
```

In turn, this set of commands: creates a private desktop group for applications delivery; adds two machines (from a catalog with a Permanent AllocationType and SingleSession SessionSupport) to the desktop group; creates access policy; creates two user objects; pre-assigns a user to each machine; creates the application; assigns users to it; and links the application to the desktop group that will host it.

Private, Assign-On-First-Use Application

You have a catalog created with a Permanent AllocationType and SingleSession SessionSupport. It contains two machines called worker1 and worker2, both in the ACME domain. You publish an application with private hosting using assign-on-first-use machines as follows:

```
Write-Host "Create a desktop group, and add machines to it"
$dg = New-BrokerDesktopGroup "Private App G2" -DesktopKind Private
-DeliveryType AppsOnly -SessionSupport 'SingleSession'
$m1 = Get-BrokerMachine -MachineName "ACME\worker1"
$m2 = Get-BrokerMachine -MachineName "ACME\worker2"
Add-BrokerMachine $m1 -DesktopGroup $dg
```

```
Add-BrokerMachine $m2 -DesktopGroup $dg
Write-Host "Setting access policy rule for desktop group"
New-BrokerAccessPolicyRule -Name "Private App G1 - Allow Everyone
    Access"
-Enabled $true -DesktopGroupUid $dg.Uid -IncludedUserFilterEnabled
    $true
-AllowedProtocols @("HDX") -AllowedUsers AnyAuthenticated
Write-Host "Create application assignment policy for desktop group"
New-BrokerAppAssignmentPolicyRule -Name "Private App G2 - App
    Assignment"
-IncludedUsers 'ACME\Domain Users' -DesktopGroupUid $dg.Uid -Enabled
    $true
Write-Host "Create an application"
New-BrokerApplication -Name "Notepad" -PublishedName "Notepad"
-CommandLineExecutable "notepad.exe" -DesktopGroup $dg.Uid
```

In turn, this set of commands: creates a private single session desktop group for applications delivery; adds two machines (from a catalog with a Permanent AllocationType and SingleSession SessionSupport) to the desktop group; creates access policy and application assignment policy rules; creates the application, and links the application to the desktop group that will host it.

Topic

Citrix Broker SDK - Assignment Policy

Short Description

Controls the automatic, permanent assignment of machines to users.

Long Description

The site's assignment policy defines rules controlling automatic assignment of machines to users in a process referred to as Assign On First Use (AOFU).

In this assignment model, a desktop group is initially populated with machines that have no assignments, and users are granted entitlements to obtain a machine selected at random from the pool by self-service assignment. Once made, the assignment is permanent. The resulting assigned machines can be used to deliver either desktop or application sessions depending on the delivery type of the desktop group.

The assignment policy comprises a set of rules. The policy can be applied only to desktop groups of desktop kind Private.

For assignment of machines to deliver desktop sessions:

- Multiple rules can apply to the same desktop group.
- Each rule grants an entitlement to one or more machines.

For assignment of machines to deliver application sessions:

- Only a single rule can apply to a given desktop group.
- Each rule grants an entitlement to a single machine.
- Although only a single application assignment rule can be defined for a group, a user can still launch multiple applications from that group because the applications all run within the same session on the assigned machine.

Once a machine is assigned to a user by an assignment policy rule, the rule plays no further part in controlling access to that machine. The rule can be changed, or even removed, without impacting the user's access to the machine.

Rules for desktop and application machine assignments are distinct. Desktop assignments are managed through the BrokerAssignmentPolicyRule SDK object, and application rules through the BrokerAppAssignmentPolicyRule object.

Desktop machine assignment rules can be created only for desktop groups with delivery type DesktopsOnly, whereas an application machine assignment rule can be created only for delivery type AppsOnly.

Because desktop groups of assigned machines do not allow delivery type DesktopsAndApps, desktop machine assignment and application machine assignment rules cannot exist for the same desktop group.

Assignment policy rules are also used to configure the RemotePC feature where their detailed usage differs. For more information on the RemotePC feature see "help about_Broker_RemotePC".

For an entitlement granted by the assignment policy to be available to a user, the site's access policy must also grant them access to the desktop group.

Assignment Policy Rules

Each assignment policy rule has the following key properties:

- The desktop group to which it applies (one rule only ever applies to one group).
- The users to which machines can be assigned by the rule.

Additionally for desktop assignment rules, the following properties exist:

- The published name of the entitlement (visible to the user).
- The number of machines (entitlements) to which the rule grants access.
- The properties that a newly assigned desktop acquires.

If multiple desktop assignment rules entitle a user to machines from the same desktop group, their total machine entitlement is the sum of those granted by all those rules. The properties of the desktop sessions obtained may differ depending on which of the entitlements the user selects to start a session.

Each rule can be individually enabled or disabled. A disabled rule is ignored when the assignment policy is evaluated.

User Filters (Full)

Each rule has two user filters, an include filter and an exclude filter:

- The include filter contains users and user groups that are granted entitlements to machines.
- The exclude filter contains users and user groups that are denied entitlements to machines.

If the include filter of a rule contains multiple instances of a user (either explicit or implicit), this does not alter the number of machine entitlements granted to them by the rule.

Entries in the exclude filter take priority, so if a user appears explicitly or implicitly in both filters, access is denied. Typically, you use this filter to exclude a user or group of users who would otherwise gain access because they are members of a user group specified in the include filter.

Because all rules are independently evaluated, the exclude filter can exclude only users who would otherwise gain an entitlement through the same rule's include filter. That is, if a user is in a rule's include filter but not its exclude filter, the rule is guaranteed to grant that user access to a machine irrespective of whether the user appears in the exclude filter of other rules.

If a filter contains a user group that contains other users and groups, the filter implicitly includes all of those users and groups.

By default the exclude filter is disabled.

To maintain assignment policy rules that can be fully displayed and edited with Citrix Studio, use the simplified user filter model below and do not use the exclude filter.

User Filters (Simplified)

The included user filter described above also supports a simplified usage model where the filter itself is disabled. When this is done, any user who has access to the desktop group through the access policy is implicitly granted an entitlement to a machine through the entitlement policy rule without the need to list the user in the rule's include filter.

This is useful in cases where the access policy for the desktop group already explicitly specifies the users who should have access.

Even if the include filter is disabled, the exclude filter can still be used to deny the entitlement to users who would otherwise gain access through the access policy alone.

This simplified usage cannot be used for RemotePC desktop groups.

Remote Pc Usage

When a desktop group is configured as a RemotePC group, the usage of the assignment policy differs in the following ways:

- Only a single rule can apply to a given desktop group.
- The delivery type of the desktop group must be DesktopsOnly.
- The simplified user filter model cannot be used. Users or user groups must appear explicitly in the included user filter of the assignment policy rule.
- If the included user filter is disabled then RemotePC assignment for the group is also effectively disabled.

For more information on the RemotePC feature see "help about_Broker_RemotePC".

Additional Desktop Assignment Rule Properties

Desktop assignment rules specify the following additional properties:

- PublishedName
- Description
- IconUid
- ColorDepth
- SecureIcaRequired

The published name, description, and icon UID properties apply to the desktop entitlement itself and determine the way in which the entitlement is presented to the user in, for example, StoreFront.

The color depth and secure ICA properties apply to the desktop session that is obtained when the entitlement is used.

In all cases, these properties can be explicitly specified. However, a null value (the default) means that the corresponding property is taken from the desktop group to which the rule applies. This inheritance from groups is

dynamic; if the property of the group changes, the property of the entitlement changes too.

For assignment rules these properties are copied to the newly assigned desktop when the granted entitlement is first used. If the properties on the rule are subsequently changed the properties on the user's assigned desktop do not change. The dynamic inheritance of desktop properties from the desktop group continues after the assignment has occurred if the original rule did not provide explicit property values.

Calculating Overall Machine Entitlements

Assignment rules are modified only by the SDK; they are not modified when used by the system to make automatic assignments. The number of machine entitlements offered to the user is determined by the number of machines (within the desktop group) already assigned to them and by which rules those assignments were made.

For each desktop group, the number of desktop entitlements available to the user is determined as follows:

1. The total number of entitlements for the user to machines in the group, from all rules, is calculated.
2. The total number of assigned machines (from any source) that the user already has in the group is determined.
3. The outstanding entitlement value is derived as the difference of the above two numbers.
4. If the outstanding entitlement value is zero or fewer, no further entitlements are allowed.
   Otherwise, for each applicable rule, the number of entitlements is that defined by the rule itself, minus the number of desktops already assigned to the user by that rule, and capped by the outstanding entitlement value.

Desktop and application machine entitlements both follow the above rules. However, because only a single application assignment rule granting a single entitlement per group can exist, these rules are seldom a consideration for applications.

Examples

- Simple case:
  A user is entitled to a single machine in a group by a single assignment rule:

  1. On first use, the user sees a single desktop entitlement.
     If the user selects this, a new desktop is assigned.
  2. On subsequent uses, the user sees the assigned desktop only.
     No other entitlements are displayed.

- Complex case:
  A user is entitled to two machines, one from each of two different rules, A and B, both applying to the same desktop group. In addition, the user has a machine explicitly assigned to them by the administrator within that group:

  1. On first use, the user sees the administrator-assigned desktop, a single entitlement to a desktop of type A, and a single entitlement to a desktop of type B. If either of the entitlements is selected, a desktop of the appropriate type, A or B, is assigned.
  2. On subsequent uses, the user sees the administrator-assigned desktop and the desktop assigned by the selected entitlement.
     No further entitlements are displayed.

Machine Entitlement Presentation

For desktop machine assignment rules, the user interface determines whether users can visually distinguish between an entitlement to a machine and an actual assigned desktop. This cannot be controlled by Broker SDK cmdlets.

Although the number of entitlements seen by users takes account of all of their currently assigned desktops, the dynamic state of the system can affect the user interaction. This means that entitlements are displayed even where the pool of machines is empty, or the remaining desktops are in maintenance mode or otherwise unavailable. If the user attempts to use an entitlement in these cases, they receive a no-available-desktop error.

For application machine entitlement rules, the entitlements themselves are not presented to the end user; only the applications available to the user are presented. The use of available assignments, or of already assigned machines, is managed automatically.

Notes

If an assignment rule grants entitlements to a user group:

- The machine is assigned to the user who selects the entitlement, thus an assignment policy rule cannot be used to assign a machine to a user group. However, an administrator can assign a machine to a user group using the Add-BrokerUser cmdlet.
- The number of machine entitlements specified in a desktop assignment rule applies to each member of the user group. For example, if a rule grants a user group access to two machines, every user in the group is entitled to two desktops.

The total number of machine entitlements defined by the assignment policy for a given desktop group may exceed the number of machines present in the group. A user attempting to use an entitlement when the pool of machines is empty receives a no-desktop-available error. (See CALCULATING OVERALL MACHINE ENTITLEMENTS above).

A machine assigned to a user as a result of the assignment policy remains permanently assigned unless the machine assignment itself is removed by the administrator. Such assignments are permanent even if the assignment rule is deleted, when the machine is treated as administrator-assigned.

The assignment policy cannot be used to assign a machine to more than one user. This is only possible using the Add-BrokerUser cmdlet.

about_Broker_AutoTagRule

March 11, 2024

Topic

Citrix Broker SDK - AutoTagRules

Short Description

Overview of administrator defined rules for automatic addition and removal of tags on machines, application groups, applications, desktop groups or desktops.

Long Description

Auto tag rules enable administrators to automatically to set and/or remove tags for machines, application groups, applications, desktop groups or desktops. The rules are periodically evaluated and the tags of associated objects updated.
Each auto tag rule is associated with exactly one Tag. A Tag is associated with at most one auto tag rule.

For example:
tag = New-BrokerTag -Name MyExample
New-BrokerAutoTagRule -Name StaticCatalogs -TagUid tag.Uid -ObjectType Catalog -RuleText "-AllocationType Static"

Citrix Broker - Concepts

Short Description

Overview of the Citrix Broker.

Long Description

The Citrix Broker is a Microsoft Windows service running on a delivery controller that responds to desktop/application launch requests from users through StoreFront by selecting a suitable machine, powering it up if necessary, and then returning the address of the selected machine to the user's endpoint system so that a session connection can be made. If required for resilience or scale, additional instances of the Broker may be installed to run on additional delivery controllers in the same delivery site.

In addition to handling launch requests, the Broker also has background responsibilities in the delivery site; these include: maintaining appropriate numbers of unused, powered-up machines to avoid unnecessary delays to users launching desktops/applications; maintaining periodic contact with powered-up machines; and monitoring the state of machines and user sessions.

The Citrix.Broker.Admin PowerShell snap-in provides the cmdlets needed to administer and monitor the behaviour of the Broker service, either on the local system (by default) or on another system (by use of the -AdminAddress command-line parameter).

The cmdlets in the broker SDK manage objects in the following broad functional areas:

Provisioning Configuration

The Broker must be informed of the machines which are at its disposal. In order to do this, machines are organized in catalogs, created with the New-BrokerCatalog cmdlet; machines are introduced into the system through the use of the New-BrokerMachine cmdlet.

Catalogs define the nature of the machines contained within them, such as the allocation type (that is, static or random), how the machines are actually provisioned (that is, by MCS, PVS or manually), whether they are physical or virtual machines, whether they are single-session or multi-session, etc.

Typically, machines configured from a provisioning standpoint are not associated with specific users (though they may need to be, for example if the machine's disk image was captured from a specific user's physical desktop using a P2V tool); this is normally done when configuring how resources are brokered to users, below.

It is also possible for a catalog to be configured to be populated automatically with end users' existing physical machines using the RemotePC feature. The about_Broker_RemotePC topic gives more detail.

Provisioning configuration involves the following SDK objects:

- BrokerHypervisorConnection
- BrokerCatalog
- BrokerMachine
- BrokerRemotePCAccount
- BrokerUser

For more information, see:

about_Broker_Machines
about_Broker_RemotePC
Get-BrokerHypervisorConnection
Get-BrokerCatalog
Get-BrokerMachine
Get-BrokerUser

Brokering Configuration

In order that resources (that is, desktops and applications) can be used in user sessions, the Broker must be configured to connect incoming user launch

requests through StoreFront with the correct machine. This is achieved by adding machines to desktop groups. The grouping of machines in desktop groups need not necessarily match the grouping of the machines within the catalogs that were used for the configuration of provisioning. It is through the desktop group that the configuration of which users can use which machine resources is achieved.

Configuration of the mapping between resources and end users is achieved through a combination of machine assignment and entitlement rules. In addition, access to those resources must also be configured (for example, some resources could be configured only to be accessible to users when they are not connecting remotely through Access Gateway.)
The about_Broker_Policies topic gives more detail of the rich configuration options available.

It is also possible for a desktop group to be configured to be populated automatically with end users existing physical machines using the RemotePC feature. The about_Broker_RemotePC topic gives more detail.

When machines are virtual, the broker can be configured to minimize power usage by switching them off when they are not expected to be in use while still maintaining good response times for end-user launch requests. This is achieved through power policy for desktop groups. This allows separate configuration for peak compared to off-peak times of the week of the number of machines nominally to be powered up, the number of machines to be powered up and idling, in addition to those in use to be used as a "buffer"to ensure prompt servicing of user launch requests, and the behavior required for virtual machines when users disconnect from their sessions for extended periods of time.

It is also possible to issue explicit power commands to machines. The about_Broker_PowerManagement topic gives more detail.

Configuration of Brokering involves the following SDK objects:

- BrokerDesktopGroup
- BrokerPrivateDesktop
- BrokerSharedDesktop
- BrokerRemotePCAccount
- BrokerPowerTimeScheme
- BrokerUser
- BrokerTag
- BrokerAccessPolicyRule

- BrokerAssignmentPolicyRule
- BrokerEntitlementPolicyRule
- BrokerApplication
- BrokerApplicationGroup
- BrokerApplicationInstance
- BrokerAppAssignmentPolicyRule
- BrokerAppEntitlementPolicyRule
- BrokerConfiguredFTA
- BrokerImportedFTA

For more information, see:

about_Broker_Desktops

about_Broker_Applications
about_Broker_RemotePC
Get-BrokerPrivateDesktop
Get-BrokerSharedDesktop
Get-BrokerPowerTimeScheme
Get-BrokerUser
Get-BrokerTag
Get-BrokerAccessPolicyRule
Get-BrokerAssignmentPolicyRule
Get-BrokerEntitlementPolicyRule

Monitoring And Administration

After you have provisioned and configured machines for brokering, use the broker SDK to monitor and administer user sessions and other aspects of the delivery site.

Monitoring and administration involve the following SDK objects:

- BrokerServiceStatus
- BrokerHypervisorAlert
- BrokerDesktop
- BrokerDesktopUsage
- BrokerHostingPowerAction
- BrokerSession
- BrokerSessionMessage

For more information, see:

about_Broker_Desktops
Get-BrokerServiceStatus
Get-BrokerHypervisorAlert
Get-BrokerDesktop
Get-BrokerDesktopUsage
Get-BrokerHostingPowerAction
Get-BrokerSession
Send-BrokerSessionMessage

Site Management

The broker must be configured after installation; this is normally performed automatically by the Citrix Studio console. Configuration tasks include selecting the database (and obtaining the SQL scripting to initialize it), selecting the Citrix Configuration Service that holds the site configuration.

Note that some aspects of broker configuration (such as the port number on which the broker listens for SDK connections) cannot be configured with PowerShell cmdlets. These are configured through the use of the Broker Service executable. For more information, see about_Broker_PostInstallPreConfiguration.

A further important aspect of site management concerns the way in which machines providing resources identify the delivery controllers to which they belong. For more information, see about_Broker_ControllerDiscovery.

Managing XenDesktop sites involves the following SDK objects:

- BrokerSite
- BrokerController
- BrokerDBConnection
- BrokerDBSchema
- BrokerDBVersionChangeScript
- BrokerInstalledDbVersion
- BrokerServiceInstance
- BrokerServiceGroupMembership
- BrokerNameCache

For more information, see:

about_Broker_PostInstallPreConfiguration
about_Broker_ControllerDiscovery

about_Broker_ConfigurationSlots

March 11, 2024

Topic

Citrix Broker SDK - Configuration Slots and Machine Configurations

Short Description

Overview of assigning a collection of related settings to a desktop group.

Long Description

Collections of related settings may be applied to individual desktop groups through the creation of configuration slots and machine configurations.

A configuration slot defines a collection of related settings that are to be associated with that slot. Each machine configuration is associated with a single configuration slot and provides specific values for settings of that slot.

The SettingsGroup property of the configuration slot determines the particular collection of related settings that are associated with that slot. These groups are defined by Citrix and are not modifiable by administrators. For example, there is a particular group of Profile management specific settings that may be associated with a configuration slot. Because of the close association between a configuration slot and its

collection of related settings, the full set of configuration slots is created during the site creation.

Each machine configuration is associated with a single configuration slot. The machine configuration contains policy data that provides specific values for the settings associated with that configuration slot.

Every value set in a machine configuration's policy must belong to the configuration slot's settings group. Therefore the appropriate SDK snap-in must be used to create the policy data. For example, the Profile management snap-in must be used to create the policy data for a machine configuration associated with the Profile management configuration slot.

To have particular policy settings applied to the machines in a desktop group, a machine configuration is associated with that desktop group. A machine configuration may be associated with multiple desktop groups. A desktop group may be associated with multiple machine configurations.

When a machine configuration is associated with a desktop group, the configuration inherits the delegated administration restrictions of the desktop group. Thus, if a machine configuration is associated with multiple desktop groups, an administrator can only modify the policy data of the configuration if the administrator has permission to modify every one of those desktop groups.

For detailed information about defining and assigning machine configurations, see:

help New-BrokerMachineConfiguration
help Add-BrokerMachineConfiguration

about_Broker_ControllerDiscovery

March 11, 2024

Topic

Citrix Broker - Configuring Controller Discovery

Short Description

Describes the way that machines providing published resources discover delivery controllers.

Long Description

In order for the broker to be able to connect users to desktops and applications, the machines from which they are published must register (that is, establish communication) with the broker on an appropriate delivery controller in the delivery site.

The default operation, whose configuration is described in this topic, is to use information from the registry. This is referred to as registry-based controller discovery. The registry information can be supplied when installing the delivery agent software on each machine or it can be supplied through group-policy.

If machines are provisioned using quick deploy, information about delivery controllers is stored in a special "identity disk"attached to the VM.

Finally, in some deployments, the use of an Organizational Unit (OU) in Active Directory (AD) may be preferred. This is referred to as AD-based controller discovery. In this case, you must configure the GUID of the OU in the machines' registries. Such configuration is not described in this topic.

To perform registry-based controller discovery, run the PowerShell script called Set-ADControllerDiscovery.ps1 that is installed on each controller in the folder:

$Env:ProgramFiles\Citrix\Broker\Service\Setup Scripts

For more information, run this script with the -help parameter.

about_Broker_Desktops

March 11, 2024

Topic

Citrix Broker SDK - Desktops

Short Description

Describes desktop concepts and usage.

Long Description

A desktop is a machine that is able to run a Microsoft Windows desktop environment (with a shell, icons and taskbar) or individual applications (seamlessly integrated with the local desktop). The configuration of the desktop determines whether it can run only desktop environments, only applications, or both desktops and applications. Machines running workstation operating systems are able to run one session at a time (single-session), whereas machines running server operating systems have the ability to run multiple simultaneous sessions (multi-session).

A key aspect of desktops is how they are assigned (or allocated) to users. Two allocation types are supported:

- Random/Shared - A user is assigned a desktop at random from a pool of shared desktops. Multi-session desktops are able to run sessions to multiple users simultaneously, whereas single-session desktops can only run one session at a time, and are returned to the pool when the user logs off. Single-session shared desktops usually discard user data stored on them after the user logs off. Multi-session shared desktops, however, do not tend to discard user data after a log-off, as this is only possible when the desktop is rebooted by a reboot schedule.
- Permanent/Private - A private desktop is permanently assigned to a specific user and data stored on it is retained across logons and restarts. A private desktop can have users assigned explicitly or on first use.

Desktop Groups

Desktops are collected together in desktop groups, and these provide a flexible grouping mechanism that can be used to associate:

- Desktops running on a particular type of machine
- Desktops with particular software installed
- Desktops for a set of users
- Desktops accessed in a similar way
- Desktops configured in a particular way
- Any combination of the above

Each desktop group can only contain one type of desktop, determined by its AllocationType and SessionSupport properties.

When assigning shared desktops or assign-on-first-use (AOFU) desktops to users, the set of candidates comes from available desktops in a particular desktop group.

You configure power management policy for single-session desktop groups, including peak and off-peak settings, for each desktop group. See about_Broker_PowerManagement for details.

Creation Of Desktops

Desktop objects are created automatically when a machine is added to a desktop group. The type of desktop is determined by the AllocationType property of the desktop group.

In order for a machine to be added from a catalog, the machine must be compatible with the desktop group. For this to be true, the catalog's AllocationType must be compatible, and the SessionSupport property must match.

Note: Because the session support and functional level of the machine are determined by the software on the machine (operating system and Citrix VDA, respectively), the SessionSupport and MinimalFunctionalLevel of the catalog and desktop group may match, but not be compatible with the machine. In this case any attempt of registration by the machine will fail.

You can add machines explicitly using the Add-BrokerMachine cmdlet, or a number of free machines can be acquired from a catalog using the Add-BrokerMachinesToDesktopGroup cmdlet. A machine can only be associated with one desktop group at a time, and has a DesktopUid property that references the corresponding desktop object. You can also associate desktops to machines with their SID properties.

Desktop objects are deleted when the machine is removed from the desktop group (using the Remove-BrokerMachine cmdlet). Desktops are also deleted

when the desktop group containing them is deleted (using the Remove-BrokerDesktopGroup cmdlet). A desktop cannot be removed from a catalog while it is in a desktop group.

Shared (Random) Desktops

Shared desktops are published to users using entitlement policy rules. Each entitlement rule allows access to a single session on a desktop machine, selected at random from the available desktops in a desktop group (with a preference for desktops that are powered on). If there are no available desktops, launching the session fails. See about_Broker_EntitlementPolicy and about_Broker_PowerManagement for details.

Private (Static) Desktops

You can assign private desktops to users explicitly or automatically, with the AOFU feature. It is also possible to assign private desktops to particular clients (through IP or client name).

You explicitly assign machines or desktops to users with the Add-BrokerUser cmdlet. Machines can be assigned to users before the machine has been added to the desktop group (desktop created), but otherwise the effect is the same.

With Add-BrokerUser you can assign a desktop to multiple users or user groups. If the desktop has single-session support then the desktop will be visible to multiple users, but only one user can log on to the desktop at any time.

Assignment policy rules allow you to use AOFU to assign desktops to users in a desktop group. When a user specified in an assignment policy rule launches a session, and if the user does not already have an assigned desktop, the broker selects an available desktop at random from the desktop group and permanently assigns it to that user. Once assigned in this way, the desktop behaves as though the assignment was made explicitly by an administrator. See about_Broker_AssignmentPolicy for details.

It is possible to assign more than one desktop to a user. You can achieve this by explicit assignment, multiple assignment policy rules, or the MaxDesktops property of an assignment policy rule.

Desktop Configuration

When presented to the user, desktops are identified by:

- An icon (IconUid property)
- A name (PublishedName property)
- A description (Description property)

When starting the session, you can configure two connection settings:

- The color depth used at the start of the session (ColorDepth property)
- Whether SecureICA encryption is required (SecureIcaRequired property)

Each desktop group provides default values for these settings, but you can override them if the desktop has more specific settings (PrivateDesktop), or use an entitlement policy rule with more specific settings (SharedDesktop).

AOFU desktops can inherit these settings from the assignment policy rule when the assignment to the user takes place.

Maintenance Mode

There are times when it is necessary to disable desktops. You can do this by setting the InMaintenanceMode property of a desktop to $true. This puts it into maintenance mode. The broker excludes single-session desktops in maintenance mode from brokering decisions and does not start new sessions on them. Existing sessions are unaffected. For multi-session desktops in maintenance mode, reconnections to existing sessions are allowed, but no new sessions are created on the machine.

Desktops in maintenance mode are also excluded from automatic power management, although explicit power actions are still performed.

Note that disabling desktop groups, entitlement policy rules, assignment policy rules, or applications are other ways of disabling aspects of brokering.

Desktop Status

Once desktops are created, you can query the configuration and state information for different kinds of desktop, or retrieve more information about desktops using the Get-BrokerMachine cmdlet. To get details of any sessions running on the desktops, use the Get-BrokerSession cmdlet.

You can also group desktops by a specific property, counting the number of desktops with each value using the Group-BrokerMachine cmdlet. This can provide useful summary statistics.

Desktop Usage

Every hour the broker records how many desktops from each desktop group are in use, and the Get-BrokerDesktopUsage cmdlet returns this information. Analyze historical usage records to understand desktop usage patterns and help with the choice of idle pool and buffer settings.

Desktop Conditions

CPU usage, ICA latency, and profile logon times of desktops are monitored. When one of these values exceeds a threshold (configured by policy), the condition is flagged in the DesktopConditions property of the desktop. When the value drops below the threshold again, the condition is cleared. Use Get-BrokerMachine or Group-BrokerMachines cmdlets to query this information.

Citrix Broker SDK - Desktop and Application Entitlement Policy

Short Description

Controls end-user entitlement to desktop and application sessions provided from a pool of shared machines.

Long Description

The site's entitlement policy defines rules controlling users' entitlements to desktop and application sessions from pools of shared machines. Each pool is defined by a desktop group.

The entitlement policy comprises a set of rules. Each rule grants users a single entitlement to a desktop or application session in a specified desktop group. The policy can be applied only to groups of desktop kind Random. For desktop entitlements multiple rules can apply to the same group, however for application entitlements only a single rule can apply to a given group.

When the user starts a session by selecting an entitlement the behavior depends on the session-support property of the desktop group:

- For single-session groups the user is temporarily assigned a machine selected at random from the group to provide their session. When the session ends, the machine is returned to the pool of available machines.
- For multi-session groups the user session is provided by the machine that is least loaded within the group when the session is launched.

If multiple desktop entitlement rules for the same group contain the same user, the user can have as many desktop sessions from the group concurrently as they have entitlements.

Although only a single application entitlement rule can be defined for a group, a user can still launch multiple applications from that group because the applications all run within that entitlement's single session.

Rules for desktop and application session entitlements are distinct. Desktop entitlements are managed through the BrokerEntitlementPolicyRule SDK object, and application rules through the BrokerAppEntitlementPolicyRule object.

Desktop entitlement rules can be created only for desktop groups with delivery types DesktopsOnly or DesktopsAndApps, whereas an application entitlement rule can be created only for delivery types AppsOnly or DesktopsAndApps.

For desktop groups with delivery type DesktopsAndApps, typically one or more desktop session entitlement rules together with a single application session entitlement rule exist.

For an entitlement granted by the entitlement policy to be available to a user, the site's access policy must also grant them access to the desktop group.

Entitlement Policy Rules

Each entitlement policy rule has the following key properties:

- The desktop group to which it applies (one rule only ever applies to one group)
- The users to whom the entitlement is granted

Additionally for desktop entitlement rules, the following properties exist:

- The published name of the entitlement (visible to the user)
- Any properties that a desktop session launched using the entitlement should use that differ from the defaults specified on the desktop group

If multiple desktop entitlements are available to a user from the same group the resultant desktop session properties may differ depending on which entitlement the user selects to start the session.

Each rule can be individually enabled or disabled. A disabled rule is ignored when the entitlement policy is evaluated.

User Filters (Full)

Each rule has two user filters, an include filter and an exclude filter:

- The include filter contains users and user groups that are granted an entitlement to a session
- The exclude filter contains users and user groups that are denied an entitlement to a session

If the include filter of a rule contains multiple instances of a user (either explicit or implicit), they get only one entitlement by that rule.

Entries in the exclude filter take priority, so if a user appears explicitly or implicitly in both filters, access is denied. Typically, you use this filter to exclude a user or group of users who would otherwise gain access because they are members of a user group specified in the include filter.

Because all rules are independently evaluated, the exclude filter can only exclude users who would otherwise gain an entitlement through the same rule's include filter. That is, if a user is in a rule's include filter but not its exclude filter, the rule is guaranteed to grant that user a session entitlement irrespective of whether the user appears in the exclude filter of other rules.

If a filter contains a user group that contains other users and groups, the filter implicitly includes all of those users and groups.

By default the exclude filter is disabled.

To maintain entitlement policy rules that can be fully displayed and edited with Citrix Studio, use the simplified user filter model below and do not use the exclude filter.

User Filters (Simplified)

The included user filter described above also supports a simplified usage model where the filter itself is disabled. When this is done, any user who has access to the desktop group through the access policy is implicitly granted an entitlement to a session through the entitlement policy rule without the need to list the user in the rule's include filter.

This is useful in cases where the access policy for the desktop group already explicitly specifies the users who should have access.

Even if the include filter is disabled, the exclude filter can still be used to deny the entitlement from users who would otherwise gain access through the access policy alone.

Additional Desktop Entitlement Rule Properties

Desktop entitlement rules specify the following additional properties:

- PublishedName
- Description
- IconUid
- ColorDepth
- SecureIcaRequired

The published name, description, and icon UID properties apply to the desktop entitlement itself and determine the way in which the entitlement is presented to the user in, for example, StoreFront.

The color depth and secure ICA properties apply to the desktop session that is obtained when the entitlement is used.

In all cases, these properties can be explicitly specified. However, a null value (the default) means that the corresponding property is taken from the desktop group to which the rule applies. This inheritance from groups is dynamic; if the property of the group changes, the property of the entitlement changes too.

Notes

If a rule grants an entitlement to a user group, the session entitlement applies to the individual user who selects the entitlement. However, this does not prevent a different user in the same user group from using the same entitlement concurrently. So, a rule that grants an entitlement to a user group containing multiple users allows each user concurrent access to a single session from the desktop group.

The total number of entitlements defined by the policy may exceed the number of machines available, or the maximum allowed sessions, from the desktop group. A user attempting to use an entitlement when no further resources are available receives a no-desktop-available error.

If a session launched through an entitlement is active when the entitlement rule is deleted, the session continues unaffected. However:

- When the user ends the session, they cannot start a new one if the deleted rule was their only entitlement to a session in that group
- If the user disconnects the session, they cannot reconnect to it

Topic

Citrix Broker SDK - Error Handling

Short Description

Describes broker errors generated by cmdlets and how to access them.

Long Description

The broker SDK cmdlets report errors through the class SdkErrorRecord, which is a subclass of the standard Powershell error record class System.Management.Automation.ErrorRecord. SdkErrorRecord contains:

- A short string to describe the error status code. This is implemented as a public property named Status.

- A dictionary of key-value pairs containing additional data specific to the cmdlet. This is implemented as a public property named ErrorData of type Dictionary<string, string>.

The error status property always has a value. Populating the error data dictionary is optional. The number of entries within the dictionary, the content of the entries, and the exact format of the key and value data is specific to each cmdlet.

You can access an SdkErrorRecord object using the standard Powershell cmdlet ErrorVariable parameter. The type of object returned by ErrorVariable depends on whether the error is terminating or non-terminating.

Non-Terminating Errors

For non-terminating errors, each object in the returned ErrorVariable array is simply an instance of type SdkErrorRecord.

Terminating Errors

For terminating errors, the object returned by ErrorVariable is of type System.Management.Automation.CmdletInvocationException.

For non-terminating errors that are escalated as terminating errors (through the "ErrorAction stop"argument), the object returned by ErrorVariable is of type System.Management.Automation.ActionPreferenceStopException.

CmdletInvocationException and ActionPreferenceStopException are subclasses of the base class System.Management.Automation.RuntimeException, which exposes the SdkErrorRecord object through its ErrorData property.

Class SdkOperationException

SdkErrorRecord's Exception property holds an instance of custom exception class SdkOperationException, which also contains the error status code and data dictionary from SdkErrorRecord.

The SDK cmdlets generate errors in response to exceptions generated by the underlying system or by the cmdlet detecting errors locally and instantiating appropriate exception types. Such exceptions, which represent the original cause of the terminating error, are specified in SdkOperationException's InnerException property.

For terminating errors, use Powershell scripts to trap SdkOperationException and access additional error information and the originating exception.

Review Of Powershell Error Handling Behavior

Powershell scripts can access error information using the following methods:

- Read error records from the $error arraylist.
- Get the cmdlet to return error records using the standard ErrorVariable cmdlet parameter.
- Use trap blocks to catch exceptions for terminating errors.

The type of the error record that Powershell puts in the $error arraylist and returns through the ErrorVariable cmdlet parameter depends on whether the error is terminating or non-terminating, and whether the ‘‘ErrorAction continue’’or ‘‘ErrorAction stop’’cmdlet parameters are specified (that turn terminating errors into non-terminating ones, and vice versa).

For the combinations of error types (terminating, non-terminating) and error actions (stop, continue), the following statements describe the relationship between:

- The type of object contained in the Powershell $error arraylist.
- The type of object returned by the ErrorVariable cmdlet parameter (assuming the script can continue after a terminating error).
- The type of the exception that is thrown (where applicable).

Non-terminating errors with ErrorAction=Continue, $error type=SdkErrorRecord, and ErrorVariable type=SdkErrorRecord do not throw an exception.

Terminating errors with ErrorAction=Stop, $error type=ErrorRecord, and ErrorVariable type=CmdletInvocationException throw an SdkOperationException exception.

Non-terminating errors with ErrorAction=Stop, $error type=ErrorRecord, and ErrorVariable type=ActionPreferenceOperationException do not throw an exception.

Terminating errors with ErrorAction=Continue, $error type=ErrorRecord, and ErrorVariable type= CmdletInvocationException throw an SdkOperationException exception.

ActionPreferenceOperationException and CmdletInvocationException are subclasses of System.Management.Automation.RuntimeException.

Accessing Error Record Data

The Powershell code sample below demonstrates how to access error information programmatically with the ErrorVariable cmdlet parameter and a trap block.

```
# Trap exceptions generated from terminating errors
trap  [Exception] {

    write ""
    write "TRAP BLOCK : BEGIN"
    if($_.Exception.GetType().Name -eq "SdkOperationException")
    {

        $sdkOpEx = $_.Exception
        # show error status
        write $("SdkOperationException.Status = " + $sdkOpEx.Status)
        # show error data dictionary
        write $("SdkOperationException.ErrorData=")
        write $("SdkOperationException.InnerException = " + $sdkOpEx.
            InnerException)
        $_.Exception.ErrorData
     }

    continue #could also call break here to halt script execution
    write "TRAP BLOCK : END"
 }
```

```
#############################################################################

## Run tests 1 to 4, below, in turn to examine terminating and
## non-terminating error behavior.
#############################################################################
```

```
#
# Test 1: Invoke cmdlet that generates a terminating error:
#         New-BrokerCatalog throws terminating error if a
#         catalog with the supplied name already exists.
#
#New-BrokerCatalog -Name "AlreadyExists" -AllocationType Random -
    ProvisioningType Manual -SessionSupport SingleSession -
    PersistUserChanges OnLocal -MachinesArePhysical $true -ErrorVariable
     ev
```

```
#
# Test 2: Force script execution to continue after a terminating error.
#
#New-BrokerCatalog -Name "AlreadyExists" -AllocationType Random -
    ProvisioningType Manual -SessionSupport SingleSession -
    PersistUserChanges OnLocal -MachinesArePhysical $true -ErrorVariable
     ev -ErrorAction continue
```

```
#
# Test 3: Invoke cmdlet that generates a non-terminating error:
#         Get-BrokerCatalog generates a non-terminating error if a catalog
#         with the specified name doesn't exist.
#
#Get-BrokerCatalog -Name "IDontExist" -ErrorVariable ev
```

```
#
# Test 4: Force script execution to halt after a non-terminating error.
#
#Get-BrokerCatalog -Name "IDontExist" -ErrorVariable ev -ErrorAction "stop"
write ""
write "GET ERROR INFORAMTION: BEGIN"
$sdkErrRecord = $null
if($ev[0].GetType().Name -eq "SdkErrorRecord")
{

    $sdkErrRecord = $ev[0]
 }

elseif($ev[0].GetType().BaseType.FullName -eq "System.Management.Automation.RuntimeException")
{

    $sdkErrRecord = $ev[0].ErrorRecord
 }

else
{

  write ("UNKNOWN ERROR VARIABLE TYPE:")
  $ev[0].GetType().Name
 }

if($sdkErrRecord -ne $null)
{

    write ("Have sdkErrRecord:")
    write ("  Type Name = " + $sdkErrRecord.GetType().FullName)
    write ("  Status = " + $sdkErrRecord.Status)
    write ("  Exception type = " + $sdkErrRecord.Exception.GetType().FullName)
    write ("  ErrorData = ")
    $sdkErrRecord.ErrorData
    write ("  FullyQualifiedErrorId = " + $sdkErrRecord.FullyQualifiedErrorId)
 }

write "GET ERROR INFORAMTION: END"
```

about_Broker_Filtering

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell
handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape
the wildcards using the normal PowerShell escape mechanisms (see
about_Escape_Characters), or switch to a filter expression and the -eq
operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                    # Matches Abc*
Get-<Noun> -Company "Abc`*"                     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}

Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
```

```
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

```
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Citrix Broker SDK - Group Policy for VDA Configurations

Short Description

Overview of Citrix Group Policy settings that control VDA behaviors.

Long Description

A VDA configuration policy is a collection of settings that specify how a VDA should initialize its environment when a user logs on. Settings that are to be enforced when a specific user session is created are user settings. Settings that are always applied to all user sessions are computer settings.

Multiple policies contianing multiple settings can be defined. Filters can be specified in a policy to define how the settings included in the policy are to be applied, based on data such as the user name, the name of the client, from which the user session is originated.

There is a policy processing engine (CSE) running on each VDA. The engine is responsible for processing the policies downloaded to the VDA from the site, to which the VDA is registered, and/or the domain the VDA is in. The engine uses policies from all the sources to calculate a net result, which is a single set of unique settings that can be used by the VDA to initialize the environment when a user logs on.

A policy object contains a set of properties that describe the object. It also contains a set of settings, which are specific VDA configuration settings, as well as a set of filters, which specify how the settings in the policy are applied.

- A setting is a single piece of data that specifies a certain behavior for a user session. For example, a wallpaper setting is used to control if a wallpaper should be displayed when a user logs on.
- A filter is a statement that specifies how the settings in the policy are to be applied. When evaluted with the input data required by the filter, the statement yields a Boolean value. A true result tells the policy engine that the settings should be applied. A false result tells the policy engine to not apply the settings.

To define a VDA configuration policy, specify a name for the policy and a priority that indicates a precendence for the settings in the policy when the policy is evaluated togehter with other policies by the Citrix policy engine (CSE) running on a VDA. A name and an optional brief description can be specified to help identifying the policy and its purpose.

Four types of objects are defined to store policy data. They are policy sets, policies, settings, and filters.

A policy set is a container of a collection of policies. For each site, there is always a default policy set defined and this policy set contains all the site policies.

A policy is a collection of settings and filters.

A setting specifies a configuration that will be honored and enforced by a VDA component.

A filter is a predicate that specifies the condition for the settings in the policy to be applied or not applied.

There can be multiple policies in a policy set. There can be multiple settings in a policy. There can be multiple filters in a policy. A setting can be used in multiple policies but can only be used once in a policy.

Multiple filters can be specified in a policy and the final result of combining all the filters decides if the policy should be applied or not.

For detailed information about defining policy objects, see:

Topic

Citrix Broker - Licensing

Short Description

Overview of broker licensing configuration.

Long Description

As part of the licensing setup for a site, the types of product licenses used by the broker when creating connections to virtual desktops or applications can be configured using the Central Configuration Service SDK.

The following licensing related properties can be specified using the Set-ConfigSite cmdlet:

- LicensingModel - Sets the licensing model to use. Values can be 'Concurrent' or 'UserDevice'.
- ProductCode - Specifies which product license is supported by the site. Values can be "MPS" for XenApp licenses or "XDT" for XenDesktop licenses.
- ProductEdition - Sets the licensing edition to use.

A license matching the specified model, product code, and edition must be available within the site's license server in order for the broker to grant licenses.

These properties are part of the site object returned by the Get-ConfigSite cmdlet.

Concurrent License Model

A concurrent license is tied to a XenDesktop session. When a user launches a session, a license is checked out to that session. When a user logs off from a session, the license is checked back in again, making it available for another session.

User Device License Model

With user device licensing, the license server automatically assigns licenses to users or devices based on usage:

- User licensing allows users to access their desktops and applications from multiple devices.
- Device licensing allows multiple users to access their desktops and applications from a single device.

When users or devices connect to an application or desktop, they consume a license for a 90-day license assignment period. The assignment period begins

when a connection is made, is renewed to the full 90 days during the life of the connection, and expires (allowing reassignment) 90 days after the last connection terminates. A license assignment can be manually ended before the 90-day period elapses using the udadmin command line installed on the license server.

Licensing State

The broker site contains the following properties related to licensing state:

- LicensingGracePeriodActive - Reports if the broker is in licensing grace period.
- LicensingOutOfBoxGracePeriodActive - Reports if the broker is in out-of-box grace period.
- LicensingGraceHoursLeft - The number of grace hours remaining, if the broker is in grace period, else it is null.
- LicensedSessionsActive - The number of active, licensed sessions.
- LicenseGraceSessionsRemaining - The number of concurrent grace sessions available for the site Product Code, if the broker is in licensing grace period, else it is null.

These properties are part of the site object returned by the Get-BrokerSite cmdlet.

License Server Test

The broker SDK cmdlet Test-BrokerLicenseServer checks whether or not a given server can be used as a license server by the broker.

Resetting License Server Connection

The broker SDK cmdlet Reset-BrokerLicensingConnection resets the broker's connection to the license server.

License Burn-In Date

The version of the product that is supported within the site is denoted by a licensing burn-in date. This date can be accessed through the

LicensingBurnInDate field of the site object returned by the Get-ConfigSite cmdlet.

about_Broker_Machines

March 11, 2024

Topic

Citrix Broker SDK - Machine Object

Short Description

Describes machine concepts and usage.

Long Description

A machine represents a physical or virtual machine that can be used to provide a user with one or more desktops, applications or both. When a machine is created, you must assign it to a catalog, which defines how the machine is allocated to a user (static or random), the session support it provides (single-session or multi-session), how the machine's disk images are created and managed (PVS, MCS or manually) and the expected functional level. If the machine is virtual but not provisioned by MCS, you must also assign it to a hypervisor connection, which represents the hypervisor (or pool of linked hypervisors) that runs the virtual machine.

Creating a machine object is the first step in the broker SDK towards configuring a physical or virtual machine to provide desktops and/or applications to users. A machine must be added to a desktop group before it is able to be used(see about_Broker_Desktops). To add machines to a desktop group, the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets can be used. This creates a desktop object corresponding to the machine.

Catalogs

When a machine is created, you must assign it to a catalog. The catalog defines the behavior of the machine within a site as well as the expected functionality and properties of the machine:

- Allocation type: The catalog determines how the machines are allocated to the user. Allocation can be static or random. Static allocation is where the machine is permanently assigned to a specific user. Data stored is retained across logons and restarts.

  The other type of allocation is random, where a random machine is assigned to a user from a pool when a session is requested. The machine returns to the pool when the user logs off.

- How the machine is created: The catalog collects together machines that are created in the same way: either with PVS, MCS or manually.

- Physical or Virtual: A machine that is virtual can have its power state controlled and monitored by the system. Virtual machines must be associated with a hypervisor connection, either directly or, in the case of MCS provisioned machines, indirectly through the provisioning scheme. Single session virtual machines can be managed using power policy to automatically be turned on or off as needed. Machines marked as physical are not monitored or controlled as to their power state.

- How the users settings are stored: The catalog also determines how the users settings are stored, either on a Citrix Personal vDisk, on the machine□s local drive, or if the user settings are discarded.

- RemotePC: If the catalog is set up as a remote PC catalog, machines are added automatically upon registration based on the site configuration. In order for a catalog to be specified as a RemotePC catalog, the session support must be single session and the catalog must be set up for physical machines.

- Functional level: The functional level of a machine is determined by the version of the Citrix VDA software it is running. Some features are not supported in machines with lower functional levels. Catalogs can supply a minimal functional level, meaning any machines in the catalog with a lower functional level will be unable to register with the site.
- Session support: This can either be single-session or multi-session. Single-session machines can have an active session with up to one user at any time, whereas multi-session machines have the capability to have active sessions with multiple users simultaneously. The session support of a machine is determined by the variant of the VDA software component installed on the machine (either with single-session support or multi-session support). The multi-session VDA software may only be installed on server operating systems. The catalog session support must match the session support of the software installed on the machine for the machine to successfully register with the site.

Machine Status

After machines are created, you can query the configuration and state information using the Get-BrokerMachine cmdlet. The information the cmdlet can provide includes, but is not limited to, the following:

- Personal vDisk interactions and lifecycle: The current state of the personal vDisk can be obtained, as well as the configuration options of how the user data is persisted.
- Session properties: The properties of the current session for single-session machines can be obtained, such as ClientName and ClientAddress. To access session information on multi-session machines, the Get-BrokerSession cmdlet can be used.
- Application status: If the machine is configured to run applications, information can be found about the published applications running on the machine.
- Connection information: Information about the time and user of the last connection to the machine can be found, as well as information about the last deregistration.

For an exhaustive list of the properties of a machine that can be queried, see the Get-BrokerMachine cmdlet.

Machine Configuration

Machine settings can be changed and configured once the machine object has been created, as long as the changes are compatible with the catalog the machine is in. For example, more users can be assigned to the machine than were initially assigned when creating the machine object, this is done with the Add-BrokerUser cmdlet.

For a full list of the machine configuration options available, see the Set-BrokerMachine command.

Maintenance Mode

There are times when it is necessary to disable machines. This can be achieved by setting the InMaintenanceMode property to $true. This puts the machine into maintenance mode. With single-session machines, this means that the broker excludes the machine from brokering decisions and does not start new sessions on them. Existing sessions are unaffected. For multi-session desktops in maintenance mode, reconnections to existing sessions are allowed, but no new sessions are created on the machine.

Machines in maintenance mode are also excluded from automatic power management, although explicit power actions are still performed.

Topic

Citrix Broker SDK - Access, Entitlement, and Assignment Policies

Short Description

Overview of the site policies that control users' access to desktop and application sessions.

Long Description

For an end user to access a desktop or application resource within a site, they must have both an entitlement to use the resource, and have access to the desktop group that contains the resource.

Entitlements to use resources can be granted by one of the following means:

- The site entitlement policy grants entitlements to launch a shared desktop or application session from a pool of shared machines.
- The site assignment policy grants entitlements for "self service" permanent assignment of machines to users for running desktop or application sessions, and is referred to as "Assign On First Use"(AOFU)
- Machines can be permanently assigned ("pre-assigned") to users by the administrator to run either desktop or application sessions.
- Machines can be configured to allow automatic permanent assignment to their normal user (using the RemotePC feature).

A user must also be granted access to the desktop group that contains the resource. These access rights are controlled by the site's access policy.

The access policy controls access using details of the user's device such as whether it's connected over a local area network (LAN) or connected through Access Gateway, the user device's name, IP address or subnet, and the requested connection protocol. The user's identity can also feed into the access check allowing, for example, certain users access to resources only when locally connected to the site, but others full remote access.

Access and entitlements can be combined to allow rich and fine-grained control over which users have access to site resource from any given user device or location.

Each site has a single access policy, entitlement policy, and assignment policy. Each policy comprises a set of rules. Policies are defined by adding, removing, or changing rules.

Each site policy can also be viewed as a set of distinct policies each relating to a single desktop group. In general a group has one or more policy rules that relate to it, however each rule relates to only a single group. Thus the rules that grant entitlement and access rights to a desktop group define the policy for that group and that group only; changing this policy has no impact on the entitlement and access rights for any other other group in the site.

For detailed information about defining policy rules, see:

help New-BrokerAccessPolicyRule
help New-BrokerEntitlementPolicyRule
help New-BrokerAssignmentPolicyRule
help New-BrokerAppEntitlementPolicyRule
help New-BrokerAppAssignmentPolicyRule

The mapping of policies to the resources that they make available within a site is described briefly below. For specific information on configuring each category of resource, consult the more detailed help topics listed.

Shared Desktop And Application Sessions

To grant access to a group of shared machines, use the access and entitlement policies:

- The access policy grants access to the desktop group containing the machines to be shared.
- The entitlement policy grants an entitlement to use one or more machines in the group to specified users or groups of users.

Groups of shared machines can be used to deliver full desktop or seamless application sessions, or both.

For more detailed information about configuring shared machines, see:

help about_Broker_AccessPolicy
help about_Broker_EntitlementPolicy

Pre-Assigned Private Machines

To grant access to private machines, use the access policy and a machine assignment:

- The access policy grants access to the desktop group containing the machines.
- The assignment links the desktop to a specified user. You can assign a machine to just one user, multiple users or user groups. However, for single-session machines, only one user can access the machine at a time.

Private machines can be used to deliver full desktop or seamless application sessions (but not both).

For more detailed information about configuring private machines, see:

help about_Broker_AccessPolicy
help Add-BrokerUser

Assign-On-First-Use (Aofu) Machines

To grant access to a desktop group containing assignable machines, use the access policy and the assignment policy:

- The access policy grants access to the desktop group containing the pool of machines.
- The assignment policy grants users a self-service entitlement to pick one or more machines from the pool.

AOFU machines can be used to deliver full desktop or seamless application sessions (but not both from the same desktop group).

For more detailed information about configuring AOFU desktops, see:

help about_Broker_AccessPolicy
help about_Broker_AssignmentPolicy

Remote Pc Machines

The RemotePC feature allows existing physical machines to be assigned automatically to their normal user thus allowing them remote access to their own machine but without the need for the administrator to individually configure access to each machine.

For more detailed information about configuring the Remote PC feature, see:

help about_Broker_RemotePC

about_Broker_PostInstallPreConfiguration

March 11, 2024

Topic

Citrix Broker SDK - Post-Installation Configuration

Short Description

Describes how to configure the Citrix Broker Service port numbers, URL reservations, and Windows Firewall exclusions.

Long Description

The XenDesktop installer configures the Citrix Broker Service with information specified during the installation. To change that configuration, use the BrokerService.exe command-line tool on each controller you want to change.

The default installation location of BrokerService.exe is:

%ProgramFiles%\Citrix\Broker\Service\BrokerService.exe

BrokerService.exe supports the following optional command-line parameters:

-SdkPort <port> (default 80)

Configures the port on which the broker listens for requests from SDK cmdlets. If you change this default value, specify the new value in the AdminAddress parameter on broker cmdlets. For example, if you changed the port to 8080, specify it as follows:

Get-BrokerSite -AdminAddress localhost:8080

-VdaPort <port> (default 80)

Configures the port on which the broker listens for registration requests from broker machines.

-WiPort <port> (default 80)

Configures the port on which the broker listens for XML requests from StoreFront/Web Interface.

-WiSslPort <port> (default 443)

Configures the port on which the broker listens for SSL (Secure Socket Layer) XML requests from StoreFront/Web Interface.

-ConfigureFirewall

Configures Windows Firewall exclusions for the specified ports.

-Show

Shows the current configuration settings.

-Uninstall

Removes configuration settings, including Windows Firewall exclusions and URL reservations.

-LogFile <fileName>

Configures the file location for logging to a text file. The directory containing the log file must grant write access to the NetworkService account.

-Upgrade

Performs configurations required after an upgrade.

-Quiet

Suppresses console output for status messages.

-? or -Help

Shows usage information for the command.

about_Broker_PowerManagement

March 11, 2024

Topic

Citrix Broker SDK - Machine Power Management

Short Description

Describes power management of machines used for desktops and applications.

Long Description

The Citrix Broker Service is in day-to-day control of the power state of the configured desktop and application machines. The Broker Service can control several hypervisors, each hypervisor connection being handled by its own site service, so all Broker Service communication to the hypervisor is through one of the controllers in the site.

Hypervisor Connections

Each hypervisor, or pool of linked hypervisors, is described and configured through the XdHyp pseudo-drive and associated Hyp PowerShell commands (cmdlets) which are provided by the host service snap-in. When you have first created the hypervisor connection using the host service cmdlets, you can create a broker equivalent object that references the Hyp instance using a GUID value. Use the broker's HypervisorConnection object to nominate a preferred controller for direct communication with the hypervisor on behalf of all other controllers for day-to-day power actions and status requests.

Power Actions And Throttling

The site, through the Broker Service, can control the power state of the machines used by the site for desktops and applications. Power state changes can have a number of causes:

- Power policy rules, such as requests to shut down or suspend machines when user sessions on those machines end or are disconnected
- If allowed, user-driven desktop restarts
- Session launch requests requiring machines to be started
- Pool size management, which controls the number of running machines
- Direct administrator request using the SDK or Citrix Studio
- Reboot schedules and cycles
- Performing personal vDisk inventory activities
- Cleaning machines back to the golden master image state after they have been used

The power state changes of machines hosting desktops and applications are controlled using a queuing mechanism. Actions to change the power state are assigned a priority and are sent to the hypervisor according to a throttling mechanism. This avoids overloading the hypervisor.

The queuing and throttling mechanisms take place on a per-hypervisor-connection basis; each hypervisor connection's queue is dealt with independently. You can view the contents of the queues using the Get-BrokerHostingPowerAction cmdlet. This includes recently completed, in-progress, and pending actions (that is, those due to be sent to the hypervisor based on the throttling settings).

Each power action object comprises:

- The machine to be acted on (Name, DNS Name, Hosting Name)
- The action to be performed (TurnOn, TurnOff, Shutdown, Reset, Restart, Suspend, or Resume)
- The action's priority (Base, the original priority, and Actual, the current priority)
- The action's state (Pending, Started, Completed, Failed, Canceled, Deleted, or Lost)
- Time stamps of the action's lifecycle points (when it was created, started, or completed)
- Any reason the action failed

The throttling of power actions is controlled by three metadata values on

the Hyp hypervisor connection object when accessed through the XdHyp pseudo-drive. The four values throttle power actions according to:

- The maximum absolute number of in-progress power actions
- The maximum number of in-progress power actions expressed as a percentage of the total number of machines controlled by the hypervisor connection
- The maximum number of new power actions sent to the hypervisor per minute
- The maximum number of in-progress PvD inventory activities expressed as a percentage of the total number of machines controlled by the hypervisor connection

You add power actions to the queue using the SDK's New-BrokerHostingPowerAction cmdlet. You cancel power actions in the queue using the Remove-BrokerHostingPowerAction cmdlet. You boost or reduce their priority using the Set-BrokerHostingPowerAction cmdlet.

You can also schedule power actions to be executed in the future, using the New-BrokerDelayedHostingPowerAction command. Only Shutdown and Suspend actions can be scheduled in this way. You can view these delayed power actions using Get-BrokerDelayedHostingPowerAction and cancel them with Remove-BrokerDelayedHostingPowerAction. When a delayed power action is ready to be executed it is deleted, and a corresponding normal power action is placed in the queue described above.

Power Policy

Policy rules associated with a desktop group allow you to change power states at configurable times after session state changes, typically a set number of minutes after session disconnection or session logout.

Note that these policy rules are defined directly as properties of the desktop group.

These policy actions allow the following operations to be specified:

- A power action to be performed at a defined period after a session is disconnected
- A power action to be performed at a defined extended period after a session is disconnected
- A power action to be performed at a defined period after a session is logged off

The two disconnect policy actions are designed to allow multi-stage policies such as initially suspending a machine shortly after a session disconnect occurs, and then later powering-off the machine if the session has not been reconnected.

At the set time after the session state change, the required action is added to the power action queue, and this is then throttled and processed as normal.

Pool Size Management

You can manage flexibly the number of machines running desktops and applications using the pool size. For any given hour of the day and day of the week, this is an absolute number of machines or the percentage of the total number of machines in the desktop group. The pool size specifies the total number of machines that are always running, regardless of whether they are in use or idle. (Note: The number of machines does not depend on their idle status, but this does affect the buffer size value, which is also used to manage pool sizes.)

To start or shut down desktop machines to achieve the desired pool size, the system places power actions in the queue. Standard throttling queue management sends these to the hypervisors. A single desktop group (and its pool) can span multiple hypervisors, so actions to start and shut down machines can be added to multiple queues.

Power Time Schemes

Each single-session desktop group can be associated with one or more power time schemes, each scheme covering a number of days of the week. The time schemes specify, for each hour of the day, whether that hour is peak or off-peak. They also specify the number of running unassigned machines maintained by the broker.

You can configure other settings, such as buffer size and any power policy rules differently for peak and off-peak hours. You can define the number of running machines, idle or in use, either as an absolute value or as a percentage of the desktop group size. Machines running desktops and applications are started (or shut down when not in use) to match the required pool size.

Each power time scheme comprises:

- The name of the scheme
- The pattern of days of the week covered by the scheme
- The set of hours considered peak and off peak
- The set of pool size values (one for each hour of the day)

The hours of the day used by time schemes are the hours in the time zone for the desktop group the scheme is associated with. You cannot associate one desktop group with multiple time schemes covering the same day of the week.

Buffer Size

In addition to the pool size, you can optionally configure two buffer sizes for each desktop group, one for peak hours and one for off-peak hours. The buffer size defines the minimum number of idle unassigned machines maintained by the broker and is specified as a percentage of the total machines in the group. These are running machines that are not used by any user session. The buffer size on its own never causes machines to shut down. It causes them to start up so a minimum number of idle machine is always available. The buffer size in conjunction with the pool size can cause machines running desktops or applications to be shut down.

Power Management Of Assigned Machines

Automatic power management for private desktop groups provides the ability to power on all assigned machines at the transition to a peak period and respectively power off all machines at the transition to an off-peak period.

If a machine is shut down during peak hours it will not be automatically powered on again, unless the AutomaticPowerOnForAssignedDuringPeak property on the desktop group is also enabled.

Note that all power management facilities apply only to single session machines.

Reboot Schedules

Reboot schedules are commonly used after image updates or to perform regular reboots of all machines in a desktop group or catalog to clear down problems resulting from a corrupt state or hung/faulty applications.

Reboot schedules allow distributing the reboot operation of all machines over a provided duration. Individual machine reboots are scheduled in a way

that attempts to maintain maximum availability of machines in the group as the reboots occur, and avoid boot storms that overload the underlying infrastructure.

Reboot schedules are the only form of automatic power management that can shut down a machine while users are logged on; however the administrator can provide a warning message to be displayed to end users at a specified period prior to the shutdown taking effect.

Reboot Cycles

Reboot cycles describe the dynamic execution of desktop group or catalog reboot operations. Reboot cycles can be created due to reboot schedules, or by on-demand reboot operations requested via the SDK.

RebootCycle objects encapsulate the details of the associated reboot operation and can be queried to show the current status.

Status

You can view the status of the hypervisor connection on the broker hypervisor connection object. You can obtain any hypervisor alerts using the Get-BrokerHypervisorAlert cmdlet. You can check the power state of machines running desktops or applications using the relevant Machine or Desktop objects.

Citrix Broker SDK - RemotePC

Short Description

Overview of the Remote PC feature.

Long Description

Remote PC allows automatic publishing of a user's physical desktop within a XenDesktop site, so that it can be accessed remotely. The configuration of

Remote PC within the Citrix Broker service specifies the rules and relationships that allow the machine to successfully register with a controller in the site, and be made available for the user to start remote sessions.

When Remote PC is configured, there are two steps required for publishing a machine as a Remote PC desktop.

First a VDA must be installed on the machine and it must be configured such that it registers with a controller in a site.

Second, a user must log on to the machine. When the Citrix Broker service detects an active console session for a user, it assigns the user to the machine and publishes it in a Remote PC desktop group.

Remote PC configuration consists of defining relationships between:

- Machines and catalogs
- Catalogs and desktop groups
- Desktop groups and assignment policy rules
- Assignment policy rules and users

The Citrix Broker service automates the assignment of Remote PC machines to users in two stages. The first stage automatically imports matching unconfigured machines into the site:

- Suitable machines are automatically added to a Remote PC catalog.
- The machines are temporarily configured to be in one of the Remote PC desktop groups associated with the catalog.

When a suitable user logs on to the console of the machine, the second stage of the automatic configuration is performed:

- The machine is configured to be in the desktop group that is appropriate for the user.
- The machine is assigned to the user that has logged on.
- The machine desktop is made available to the user remotely, configured to appear as the machine hostname.

Catalogs and desktop groups can be marked as participating in RemotePC automation with the 'IsRemotePC'property, but this property can only be set to true if various other properties of the catalog or desktop group are appropriate. Catalogs must be single-sessioned and contain physical machines. Desktop Groups must be single session, configured to deliver private assigned machines, delivering desktop sessions only.

Catalogs and desktop groups can have the 'IsRemotePC'property cleared to remove them from the RemotePC automation, but only when all RemotePC associations relating to them through RemotePCAccounts and catalog/group relationships have first been removed.

Machines And Catalogs

Mappings are defined between machines and Remote PC catalogs through the RemotePCAccount cmdlets.

The machine to catalog mappings support the automated addition of machines to catalogs.

Properties

RemotePCAccounts expose sets of included and excluded machine name filters specified in DOMAIN\MACHINE format. A MachinesIncluded or MachinesExcluded entry can include asterisk wildcards to generalize matches.

Each RemotePCAccount can specify the Distinguished Name (DN) of an AD container in addition to the machine name filters, in the RemotePCAccount Organisational Unit (OU) property, and this limits the machines that the account objects act on to those that reside at or below that container in the AD domain hierarchy. An AllowSubfolderMatches setting on the RemotePCAccount indicates whether the computer must exist directly within the container to trigger a match, or whether it can be in a child below the defined container in the AD hierarchy.

Note that the AD container component is optional and a special value of 'any'can be supplied in the OU field to permit the RemotePCAccount to automatically match regardless of the AD machine object location in the AD domain hierarchy. A match is still subject to machine name filtering.

The last component of the RemotePCAccount is the CatalogUid. This indicates which catalog the Remote PC automation should move the machine into when a match is found.

Constraints

The IsRemotePC setting must be enabled on catalogs before they can be specified in a RemotePCAccount.

There can be any number of RemotePCAccounts configured in the site as long as each specifies a unique OU. There can be only one RemotePCAccount with the 'any'OU.

Automation

When a machine matching the criteria set up in a RemotePCAccount instance registers with one of the brokers in the site, it is automatically added to the catalog defined by the RemotePCAccount. This can take up to 30 seconds to happen after the machine registers.

When the machine registration occurs, the machine details can match more than one RemotePCAccount instance, but the machine can only be placed into one catalog, so one RemotePCAccount instance is chosen from the list that best matches the machine. This choice is made according to the length in nodes of the DN of the AD container specification associated with the RemotePCAccount, so more specific child OUs override specifications for their parent OUs if both are present. The RemotePCAccount for the 'any'OU is always last and used only if no other instances match.

A Windows eventlog message is generated when an automated catalog assignment is performed.

Notes

The AD distinguished name for the container is checked when the RemotePCAccount is created, but if the container is subsequently moved or deleted, the site does not automatically accommodate this, and the RemotePCAccount must be changed or removed manually.

Related Cmdlets

- Get-BrokerRemotePCAccount
- Set-BrokerRemotePCAccount
- Remove-BrokerRemotePCAccount
- New-BrokerCatalog [-IsRemotePC <Boolean>]
- Set-BrokerCatalog [-IsRemotePC <Boolean>]

Catalogs And Desktop Groups

A Remote PC catalog may be associated with one or more Remote PC desktop groups. The catalog to desktop group associations support automated publishing of machines to users.

Usage

An association is formed via:

Add-BrokerDesktopGroup -RemotePCCatalog <Catalog> [-Priority <Int32>]

An association is broken via:

Remove-BrokerDesktopGroup -RemotePCCatalog <Catalog>

To find associated desktop groups:

Get-BrokerDesktopGroup -RemotePCCatalogUid <Int32>

Automation

When a machine in a Remote PC catalog is not already assigned to a user, Remote PC automation temporarily places the machine in one of the desktop groups associated with the catalog. The temporary placing of the machine in a group will be adjusted as needed when the machine assignment to a user is first made.

The desktop group chosen as the temporary home for a machine is according to the priority value supplied when making the association between the group and the catalog. The group with the highest priority (lowest numerical priority value) is chosen.

A Windows eventlog message is generated when an automated machine assignment is performed.

Priority

Each desktop group to catalog association has a priority value that can be specified when the association is made or defaults to lower than the lowest existing association priority (highest numerical value) or zero if no other association exists yet. The lower the priority numerical value, the higher the priority level. The priority value for the association is

used to choose the temporary desktop group to place a new RemotePC machine in when it first registers. It is also used to decide which group to finally place the machine in when the user that the machine is being assigned to is appropriate for more than one of the associated desktop groups, usually because the desktop groups are using AD security groups for the user associations with the desktop groups.

The priority values for each association between a desktop group and a catalog are automatically maintained as unique for each catalog, and priorities can be adjusted up or down accordingly by the system. The last association created without a specified priority is always arranged to have the least priority (the highest numerical priority value).

Notes

The temporary placement of the machines in a desktop group is not re-evaluated if settings change after the automatic placement.

Related Cmdlets

Desktop Groups, Assignment Policy Rules, And Users

Assignment policy rules are used to define sets of users allowed to be assigned to machines by Remote PC automation, and to determine which desktop group the machine is placed in when the user assignment is made.

Automation

A machine is automatically assigned to a user when the Citrix Broker service sees that the user has logged on to a RemotePC machine, and the user is amongst those configured in the desktop group assignment policy

rule. If this is the first assignment of a user to a machine, all the assignment policy rules for all groups associated with the machine are checked, and the machine can be moved to a different, more appropriate desktop group if needed.

A Windows eventlog message is generated when an automated assignment of a machine to a user is made.

Multiple Assignments

By default, multiple automatic assignments of users to the same machine can be established if multiple users log on to the RemotePC machine, but this can be disabled if desired using a registry setting (see CTX137805).

Notes

User to machine assignments can still be made and removed manually through the Powershell SDK for machines in Remote PC catalogs and desktop groups.

The automatic placement of a machine in an appropriate desktop group happens when the first automatic assignment of a user to the machine is made, and this placement will not be automatically updated if the configuration subsequently changes.

Only a single assignment policy rule is allowed for each RemotePC desktop group.

Example

The following example creates a simple configuration that allows any user and machine in the current AD domain to participate in RemotePC.

```
# Create a Remote PC catalog
$catalog = New-BrokerCatalog -IsRemotePC $true
                             -SessionSupport SingleSession
                             -MachinesArePhysical $true
```

```
                                -AllocationType Static
                                -PersistUserChanges OnLocal
                                -ProvisioningType Manual
                                -Name RemotePCCatalog
```

```
# Create a Remote PC desktop group
$dg = New-BrokerDesktopGroup -IsRemotePC $true
                             -SessionSupport SingleSession
                             -DeliveryType DesktopsOnly
                             -DesktopKind Private
                             -Name RemotePCDesktopGroup
```

```
# Create an assignment policy rule for that desktop group allowing any
# domain user to match.
New-BrokerAssignmentPolicyRule -DesktopGroupUid $dg.Uid
                               -IncludedUsers 'domain users'
                               -Name RemotePCAPR
```

```
# Create a RemotePCAccount matching any unconfigured machine, causing
   the
# machines to be added to the catalog by Remote PC automation.
New-BrokerRemotePCAccount -OU 'any'
                          -CatalogUid $catalog.Uid
```

```
# Associate the desktop group and catalog to permit domain users to be
# automatically assigned to machines in that catalog
Add-BrokerDesktopGroup $dg -RemotePCCatalog $catalog
```

```
# Create an access policy rule, allowing access to the users to the
# Remote PC desktop group.
New-BrokerAccessPolicyRule -IncludedUsers 'domain users'
                           -DesktopGroupUid $dg.Uid
                           -IncludedUserFilterEnabled $true
                           -Name RemotePCAccessPolicyRule
```

about_Broker_ServiceConfigurationData

March 11, 2024

Topic

Broker Service Configuration Data

Description

The detailed behavior of the Broker service can be configured using settings available via the Set/Get-BrokerServiceConfigurationData SDK cmdlets.
The Get-BrokerServiceConfigurationData cmdlet shows a list of currently configured settings. A setting that has not been configured has its default value and does not appear in this list. An example setting can be specified as follows:

- Set-BrokerServiceConfigurationData HostingManagement.MaxRegistrationDelayMin -SettingValue 21
  To revert a setting to its default value, using the same example setting as above, do:
- Set-BrokerServiceConfigurationData HostingManagement.MaxRegistrationDelayMin

Core Settings

Core.Heartbeatperiodms

Type: int
Default Value: 600000
Summary:

Controls both the interval and timeouts used for the keep-alive 'pings' from the VDA.

This value is sent from the DDC to VDA and causes the VDA to ping the DDC at an interval half that of the time specified by this setting. By default the DDC will consider contact to have been lost, and discard the VDA's registration, if no ping is received within the full time specified (i.e. the timeout is double the ping interval).

This setting is dynamic, that is, changing it immediately alters both the active ping interval for all VDAs and the maximum interval enforced by the DDC.

The maximum period over which no ping is received before contact is considered to have been lost can be controlled independently of the VDA ping interval itself using the MaxHeartbeatIntervalMs setting.

Core.Maxdisconnectwaittimesecs

Type: int
Default Value: 10
Summary:

Maximum time that the VDA will wait for VDI sessions to disconnect when requested as part of user-driven restart request from StoreFront. This timeout value is sent to the VDA as part of the disconnect request and thus has no impact on the overall request timeout if there are network connectivity issues (see DisconnectOperationTimeOutSecs).

Core.Maxregistrationcompletiontimesecs

Type: int
Default Value: 600
Summary:

Maximum time within which the registration sequence for a single machine must complete. This refers to both immediate hard registrations, and soft to hard registration transitions. If the registration fails to complete within this time then the machine's partial registration is discarded by the broker.

Core.Maxsessionestablishmenttimesecs

Type: int
Default Value: 200
Summary:

Used for logon ticket lifetime, VDA listening timeout, and deadline imposed by the broker for evidence of client connection.

Core.Maxworkers

Type: int
Default Value: 11000
Summary:

The limit for the number of registered VDAs that the controller will accept.

Hostingmanagement Settings

Hostingmanagement.Completedactionretentionperiodsec

Type: int
Default Value: 259200
Summary:

How long a completed power action is retained in the database before being purged.

Hostingmanagement.Maxfailedregistrationsallowed

Type: int
Default Value: 2
Summary:

How many times a VM can fail to register before we put it into maintenance mode. A negative value means that we never automatically put a VM into maintenance mode.

Hostingmanagement.Maxregistrationdelaymin

Type: int
Default Value: 20
Summary:

How long to wait in minutes after a VM is powered on before a failure to receive a registration from the VM is deemed a problem.

This setting is also used in combination with the RebootSchedule/MaxShutdownDelayMin setting to define the maximum allowed time for a machine (either physical or a VM) to successfully reboot during reboot schedule processing.

Logging Settings

Logging.Connectionloglifetimehours

Type: int
Default Value: 48
Summary:

Time for which connection log entries are kept before being purged.

Logging.Hypervisoralertlifetimehours

Type: int
Default Value: 168
Summary:

Time for which hypervisor alert entries are kept before being purged.

Namecache Settings

Namecache.Namerefreshperiodaftererrormins

Type: int
Default Value: 60
Summary:

Starting period after which cached AD user/group account name, or machine name details are refreshed in the case where the SAM name of the cached entity could not be obtained (the cache may thus either contain no SAM name information, or potentially an out of date value). This period is increased exponentially depending on the number of consecutive lookup failures.

Namecache.Namerefreshperiodmins

Type: int
Default Value: 1440
Summary:

Period after which cached AD user/group account name, or machine name details are refreshed in the case where the SAM name of the cached entity was successfully obtained.

Add-BrokerApplication

March 11, 2024

Adds applications to a desktop group or application group.

Syntax

```
Add-BrokerApplication
   [-InputObject] <Application[]>
   [-ApplicationGroup <ApplicationGroup>]
   [-DesktopGroup <DesktopGroup>]
   [-Priority <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-BrokerApplication
   [-Name] <String>
   [-ApplicationGroup <ApplicationGroup>]
   [-DesktopGroup <DesktopGroup>]
   [-Priority <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-BrokerApplication cmdlet is used to associate one or more applications with an existing desktop group or application group.

There are two parameter sets for this cmdlet, allowing you to specify the application either by its BrowserName or by an array of object references. Uids can also be substituted for the object references.

See about_Broker_Desktops and about_Broker_Applications for more information.

Examples

EXAMPLE 1

Adds the application with a Name of “Notepad”to the desktop group called “Private DesktopGroup”
.

```
Add-BrokerApplication -Name "Notepad" -DesktopGroup "Private
    DesktopGroup"
```

Parameters

-InputObject

Specifies the application to associate. Its Uid can also be substituted for the object reference.

Type:	Application[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application to be associated with the desktop group.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ApplicationGroup

Specifies which application group this application should be associated with.

Type:	ApplicationGroup
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

Specifies which desktop group this application should be associated with. Note that applications can only be associated with desktop groups of the AppsOnly or DesktopsAndApps delivery type.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Priority

Specifies the priority of the mapping between the application and desktop group where lower numbers imply higher priority with zero being highest.

If one association has a higher priority than the other, machines from that group will be selected for launching sessions until all machines are at maximum load, in maintenance mode, unregistered, or unavailable for any other reason. Only when all machines from the higher-priority group are unavailable will new connections be routed to the next lowest priority group.

If multiple associations with equal priorities are encountered, session launches will be load balanced across all machines in both groups. The least-loaded machine across the groups will be chosen.

This parameter is used only when adding an application to a desktop group. It is an error to specify a priority when adding an application to an application group.

Type:	Int32
Position:	Named

Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Application, or as appropriate by property name

You can pipe the application to be added to Add-BrokerApplication. You can also pipe some of the other parameters by name.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerApplicationGroup

March 11, 2024

Adds application groups to a desktop group.

Syntax

```
Add-BrokerApplicationGroup
   [-InputObject] <ApplicationGroup[]>
   [-DesktopGroup <DesktopGroup>]
   [-Priority <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-BrokerApplicationGroup
   [-Name] <String>
   [-DesktopGroup <DesktopGroup>]
   [-Priority <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-BrokerApplicationGroup cmdlet is used to associate one or more application groups with an existing desktop group.

Associating an application group with a desktop group makes the desktop groups's machines available for launching applications in that application group. Until an application group is associated with a desktop group, its applications cannot be launched.

There are two parameter sets for this cmdlet, allowing you to specify the application groups either by Name or by an array of object references. Uids can also be substituted for the object references.

See about_Broker_Applications for more information.

Examples

EXAMPLE 1

Adds the application group with the Name "Office Apps"to the desktop group called "Private DesktopGroup".

```
Add-BrokerApplicationGroup -Name "Office Apps" -DesktopGroup "Private
   DesktopGroup"
```

Parameters

-InputObject

Specifies the application group to associate with the desktop group. Its Uid can also be substituted for the object reference.

Type:	ApplicationGroup[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application group to associate with the desktop group.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroup

Specifies the desktop groups with which the application groups should be associated.

Note that application groups can only be associated with desktop groups whose delivery type is either AppsOnly or DesktopsAndApps.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Priority

Specifies the priority of the mapping between the application group and desktop group. Lower numbers imply higher priority with zero being highest.

If one association has a higher priority than the other, machines from that group will be selected for launching sessions until all machines are at maximum load, in maintenance mode, unregistered, or unavailable for any other reason. Only when all machines from the higher-priority desktop group are unavailable will new connections be routed to the next lowest priority desktop group.

If multiple associations with equal priorities are encountered, session launches will be load balanced across all machines in both desktop groups. The least-loaded machine across the desktop groups will be chosen.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.ApplicationGroup, or as appropriate by property name

You can pipe the application group to be added to Add-BrokerApplicationGroup. You can also pipe some of the other parameters by name.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerDesktopGroup

March 11, 2024

Associate Remote PC desktop groups with the specified Remote PC catalog.

Syntax

```
Add-BrokerDesktopGroup
   [-InputObject] <DesktopGroup[]>
   [-RemotePCCatalog <Catalog>]
   [-Priority <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-BrokerDesktopGroup
   [-Name] <String>
   [-RemotePCCatalog <Catalog>]
   [-Priority <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet forms relationships between Remote PC desktop groups and catalogs.

The Remote PC relationships are used by Remote PC automation to determine which desktop groups a machine in a particular Remote PC catalog can be published to. The assignment policy rules belonging to those desktop groups also determines the set of users that are allowed to be assigned to machines from the catalog.

Examples

EXAMPLE 1

Add all Remote PC desktop groups to Remote PC catalog 42.

```
Get-BrokerDesktopGroup -IsRemotePC $true | Add-BrokerDesktopGroup -
   RemotePCCatalog 42
```

EXAMPLE 2

Add desktop groups with names containing MyGroup to Remote PC catalog with name “RPCCat”.

```
Add-BrokerDesktopGroup -Name *MyGroup* -RemotePCCatalog RPCCat
```

Parameters

-InputObject

Specifies one or more Remote PC desktop groups to add to a Remote PC catalog.

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the Remote PC desktop groups to add to a Remote PC catalog based on their name properties.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RemotePCCatalog

The Remote PC catalog which the desktop groups are to be added to. Specified by name, Uid or instance.

Type:	Catalog
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Priority

Desktop group to catalog associations carry a priority number, where numerically lower values indicate a higher priority.

The priority relative to other associations determines which desktop group Remote PC automation will move a qualifying unconfigured machine into when it registers. Priority also determines which desktop group a machine will be published to when a user is assigned to the machine by Remote PC automation.

If a value is not supplied, then the desktop group association is automatically assigned a lower priority than any existing associations.

If a priority value is specified that conflicts with an existing association's priority value, then the new association is inserted with that value and existing associations are renumbered upwards to accommodate it.

Type:	Int32
Position:	Named
Default value:	See description
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

The set of Remote PC desktop groups to be added to the catalog can be piped into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerMachine

March 11, 2024

Adds one or more machines to a desktop group.

Syntax

```
Add-BrokerMachine
   [-InputObject] <Machine[]>
   [-DesktopGroup <DesktopGroup>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-BrokerMachine
   [-MachineName] <String>
   [-DesktopGroup <DesktopGroup>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-BrokerMachine cmdlet adds specified machines to a desktop group. There are three forms:

- Use the -InputObject parameter to add a single machine instance or array of instances to the group.
- Use the -MachineName parameter to add a single, named machine to the group.
- Use pipelining to pipe machines instances to the command.

The desktop group to which the machines are added can be specified by name, unique identifier (UID), or instance.

For a machine to be used in a site, the machine must be added to a desktop group. The machine and desktop group must be compatible in order for the process to succeed; for example a machine in a single-session catalog cannot be added to a multi-session desktop group.

For more information about machines, see about_Broker_Machines.

Examples

EXAMPLE 1

These examples all add a single machine instance to a desktop group, identifying the group by instance, UID, or name.

```
Add-BrokerMachine -InputObject $machine -DesktopGroup $desktopGroup
Add-BrokerMachine -InputObject $machine -DesktopGroup 2
Add-BrokerMachine $machine -DesktopGroup "MyDesktopGroup"
```

EXAMPLE 2

These examples add the machine called MyMachine to a desktop group.

```
Add-BrokerMachine -MachineName "MyDomain\MyMachine" -DesktopGroup 2
Add-BrokerMachine "MyDomain\MyMachine" -DesktopGroup "MyDesktopGroup"
Add-BrokerMachine "MyDomain\MyMachine" -DesktopGroup $desktopGroup
```

EXAMPLE 3

These examples find specific machines and add them to a desktop group.

```
Get-BrokerMachine -Uid 3 | Add-BrokerMachine -DesktopGroup 2
Get-BrokerMachine -CatalogUid 4 | Add-BrokerMachine -DesktopGroup 2
```

Parameters

-InputObject

An array of machines to add to the group.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

The name of the single machine to add (must match the MachineName property of the machine).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroup

The desktop group to which the machines are added, specified by name, Uid, or instance.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Machine

You can pipe in the machines you want to add.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerMachineConfiguration

March 11, 2024

Adds a machine configuration to a desktop group.

Syntax

```
Add-BrokerMachineConfiguration
   [-InputObject] <MachineConfiguration[]>
   [-Application <Application>]
   [-DesktopGroup <DesktopGroup>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-BrokerMachineConfiguration
   [-Name] <String>
   [-Application <Application>]
   [-DesktopGroup <DesktopGroup>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Associates a machine configuration with a desktop group. The settings in the machine configuration are then applied to the machines in the desktop group.

Examples

EXAMPLE 1

Adds the machine configuration named UPM\Conf1 to the desktop group with Uid 1.

```
Add-BrokerMachineConfiguration -Name UPM\Conf1 -DesktopGroup 1
```

EXAMPLE 2

Adds the machine configuration $mc to the desktop group named "AdminDesktops".

```
$mc | Add-BrokerMachineConfiguration -DesktopGroup AdminDesktops
```

Parameters

-InputObject

Machine configuration to add to the desktop group.

Type:	MachineConfiguration[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Name of a machine configuration to add to the desktop group.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Application

The application to which the machine configurations are added, specified by name, Uid, or instance.

Type:	Application
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-DesktopGroup

The desktop group to which the machine configurations are added, specified by name, Uid, or instance.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.MachineConfiguration

The machine configuration to add to the desktop group.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerMachinesToDesktopGroup

March 11, 2024

Adds machines from a catalog to a desktop group.

Syntax

```
Add-BrokerMachinesToDesktopGroup
   [-Catalog] <Catalog>
   [-DesktopGroup] <DesktopGroup>
   [-Count] <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-BrokerMachinesToDesktopGroup cmdlet adds a specified number of machines from a catalog to a desktop group.

The cmdlet adds as many machines as possible from the catalog to the desktop group, up to the specified number. The number of machines successfully added to the desktop group is returned.

The machines are added randomly from the catalog and are selected from those that are not already members of a desktop group, and not already assigned to a client, IP address, or user.

Both the catalog and desktop group can be referenced either by instance, name, or unique identifier (Uid). The allocation type of the catalog must be compatible with the type of desktop group. This means the session support (single/multi) and the allocation type (private/shared) of the catalog must match the session support and allocation type in the desktop group.

Examples

EXAMPLE 1

All these examples request that a thousand machines from a catalog are added to a desktop group. The first example references both catalog and desktop group by instance. The second example references both catalog and desktop group by name. The third example references both catalog and desktop group by Uid.

```
Add-BrokerMachinesToDesktopGroup -Catalog $catalog -DesktopGroup
   $desktopGroup -Count 1000
Add-BrokerMachinesToDesktopGroup -Catalog "MyCatalog" -DesktopGroup "
   MyDesktopGroup" -Count 1000
Add-BrokerMachinesToDesktopGroup -Catalog 23 -DesktopGroup 4 -Count
   1000
```

EXAMPLE 2

This example takes ten machines from each manually provisioned catalog and adds them to the specified desktop group.

```
Get-BrokerCatalog -ProvisioningType Manual | Add-
    BrokerMachinesToDesktopGroup -DesktopGroup $desktopGroup -Count 10
```

Parameters

-Catalog

The catalog from which the machines are taken.

Type:	Catalog
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

The desktop group to which the machines are added.

Type:	DesktopGroup
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Count

The number of machines to add to the desktop group.

Type:	Int32
Position:	4

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

You can pipe in the catalog from which the machines are taken.

Int32

You can pipe in the Uid of the catalog from which the machines are taken.

String

You can pipe in the name of the catalog from which the machines are taken.

Outputs

Int32

The number of machines added to the desktop group.

Add-BrokerScope

March 11, 2024

Add the specified catalog/desktop group to the given scope(s).

Syntax

```
Add-BrokerScope
   [-InputObject] <Scope[]>
   [-ApplicationGroup <ApplicationGroup>]
   [-Catalog <Catalog>]
   [-DesktopGroup <DesktopGroup>]
   [-PolicySet <GpoPolicySet>]
   [-Tag <Tag>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-BrokerScope cmdlet is used to associate a scopeable object with the given scope(s). A scopeable object is one of:

- a catalog
- a desktop group
- an application group

To add a scopeable object to a scope you need permission to change the scopes of the scopeable object and permission to add objects to all of the scopes you have specified.

If the scopeable object is already in any scope supplied, that scope will be silently ignored.

Examples

EXAMPLE 1

Adds the desktop group with Uid 27 to the Sales scope.

```
1 Add-BrokerScope Sales -DesktopGroup 27
```

EXAMPLE 2

Adds the BangaloreMachines catalog to the scope with the specified ScopeID.

```
1 Add-BrokerScope BFC74867-C6EF-482C-996F-3E0D340E96AC -Catalog
     BangaloreMachines
```

Parameters

-InputObject

Specifies the scope(s) to add the object to. Each can take the form of either the string form of the scope's GUID or its name.

Type:	Scope[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ApplicationGroup

Specifies the application group to be added. This can take the form of an existing application group object, an application group Uid or name.

Type:	ApplicationGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Catalog

Specifies the catalog object to be added. This can take the form of an existing catalog object, a catalog Uid or name.

Type:	Catalog
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

Specifies the desktop group object to be added. This can take the form of an existing desktop group object, a desktop group Uid or name.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PolicySet

Specifies the policy set object to be added. This can take the form of an existing policy set object, a policy set Uid or name.

Type:	GpoPolicySet
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Tag

Specifies the tag object to be added. This can take the form of an existing tag object, a tag Uid or name.

Type:	Tag
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Scope

You can pipe scopes to Add-BrokerScope.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerStorefrontAddress

March 11, 2024

Modifies a StoreFront address configuration by adding an additional StoreFront address to it.

Syntax

```
Add-BrokerStorefrontAddress
   [-ByteArray] <Byte[]>
   -Name <String>
   -Url <String>
   -Enabled <Boolean>
   -Description <String>
   [<CommonParameters>]
```

Description

Use this command to transform an existing StoreFront configuration into a new configuration, where the new configuration contains one additional address. The original configuration is supplied as an input, along with the properties of the new StoreFront address being added. The cmdlet outputs the modified configuration, which can then be passed to the Citrix Broker Service using the Add-BrokerMachineConfiguration command.

This command does not, by itself, have any persistent effects within XenDesktop. To make the change persistent, the new configuration byte array must first be transformed into a machine configuration within the Citrix Broker Service. To do this, use the New-BrokerMachineConfiguration command. You can then use the Add-BrokerMachineConfiguration and Set-BrokerMachineConfiguration commands to fully associate the new configuration with a delivery group.

Examples

EXAMPLE 1

This command transforms the configuration byte array specified by $originalConfiguration, adds the new StoreFront details, and stores the resulting configuration in $newConfiguration.

```
$newConfiguration = Add-BrokerStorefrontAddress -ByteArray
    $originalConfiguration -Url "https://mysite.com/Citrix/StoreWeb" -
    Description "This StoreFront delivers my corporate applications" -
    Name "StoreFront1" -Enabled $true
```

Parameters

-ByteArray

Specifies the initial configuration, on which the new configuration is based. All of the addresses in the original configuration are also present in the new configuration, along with the additional address specified. This configuration byte array is obtained from an earlier call to New-BrokerStorefrontAddress, or from Get-BrokerMachineConfiguration.

Type:	Byte[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the new StoreFront.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Url

Specifies the URL to the StoreFront, such as “https://mysite.com/Citrix/StoreWeb”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Specifies if the new StoreFront address should be enabled for user access.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Specifies a human-readable description of the new StoreFront.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Byte[]

This cmdlet accepts configurations as pipeline input, as an alternative to supplying the ByteArray parameter.

Outputs

Byte[]

This cmdlet outputs the new, modified configuration. This differs from the original configuration in that it contains the additional StoreFront address.

Add-BrokerTag

March 11, 2024

Associate a tag with another object in the site.

Syntax

```
Add-BrokerTag
   [-InputObject] <Tag[]>
   [-Application <Application[]>]
   [-ApplicationGroup <ApplicationGroup[]>]
   [-Catalog <Catalog[]>]
   [-Desktop <Desktop[]>]
   [-DesktopGroup <DesktopGroup[]>]
   [-Machine <Machine[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-BrokerTag
   [-Name] <String>
   [-Application <Application[]>]
   [-ApplicationGroup <ApplicationGroup[]>]
   [-Catalog <Catalog[]>]
   [-Desktop <Desktop[]>]
   [-DesktopGroup <DesktopGroup[]>]
   [-Machine <Machine[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Associates one or more tags with a machine, application group, application, desktop group or desktop within the site.

Examples

EXAMPLE 1

Associates ‘Tag1’with machine DOMAIN\Machine.

```
Add-BrokerTag -Name 'Tag1' -Machine DOMAIN\Machine
```

EXAMPLE 2

Creates a new tag with name ‘Tag2’and associates it with the machine with Uid 1.

```
$machine = Get-BrokerMachine -Uid 1
New-BrokerTag 'Tag2' | Add-BrokerTag -Machine $machine
```

Parameters

-InputObject

Specifies one or more tag objects.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies a tag by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Application

Associates the tag with the specified application.

Type:	Application[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-ApplicationGroup

Associates the tag with the specified application group.

Type:	ApplicationGroup[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Catalog

Associates the tag with the specified catalog.

Type:	Catalog[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Desktop

Associates the tag with the specified desktop. The tag is associated with the underlying machine not with the desktop itself.

This parameter is deprecated, use -Machine instead.

Type:	Desktop[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

Associates the tag with the specified desktop group.

Type:	DesktopGroup[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Machine

Associates the tag with the specified machine.

Type:	Machine[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Tag

Tags may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Add-BrokerUser

March 11, 2024

Creates an association between a user and another broker object

Syntax

```
Add-BrokerUser
    [-InputObject] <User[]>
    [-ApplicationGroup <ApplicationGroup>]
    [-Application <Application>]
    [-SessionLinger <SessionLinger>]
    [-SessionPreLaunch <SessionPreLaunch>]
    [-Machine <Machine>]
    [-PrivateDesktop <PrivateDesktop>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-BrokerUser
    [-Name] <String>
    [-ApplicationGroup <ApplicationGroup>]
    [-Application <Application>]
    [-SessionLinger <SessionLinger>]
    [-SessionPreLaunch <SessionPreLaunch>]
    [-Machine <Machine>]
    [-PrivateDesktop <PrivateDesktop>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Add-BrokerUser cmdlet adds broker user objects to another specified object, such as a broker private desktop. This depends on the target object type:

- Machine - assign the broker machine to the specified user(s); when the

machine is subsequently added to a desktop group, the desktop is also assigned to the same user(s).

- PrivateDesktop - assign the desktop to the specified user(s).
- Application - assign the application to the specified user(s).
- Application group - assign the applications in the application group to the specified user(s).

Examples

EXAMPLE 1

Assign the specified private desktop to the specified user.

```
1  Add-BrokerUser "DOMAIN\UserName" -PrivateDesktop "DOMAIN\MachineName"
```

EXAMPLE 2

Assign the specified application to the specified user.

```
1  Add-BrokerUser "DOMAIN\UserName" -Application "ApplicationName"
```

Parameters

-InputObject

The user objects to add.

Type:	User[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the user or users to be added.

Type:	String
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ApplicationGroup

The application group to which the user is to be assigned.

Type:	ApplicationGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Application

The application to which the user is to be assigned.

Type:	Application
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SessionLinger

The session linger setting to which the user is to be assigned.

Type:	SessionLinger
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SessionPreLaunch

The session pre-launch setting to which the user is to be assigned.

Type:	SessionPreLaunch
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Machine

The machine to which the user is to be assigned

Type:	Machine
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PrivateDesktop

The desktop to which the user is to be assigned

Type:	PrivateDesktop
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.USer

You can pipe the users to be added to Add-BrokerUser.

Outputs

None

By default, this cmdlet returns no output.

Notes

Specify one of the -Machine or -PrivateDesktop or -Application parameters only.

Copy-BrokerGpoPolicy

March 11, 2024

Copy policies to other policy sets.

Syntax

```
Copy-BrokerGpoPolicy
    -PolicyGuids <Guid[]>
    -ToPolicySets <Guid[]>
    [-WithFilters]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Copy policies, which must be from the same policy set, to other policy sets. The names of the policies to be copied must not exist in the destination policy sets. Priorities of the policies in the destination sets may not be in the same order as the original policies.

Examples

Parameters

-PolicyGuids

The GUIDs of the policies to be copied.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPolicySets

The GUIDs of the destination policy sets. The GUID of the policy set that contains the source policies must not be in this array.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-WithFilters

Indicates that filters of each policy are to be copied.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Copy-BrokerGpoPolicySet

March 11, 2024

Make a full or partial copy of a policy set

Syntax

```
Copy-BrokerGpoPolicySet
    -PolicySetGuid <Guid>
    -Name <String>
    [-WithFilters]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Copy a policy set, including the policies, and the settings and filters in each policy. The type of the new policy set is always DeliveryGroupPolicies. If errors are encountered during copying, the resulting policy set may contain incomplete data.

Examples

EXAMPLE 1

Copy a policy set.

```
Copy-BrokerGpoPolicySet -Name newSet -PolicySetGuid "1234..."
```

Parameters

-PolicySetGuid

The GUID of the policy set to be copied

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the new policy set

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-WithFilters

Indicate if filters should be copied

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoPolicySet

Copy-BrokerGpoPolicySet returns the new policy set object.

Disable-BrokerGpoPolicy

March 11, 2024

Disable a collection of policies, which must be in the same set.

Syntax

```
Disable-BrokerGpoPolicy
        [-PolicyGuids] <Guid[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Examples

EXAMPLE 1

Disable the policies.

```
Disable-BrokerGpoPolicy -PolicyGuids @("abcdef12-...", "12345678-...")
```

Parameters

-PolicyGuids

GUIDs of the policies to be disabled.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Disconnect-BrokerSession

March 11, 2024

Disconnect a session.

Syntax

```
Disconnect-BrokerSession
           [-InputObject] <Session[]>
           [-LoggingId <Guid>]
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Disconnects the specified session.

If the session is active, no warning is issued to the user before that session is disconnected.

After disconnection, sessions enter a Disconnected state. In a Disconnected state, a session still exists but there is no remote connection to that session.

Examples

EXAMPLE 1

Attempts to disconnect all of the sessions for the user MyDomain\MyAccount.

```
Get-BrokerSession -UserName MyDomain\MyAccount | Disconnect-
    BrokerSession
```

EXAMPLE 2

Disconnects the session on MyMachine.

```
$desktop = Get-BrokerDesktop -DNSName MyMachine.MyDomain.com
Disconnect-BrokerSession $desktop.SessionUid
```

EXAMPLE 3

Attempts to disconnect sessions 10, 11 and 12. Traps and displays the error information.

```
trap  [Citrix.Broker.Admin.SDK.SdkOperationException]
{

  write $("Exception name = " + $_.Exception.GetType().FullName)
  write $("SdkOperationException.Status = " + $_.Exception.Status)
  write $("SdkOperationException.ErrorData=")
  $_.Exception.ErrorData

  write $("SdkOperationException.InnerException = " + $_.Exception.
      InnerException)
  $_.Exception.InnerException
  continue
 }

Disconnect-BrokerSession -InputObject 10,11,12
```

Parameters

-InputObject

Identifies the session(s) to disconnect. This can be expressed as either a session Uid or a session object.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

The sessions to disconnect can be piped into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between the controller and the machine, or if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Disconnect-BrokerSession could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the disconnect session operation is invoked on only the valid sessions.

The system can fail to disconnect the session if the machine is not in an appropriate state or if there are problems in communicating with the machine. When a disconnect is requested the system detects if the operation was initiated successfully or not by the machine. As this operation is non-blocking the system doesn't detect or report whether the disconnect ultimately succeeded or failed after it was started.

Disconnect failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandling). In the event of errors the SdkErrorRecord error status is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount: The number of operations attempted.
- OperationsFailedCount - The number of failed operations.
- OperationsSucceededCount - The number of successfully executed operations.

- UnresolvedSessionFailuresCount - The number of operations that failed due to invalid sessions being supplied.
- OperationInvocationFailuresCount - The number of operations that failed because they could not be invoked on the machine.
- DesktopExecutionFailuresCount - The number of operations that failed because they could not be successfully executed by the machine.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

"Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded:<OperationsSucceededCount>"

Enable-BrokerGpoPolicy

March 11, 2024

Enable a collection of policies, which must be in the same set.

Syntax

```
Enable-BrokerGpoPolicy
       [-PolicyGuids] <Guid[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Examples

EXAMPLE 1

Enable the policies.

```
Enable-BrokerGpoPolicy -PolicyGuids @("abcdef12-...", "12345678-...")
```

Parameters

-PolicyGuids

GUIDs of the policies to be enabled.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- Disable-BrokerGpoPolicy

Export-BrokerConfiguration

March 11, 2024

Obtains an XML document containing the configuration of the broker and optionally a script to import it into another broker

Syntax

```
Export-BrokerConfiguration
      [-TargetBrokerVersion <Version>]
      [-ExistingImportScriptId <String>]
      [-ExistingConfigLastChangeTime <String>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Examples

Parameters

-TargetBrokerVersion

The version of the broker receiving the configuration

Type:	Version
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExistingImportScriptId

The Id of the script the caller already has; a new script will be returned in the XML document if different.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExistingConfigLastChangeTime

The value of ConfigLastChangeTime in the site object of any configuration already held by the caller. If nothing has changed, an empty configuration will be returned with the “Updated”attribute set to false.

Type:	String
Position:	Named

Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet does not accept input

Outputs

String

The XML document

Related Links

Export-BrokerDesktopPolicy

March 11, 2024

Gets the policies of a policy set as a byte array.

Syntax

```
Export-BrokerDesktopPolicy
      [-PolicySetGuid <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Export-BrokerDesktopPolicy returns an array of bytes containing the policies in a policy set.

Examples

EXAMPLE 1

This command exports the policy settings of the policy set.

```
$policy = Export-BrokerDesktopPolicy
```

Parameters

-PolicySetGuid

The GUID of the policy set to export. If this is not specified, the data of the site default policy set is exported.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

The configuration data as an opaque binary blob. This will be null if the policy set contains no data.

- New-BrokerMachineConfiguration
- about_Broker_ConfigurationSlots

Export-BrokerPiiData

March 11, 2024

Exports the personal identifation information and scrambled values

Syntax

```
Export-BrokerPiiData
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Export-BrokerPiiData exports the personal identification information (PII) data and scrambled values. If the admin chooses to send scrambled PII data in the licensing events, the original data and its scrambled values can be exported by this cmdlet.

The retention time of the PII data is one year from the last accessed date of the specific PII data.

Examples

EXAMPLE 1

Returns all the PII data and the scrambled values and save the output

to the target file.

```
1  Export-BrokerPiiData | Out-File -Path C:\Foo\data.csv
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Byte[]

Export-BrokerPiiData returns a list of PII data and scrambled values

Related Links

Export-BrokerPolicyTemplates

March 11, 2024

Gets the site wide Citrix Group Policy templates.

Syntax

```
Export-BrokerPolicyTemplates
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Export-BrokerPolicyTemplates returns an array of bytes containing the site-wide Citrix Group Policy templates. These templates can be used to create new policies.

Examples

EXAMPLE 1

This command exports the site wide Citrix Group Policy templates.

```
$policy = Export-BrokerPolicyTemplates
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

The policy templates data as an opaque binary blob. This will be null if no site wide Citrix Group Policy templates have been created.

Notes

Export-BrokerPolicyTemplates performs a specialized operation. Direct usage of it in scripts is discouraged, and could result in data corruption. It is recommended that this operation only be performed via the Citrix Studio.

Get-BrokerAccessPolicyRule

March 11, 2024

Gets rules from the site's access policy.

Syntax

```
Get-BrokerAccessPolicyRule
   [[-Name] <String>]
   [-AllowedConnections <AllowedConnection>]
   [-AllowedUsers <AllowedUser>]
   [-Description <String>]
   [-DesktopGroupName <String>]
   [-DesktopGroupUid <Int32>]
   [-Enabled <Boolean>]
```

```
    [-ExcludedClientIPFilterEnabled <Boolean>]
    [-ExcludedClientName <String>]
    [-ExcludedClientNameFilterEnabled <Boolean>]
    [-ExcludedSmartAccessFilterEnabled <Boolean>]
    [-ExcludedSmartAccessTag <String>]
    [-ExcludedUser <User>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-IncludedClientIPFilterEnabled <Boolean>]
    [-IncludedClientName <String>]
    [-IncludedClientNameFilterEnabled <Boolean>]
    [-IncludedSmartAccessFilterEnabled <Boolean>]
    [-IncludedSmartAccessFilterType <String>]
    [-IncludedSmartAccessTag <String>]
    [-IncludedUser <User>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerAccessPolicyRule
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns rules matching the specified search criteria from the site's access policy. If no search criteria are specified, all rules in the access policy are obtained.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

———————BrokerAccessPolicyRule Object

A BrokerAccessPolicyRule object represents a single rule within the site's access policy. For a user to gain access to a desktop group via the rule their connection must match all its enabled include filters, and none of its enabled exclude filters. The object contains the following properties:

- AllowedConnections (Citrix.Broker.Admin.SDK.AllowedConnection)

Controls whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection. This property forms part of the included SmartAccess tags filter.
For a detailed description of this property see "help about_Broker_AccessPolicy".

- AllowedProtocols (System.String[])

  Protocols (for example HDX, RDP) available to the user for sessions delivered from the rule's desktop group. If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.
  If the protocol list is empty, access to the desktop group is implicitly denied.

- AllowedUsers (Citrix.Broker.Admin.SDK.AllowedUser)

  Controls the behavior of the included users filter. This can restrict access to a list of named users or groups, or allow access to any authenticated user. For a detailed description of this property see "help about_Broker_AccessPolicy".

- AllowRestart (System.Boolean)

  Indicates if the user can restart sessions delivered from the rule's desktop group. Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

- AppProtectionKeyLoggingRequired (System.Boolean)

  Specifies whether key logging app protection is required.

- AppProtectionScreenCaptureRequired (System.Boolean)

  Specifies whether screen capture app protection is required.

- Description (System.String)

  An optional description of the rule. The text is purely informational for the administrator, it is never visible to the end user.

- DesktopGroupName (System.String)

  The name of the desktop group to which the rule applies.

- DesktopGroupUid (System.Int32)

  The unique ID of the desktop group to which the rule applies.

- Enabled (System.Boolean)

  Indicates whether the rule is enabled. A disabled rule is ignored when evaluating the site's access policy.

- ExcludedClientIPFilterEnabled (System.Boolean)

  Indicates whether the excluded client IP filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- ExcludedClientIPs (Citrix.Broker.Admin.SDK.ChbIPAddressRange[])

  IP addresses of user devices explicitly denied access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

- ExcludedClientNameFilterEnabled (System.Boolean)

  Indicates whether the excluded client name filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- ExcludedClientNames (System.String[])

  Names of user devices explicitly denied access to the rule's desktop group. This property forms part of the excluded client names filter.

- ExcludedSmartAccessFilterEnabled (System.Boolean)

  Indicates whether the excluded SmartAccess tags filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- ExcludedSmartAccessTags (System.String[])

  SmartAccess tags which explicitly deny access to the rule's desktop group if any occur in those provided by with the user's connection. This property forms part of the excluded SmartAccess tags filter.

- ExcludedUserFilterEnabled (System.Boolean)

  Indicates whether the excluded users filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- ExcludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  Users and groups who are explicitly denied access to the rule's desktop group. This property forms part of the excluded users filter.

- HdxSslEnabled (System.Boolean)

  Indicates whether TLS encryption is enabled for sessions delivered from the rule's desktop group.

- IncludedClientIPFilterEnabled (System.Boolean)

  Indicates whether the included client IP filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- IncludedClientIPs (Citrix.Broker.Admin.SDK.ChbIPAddressRange[])

  IP addresses of user devices allowed access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the included client IP address filter.

- IncludedClientNameFilterEnabled (System.Boolean)

  Indicates whether the included client names filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- IncludedClientNames (System.String[])

  Names of user devices allowed access to the rule's desktop group. This property forms part of the included client names filter.

- IncludedSmartAccessFilterEnabled (System.Boolean)

  Indicates whether the included SmartAccess tags filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- IncludedSmartAccessFilterType (System.String)

  Indicates whether all tags present in IncludedSmartAccessTags must match tags provided by the user's connection to grant access (MatchAll), or whether any tag matching is sufficient (MatchAny).

- IncludedSmartAccessTags (System.String[])

  The SmartAccess tags which grant access to the rule's desktop group if they occur in those provided with the user's connection. If multiple tags are specified, access also depends on the IncludedSmartAccessFilterType setting. This property forms part of the included SmartAccess tags filter.

- IncludedUserFilterEnabled (System.Boolean)

  Indicates whether the included users filter is enabled. If the filter is disabled it is ignored when the rule is evaluated.

- IncludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  Users and groups who are granted access to the rule's desktop group. This property forms part of the included users filter.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  A collection of arbitrary key/value pairs that can be associated with the rule. The administrator can use these values for any purpose; they are not used by the site itself in any way.

- Name (System.String)

  Administrative name of the rule. Each rule in the site's access policy must have a unique name.

- Uid (System.Int32)

  Unique ID of the rule itself.

Examples

EXAMPLE 1

Returns all access policy rules. This offers a complete description of the current site's access policy.

```
Get-BrokerAccessPolicyRule
```

EXAMPLE 2

Returns all rules that are both enabled and explicitly include the SALES\tech-support group in their included users filter.

```
Get-BrokerAccessPolicyRule -Enabled $true -IncludedUser sales\tech-
    support
```

Parameters

-Uid

Gets only the rule with the specified unique ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only rules with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AllowedConnections

Gets only rules that have the specified value in the AllowedConnections property of their included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, ViaAG and AnyViaAG.

Type:	AllowedConnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowedUsers

Gets only rules that have the specified value in the AllowedUsers property of their included users filter.

Valid values are Filtered, AnyAuthenticated, Any, AnonymousOnly and FilteredOrAnonymous.

Type:	AllowedUser
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Description

Gets only rules with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupName

Gets only rules applying to desktop groups with names matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only rules that apply to the desktop group with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets only rules that are in the specified state, either enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedClientIPFilterEnabled

Gets only rules that have their excluded client IP address filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedClientName

Gets only rules that have the specified client name in their excluded client names filter (whether the filter is enabled or not).

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExcludedClientNameFilterEnabled

Gets only rules that have their excluded client name filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedSmartAccessFilterEnabled

Gets only rules that have their excluded SmartAccess tags filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedSmartAccessTag

Gets only rules that have the specified SmartAccess tag in their excluded SmartAccess tags filter (whether the filter is enabled or not).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExcludedUser

Gets only rules that have the specified user in their excluded users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Gets only rules that have their excluded user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedClientIPFilterEnabled

Gets only rules that have their included client IP address filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedClientName

Gets only rules that have the specified user device name in their included client names filter (whether the filter is enabled or not).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IncludedClientNameFilterEnabled

Gets only rules that have their included client name filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedSmartAccessFilterEnabled

Gets only rules that have their included SmartAccess tags filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedSmartAccessFilterType

Gets only rules that have the specified included SmartAccess tags filter type (MatchAll, or MatchAny).

Type:	String
Accepted values:	MatchAll, MatchAny
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedSmartAccessTag

Gets only rules that have the specified SmartAccess tag in their included SmartAccess tags filter (whether the filter is enabled or not).

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-IncludedUser

Gets only rules that have the specified user in their included users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Gets only rules that have their included user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AccessPolicyRule

Get-BrokerAccessPolicyRule returns all access policy rules that match the specified selection criteria.

Get-BrokerAdminFolder

March 11, 2024

Get the admin folders in this site.

Syntax

```
Get-BrokerAdminFolder
    [[-Name] <String>]
    [-DirectChildAdminFolders <Int32>]
    [-DirectChildApplicationGroups <Int32>]
    [-DirectChildApplications <Int32>]
    [-DirectChildCatalogs <Int32>]
    [-DirectChildDesktopGroups <Int32>]
    [-FolderName <String>]
    [-LastChangeId <Guid>]
    [-Metadata <String>]
    [-ParentAdminFolderUid <Int32>]
    [-TotalChildApplicationGroups <Int32>]
    [-TotalChildApplications <Int32>]
    [-TotalChildCatalogs <Int32>]
    [-TotalChildDesktopGroups <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerAdminFolder
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerAdminFolder cmdlet gets admin folders in this site.

Without parameters, Get-BrokerAdminFolder gets all the admin folders that have been created. You can also use the parameters of Get-BrokerAdminFolder to filter the results to just the folders you're interested in. You can also identify folders by their UIDs or their FolderNames.

————————BrokerAdminFolder Object

A folder for use in the administration console for organising other objects. E.g. BrokerApplication objects

- DirectChildAdminFolders (System.Int32)

  The number of admin folders with this folder as a direct parent

- DirectChildApplicationGroups (System.Int32)

  The number of application groups in this admin folder (does not include any application groups in child folders)

- DirectChildApplications (System.Int32)

  The number of applications in this admin folder (does not include any applications in child folders)

- DirectChildCatalogs (System.Int32)

  The number of catalogs in this admin folder (does not include any catalogs in child folders)

- DirectChildDesktopGroups (System.Int32)

  The number of desktop groups in this admin folder (does not include any desktop groups in child folders)

- FolderName (System.String)

  The simple name of this folder within any parent folder

- LastChangeId (System.Guid)

  A random GUID assigned whenever there is a change anywhere in the hierarchy of admin folders below this node; each change updates this value on the changed folder and all parents all the way up to the root folder. Note that nodes below any change do not have their LastChangeId value updated

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Holds any metadata associated with the admin folder

- Name (System.String)

  The full name of the folder including the full parent hierarchy separated by back-slash characters and including a trailing back-slash

- ParentAdminFolderUid (System.Int32)

  The UID of the parent admin folder; the root folder references itself (zero)

- TotalChildApplicationGroups (System.Int32)

  The number of application groups in this admin folder (including any application groups in child folders)

- TotalChildApplications (System.Int32)

  The number of applications in this admin folder (including any applications in child folders)

- TotalChildCatalogs (System.Int32)

  The number of catalogs in this admin folder (including any catalogs in child folders)

- TotalChildDesktopGroups (System.Int32)

  The number of desktop groups in this admin folder (including any desktop groups in child folders)

- Uid (System.Int32)

  The unique ID of the admin folder (the root folder has the value zero)

Examples

EXAMPLE 1

Return all administration folders.

```
Get-BrokerAdminFolder
```

EXAMPLE 2

Get the administration folder with Uid 1.

```
Get-BrokerAdminFolder -Uid 1
```

Parameters

-Uid

Gets only the admin folder with the specified unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets admin folders matching the specified name (if no trailing backslash is supplied, it is assumed).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DirectChildAdminFolders

Gets admin folders with the specified number of child folders.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DirectChildApplicationGroups

Gets admin folders with the specified number of application groups (excluding those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DirectChildApplications

Gets admin folders with the specified number of applications (excluding those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DirectChildCatalogs

Gets admin folders with the specified number of catalogs (excluding those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DirectChildDesktopGroups

Gets admin folders with the specified number of desktop groups (excluding those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FolderName

Gets only the admin folders matching the specified simple folder name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastChangeId

Gets only the admin folders with the specified value for LastChangeId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ParentAdminFolderUid

Gets only admin folders with the specified parent admin folder UID value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalChildApplicationGroups

Gets admin folders with the specified number of application groups (including those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalChildApplications

Gets admin folders with the specified number of applications (including those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalChildCatalogs

Gets admin folders with the specified number of catalogs (including those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalChildDesktopGroups

Gets admin folders with the specified number of desktop groups (including those in sub-folders).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AdminFolder

Returns admin folders.

Get-BrokerAppAssignmentPolicyRule

March 11, 2024

Gets application rules from the site's assignment policy.

Syntax

```
Get-BrokerAppAssignmentPolicyRule
   [[-Name] <String>]
   [-Description <String>]
   [-DesktopGroupUid <Int32>]
   [-Enabled <Boolean>]
   [-ExcludedUser <User>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-IncludedUser <User>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerAppAssignmentPolicyRule
   [-Uid] <Int32>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns application rules matching the specified search criteria from the site's assignment policy. If no search criteria are specified, all application rules in the assignment policy are obtained.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

——————————BrokerAppAssignmentPolicyRule Object

The BrokerAppAssignmentPolicyRule object represents a single application rule within the site's assignment policy. It contains the following properties:

- Description (System.String)

  An optional description of the rule. The text is purely informational for the administrator, it is never visible to the end user.

- DesktopGroupUid (System.Int32)

  The unique ID of the desktop group to which the rule applies.

- Enabled (System.Boolean)

  Indicates whether the rule is enabled. A disabled rule is ignored when evaluating the site's assignment policy.

- ExcludedUserFilterEnabled (System.Boolean)

  Indicates whether the excluded users filter is enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

- ExcludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule's desktop group.

- IncludedUserFilterEnabled (System.Boolean)

  Indicates whether the included users filter is enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly entitled to the machine assignment described by the rule.

- IncludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The included users filter of the rule, that is, the users and groups who are entitled to a machine assignment from the rule's desktop group.

- Name (System.String)

  The administrative name of the rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

- Uid (System.Int32)

  The unique ID of the rule itself.

Examples

EXAMPLE 1

Returns all application rules from the assignment policy. This offers a complete description of the current site's assignment policy with respect to machine assignment entitlements for delivery of application sessions from private desktop groups.

```
Get-BrokerAppAssignmentPolicyRule
```

EXAMPLE 2

Returns the rule in the assignment policy that gives users entitlements to machine assignments in the Sales Support desktop group for delivery of application sessions.

```
$dg = Get-BrokerDesktopGroup 'Sales Support'
Get-BrokerAppAssignmentPolicyRule -DesktopGroupUid $dg.Uid
```

Parameters

-Uid

Gets the application rule with the specified unique ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only application rules with the specified name.

Type:	String
Position:	2

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets only application rules with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only application rules that apply to the desktop group with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets only application rules that are in the specified state, either enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUser

Gets only application rules that have the specified user in their excluded users filter (whether the filter is enabled or not)

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Gets only application rules that have their excluded user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUser

Gets only application rules that have the specified user in their included users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Gets only application rules that have their included user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

Get-BrokerAppAssignmentPolicyRule returns all application rules in the assignment policy that match the specified selection criteria.

Get-BrokerAppEntitlementPolicyRule

March 11, 2024

Gets application rules from the site's entitlement policy.

Syntax

```
Get-BrokerAppEntitlementPolicyRule
    [[-Name] <String>]
    [-Description <String>]
    [-DesktopGroupUid <Int32>]
    [-Enabled <Boolean>]
    [-ExcludedUser <User>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-IncludedUser <User>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-LeasingBehavior <LeasingBehavior>]
    [-SessionReconnection <SessionReconnection>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerAppEntitlementPolicyRule
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns application rules matching the specified search criteria from the site's entitlement policy. If no search criteria are specified, all application rules in the entitlement policy are obtained.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

——————————BrokerAppEntitlementPolicyRule Object

The BrokerAppEntitlementPolicyRule object represents a single application rule within the site's entitlement policy. It contains the following properties:

- Description (System.String)

  Optional description of the rule. The text is purely informational for the administrator, it is never visible to the end user.

- DesktopGroupUid (System.Int32)

  The unique ID of the desktop group to which the rule applies.

- Enabled (System.Boolean)

  Indicates whether the rule is enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

- ExcludedUserFilterEnabled (System.Boolean)

  Indicates whether the excluded users filter of the rule is enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

- ExcludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to use published applications from the associated desktop group.

- IncludedUserFilterEnabled (System.Boolean)

  Indicates whether the included users filter of the rule is enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to an application session by the rule.

- IncludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.
  If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

- LeasingBehavior (Citrix.Broker.Admin.SDK.LeasingBehavior)

  Defines the desired connection leasing behavior applied to sessions launched using this entitlement. Possible values are:
  Allowed and Disallowed.

- Name (System.String)

  The administrative name of the rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

- SessionReconnection (Citrix.Broker.Admin.SDK.SessionReconnection)

  Defines reconnection (roaming) behavior for sessions launched using this rule. Possible values are:
  Always, DisconnectedOnly, and SameEndpointOnly.

- Uid (System.Int32)

  The unique ID of the rule itself.

Examples

EXAMPLE 1

Returns all application rules from the entitlement policy. This offers a complete description of the current site's entitlement policy with respect to application entitlements from shared desktop groups.

```
Get-BrokerAppEntitlementPolicyRule
```

EXAMPLE 2

Returns the application rule in the entitlement policy that grants users an entitlement to application sessions in the Customer Support desktop group.

```
$dg = Get-BrokerDesktopGroup 'Customer Support'
Get-BrokerAppEntitlementPolicyRule -DesktopGroupUid $dg.Uid
```

Parameters

-Uid

Gets the application rule with the specified unique ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only application rules with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets only application rules with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only the application rule that applies to the desktop group with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets only application rules that are in the specified state, either enabled ($true), or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUser

Gets only application rules that have the specified user in their excluded users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Gets only application rules that have their excluded user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUser

Gets only application rules that have the specified user in their included users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Gets only application rules that have their included user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LeasingBehavior

Gets only application rules with the specified connection leasing behavior. Possible values are: Allowed and Disallowed.

Type:	LeasingBehavior
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionReconnection

Gets only application rules with the specified session reconnection behavior. Possible values are: Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

Get-BrokerAppEntitlementPolicyRule returns all application rules from the entitlement policy that match the specified selection criteria.

Get-BrokerApplication

March 11, 2024

Get the applications published on this site.

Syntax

```
Get-BrokerApplication
    [[-Name] <String>]
    [-AdminFolderName <String>]
    [-AdminFolderUid <Int32>]
    [-AllAssociatedDesktopGroupUid <Int32>]
    [-AllAssociatedDesktopGroupUUID <Guid>]
    [-ApplicationName <String>]
    [-ApplicationType <ApplicationType>]
    [-AssociatedApplicationGroupUid <Int32>]
    [-AssociatedApplicationGroupUUID <Guid>]
    [-AssociatedDesktopGroupPriority <Int32>]
    [-AssociatedDesktopGroupUid <Int32>]
    [-AssociatedDesktopGroupUUID <Guid>]
    [-AssociatedUserFullName <String>]
    [-AssociatedUserName <String>]
    [-AssociatedUserSID <String>]
    [-AssociatedUserUPN <String>]
    [-BrowserName <String>]
    [-ClientFolder <String>]
    [-CommandLineArguments <String>]
    [-CommandLineExecutable <String>]
    [-CpuPriorityLevel <CpuPriorityLevel>]
    [-Description <String>]
    [-DoNotEnumerate <Boolean>]
    [-Enabled <Boolean>]
    [-HomeZoneName <String>]
    [-HomeZoneOnly <Boolean>]
    [-HomeZoneUid <Guid>]
```

```
    [-IconFromClient <Boolean>]
    [-IconUid <Int32>]
    [-IgnoreUserHomeZone <Boolean>]
    [-LocalLaunchDisabled <Boolean>]
    [-MaxPerMachineInstances <Int32>]
    [-MaxPerUserInstances <Int32>]
    [-MaxTotalInstances <Int32>]
    [-MetadataKey <String>]
    [-Metadata <String>]
    [-PackagedApplicationId <String>]
    [-PackagedApplicationType <String>]
    [-PublishedName <String>]
    [-SecureCmdLineArgumentsEnabled <Boolean>]
    [-ShortcutAddedToDesktop <Boolean>]
    [-ShortcutAddedToStartMenu <Boolean>]
    [-StartMenuFolder <String>]
    [-Tag <String>]
    [-UserFilterEnabled <Boolean>]
    [-UUID <Guid>]
    [-Visible <Boolean>]
    [-WaitForPrinterCreation <Boolean>]
    [-WorkingDirectory <String>]
    [-DesktopUid <Int32>]
    [-ApplicationGroupUid <Int32>]
    [-SessionUid <Int64>]
    [-UserSID <String>]
    [-DesktopGroupUid <Int32>]
    [-MachineConfigurationUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerApplication
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerApplication cmdlet gets the published applications that are hosted on this site.

Without parameters, Get-BrokerApplication gets all the applications that have been published, regardless of whether they are visible to users or not. You can also use the parameters of Get-BrokerApplication to filter the results to just the applications you're interested in. You can also

identify applications by their UIDs or their BrowserNames.

For more information about applications, see about_Broker_Applications.

----------BrokerApplication Object

The BrokerApplication object represents a published application in the site. It contains the following properties:

- AdminFolderName (System.String)

  The name of the admin folder the application is in (including trailing backslash), or the empty string if the application is at the root level

- AdminFolderUid (System.Int32)

  The Uid of the admin folder the application is in (if any)

- AllAssociatedDesktopGroupUids (System.Int32[])

  List of associated desktop group uids, including desktop groups that are indirectly associated with the application by virtue of being associated with an application group of which this application is a member.

- AllAssociatedDesktopGroupUUIDs (System.Guid[])

  List of associated desktop group UUIDs, including desktop groups that are indirectly associated with the application by virtue of being associated with an application group of which this application is a member.

- ApplicationName (System.String)

  The simple name of the application within its parent admin folder (if any)

- ApplicationType (Citrix.Broker.Admin.SDK.ApplicationType)

  The type of the application, whether HostedOnDesktop, InstalledOnClient or PublishedContent.

- AssociatedApplicationGroupUids (System.Int32[])

  List of associated application group uids.

- AssociatedApplicationGroupUUIDs (System.Guid[])

  List of associated application group UUIDs.

- AssociatedDesktopGroupPriorities (System.Int32[])

  List of directly associated desktop group priorities. Associated desktop groups is the list of desktop groups on which the application is published. When launching an application an available machine from one of the associated groups is selected. Desktop groups are searched for available machines in order of their priority.

- AssociatedDesktopGroupUids (System.Int32[])

  List of directly associated desktop group uids. Associated desktop groups is the list of desktop groups on which the application is published. The list is sorted by priority, with the highest priority group first.

- AssociatedDesktopGroupUUIDs (System.Guid[])

  List of directly associated desktop group UUIDs. Associated desktop groups is the list of desktop groups on which the application is published. The list is sorted by priority, with the highest priority group first.

- AssociatedUserFullNames (System.String[])

  List of associated users (full names). Associated users is the list of users who are given access using the application/user mapping filter.

- AssociatedUserNames (System.String[])

  List of associated users (SAM names). Associated users is the list of users who are given access using the application/user mapping filter.

- AssociatedUserSIDs (System.String[])

  List of associated users (SIDs). Associated users is the list of users who are given access using the application/user mapping filter.

- AssociatedUserUPNs (System.String[])

  List of associated users (user principle names). Associated users is the list of users who are given access using the application/user mapping filter.

- BrowserName (System.String)

  Unique browser name used to identify this application to other components in the site. This value is not visible to the end users.

- ClientFolder (System.String)

  The folder that the application belongs to as the user sees it.

- CommandLineArguments (System.String)

  The command-line arguments to use when launching the executable.

- CommandLineExecutable (System.String)

  The name including the full path of the executable file to launch.

- ConfigurationSlotUids (System.Int32[])

  Uids of any configuration slots which hold machine configurations associated with the application. The order of slot UIDs in this list correspond with the order of items in the associated

MachineConfigurationNames and MachineConfigurationUids list properties, and so the same slot UID can appear more than once.

- CpuPriorityLevel (Citrix.Broker.Admin.SDK.CpuPriorityLevel)

  The CPU priority of the launched process. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High.

- Description (System.String)

  Optional application description. This description is visible to the end users.

- DoNotEnumerate (System.Boolean)

  Specifies if the application is returned to the user by enumeration.

- Enabled (System.Boolean)

  Specifies whether or not this application can be launched.

- HomeZoneName (System.String)

  Name of optional preferred home zone for launching the application.

- HomeZoneOnly (System.Boolean)

  Indicates that if the preferred zone for launching the application is its home zone but no machine is available from that zone then the launch fails.

- HomeZoneUid (System.Guid?)

  Optional preferred home zone for launching the application.

- IconFromClient (System.Boolean)

  Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

- IconUid (System.Int32?)

  The icon UID used for this application. If not specified a generic icon is used.

- IgnoreUserHomeZone (System.Boolean)

  Indicates that when launching the application and the user has a home zone specified then the user's home zone preference should be ignored.

- LocalLaunchDisabled (System.Boolean)

  When launching a published application from within a published desktop, do not launch the application in that desktop session.

- MachineConfigurationNames (System.String[])

  The MachineConfiguration names associated with the application.

- MachineConfigurationUids (System.Int32[])

  The MachineConfiguration uids associated with the application.

- MaxPerMachineInstances (System.Int32)

  Maximum allowed concurrently running instances of the application that an individual machine can have. A value of zero allows unlimited usage subject to any site-wide limit.

- MaxPerUserInstances (System.Int32)

  Maximum allowed concurrently running instances of the application that an individual user can have. A value of zero allows unlimited usage subject to any site-wide limit.

- MaxTotalInstances (System.Int32)

  Maximum allowed total of concurrently running instances of the application in the site. A value of zero allows unlimited usage.

- MetadataKeys (System.String[])

  All key names of metadata items associated with this application.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this application.

- Name (System.String)

  Unique administrative name of application; this will include any parent admin folder hierarchy separated by backslash characters.

- PackagedApplicationId (System.String)

  The Id of the Packaged Application in the AppLibrary

- PackagedApplicationType (System.String)

  The packaging technology used to create this application

- PublishedName (System.String)

  Published name of application as seen by end user. If not specified value used defaults to the administrative name.

- SecureCmdLineArgumentsEnabled (System.Boolean)

  Specifies whether the command-line arguments should be secured.

- ShortcutAddedToDesktop (System.Boolean)

  Specifies whether a shortcut to the application should be placed on the user device.

- ShortcutAddedToStartMenu (System.Boolean)

  Specifies whether a shortcut to the application should be placed in the user's Start menu on their user device.

- StartMenuFolder (System.String)

  The name of the Start menu folder that holds the application shortcut.

- Tags (System.String[])

  A list of tags associated with the application.

- Uid (System.Int32)

  A unique identifier of the application.

- UserFilterEnabled (System.Boolean)

  Indicates if application-specific user filter is enabled.

- UUID (System.Guid)

  UUID of the application.

- Visible (System.Boolean)

  Specifies if the application is visible to users.

- WaitForPrinterCreation (System.Boolean)

  Specifies whether the VDA delays starting the app until printers are set up or not.

- WorkingDirectory (System.String)

  The working directory the executable is launched from.

Examples

EXAMPLE 1

Returns the application with the Name of “Notepad”.

```
1  Get-BrokerApplication Notepad
```

EXAMPLE 2

Returns the applications that have a PublishedName starting with “Note”and that are enabled.

```
1  Get-BrokerApplication -PublishedName Note* -Enabled $true
```

Parameters

-Uid

Gets only the application with the specified unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only the applications matching the specified name (including any parent admin folder hierarchy.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderName

Gets applications that are in admin folders matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderUid

Gets applications that are in the specified admin folder.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllAssociatedDesktopGroupUid

Gets applications associated with the desktop group identified by the uid.

The application may be either published directly on the desktop group or published indirectly on the desktop group as part of an application group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllAssociatedDesktopGroupUUID

Gets applications associated with the desktop group identified by the UUID.

The application may be either published directly on the desktop group or published indirectly on the desktop group as part of an application group.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationName

Gets applications that match the specified simple name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ApplicationType

Gets applications that match the type specified: HostedOnDesktop, InstalledOnClient or Published-Content.

Type:	ApplicationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedApplicationGroupUid

Gets applications that are members of the application group identified by the uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedApplicationGroupUUID

Gets applications that are members of the application group identified by the UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedDesktopGroupPriority

Gets applications with an associated desktop group identified by priority assigned to the pairing between an application and desktop group.

Associated desktop group is a desktop group on which the application is published.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AssociatedDesktopGroupUid

Gets applications directly associated with the desktop group identified by the uid.

The application must be published directly on the desktop group. To search for applications that may be published indirectly on the desktop group as part of an application group, use the AllAssociated-DesktopGroupUid filter instead.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedDesktopGroupUUID

Gets applications directly associated with the desktop group identified by the UUID.

The application must be published directly on the desktop group. To search for applications that may be published indirectly on the desktop group as part of an application group, use the AllAssociated-DesktopGroupUid filter instead.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserFullName

Gets applications with an associated user identified by their full name (usually 'first-name last-name').

If the 'UserFilterEnabled'property is true then access to the application is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserName

Gets applications with an associated user identified by their user name (in the form 'domain\user'). If the 'UserFilterEnabled'property is true then access to the application is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserSID

Gets applications with an associated user identified by their Windows SID. If the 'UserFilterEnabled' property is true then access to the application is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserUPN

Gets applications with an associated user identified by their user principle name (in the form 'user@domain'). If the 'UserFilterEnabled'property is true then access to the application is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BrowserName

Gets only the applications that match the supplied name. The BrowserName is usually an internal name for the application and is unique in the site.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientFolder

Gets only the applications that match the specified value for the folder the application belongs to as seen by the end-user. This folder can be seen in the Citrix Online Plug-in, in Web Services, and also potentially in the user's start menu.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CommandLineArguments

Gets only the applications that match the supplied arguments to the command-line executable.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CommandLineExecutable

Gets only the applications that match the supplied command-line executable.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-CpuPriorityLevel

Gets only the applications that have the specified value for the CPU priority level of the launched executable. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High.

Type:	CpuPriorityLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets only the applications that match the supplied description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DoNotEnumerate

Gets only the applications that have the specified value for whether the application is hidden from enumeration. Hidden applications are not visible to the user but may still be launched by other means.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets only the applications that have the specified value for whether the application is enabled. Disabled applications are still visible to users (that is controlled by the Visible setting) but cannot be launched.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HomeZoneName

Gets only applications with a home zone preference matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HomeZoneOnly

Gets only applications that have the specified behaviour with respect to forcing use of their home zone during launch.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HomeZoneUid

Gets only applications with a home zone preference matching the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconFromClient

Gets only the applications that have the specified value for whether the application icon should be retrieved from the user device.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets only the applications that use the specified icon (identified by its Uid).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreUserHomeZone

Gets only applications that have the specified behaviour with respect to ignoring user home zones during launch.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalLaunchDisabled

Gets only applications that have the specified local launch behaviour

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPerMachineInstances

Gets only applications with the specified maximum allowed concurrently running instances that an individual machine can have.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPerUserInstances

Gets only applications with the specified maximum allowed concurrently running instances that an individual user can have.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTotalInstances

Gets only applications with the specified maximum allowed total of concurrently running instances in the site.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-MetadataKey

Gets only applications whose associated metadata contains key names matching the specified value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PackagedApplicationId

Gets only the applications with the specified Packaged Application Id

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PackagedApplicationType

Gets only the applications with the specified application package type

Type:	String
Accepted values:	AppAttach, AppVDualAdmin, AppVSingleAdmin, FlexApp, Msix, NotApplicable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Gets applications whose published name matches the supplied pattern.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SecureCmdLineArgumentsEnabled

Gets only the applications that have the specified value for whether the command-line arguments should be secured. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ShortcutAddedToDesktop

Gets only the applications that match depending on whether a shortcut for the application has been added to the user device or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ShortcutAddedToStartMenu

Gets only the applications that match depending on whether a shortcut for the application has been added to Start Menu of the user device or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-StartMenuFolder

Gets only the applications that match the specified name for the start menu folder that holds the application shortcut. This is valid only for the Citrix Online Plug-in.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Tag

Gets applications associated with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserFilterEnabled

Gets only applications whose user filter is in the specified state.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets applications with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Visible

Gets only the applications that have the specified value for whether it is visible to the users.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WaitForPrinterCreation

Gets only the applications that match depending on whether the VDA delays starting the application until printers are set up.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WorkingDirectory

Gets only the applications that match the specified working directory.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopUid

Gets only the applications that have been associated (using a desktop group) to the specified desktop (identified by its Uid). Note that an application is not directly associated with a desktop, but only indirectly by which desktop group it has been published to.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationGroupUid

Gets applications that are members of the application group identified by the uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Gets only the applications that are running in the specified session (identified by its Uid).

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserSID

Gets only applications with their accessibility restricted to include the specified user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only the applications that have been published to the specified desktop group (identified by its Uid).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineConfigurationUid

Gets only applications which have an associated machine configuration identified by the given Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Application

Get-BrokerApplication returns an object for each application it gets.

Notes

Get-BrokerApplication returns just the application object, and as such is not a complete picture. The returned objects do not tell you what File-Type Associations are configured for this application, etc.

Use the following cmdlets to gather data related to applications (shown with examples of syntax):

Get-BrokerConfiguredFTA -ApplicationUid $app.Uid

Get-BrokerTag -ApplicationUid $app.Uid

Get-BrokerDesktopGroup -ApplicationUid $app.Uid

Get-BrokerDesktop -PublishedApplication $app

Get-BrokerSession -ApplicationUid $app.Uid

Get-BrokerApplicationInstance -ApplicationUid $app.Uid

Get-BrokerApplicationGroup

March 11, 2024

Gets details of configured application groups.

Syntax

```
Get-BrokerApplicationGroup
   [[-Name] <String>]
   [-AdminFolderName <String>]
   [-AdminFolderUid <Int32>]
   [-ApplicationGroupName <String>]
   [-AssociatedDesktopGroupPriority <Int32>]
   [-AssociatedDesktopGroupUid <Int32>]
```

```
    [-AssociatedDesktopGroupUUID <Guid>]
    [-AssociatedUserFullName <String>]
    [-AssociatedUserName <String>]
    [-AssociatedUserSID <String>]
    [-AssociatedUserUPN <String>]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-Metadata <String>]
    [-RestrictToTag <String>]
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-SessionSharingEnabled <Boolean>]
    [-SingleAppPerSession <Boolean>]
    [-Tag <String>]
    [-TenantId <Guid>]
    [-TotalApplications <Int32>]
    [-TotalMachines <Int32>]
    [-TotalMachinesWithTagRestriction <Int32>]
    [-UserFilterEnabled <Boolean>]
    [-UUID <Guid>]
    [-ApplicationUid <Int32>]
    [-DesktopGroupUid <Int32>]
    [-TagUid <Int32>]
    [-UserSID <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerApplicationGroup
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerApplicationGroup cmdlet returns application groups that have been configured as part of the site.

With no parameters, Get-BrokerApplicationGroup returns all the application groups that have been configured. You also can use the parameters of Get-BrokerApplicationGroup to filter the results to just application groups you're interested in. You can also identify application groups by their UIDs or their Names.

See about_Broker_Applications for more information.

——————————BrokerApplicationGroup Object

A BrokerApplicationGroup object represents a single application group that has been configured as part of the site. It has the following properties:

- AdminFolderName (System.String)

  The name of the admin folder the application group is in (including trailing backslash), or the empty string if the application group is at the root level

- AdminFolderUid (System.Int32)

  The Uid of the admin folder the application group is in (if any)

- ApplicationGroupName (System.String)

  Name of the application group (must be unique within a Folder)

- AssociatedDesktopGroupPriorities (System.Int32[])

  List of associated desktop group priorities. This list is presented in the same order as AssociatedDesktopGroupUids and AssociatedDesktopGroupUUIDs.
  When launching an application an available machine from one of the associated desktop groups is selected. Desktop groups are searched for available machines in order of their priority.

- AssociatedDesktopGroupUids (System.Int32[])

  List of associated desktop group uids. Associated desktop groups is the list of desktop groups on which the application group is published. The list is sorted by priority, with the highest priority desktop group first.

- AssociatedDesktopGroupUUIDs (System.Guid[])

  List of associated desktop group UUIDs. Associated desktop groups is the list of desktop groups on which the application group is published. The list is sorted by priority, with the highest priority desktop group first.

- AssociatedUserFullNames (System.String[])

  List of associated users (full names). Associated users is the list of users who are given access using the application group/user mapping filter.

- AssociatedUserNames (System.String[])

  List of associated users (SAM names). Associated users is the list of users who are given access using the application group/user mapping filter.

- AssociatedUserSIDs (System.String[])

  List of associated users (SIDs). Associated users is the list of users who are given access using the application group/user mapping filter.

- AssociatedUserUPNs (System.String[])

  List of associated users (user principle names). Associated users is the list of users who are given access using the application group/user mapping filter.

- Description (System.String)

  Optional application group description. This description is visible in Citrix Studio and can be used for any purpose. As with other facets of application groups, the description is not visible to end users.

- Enabled (System.Boolean)

  Specifies whether or not the applications in this application group can be launched.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this application group.

- Name (System.String)

  Site-wide unique full path name of this application group including all containing folders, for example, Folder1\Folder2\MyApplicationGroup The name is visible in Citrix Studio and uniquely identifies the application group. As with other facets of application groups, the name is not visible to end users.

- RestrictToTag (System.String)

  Optional tag that may be used further to restrict which machines may be used for launching the application group's applications. A machine may be used by an application group if either the application group has no tag restriction or the application group does have a tag restriction and the machine is tagged with the same tag.

- Scopes (Citrix.Fma.Sdk.DelegatedAdminInterfaces.ScopeReference[])

  The list of the delegated admin scopes to which the application group belongs.

- SessionSharingEnabled (System.Boolean)

  Whether applications in this application group can share sessions with applications in other application groups (or with applications that are not a member of an application group). Applications in the same application group can always share sessions with each other, unless session sharing has been disabled by other means.

- SingleAppPerSession (System.Boolean)

  Indicates whether each application launched from this application group uses a new session or can share an existing one.

- Tags (System.String[])

  Tags associated with the application group.

- TenantId (System.Guid?)

  Identity of tenant associated with application group. Not applicable (always blank) in non-multitenant sites.

- TotalApplications (System.Int32)

  Number of applications in the application group.

- TotalMachines (System.Int32)

  Total number of machines across all desktop groups on which the application group is published.

- TotalMachinesWithTagRestriction (System.Int32)

  Total number of machines across all desktop groups on which the application group is published, and which are tagged with the tag given by the RestrictToTag property.
  The value of this property is always equal to or less than the value of the TotalMachines property. If RestrictToTag is $null, then the properties' values are equal.

- Uid (System.Int32)

  Uid of the application group.

- UserFilterEnabled (System.Boolean)

  Whether the application group's user filter is enabled.

- UUID (System.Guid)

  UUID of the application group.

Examples

EXAMPLE 1

Gets application groups whose name starts with "Account".

```
1 Get-BrokerApplicationGroup -Name "Account*"
```

EXAMPLE 2

Gets application groups for which session sharing with applications in other application groups has been disabled.

```
1 Get-BrokerApplicationGroup -SessionSharingEnabled $false
```

Parameters

-Uid

Gets the application group with the given Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets application groups whose full path name matches the supplied pattern.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderName

Gets application groups that are in admin folders matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-AdminFolderUid

Gets application groups that are in the specified admin folder.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationGroupName

Gets application groups that match the specified simple name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedDesktopGroupPriority

Gets application groups with which a desktop group has been associated with the specified priority.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedDesktopGroupUid

Gets application groups which have been associated with the specified desktop group. The desktop group is identified by its Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedDesktopGroupUUID

Gets application groups which have been associated with the specified desktop group. The desktop group is identified by its UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserFullName

Gets application groups with an associated user identified by their user name (usually 'first-name last-name').

If the 'UserFilterEnabled'property is true then access to applications in the application group is restricted to those users only. Otherwise, access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserName

Gets application groups with an associated user identified by their user name (in the form 'domain\user').

If the 'UserFilterEnabled'property is true then access to applications in the application group is restricted to those users only. Otherwise, access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserSID

Gets application groups with an associated user identified by their Windows SID.

If the 'UserFilterEnabled'property is true then access to applications in the application group is restricted to those users only. Otherwise, access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserUPN

Gets application groups with an associated user identified by their user principle name (in the form 'user@domain').

If the 'UserFilterEnabled'property is true then access to applications in the application group is restricted to those users only. Otherwise, access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets application groups whose description matches the supplied pattern.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Enabled

Gets application groups which are currently enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTag

Gets only application groups with the specified tag restriction.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-ScopeId

Gets application groups which are part of the supplied administrative scope. The scope is identified by its GUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets application groups which are part of an administrative scope whose name matches the supplied pattern.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionSharingEnabled

Gets application groups for which session sharing is enabled.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SingleAppPerSession

Specifies whether each application launched from this application group starts in its own new session or can share an existing suitable session if present.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

Gets application groups that have been tagged with a tag whose name matches the specified pattern.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantId

Gets desktop groups associated with the specified tenant identity.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalApplications

Gets application groups that contain the specified number of applications.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalMachines

Gets application groups that are published on the specified number of machines, without taking the tag restriction into account.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalMachinesWithTagRestriction

Gets application groups that are published on the specified number of machines, taking the tag restriction into account.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Gets application groups whose user filter is currently enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets the application group with the given UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets only application groups to which the given application has been added.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Gets application groups which have been added to the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TagUid

Gets application groups that have been tagged the given tag. The tag is identified by its Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserSID

Gets application groups for which the specified user is a member of the user filter. The user account is identified by its SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ApplicationGroup

Get-BrokerApplicationGroup returns an object for each matching application group.

Notes

Application groups are explained in about_Broker_Applications.

To perform greater-than or less-than comparisons, use -Filter. For more information, see about_Broker_Filtering and the examples.

Get-BrokerApplicationInstance

March 11, 2024

Gets the running applications on the desktops.

Syntax

```
Get-BrokerApplicationInstance
   [-ApplicationName <String>]
   [-ApplicationUid <Int32>]
   [-ApplicationUUID <Guid>]
   [-Instances <Int32>]
   [-MachineName <String>]
   [-MachineUid <Int32>]
   [-Metadata <String>]
   [-SessionKey <Guid>]
   [-SessionUid <Int64>]
   [-UserName <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerApplicationInstance
   -Uid <Int64>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Get-BrokerApplicationInstance gets the published applications that are running on desktops.

Only published applications that are launched from a Citrix client are returned. If a user launches an application from within a session (by double-clicking on an attachment from an email, for example) this will not show up in the list of running applications.

Also note that this is a list of launched published applications, not a list of processes running on the desktop. In some cases the original process associated with the published application may no longer be running, but if the session is still running the published application may be listed as running.

The number of instances for each published application running in a session is also returned. For example, if a user launches two Notepad applications from a Citrix client, and session-sharing occurs such that both Notepad applications run in the same session, then the Instances property indicates that 2 copies are running in the session.

See Get-BrokerApplication and Get-BrokerSession to get the details for the applications and sessions, respectively.

The Get-BrokerMachine cmdlet also returns a list of published applications that are running on a desktop. See the "ApplicationsInUse"attribute of the returned desktop objects.

——————————BrokerApplicationInstance Object

The BrokerApplicationInstance object represents an instance of a published application in the site. It contains the following properties:

- ApplicationName (System.String)

  The administrative name of the application.

- ApplicationUid (System.Int32)

  The UID of the application.

- ApplicationUUID (System.Guid)

  The UUID of the application.

- Instances (System.Int32)

  The number of times this published application is running in the specified session.

- MachineName (System.String)

  Machine's SAM name (of the form domain\machine). If SAM name is unavailable, contains the machines's SID.

- MachineUid (System.Int32)

  UID of underlying machine.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this application instance.

- SessionKey (System.Guid)

  The key of the session.

- SessionUid (System.Int64)

  The UID of the session.

- Uid (System.Int64)

  The unique identifier for this application instance object itself, distinct from the Uids of either application or session. objects.

- UserName (System.String)

  User name (SAMName).

Examples

EXAMPLE 1

Returns the application instance with a Uid of 3. Note that this
is the unique identifier for application instances, which is distinct from the
unique identifiers of either application or session objects.

```
Get-BrokerApplicationInstance -Uid 3
```

EXAMPLE 2

Returns all the application instances for the Notepad application.
Use this to see if there are any launched instances of Notepad
running in your site and, if so, from which desktops.

```
$app = Get-BrokerApplication Notepad
Get-BrokerApplicationInstance -ApplicationUid $app.Uid
```

EXAMPLE 3

Returns all the applications that are running on the “Worker1”machine
in the “ACME”domain. Use this to see which published applications
are running on a specific machine.
Note that the SessionUid, not the SessionId, is specified as a parameter to this
cmdlet. The SessionId is a unique identifier that Remote Desktop Services uses to
track the session, and is unique only on that machine. The SessionUid, on the other
hand, is unique across the entire site.
The “ApplicationsInUse”attribute of the returned session object also provides

a list of running launched applications, and in many cases might be more convenient to use. It returns a list of application BrowserNames.

```
$sessions = Get-BrokerSession -MachineName "ACME\Worker1"
for ($i=0; $i -lt $sessions.Length; $i++) {

            Get-BrokerApplicationInstance -SessionUid $sessions[$i].
               SessionUid
           }
```

Parameters

-Uid

Gets only the application instances specified by the unique identifier. This is the unique identifier for the application instance object itself, and is distinct from the Uids of either application or session objects.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationName

Gets only application instances for the specified application name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-ApplicationUid

Gets only application instances for the specified application Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUUID

Gets only the application instances for the specified application UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Instances

Gets only application instances that match the specified number of instances.

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets only application instances running on the specified machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineUid

Gets only application instances running on the machine with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionKey

Gets only application instances for the published applications running in the specified session.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Gets only application instances for the published applications running in the specified session.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserName

Gets only application instances being run by the specified users.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ApplicationInstance

Get-BrokerApplicationInstance returns an object for each application instance it gets.

Get-BrokerAssignmentPolicyRule

March 11, 2024

Gets desktop rules from the site's assignment policy.

Syntax

```
Get-BrokerAssignmentPolicyRule
   [[-Name] <String>]
   [-ColorDepth <ColorDepth>]
   [-Description <String>]
   [-DesktopGroupUid <Int32>]
   [-Enabled <Boolean>]
```

```
    [-ExcludedUser <User>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-IconUid <Int32>]
    [-IncludedUser <User>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-MaxDesktops <Int32>]
    [-Metadata <String>]
    [-PublishedName <String>]
    [-SecureIcaRequired <Boolean>]
    [-UUID <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerAssignmentPolicyRule
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns desktop rules matching the specified search criteria from the site's assignment policy. If no search criteria are specified, all desktop rules in the assignment policy are obtained.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

——————————BrokerAssignmentPolicyRule Object

The BrokerAssignmentPolicyRule object represents a single desktop rule within the site's assignment policy. It contains the following properties:

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth?)

  The color depth of desktop sessions launched by the user from machines assigned to them by the rule. If null, the equivalent setting from the rule's desktop group is used.

- Description (System.String)

  Optional description of the rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

- DesktopGroupUid (System.Int32)

  The unique ID of the desktop group to which the rule applies.

- Enabled (System.Boolean)

  Indicates whether the rule is enabled. A disabled rule is ignored when evaluating the site's assignment policy.

- ExcludedUserFilterEnabled (System.Boolean)

  Indicates whether the excluded users filter is enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

- ExcludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to machine assignments from the rule's desktop group.

- IconUid (System.Int32?)

  The unique ID of the icon used for the machine entitlement seen by the user or, after a machine is assigned by the rule, the icon for the desktop itself. If null, the equivalent setting from the rule's desktop group is used.

- IncludedUserFilterEnabled (System.Boolean)

  Indicates whether the included users filter is enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly entitled to the machine assignments described by the rule.
  For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

- IncludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The included users filter of the rule, that is, the users and groups who are entitled to machine assignments from the rule's desktop group.

- MaxDesktops (System.Int32)

  The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  A collection of arbitrary key/value pairs that can be associated with the rule. The administrator can use these values for any purpose; they are not used by the site itself in any way.

- Name (System.String)

The administrative name of the rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

- PublishedName (System.String)

  The published name of the desktop entitlement seen by the user or, after a machine is assigned by the rule, the published name of the desktop itself. If null, the equivalent setting from the rule's desktop group is used.

- SecureIcaRequired (System.Boolean?)

  Indicates whether the rule requires the SecureICA protocol for desktop sessions launched using a machine assigned by the rule. If null, the equivalent setting from the rule's desktop group is used.

- Uid (System.Int32)

  The unique ID of the rule itself.

- UUID (System.Guid)

  UUID of the rule.

Examples

EXAMPLE 1

Returns all desktop rules from the assignment policy. This offers a complete description of the current site's assignment policy with respect to machine assignment entitlements for delivery of desktop sessions from private desktop groups.

```
Get-BrokerAssignmentPolicyRule
```

EXAMPLE 2

Returns all rules in the assignment policy that give users entitlements to machine assignments in the Sales Support desktop group for delivery of full desktop sessions.

```
$dg = Get-BrokerDesktopGroup 'Sales Support'
Get-BrokerAssignmentPolicyRule -DesktopGroupUid $dg.Uid
```

Parameters

-Uid

Gets the desktop rule with the specified unique ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only desktop rules with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ColorDepth

Gets only desktop rules with the specified color depth.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets only desktop rules with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only desktop rules that apply to the desktop group with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets only rules that are in the specified state, either enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUser

Gets only desktop rules that have the specified user in their excluded users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Gets only desktop rules that have their excluded user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets only desktop rules using the icon with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUser

Gets only desktop rules that have the specified user in their included users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Gets only desktop rules that have their included user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDesktops

Gets only desktop rules granting the specified number of machine assignment entitlements.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Gets only desktop rules with the specified published name, that is, the desktop name that the end user sees.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SecureIcaRequired

Gets only desktop rules that require desktop sessions to machines assigned by the rule to use the SecureICA protocol ($true) or not ($false).

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets rules with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

Get-BrokerAssignmentPolicyRule returns all assignment policy rules that match the specified selection criteria.

Get-BrokerAutoTagRule

March 11, 2024

Gets AutoTagRules that have been defined for this site.

Syntax

```
Get-BrokerAutoTagRule
    [[-Name] <String>]
    [-Description <String>]
    [-Metadata <String>]
    [-ObjectType <String>]
    [-RuleText <String>]
    [-TagUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerAutoTagRule
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves AutoTagRules matching the specified criteria. If no parameters are specified this cmdlet enumerates all catalogs.

See about_Broker_Filtering for information about advanced filtering options.

————————BrokerAutoTagRule Object

The BrokerAutoTagRule object represents a single instance of an AutoTagRule.

See about_Broker_AutoTagRule for more information.

A BrokerAutoTagRule contains the following properties:

- Description (System.String)

Description of the AutoTagRule

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  The metadata for the AutoTagRule.

- Name (System.String)

  The name of the AutoTagRule

- ObjectType (System.String)

  The object type the rule is applied to.

- RuleText (System.String)

  The rule in a text format

- TagUid (System.Int32)

  The Tag Uid this rule sets or removes

- Uid (System.Int32)

  The Uid of the AutoTagRule

Examples

EXAMPLE 1

Gets the AutoTagRules with the name RandomAllocatedCatalogs

```
1  Get-AutoTagRule -Name RandomAllocatedCatalogs
```

Parameters

-Uid

Gets the AutoTagRule with the unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Name

Gets AutoTagRules that have the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets the AutoTagRules that have the specified Description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ObjectType

Gets the AutoTagRules that operate on the ObjectType.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RuleText

Gets the AutoTagRules that have the specified RuleText.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TagUid

Gets the AutoTagRule associated with the TagUid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AutoTagRule

Get-AutoTagRule returns matching AutoTagRule objects.

Get-BrokerCatalog

March 11, 2024

Gets catalogs configured for this site.

Syntax

```
Get-BrokerCatalog
   [[-Name] <String>]
   [-AdminFolderName <String>]
   [-AdminFolderUid <Int32>]
```

```
    [-AllocationType <AllocationType>]
    [-AppDnaAnalysisState <AppDnaAnalysisState>]
    [-AssignedCount <Int32>]
    [-AvailableAssignedCount <Int32>]
    [-AvailableCount <Int32>]
    [-AvailableUnassignedCount <Int32>]
    [-CatalogName <String>]
    [-Description <String>]
    [-HypervisorConnectionUid <Int32>]
    [-IsRemotePC <Boolean>]
    [-MachinesArePhysical <Boolean>]
    [-MdmEnrollment <String>]
    [-Metadata <String>]
    [-MinimumFunctionalLevel <FunctionalLevel>]
    [-PersistUserChanges <PersistUserChanges>]
    [-ProvisioningSchemeId <Guid>]
    [-ProvisioningType <ProvisioningType>]
    [-PvsAddress <String>]
    [-PvsDomain <String>]
    [-RemotePCDesktopGroupPriority <Int32>]
    [-RemotePCDesktopGroupUid <Int32>]
    [-RemotePCHypervisorConnectionUid <Int32>]
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-SessionSupport <SessionSupport>]
    [-Tag <String>]
    [-TenantId <Guid>]
    [-TimeZone <String>]
    [-UnassignedCount <Int32>]
    [-UsedCount <Int32>]
    [-UUID <Guid>]
    [-ZoneHealthy <Boolean>]
    [-ZoneName <String>]
    [-ZoneUid <Guid>]
    [-MachineUid <Int32>]
    [-TagUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerCatalog
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves catalogs matching the specified criteria. If no parameters are specified this cmdlet enumerates all catalogs.

See about_Broker_Filtering for information about advanced filtering options.

——————————BrokerCatalog Object

The catalog object returned represents a group of related physical or virtual machines that have been configured in the site.

See about_Broker_Machines for more information.

- AdminFolderName (System.String)

  The name of the admin folder the catalog is in (including trailing backslash), or the empty string if the catalog is at the root level

- AdminFolderUid (System.Int32)

  The Uid of the admin folder the catalog is in (if any)

- AllocationType (Citrix.Broker.Admin.SDK.AllocationType)

  Denotes how the the machines in the catalog are allocated to a user.
  Possible values are:

  - Static: Machines get assigned to a user either by the admin or on first use. This relationship is static and changes only if an admin explicitly changes the assignments.
  - Random: Machines are allocated to users randomly from a pool of available machines.

- AppDnaAnalysisState (Citrix.Broker.Admin.SDK.AppDnaAnalysisState?)

  The AppDNA Analysis State of the catalog

- AssignedCount (System.Int32)

  The number of assigned machines (machines that have been assigned to a user/users or a client name/address).

- AvailableAssignedCount (System.Int32)

  The number of available machines (not in a desktop group), that are also assigned to users.

- AvailableCount (System.Int32)

  The number of available machines (those not in any desktop group).

- AvailableUnassignedCount (System.Int32)

  The number of available machines (those not in any desktop group) that are not assigned to users.

- CatalogName (System.String)

  Name of the catalog (must be unique within a Folder)

- Description (System.String)

  Description of the catalog.

- HypervisorConnectionUid (System.Int32?)

  The Uid of the hypervisor connection that is associated with the machines in the catalog. This property only applies to MCS provisioned catalogs. For other provisioning types machines can be from one or more different hypervisor connections.

- IsRemotePC (System.Boolean)

  Specifies whether or not the catalog is a RemotePC catalog. Remote PC catalogs automatically configure appropriate machines without the need for manual configuration. See about_Broker_RemotePC for more information.

- MachinesArePhysical (System.Boolean)

  Specifies whether or not the machines in the catalog can be power-managed by the broker.

- MdmEnrollment (System.String)

  Indicates the MdmEnrollment of the catalog.
  Possible values:

  - None: No Mdm.
  - Intune: Microsoft Intune.
  - IntuneWithCitrixTags: Microsoft Intune with Citrix tags.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Holds any metadata associated with the catalog.

- MinimumFunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel)

  The expected minimal functional level of the machines in the catalog.

- Name (System.String)

  Site-wide unique full path name of the catalog including all containing folders, for example, Folder1\Folder2\MyCatalog.

- PersistUserChanges (Citrix.Broker.Admin.SDK.PersistUserChanges)

  Specifies how user changes are persisted on machines in the catalog. Possible values are:

  - OnLocal: User changes are stored on the machine's local storage.
  - Discard: User changes are discarded.

- ProvisioningSchemeId (System.Guid?)

  The GUID of the provisioning scheme (if any) associated with the catalog. This only applies if the provisioning type is MCS.

- ProvisioningType (Citrix.Broker.Admin.SDK.ProvisioningType)

  Specifies how the machines are provisioned in the catalog. Possible values are:

  - Manual: No provisioning.
  - PVS: Machine provisioned by PVS (machine may be physical, blade, VM…)
  - MCS: Machine provisioned by MCS (machine must be a VM).

- PvsAddress (System.String)

  IP address of the PVS server to be used in a catalog with a PVS ProvisioningType.

- PvsDomain (System.String)

  The domain of the PVS server to be used in a catalog with a PVS ProvisioningType.

- RemotePCDesktopGroupPriorities (System.Int32[])

  Remote PC desktop groups'association priorities.

- RemotePCDesktopGroupUids (System.Int32[])

  UIDs of the Remote PC desktop groups associated with this catalog.

- RemotePCHypervisorConnectionUid (System.Int32?)

  UID of the hypervisor connection used for powering on RemotePC machines in this catalog (only for catalogs with IsRemotePC set to true).

- Scopes (Citrix.Fma.Sdk.DelegatedAdminInterfaces.ScopeReference[])

  The list of the delegated admin scopes to which the catalog belongs.

- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport)

  Specifies the session support of the machines in the catalog. Valid values are: SingleSession, MultiSession.

- Tags (System.String[])

  Tags associated with the catalog.

- TenantId (System.Guid?)

  Identity of tenant associated with catalog. Not applicable (always blank) in non-multitenant sites.

- TimeZone (System.String)

  The timezone that desktops in the catalog are in (for catalog reboot schedule purposes).

- Uid (System.Int32)

  Uid of the catalog.

- UnassignedCount (System.Int32)

  The number of unassigned machines (machines not assigned to users).

- UsedCount (System.Int32)

  The number of machines in the catalog that are in a desktop group.

- UUID (System.Guid)

  The global ID of the catalog.

- ZoneHealthy (System.Boolean?)

  Health state of the Zone associated with this catalog.

- ZoneName (System.String)

  Name of the Zone associated with this catalog.

- ZoneUid (System.Guid)

  Uid of the Zone associated with this catalog.

Examples

EXAMPLE 1

These commands return all catalogs containing machines that are randomly assigned to users. The second form uses advanced filtering (see about_Broker_Filtering).

```
Get-BrokerCatalog -AllocationType Random
Get-BrokerCatalog -Filter {
  AllocationType  -eq 'Random' }
```

EXAMPLE 2

This command returns catalogs with more than 10 unused machines that are available for assignment to users.

```
Get-BrokerCatalog -Filter {
  AvailableCount  -gt 10 }
```

EXAMPLE 3

This command returns the unmanaged catalog with the highest number of available machines.

```
Get-BrokerCatalog -MaxRecordCount 1 -ProvisioningType Manual -SortBy '-
    AvailableCount'
```

Parameters

-Uid

Get catalogs with the specified UID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets catalogs whose full path name matches the specified supplied pattern.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderName

Gets catalogs that are in admin folders matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderUid

Gets catalogs that are in the specified admin folder.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllocationType

Gets catalogs that are of the specified allocation type. Values can be:

- Static - Machines in a catalog of this type are permanently assigned to a user.
- Permanent - equivalent to 'Static'.
- Random - Machines in a catalog of this type are picked at random and temporarily assigned to a user.

Type:	AllocationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AppDnaAnalysisState

Gets catalogs that have of the specified AppDNA Analysis State. Values can be:

- None - No AppDNA analysis has not been preformed.
- Capturing - AppDNA analysis is running and capturing infomation from a catalog machine.
- Canceled - The AppDNA analysis process was cancelled.
- Ready - The AppDNA analysis process has finished correctly.
- Failed - The AppDNA analysis process failed.
- Importing - AppDNA analysis is running and uploading results to the AppDNA server.

Type:	AppDnaAnalysisState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedCount

Gets catalogs containing a specified number of assigned machines (machines that have been assigned to users).

This property is typically used with advanced filtering; see about_Broker_Filtering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AvailableAssignedCount

Gets catalogs containing a specified number of available machines (those not in any desktop group) that are also assigned to users.

This property is typically used with advanced filtering; see about_Broker_Filtering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AvailableCount

Gets catalogs containing a specified number of available machines (those not in any desktop group).

This property is typically used with advanced filtering; see about_Broker_Filtering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AvailableUnassignedCount

Gets catalogs containing a specified number of available machines (those not in any desktop group) that are not assigned to users.

This property is typically used with advanced filtering; see about_Broker_Filtering.

Type:	Int32

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets Catalogs that match the specified simple name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets catalogs with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets catalogs associated with the specified hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsRemotePC

Gets catalogs with the specified IsRemotePC value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesArePhysical

Specifies whether machines in the catalog can be power-managed by the Citrix Broker Service. Where the Citrix Broker Service cannot control the power state of the machine specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the legacy CatalogKind parameter only with a Pvs catalog kind.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MdmEnrollment

Gets catalogs that have the specified MdmEnrollment. Values can be:

- None - No enrollment.
- Intune - Microsoft Intune.

Type:	String
Accepted values:	Intune, IntuneWithCitrixTags, None
Position:	Named
Default value:	If no value is provided, the catalog does not enroll with Mdm.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MinimumFunctionalLevel

Gets catalogs with a specific MinimumFunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25, L7_30, L7_34

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PersistUserChanges

Gets catalogs with the specified behavior when persisting changes made by the end user. Possible values are:

- OnLocal - User changes are stored on the machine's local storage.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeId

Gets catalogs associated with the specified provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

Specifies the provisioning type for the catalog. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,…).
- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvsAddress

Gets catalogs containing machines provided by the Provisioning Services server with the specified address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PvsDomain

Gets catalogs containing machines provided by the Provisioning Services server in the specified domain.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RemotePCDesktopGroupPriority

Gets Remote PC catalogs with a Remote PC desktop group association with the specified priority.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemotePCDesktopGroupUid

Gets Remote PC catalogs associated with the specified Remote PC desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemotePCHypervisorConnectionUid

Gets Remote PC catalogs associated with the specified Remote PC hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeId

Gets catalogs that are associated with the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets catalogs that are associated with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionSupport

Gets catalogs that have the specified session capability. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

Gets catalogs tagged with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantId

Gets catalogs associated with the specified tenant identity.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TimeZone

Gets catalogs with the specified value of TimeZone.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UnassignedCount

Gets catalogs containing a specified number of unassigned machines (machines not assigned to users).

This property is typically used with advanced filtering; see about_Broker_Filtering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UsedCount

Gets catalogs containing a specified number of machines used in a desktop group.

This property is typically used with advanced filtering; see about_Broker_Filtering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Get catalogs with the specified global ID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneHealthy

Gets catalogs located in the zone with the specified health state.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Gets catalogs located in the zone with the specified name.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneUid

Gets machines located in the zone with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets the catalog containing the machine referenced by the specified unique identifier (UID).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TagUid

Gets catalogs to which the specified tag (identified by its Uid) has been added to help identify it - see Add-BrokerTag for more information.

Type:	Int32

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Catalog

Get-BrokerCatalog returns an object for each matching catalog.

Get-BrokerCatalogRebootSchedule

March 11, 2024

Gets one or more catalog reboot schedules.

Syntax

```
Get-BrokerCatalogRebootSchedule
    [[-Name] <String>]
    [-Active <Boolean>]
    [-CatalogName <String>]
    [-CatalogUid <Int32>]
    [-Enabled <Boolean>]
    [-MaxOvertimeStartMins <Int32>]
    [-RebootDuration <Int32>]
    [-StartDate <String>]
    [-StartTime <TimeSpan>]
    [-WarningRepeatInterval <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerCatalogRebootSchedule
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerCatalogRebootSchedule cmdlet is used to enumerate catalog reboot schedules that match all of the supplied criteria.

A catalog reboot schedule can be configured to cause all of the machines in a catalog to be rebooted once at a particular time and day, with the reboot of the individual machines spread out over the duration of the whole reboot cycle. A specific warning message can be configured to be displayed to users who are running sessions on the machines being rebooted.

See about_Broker_Filtering for information about advanced filtering options.

——————————BrokerCatalogRebootSchedule Object

The catalog reboot schedule object returned represents a scheduled reboot of machines in a catalog.

- Active (System.Boolean)

  True if there is an active reboot cycle for this schedule, false otherwise.

- CatalogName (System.String)

  Name of the catalog rebooted by this schedule.

- CatalogUid (System.Int32)

  Uid of the catalog rebooted by this schedule.

- Description (System.String)

  An optional description for the reboot schedule.

- Enabled (System.Boolean)

  True if this schedule is currently enabled, false otherwise.

- MaxOvertimeStartMins (System.Int32)

  Maximum delay in minutes after which the scheduled reboot will not take place

- Name (System.String)

  Name of the reboot schedule.

- RebootDuration (System.Int32)

  Approximate maximum number of minutes over which the scheduled reboot cycle runs.

- StartDate (System.String)

  The date on which the schedule is expected to run, date is in ISO 8601 Format (YYYY-MM-DD).

- StartTime (System.TimeSpan)

  Time of day at which the scheduled reboot cycle starts.

- Uid (System.Int32)

  Uid of the reboot schedule.

- WarningDuration (System.Int32)

  Number of minutes to display the warning message for.

- WarningMessage (System.String)

  Warning message to display to users in active sessions prior to rebooting the machine.

- WarningRepeatInterval (System.Int32)

  Number of minutes to wait before displaying the warning message again.

- WarningTitle (System.String)

  Title of the warning message dialog.

Examples

EXAMPLE 1

Enumerates all of the catalog reboot schedules.

```
Get-BrokerCatalogRebootSchedule
```

EXAMPLE 2

Enumerates all disabled catalog reboot schedules.

```
Get-BrokerCatalogRebootSchedule -Enabled $false
```

EXAMPLE 3

Returns the catalog reboot schedules for the catalog having the Uid 11.

```
Get-BrokerCatalogRebootSchedule -CatalogUid 11
```

Parameters

-Uid

Gets the reboot schedule with the specified Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets the reboot schedule with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Active

Gets desktop group reboot schedules according to whether they are currently active or not. A schedule is active if there is a reboot cycle currently running that was started as a result of the schedule.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets the reboot schedules for the catalog having this name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogUid

Gets the reboot schedules for the catalog having this Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets the reboot schedules with the specified Enabled value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxOvertimeStartMins

Maximum delay in minutes after which the scheduled reboot will not take place

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Gets the reboot schedules with the specified duration.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartDate

Gets the reboot schedules with the specified start date (YYY-MM-DD).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-StartTime

Gets the reboot schedules with the specified start time (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Gets the reboot schedules with the specified warning repeat interval.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.CatalogRebootSchedule

Returns matching catalog reboot schedules.

Get-BrokerConfigurationSlot

March 11, 2024

Gets configuration slots configured for this site.

Syntax

```
Get-BrokerConfigurationSlot
    [[-Name] <String>]
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerConfigurationSlot
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Get the list of configuration slots defined for this site. Each configuration slot determines a collection of related settings that can be specified in a machine configuration associated with this slot.

For example, a configuration slot may be defined to configure only "User Profile Manager"settings.

See about_Broker_Filtering for information about advanced filtering options.

————————BrokerConfigurationSlot Object

The configuration slot object returned represents a named collection of related settings.

- Description (System.String)

  Optional description of this configuration slot.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  A map of metadata associated with this configuration slot.

- Name (System.String)

  Unique name of this configuration slot.

- SettingsGroup (System.String)

  The encoded identity of the settings group that every setting in the associated machine configuration instances must belong to.

- Uid (System.Int32)

  Unique Uid of this configuration slot.

Examples

EXAMPLE 1

Retrieves every configuration slot.

```
Get-BrokerConfigurationSlot
```

EXAMPLE 2

Retrieves the configuration slot named “AppV”.

```
Get-BrokerConfigurationSlot -Name "AppV"
```

Parameters

-Uid

Get only the configuration slot with the specified unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Get only the configuration slot with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ConfigurationSlot

Get-BrokerConfigurationSlot returns an object for each matching slot.

Get-BrokerConfiguredFTA

March 11, 2024

Gets any file type associations configured for an application.

Syntax

```
Get-BrokerConfiguredFTA
    [-ApplicationUid <Int32>]
    [-ContentType <String>]
    [-ExtensionName <String>]
    [-HandlerDescription <String>]
    [-HandlerName <String>]
    [-HandlerOpenArguments <String>]
    [-UUID <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerConfiguredFTA
   -Uid <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets any file type associations that are configured for content redirection to a published application.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Configured file type associations are different from imported file type associations. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection. Imported file type associations are lists of known file type associations for a given desktop group. See Update-BrokerImportedFTA for more information about imported file type associations.

——————————BrokerConfiguredFTA Object

The BrokerConfiguredFTA object represents a file type association configured for a published application. It contains the following properties:

- ApplicationUid (System.Int32)

The Uid of the application configured for the file type association.

- ContentType (System.String)

  Content type of the file, such as “text/plain”or “application/vnd.ms-excel”.

- ExtensionName (System.String)

  A single file extension, such as .txt, unique within the scope of a desktop group.

- HandlerDescription (System.String)

  File type description, such as “Test Document”, “Microsoft Word Text Document”, etc.

- HandlerName (System.String)

  File type handler name, e.g. “Word.Document.8”or TXTFILE.

- HandlerOpenArguments (System.String)

  The arguments used for the ‘open’action on files of this type.

- Uid (System.Int32)

  Unique internal identifier of configured file type association.

- UUID (System.Guid)

  UUID of the configured file type association.

Examples

EXAMPLE 1

Returns all configured file type associations.

```
Get-BrokerConfiguredFTA
```

EXAMPLE 2

Returns only configured file type associations

that have a “.txt”extension.

```
Get-BrokerConfiguredFTA -ExtensionName ".txt"
```

Parameters

-Uid

Gets only the configured file type association for the specified unique identifier.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets only the configured file type associations for the specified application unique identifier.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ContentType

Gets only the configured file type associations for the specified content type (as seen in the Registry). For example, “text/plain”or “application/msword”.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExtensionName

Gets only the configured file type associations for the specified extension name. For example, “.txt”or “.doc”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HandlerDescription

Gets only the configured file type associations for the specified handler description. For example, “Text Document”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HandlerName

Gets only the configured file type associations for the

specified handler name. For example, “TXTFILE”or “Word.Document.8”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HandlerOpenArguments

Gets only the configured file type associations for the

specified open argument to the handler. For example, “%1”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UUID

Gets configured file type associations with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32

Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

No input is accepted from the pipeline.

Outputs

Citrix.Broker.Admin.SDK.ConfiguredFTA

This cmdlet returns one or more ConfiguredFTA objects.

Get-BrokerConnectionLog

March 11, 2024

Get entries from the site's session connection log.

Syntax

```
Get-BrokerConnectionLog
   [[-MachineName] <String>]
   [-BrokeringTime <DateTime>]
   [-BrokeringUserName <String>]
   [-BrokeringUserUPN <String>]
   [-ConnectionFailureReason <ConnectionFailureReason>]
   [-Disconnected <Boolean>]
   [-EndTime <DateTime>]
   [-EstablishmentTime <DateTime>]
   [-MachineDNSName <String>]
   [-MachineUid <Int32>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
```

```
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerConnectionLog
    [-Uid] <Int64>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets connection log entries matching the specified criteria. If no parameters are specified all connection log entries are returned.

The session connection log contains entries describing each brokered connection, or reconnection, attempt to a session in the site.

Each log entry describes a single connection brokering attempt to a new or existing session within the site. A single session can have multiple entries in the connection log, for example where the end user brokers a connection to a new session, disconnects and later brokers a reconnection. Conversely, other sessions may have none (e.g. console sessions).

By default connection log entries are removed after 48 hours.

For information about advanced filtering options when using the -Filter parameter, see about_Broker_Filtering; for information about machines, see about_Broker_Machines.

————————BrokerConnectionLog Object

The BrokerConnectionLog object represents a single brokered connection attempt to a new or existing session on a machine in the site. It contains the following properties:

- BrokeringTime (System.DateTime)

  The time at which the connection attempt was made.

- BrokeringUserName (System.String)

  The name of the user making the connection (in DOMAIN\User format).

- BrokeringUserUPN (System.String)

  The name of the user making the connection (in `user@upndomain.com` format).

- ConnectionFailureReason (Citrix.Broker.Admin.SDK.ConnectionFailureReason?)

  The status of the connection attempt. A value of None indicates that the connection was successfully established, $null that the attempt is still in progress, and other values indicate that the attempt failed for the specified reason.

- Disconnected (System.Boolean?)

  Indicates if the connection was ended by disconnection (True), logoff or establishment failure (False), or is still active ($null).

- EndTime (System.DateTime?)

  The time at which the connection ended. If the connection ended by disconnection, the underlying machine session would still exist in a disconnected state.

- EstablishmentTime (System.DateTime?)

  The time at which the connection was successfully established. The value is $null if the connection attempt failed or is still in progress.

- MachineDNSName (System.String)

  The name of the machine to which the connection was made (in `machine@dnsdomain.com` form).

- MachineName (System.String)

  The name of the machine to which the connection was made (in DOMAIN\Machine format).

- MachineUid (System.Int32)

  The UID of the machine to which the connection was made.

- Uid (System.Int64)

  The UID of the connection log entry itself.

Examples

EXAMPLE 1

Gets all connection log entries for sessions brokered in the past 30 minutes, ordered first by machine name (ascending), then by session end time (descending).

```
$when = [DateTime]::Now - [TimeSpan]::FromMinutes(30)
Get-BrokerConnectionLog -Filter {
 BrokeringTime -gt $when }
  -SortBy '+MachineName,-EndTime'
```

Parameters

-Uid

Gets a specific connection log entry identified by its UID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets connection log entries for the specified machines (in DOMAIN\Machine format).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BrokeringTime

Gets connection log entries with a specified brokering time. For more flexibility when searching on brokering time use the -Filter parameter.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringUserName

Gets connection log entries for the specified users (in DOMAIN\User format).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BrokeringUserUPN

Gets connection log entries for the specified users (in `user@upndomain.com` format).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ConnectionFailureReason

Gets connection log entries which failed for the specified reason.

Type:	ConnectionFailureReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Disconnected

Gets connection log entries with the specified disconnection status, that is, whether the connection was disconnected, or logged-off.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EndTime

Gets connection log entries with the specified end time. For more flexibility when searching on end time use the -Filter parameter.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EstablishmentTime

Gets connection log entries with the specific establishment time. For more flexibility when searching on establishment time use the -Filter parameter.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MachineDNSName

Gets connection log entries for the specified machines (in `machine@dnsdomain.com` format).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineUid

Gets connection log entries for a specific machine identified by its UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or

descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ConnectionLog

An entry from the connection log.

Get-BrokerController

March 11, 2024

Gets Controllers running broker services in the site.

Syntax

```
Get-BrokerController
    [[-MachineName] <String>]
    [-ControllerVersion <String>]
    [-DesktopsRegistered <Int32>]
    [-DNSName <String>]
    [-LastActivityTime <DateTime>]
    [-LastLicensingServerEvent <LicensingServerEvent>]
    [-LastLicensingServerEventTime <DateTime>]
    [-LastStartTime <DateTime>]
    [-LicensingGraceState <LicensingGraceState>]
    [-LicensingServerState <LicensingServerState>]
    [-Metadata <String>]
    [-OSType <String>]
    [-OSVersion <String>]
    [-SID <String>]
    [-State <ControllerState>]
    [-UUID <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerController
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets Controllers from the current site that match the specified search criteria.

Controllers are server machines running instances of the broker service. The broker service is responsible for the brokering of user sessions to desktops or applications, and for power management of the underlying machines. An operational site must contain at least one Controller.

If no search criteria are specified, all Controllers in the site are obtained.

——————————BrokerController Object

The BrokerController object represents a single controller running an instance of the Broker service. It contains the following properties:

- ActiveSiteServices (System.String[])

  The Broker site services active on the controller.

- AssociatedHypervisorConnectionUids (System.Int32[])

  The UIDs of the hypervisor connections being managed by the Broker service on the controller.

- ControllerVersion (System.String)

  The version of the Broker service on the controller.

- DesktopsRegistered (System.Int32)

  The number of VDA machines registered with the Broker service on the controller.

- DNSName (System.String)

  The DNS name of the controller.

- LastActivityTime (System.DateTime?)

  The last reported activity time of the Broker service on the controller.

- LastLicensingServerEvent (Citrix.Broker.Admin.SDK.LicensingServerEvent?)

  Last significant licensing server event reported by the Broker service on the controller.

- LastLicensingServerEventDetails (System.String[])

  Additional details associated with the last significant licensing server event.

- LastLicensingServerEventTime (System.DateTime?)

  Time at which the last significant licensing server event was reported.

- LastStartTime (System.DateTime?)

  The last start-up time of the Broker service on the controller.

- LicensingGracePeriodReasons (Citrix.Broker.Admin.SDK.LicensingGracePeriodReason[])

  Current active or expired licensing grace periods in effect on the controller.

- LicensingGracePeriodTimesRemaining (System.TimeSpan[])

  Times remaining in currently active or expired licensing grace periods in effect on the controller. Expired grace periods are indicated by zero remaining time. The number and order of entries in this list matches that in the LicensingGracePeriodReasons list.

- LicensingGraceState (Citrix.Broker.Admin.SDK.LicensingGraceState)

  The licensing grace state currently in effect in the Broker service on the controller.

- LicensingServerState (Citrix.Broker.Admin.SDK.LicensingServerState)

  The licensing server state currently in effect in the Broker service on the controller.

- MachineName (System.String)

  The Windows name of the controller.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  The metadata for the controller.

- OSType (System.String)

  The Operating System type of the controller.

- OSVersion (System.String)

  The Operating System version of the controller.

- SID (System.String)

  The SID of the controller.

- State (Citrix.Broker.Admin.SDK.ControllerState)

  The state of the Broker service on the controller.

- Uid (System.Int32)

  The UID of the controller instance.

- UUID (System.Guid)

  A globally unique identifier of the controller instance.

Examples

EXAMPLE 1

Gets all Controllers in the site that are currently active (powered on and fully operational).

```
1 Get-BrokerController -State Active
```

EXAMPLE 2

Gets all Controllers in the site that started-up in the last 30 minutes.

```
1  Get-BrokerController -Filter 'LastStartTime -gt "-30:00"'
```

Parameters

-Uid

Gets only Controller with the specified unique ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets only Controllers with the specified Windows name. (‘domain\machine’)

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ControllerVersion

Gets only Controllers running the specified version of the broker service.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopsRegistered

Gets only Controllers that have the specified number of desktops currently registered. This parameter is mainly of use with advanced filtering; see about_Broker_Filtering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets only Controllers with the specified DNS name ('machine.domain')

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastActivityTime

Gets only Controllers last reported as active at the specified time. This parameter is mainly of use with advanced filtering; see about_Broker_Filtering.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastLicensingServerEvent

Gets only Controllers with the specified last license server event recorded.

Type:	LicensingServerEvent
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastLicensingServerEventTime

Gets only Controllers with its last recorded licensing server event at the specified time. This parameter is mainly of use with advanced filtering; see about_Broker_Filtering.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LastStartTime

Gets only Controllers that last started-up at the specified time. This parameter is mainly of use with advanced filtering; see about_Broker_Filtering.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicensingGraceState

Gets only Controllers in the specified licensing grace state.

Valid values are: NotActive, InOutOfBoxGracePeriod, InSupplementalGracePeriod, InEmergencyGracePeriod and GracePeriodExpired.

Type:	LicensingGraceState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicensingServerState

Gets only Controllers in the specified licensing server state. Valid values are: ServerNotSpecified, NotConnected, OK, LicenseNotInstalled, LicenseExpired, Incompatible and Failed.

Type:	LicensingServerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets only Controllers running the specified Operating System type.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OSVersion

Gets only Controllers running the specified Operating System version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SID

Gets only Controllers with the specified SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-State

Gets only Controllers currently in the specified state.

Valid values are: Failed, Off, On, and Active.

Type:	ControllerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets only the Controller with the specified GUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Controller

Returns Controllers matching all specified selection criteria.

Get-BrokerDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Broker Service.

Syntax

```
Get-BrokerDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Broker Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Broker SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Broker Service instance running on controller "controller1.mydomain.net".

```
1 Get-BrokerDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Broker Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the BrokerService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Test-BrokerDBConnection

Get-BrokerDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Broker Service.

Syntax

```
Get-BrokerDBSchema
   -DatabaseName <String>
   [-ServiceGroupName <String>]
   [-ScriptType <DatabaseScriptType>]
   [-SID <String>]
   [-LocalDatabase]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Broker Service database schema, add a new Broker service to an existing site, remove a Broker service from a site, or create a database server logon for a Broker service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Broker service instance, otherwise the scripts relate to Broker service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Broker SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Broker service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user

- Addition of database user to Broker service roles

If ScriptType is Evict, the returned script contains:

- Removal of Broker service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Broker Service and copies it to a file called "C:\BrokerSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Broker service schema.

```
Get-BrokerDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\BrokerSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Broker service. This can be used when configuring a mirror server for use.

```
Get-BrokerDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    BrokerLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Broker service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Broker services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Broker Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Broker Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Broker Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Broker Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	DatabaseScriptType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SID

Specifies the SID of the controller on which the Broker Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Broker services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Broker Service.

Syntax

```
Get-BrokerDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Broker Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Broker Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Broker Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Broker Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Broker Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-BrokerServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-BrokerDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Broker Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-BrokerDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Broker Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Broker services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-BrokerServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerDelayedHostingPowerAction

March 11, 2024

Gets power actions that are executed after a delay.

Syntax

```
Get-BrokerDelayedHostingPowerAction
    [[-MachineName] <String>]
    [-Action <PowerManagementAction>]
    [-ActionDueTime <DateTime>]
    [-DNSName <String>]
```

```
    [-HostedMachineName <String>]
    [-HypervisorConnectionName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerDelayedHostingPowerAction
    [-Uid] <Int64>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Finds all delayed power actions that match the specified search criteria.

————————BrokerDelayedHostingPowerAction Object

The BrokerDelayedHostingPowerAction object represents an instance of a power action that is executed after a delay. It contains the following properties:

- Action (Citrix.Broker.Admin.SDK.PowerManagementAction)

  The power action to apply to the machine. Possible values are ShutDown and Suspend.

- ActionDueTime (System.DateTime)

  The UTC time at which the power action is due to be queued for execution.

- DNSName (System.String)

  The fully qualified DNS name of the machine that the power action applies to.

- HostedMachineName (System.String)

  The hypervisor's name for the machine that the power action applies to.

- HypervisorConnectionUid (System.Int32)

  The unique identifier of the hypervisor connection that is associated with the target machine.

- MachineName (System.String)

  The name of the machine that the power action applies to, in the form domain\machine.

- Uid (System.Int64)

  The unique identifier of the power action.

Examples

EXAMPLE 1

Fetches records for all known delayed power actions that have not yet been queued for execution.

```
Get-BrokerDelayedHostingPowerAction
```

Parameters

-Uid

Gets only the single action record whose ID matches the specified value.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets only the records for actions that are for machines whose name (of the form domain\machine) matches the specified string.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Action

Gets only the records for actions with the specified action type.

Valid values are Shutdown and Suspend.

Type:	PowerManagementAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ActionDueTime

Gets only the records for actions due to be queued for execution at the specified time. This is useful with advanced filtering; for more information, see about_Broker_Filtering.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets only the records for actions that are for machines whose DNS name matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineName

Gets only the records for actions that are for machines whose Hosting Name (the machine name as understood by the hypervisor) matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionName

Gets only the records for actions for machines hosted through a hypervisor connection whose name matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets only the records for actions for machines hosted through a hypervisor connection whose ID matches the specified value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.DelayedHostingPowerAction

Get-BrokerDelayedHostingPowerAction returns all delayed power actions that match the specified selection criteria.

Get-BrokerDesktop

March 11, 2024

Gets desktops configured for this site.

Syntax

```
Get-BrokerDesktop
    [[-MachineName] <String>]
    [-AgentVersion <String>]
    [-ApplicationInUse <String>]
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
    [-AssociatedUserFullName <String>]
    [-AssociatedUserName <String>]
    [-AssociatedUserUPN <String>]
    [-AutonomouslyBrokered <Boolean>]
    [-CatalogName <String>]
    [-CatalogUid <Int32>]
    [-ClientAddress <String>]
    [-ClientName <String>]
    [-ClientVersion <String>]
    [-ColorDepth <ColorDepth>]
    [-ConnectedViaHostName <String>]
    [-ConnectedViaIP <String>]
    [-ControllerDNSName <String>]
    [-DeliveryType <DeliveryType>]
    [-Description <String>]
    [-DesktopCondition <String>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-DesktopKind <DesktopKind>]
    [-DeviceId <String>]
    [-DNSName <String>]
    [-FunctionalLevel <FunctionalLevel>]
    [-HardwareId <String>]
    [-HostedMachineId <String>]
    [-HostedMachineName <String>]
    [-HostingServerName <String>]
    [-HypervisorConnectionName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-IconUid <Int32>]
    [-ImageOutOfDate <Boolean>]
    [-InMaintenanceMode <Boolean>]
    [-IPAddress <String>]
    [-IsAssigned <Boolean>]
    [-IsPhysical <Boolean>]
    [-LastConnectionFailure <ConnectionFailureReason>]
    [-LastConnectionTime <DateTime>]
    [-LastConnectionUser <String>]
    [-LastDeregistrationReason <DeregistrationReason>]
    [-LastDeregistrationTime <DateTime>]
    [-LastErrorReason <String>]
    [-LastErrorTime <DateTime>]
    [-LastHostingUpdateTime <DateTime>]
    [-LaunchedViaHostName <String>]
    [-LaunchedViaIP <String>]
    [-MachineInternalState <MachineInternalState>]
    [-MachineUid <Int32>]
    [-OSType <String>]
```

```
    [-OSVersion <String>]
    [-PersistUserChanges <PersistUserChanges>]
    [-PowerActionPending <Boolean>]
    [-PowerState <PowerState>]
    [-Protocol <String>]
    [-ProvisioningType <ProvisioningType>]
    [-PublishedApplication <String>]
    [-PublishedName <String>]
    [-PvdStage <PvdStage>]
    [-RegistrationState <RegistrationState>]
    [-SecureIcaActive <Boolean>]
    [-SecureIcaRequired <Boolean>]
    [-SessionHidden <Boolean>]
    [-SessionId <Int32>]
    [-SessionState <SessionState>]
    [-SessionStateChangeTime <DateTime>]
    [-SessionUid <Int64>]
    [-SessionUserName <String>]
    [-SessionUserSID <String>]
    [-SID <String>]
    [-SmartAccessTag <String>]
    [-StartTime <DateTime>]
    [-SummaryState <DesktopSummaryState>]
    [-Tag <String>]
    [-WillShutdownAfterUse <Boolean>]
    [-ApplicationUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerDesktop
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet is now deprecated, please use Get-BrokerMachine.

Retrieves desktops matching the specified criteria. If no parameters are specified this cmdlet enumerates all desktops.

Get-BrokerDesktop returns objects that combine desktop configuration and state information.

For single-session desktops, session information is displayed if present. It is possible that there are more than one sessions present on single-session desktops if 'fast user switching'is enabled, this cmdlet will prefer to return information about brokered sessions (rather than, for example, unbrokered direct RDP sessions). If there is no session running, session related fields return $null.

For multi-session desktops, no session information is ever displayed by this cmdlet, so session related fields always return $null. Get-BrokerSession can be used to get information about sessions on both multi-session and single-session desktops.

To count desktops, rather than retrieve full details of each desktop, use Group-BrokerDesktop instead.

For information about advanced filtering options, see about_Broker_Filtering; for information about desktops, see about_Broker_Desktops.

————————BrokerDesktop Object

The desktop object returned represents a physical or virtual machine configured in the site that is able to run either a Microsoft Windows desktop environment, individual applications, or both.

- AgentVersion (System.String)

  Version of the Citrix Virtual Delivery Agent (VDA) installed on the desktop.

- ApplicationsInUse (System.String[])

  List of applications in use on the desktop (in the form of browser name).

- AssignedClientName (System.String)

  The name of the endpoint client device that the desktop has been assigned to.

- AssignedIPAddress (System.String)

  The IP address of the endpoint client device that the desktop has been assigned to.

- AssociatedUserFullNames (System.String[])

  Full names of the users that have been associated with the desktop (in the form "Firstname Lastname").
  Associated users are the current user(s) for shared desktops and the assigned users for private desktops.

- AssociatedUserNames (System.String[])

  Usernames of the users that have been associated with the desktop (usually in the form "domain\user").
  Associated users are the current user(s) for shared desktops and the assigned users for private desktops.

- AssociatedUserUPNs (System.String[])

  The user principal names of the users that have been associated with the desktop (in the form `user@upndomain.com`).
  Associated users are the current user(s) for shared desktops and the assigned users for private desktops.

- AutonomouslyBrokered (System.Boolean?)

  Session property indicating if the current session is an HDX session established by direct connection without being brokered.
  Session properties are always null for multi-session desktops.

- CatalogName (System.String)

  Name of the catalog the desktop is a member of.

- CatalogUid (System.Int32)

  UID of the catalog the desktop is a member of.

- ClientAddress (System.String)

  Session property indicating the IP address of the client connected to the desktop.
  Session properties are always null for multi-session desktops.

- ClientName (System.String)

  Session property indicating the host name of the client connected to the desktop.
  Session properties are always null for multi-session desktops.

- ClientVersion (System.String)

  Session property indicating the version of the Citrix Receiver running on the connected client.
  Session properties are always null for multi-session desktops.

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth?)

  The color depth setting configured on the desktop, possible values are:
  $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

- ConnectedViaHostName (System.String)

  Session property indicating the host name of the connection gateway, router or client.
  Session properties are always null for multi-session desktops.

- ConnectedViaIP (System.String)

  Session property indicating the IP address of the connection gateway, router or client.
  Session properties are always null for multi-session desktops.

- ControllerDNSName (System.String)

  The DNS host name of the controller that the desktop is registered to.

- DeliveryType (Citrix.Broker.Admin.SDK.DeliveryType)

  Denotes whether the desktop delivers desktops only, apps only or both.

- Description (System.String)

  Description of the desktop.

- DesktopConditions (System.String[])

  List of outstanding desktop conditions for the desktop.

- DesktopGroupName (System.String)

  Name of the desktop group the desktop has been assigned to.

- DesktopGroupUid (System.Int32)

  Uid of the desktop group the desktop has been assigned to.

- DesktopKind (Citrix.Broker.Admin.SDK.DesktopKind)

  Denotes whether the desktop is private or shared.

- DeviceId (System.String)

  Session property indicating a unique identifier for the client device that has most recently been associated with the current session.
  Session properties are always null for multi-session desktops.

- DNSName (System.String)

  The DNS host name of the desktop.

- FunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel?)

  The functional level of the desktop, if known.

- HardwareId (System.String)

  Session property indicating a unique identifier for the client hardware that has been most recently associated with the current session.
  Session properties are always null for multi-sesison desktops.

- HostedMachineId (System.String)

  Unique ID within the hosting unit of the target managed desktop.

- HostedMachineName (System.String)

  The friendly name of a hosted desktop as used by its hypervisor. This is not necessarily the DNS name of the desktop.

- HostingServerName (System.String)

  DNS name of the hypervisor that is hosting the desktop if managed.

- HypervisorConnectionName (System.String)

  The name of the hypervisor connection that the desktop's hosting server is accessed through, if managed.

- HypervisorConnectionUid (System.Int32?)

  The UID of the hypervisor connection that the desktop's hosting server is accessed through, if managed.

- IconUid (System.Int32?)

  The UID of the desktop's icon that is displayed in StoreFront.

- ImageOutOfDate (System.Boolean?)

  Denotes whether the VM image for a hosted desktop is out of date.

- InMaintenanceMode (System.Boolean)

  Denotes whether the desktop is in maintenance mode.

- IPAddress (System.String)

  The IP address of the desktop.

- IsAssigned (System.Boolean)

  Denotes whether a private desktop has been assigned to a user/users, or a client name/address. Users can be assigned explicitly or by assigning on first use of the desktop.

- IsPhysical (System.Boolean)

  This value is true if the desktop is physical(ie not power managed by the Citrix Broker Service), and false otherwise.

- LastConnectionFailure (Citrix.Broker.Admin.SDK.ConnectionFailureReason)

  The reason for the last failed connection between a client and the desktop.

- LastConnectionTime (System.DateTime?)

  Time of the last detected connection attempt that either failed or succeeded.

- LastConnectionUser (System.String)

  The SAM name (in the form DOMAIN\user) of the user that last attempted a connection with the desktop. If the SAM name is not available, the SID is used.

- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

  The reason for the last deregistration of the desktop with the broker. Possible values are: AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistra-

tionRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

- LastDeregistrationTime (System.DateTime?)

  Time of the last deregistration of the desktop from the controller.

- LastErrorReason (System.String)

  The reason for the last error detected in the desktop.

- LastErrorTime (System.DateTime?)

  The time of the last detected error.

- LastHostingUpdateTime (System.DateTime?)

  Time of last update to any hosting data (such as power state) for this desktop reported by the hypervisor connection.

- LaunchedViaHostName (System.String)

  Session property that denotes the host name of the StoreFront server used to launch the current brokered session.
  Session properties are always null for multi-session desktops.

- LaunchedViaIP (System.String)

  Session property that denotes the IP address of the StoreFront server used to launch the current brokered session.
  Session properties are always null for multi-session desktops.

- MachineInternalState (Citrix.Broker.Admin.SDK.MachineInternalState)

  The internal state of the machine associated with the desktop; reported while the desktop is registered to a controller, plus some private Citrix Broker Service states while the machine is not registered.

- MachineName (System.String)

  DNS host name of the machine associated with the desktop.

- MachineUid (System.Int32)

  Uid of the associated machine.

- OSType (System.String)

  A string that can be used to identify the operating system that is running on the desktop.

- OSVersion (System.String)

  A string that can be used to identify the version of the operating system running on the desktop, if known

- PersistUserChanges (Citrix.Broker.Admin.SDK.PersistUserChanges)

  Describes whether/how the user changes are persisted. Possible values are:

  - OnLocal - Persist the user changes on the local disk of the desktop.
  - Discard - Discard user changes.

- PowerActionPending (System.Boolean)

  Property indicating whether there are any pending power actions for the desktop.

- PowerState (Citrix.Broker.Admin.SDK.PowerState)

  The current power state of the desktop. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, resuming.

- Protocol (System.String)

  Session property that denotes the protocol that the current session is using, can be either HDX, RDP or Console. Console sessions on XenDesktop 5 VDAs appear with a blank protocol.
  Session properties are always null for multi-session desktops.

- ProvisioningType (Citrix.Broker.Admin.SDK.ProvisioningType)

  Describes how the machine associated with the desktop was provisioned, possible values are: Manual: No automated provisioning.PVS: Machine provisioned by PVS (may be physical, blade, VM,…)MCS: Machine provisioned by MCS (machine must be VM)

- PublishedApplications (System.String[])

  List of applications published by the desktop (displayed as browser names).

- PublishedName (System.String)

  The name of the desktop that is displayed in StoreFront, if the desktop is published.

- PvdStage (Citrix.Broker.Admin.SDK.PvdStage)

  This property is no longer supported.

- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

  Indicates the registration state of the desktop. Possible values are: Unregistered, Initializing, Registered, AgentError.

- SecureIcaActive (System.Boolean?)

  Session property that indicates whether SecureICA is active on the current session.
  Session properties are always null for multi-session desktops.

- SecureIcaRequired (System.Boolean?)

  Flag indicating whether SecureICA is required or not when starting a session on the desktop.

- SessionHidden (System.Boolean?)

  Session property that indicates if a session is hidden.
  Session properties are always null for multi-session desktops.

- SessionId (System.Int32?)

  Deprecated. A unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine and only unique at any one particular time.

- SessionState (Citrix.Broker.Admin.SDK.SessionState?)

  Session property indicating the state of the current session.
  Session properties are always null for multi-session desktops, possible values are: Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession and Unknown.

- SessionStateChangeTime (System.DateTime?)

  Session property indicating the time of the last state change of the current session.
  Session properties are always null for multi-session desktops.

- SessionUid (System.Int64?)

  Session property indicating the UID of the current session.
  Session properties are always null for multi-session desktops.

- SessionUserName (System.String)

  Session property indicates the name of the current sessions' user (in the form DOMAIN\user).
  Session properties are always null for multi-session desktops.

- SessionUserSID (System.String)

  Session property indicates the SID of the current sessions' user.
  Session properties are always null for multi-session desktops.

- SID (System.String)

  The SID of the desktop.

- SmartAccessTags (System.String[])

  Session property that indicates the Smart Access tags for the current session.
  Session properties are always null on multi-session desktops.

- StartTime (System.DateTime?)

  Session property that indicates the start time of the current session.
  Session properties are always null on multi-session desktops.

- SummaryState (Citrix.Broker.Admin.SDK.DesktopSummaryState)

  Indicates the overall state of the desktop. The overall state is a result of other more specific states such as session state, registration state and power state. Possible values: Off, Unregistered, Available, Disconnected, InUse, Preparing.

- Tags (System.String[])

  A list of tags for the desktop.

- Uid (System.Int32)

  UID of the desktop object.

- WillShutdownAfterUse (System.Boolean)

  Flag indicating whether this desktop is tainted and will be shut down after all sessions on the desktop have ended. This flag should only ever be true on power managed, single-session desktops.
  Note: The desktop will not shut down if it is in maintenance mode, but will shut down after the desktop is taken out of maintenance mode.

Examples

EXAMPLE 1

Both commands retrieve desktops that are unregistered. The second command also includes desktops with a registration state of AgentError.

```
Get-BrokerDesktop -RegistrationState Unregistered
Get-BrokerDesktop -Filter {
  RegistrationState -ne 'Registered'  }
```

EXAMPLE 2

Gets desktops without sessions, listing the DNS name and current state.

```
Get-BrokerDesktop -SessionUid $null | ft -a DNSName,SummaryState
```

EXAMPLE 3

Finds all Windows XP desktops with an out-of-date image.

```
Get-BrokerDesktop -Filter {
  OSType -like "Windows XP*" -and ImageOutOfDate  }
```

EXAMPLE 4

Gets desktops running a published PowerPoint application. It matches any application browser name containing the word 'powerpoint'. String comparisons are case-insensitive.

```
Get-BrokerDesktop -ApplicationInUse '*powerpoint*'
```

EXAMPLE 5

Finds all desktops with an outstanding desktop condition, listing the affected desktop and user.

```
Get-BrokerDesktop -DesktopCondition * DNSName,SessionUserName,
    DesktopConditions
```

EXAMPLE 6

Finds users who have been logged on for more than a day, and outputs the machine name, start time, and duration the session has been logged on.

```
$d = (Get-Date).AddDays(-1)
Get-BrokerDesktop -Filter {
  StartTime -le $d  }
  | ft MachineName,SessionUserName,StartTime,@{
 Label='Duration'; Expression={
 (Get-Date) - $_.StartTime }
  }
```

Parameters

-Uid

Gets desktops with a specific UID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets desktops with a specific machine name (in the form 'domain\machine').

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AgentVersion

Gets desktops with a specific Citrix Virtual Delivery Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ApplicationInUse

Gets desktops running a specified published application (identified by browser name).

String comparisons are case-insensitive.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedClientName

Gets desktops assigned to a specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedIPAddress

Gets desktops assigned to a specific client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserFullName

Gets desktops with an associated user identified by their full name (usually in the form ‘first-name last-name’).

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserName

Gets desktops with an associated user identified by their user name (in the form 'domain\user').

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserUPN

Gets desktops with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AutonomouslyBrokered

Gets desktops according to whether their current session is autonomously brokered or not. Autonomously brokered sessions are HDX sessions established by direct connection without being brokered.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets desktops from the catalog with the specific name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogUid

Gets desktops from a catalog with a specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ClientAddress

Gets desktops with a specific client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientName

Gets desktops with a specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientVersion

Gets desktops with a specific client version.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ColorDepth

Gets desktops configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectedViaHostName

Gets desktops with a specific host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ConnectedViaIP

Gets desktops with a specific IP address of the incoming connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ControllerDNSName

Gets desktops with a specific DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DeliveryType

Gets desktops of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Type:	DeliveryType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets desktops with a specific description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopCondition

Gets desktop with an outstanding desktop condition condition.

Valid values are:

- CPU: Indicates the machine has high CPU usage
- ICALatency: Indicates the network latency is high
- UPMLogonTime: Indicates that the profile load time was high

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupName

Gets desktops from a desktop group with the specified name.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets desktops from a desktop group with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopKind

Deprecated: Use AllocationType parameter.

Gets desktops of a particular kind.

Valid values are Private, Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeviceId

Gets desktops with a specific client device ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DNSName

Gets desktops with a specific DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FunctionalLevel

Gets desktops with a specific FunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HardwareId

Gets desktops with a specific client hardware ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineId

Gets desktops with a specific machine ID known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineName

Gets desktops with a specific machine name known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostingServerName

Gets desktops with a specific name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionName

Gets desktops with a specific name of the hosting hypervisor connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets desktops with a specific UID of the hosting hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets desktops with a specific configured icon. Note that desktops with a null IconUid use the icon of the desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageOutOfDate

Gets desktops by whether their disk image is out of date (for machines provisioned using MCS only).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets desktops with a specific InMaintenanceMode setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Gets desktops with a specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsAssigned

Gets desktops according to whether they are assigned or not. Desktops may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsPhysical

Specifies if machines in the catalog can be power managed by the Citrix Broker Service. Where the power state of the machine cannot be controlled, specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the deprecated CatalogKind parameter only with a Pvs catalog kind.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionFailure

Gets desktops with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the desktop yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Type:	ConnectionFailureReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionTime

Gets desktops that last connected at a specific time. This is the time that the broker detected that the connection attempt either succeeded or failed.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionUser

Gets desktops where a specific user name last attempted a connection (in the form 'domain\user').

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastDeregistrationReason

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Type:	DeregistrationReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationTime

Gets desktops by the time that they were last deregistered.

Type:	DateTime
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastErrorReason

Gets desktops with the specified last error reason.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastErrorTime

Gets desktops with the specified last error time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastHostingUpdateTime

Gets desktops with a specific time that the hosting information was last updated.

Type:	DateTime
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaHostName

Gets desktops with a specific host name of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LaunchedViaIP

Gets desktops with a specific IP address of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineInternalState

Gets desktops with the specified internal machine state.

Type:	MachineInternalState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets desktops with a specific machine UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets desktops by the type of operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OSVersion

Gets desktops by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PersistUserChanges

Gets desktops by the location where the user changes are persisted.

- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerActionPending

Gets desktops with a specific power action pending state.

Valid values are $true or $false.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-PowerState

Gets desktops with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Protocol

Gets desktops with connections using a specific protocol, for example HDX, RDP, or Console.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningType

Gets desktops that are in a catalog with a particular provisioning type. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,…).

- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedApplication

Gets desktops with a specific application published to them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PublishedName

Gets desktops with a specific published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PvdStage

This property is no longer supported.

Type:	PvdStage
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RegistrationState

Gets desktops with a specific registration state.

Valid values are Unregistered, Initializing, Registered and AgentError.

Type:	RegistrationState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaActive

Gets desktops depending on whether the current session uses SecureICA or not.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-SecureIcaRequired

Gets desktops configured with a particular SecureIcaRequired setting. Note that the desktop setting of $null indicates that the desktop group value is used.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionHidden

Gets desktops by whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionId

Deprecated.

Gets desktops by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionState

Gets desktops with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.

Session properties are always null for multi-session desktops.

Type:	SessionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStateChangeTime

Gets desktops whose sessions last changed state at a specific time.

Session properties are always null for multi-session desktops.

Type:	DateTime
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Gets single-session desktops with a specific session UID ($null for no session).

Session properties are always null for multi-session desktops.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUserName

Gets desktops with a specific user name for the current session (in the form 'domain\user').

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionUserSID

Gets desktops with a specific SID of the current session user.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SID

Gets desktops with a specific machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SmartAccessTag

Gets session desktops where the session has the specific SmartAccess tag.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-StartTime

Gets desktops with a specific session start time.

Session properties are always null for multi-session desktops.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SummaryState

Gets desktops with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, InUse and Preparing.

Type:	DesktopSummaryState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

Gets desktops with a specific tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-WillShutdownAfterUse

Gets desktops depending on whether they shut down after use or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets desktops with a specific published application (identified by its UID).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Desktop

Get-BrokerDesktop returns an object for each matching desktop.

Notes

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

Get-BrokerDesktopGroup

March 11, 2024

Gets broker desktop groups configured for this site.

Syntax

```
Get-BrokerDesktopGroup
   [[-Name] <String>]
   [-AdminFolderName <String>]
   [-AdminFolderUid <Int32>]
   [-AllowReconnectInMaintenanceMode <Boolean>]
   [-AppDisk <Guid>]
   [-AppDnaAnalysisState <AppDnaAnalysisState>]
   [-AppDnaCompatibility <AppDnaCompatibility>]
   [-AppProtectionKeyLoggingRequired <Boolean>]
   [-AppProtectionScreenCaptureRequired <Boolean>]
   [-AutomaticPowerOnForAssigned <Boolean>]
   [-AutomaticPowerOnForAssignedDuringPeak <Boolean>]
   [-AutomaticRestartForUntaggedMachines <Boolean>]
   [-AutoscaleLogOffReminderEnabled <Boolean>]
   [-AutoscaleLogOffReminderIntervalSecondsOffPeak <Int32>]
   [-AutoscaleLogOffReminderIntervalSecondsPeak <Int32>]
   [-AutoscaleLogOffReminderMessage <String>]
   [-AutoscaleLogOffReminderTitle <String>]
   [-AutoscaleLogOffWarningMessage <String>]
   [-AutoscaleLogOffWarningTitle <String>]
   [-AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak <Int32>]
   [-AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak <Int32>]
   [-AutoscalingEnabled <Boolean>]
   [-ColorDepth <ColorDepth>]
```

```
    [-DeliveryType <DeliveryType>]
    [-Description <String>]
    [-DesktopGroupName <String>]
    [-DesktopKind <DesktopKind>]
    [-DisconnectOffPeakIdleSessionAfterSeconds <Int32>]
    [-DisconnectPeakIdleSessionAfterSeconds <Int32>]
    [-Enabled <Boolean>]
    [-InMaintenanceMode <Boolean>]
    [-IsRemotePC <Boolean>]
    [-IsUsedByGpo <Boolean>]
    [-LicenseModel <LicenseModel>]
    [-LogoffOffPeakDisconnectedSessionAfterSeconds <Int32>]
    [-LogoffPeakDisconnectedSessionAfterSeconds <Int32>]
    [-MachineCost <Decimal>]
    [-MachineLogOnType <MachineLogOnType>]
    [-Metadata <String>]
    [-MinimumFunctionalLevel <FunctionalLevel>]
    [-OffPeakBufferSizePercent <Int32>]
    [-OffPeakDisconnectAction <SessionChangeHostingAction>]
    [-OffPeakDisconnectTimeout <Int32>]
    [-OffPeakExtendedDisconnectAction <SessionChangeHostingAction>]
    [-OffPeakExtendedDisconnectTimeout <Int32>]
    [-OffPeakLogOffAction <SessionChangeHostingAction>]
    [-OffPeakLogOffTimeout <Int32>]
    [-PeakAutoscaleAssignedPowerOnIdleAction <String>]
    [-PeakAutoscaleAssignedPowerOnIdleTimeout <Int32>]
    [-PeakBufferSizePercent <Int32>]
    [-PeakDisconnectAction <SessionChangeHostingAction>]
    [-PeakDisconnectTimeout <Int32>]
    [-PeakExtendedDisconnectAction <SessionChangeHostingAction>]
    [-PeakExtendedDisconnectTimeout <Int32>]
    [-PeakLogOffAction <SessionChangeHostingAction>]
    [-PeakLogOffTimeout <Int32>]
    [-PolicySetGuid <Guid>]
    [-PowerOffDelay <Int32>]
    [-ProductCode <String>]

    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerDesktopGroup
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve desktop groups matching the specified criteria. If no parameters are specified this cmdlet enumerates all desktop groups.

Desktop groups represent groups of desktops that are managed together for brokering purposes.

————————BrokerDesktopGroup Object

A desktop group object represents a collection of machines that are fully configured in a site that is able to run either a Microsoft Windows desktop environment, individual applications, or both.

- AdminFolderName (System.String)

  The name of the admin folder the desktop group is in (including trailing backslash), or the empty string if the desktop group is at the root level

- AdminFolderUid (System.Int32)

  The Uid of the admin folder the desktop group is in (if any)

- AllowReconnectInMaintenanceMode (System.Boolean)

  Specifies whether reconnecting sessions are allowed for machines in Maintenance mode.

- AppDisks (System.Guid[])

  The Application Disks used by machines in the desktop group.

- AppDnaAnalysisState (Citrix.Broker.Admin.SDK.AppDnaAnalysisState?)

  Specifies the current state of AppDNA Analysis on the desktop group

- AppDnaCompatibility (Citrix.Broker.Admin.SDK.AppDnaCompatibility?)

  The compatibility with the application disks attached to the desktop group

- AppProtectionKeyLoggingRequired (System.Boolean)

  Specifies whether key logging app protection is required.

- AppProtectionScreenCaptureRequired (System.Boolean)

  Specifies whether screen capture app protection is required.

- AutomaticPowerOnForAssigned (System.Boolean)

  Specifies whether assigned desktops in the desktop group are automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

- AutomaticPowerOnForAssignedDuringPeak (System.Boolean)

  Specifies whether assigned desktops in the desktop are automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

- AutomaticRestartForUntaggedMachines (System.Boolean)

  Indicates whether untagged single-session machines belonging to a desktop group configured for restrict Autoscale and shutdown after use should restart after untainting.

- AutoscaleLogOffReminderEnabled (System.Boolean)

  Boolean value indicating whether the warning messages should be sent on an interval to nudge a logoff should be sent on an interval when autoscale is enabled.

- AutoscaleLogOffReminderIntervalSecondsOffPeak (System.Int32)

  Represents the time interval at which messages are sent to the user during off peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off.

- AutoscaleLogOffReminderIntervalSecondsPeak (System.Int32)

  Represents the time interval at which messages are sent to the user during peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off.

- AutoscaleLogOffReminderMessage (System.String)

  Notification message to display to users in active sessions belonging to machines needed by Autoscale for shutdown.

- AutoscaleLogOffReminderTitle (System.String)

  Notification message dialog title displayed when Autoscale issues a logoff reminder request.

- AutoscaleLogOffWarningMessage (System.String)

  Warning message to display to users in active sessions prior to Autoscale issuing a logoff request.

- AutoscaleLogOffWarningTitle (System.String)

  Warning message dialog title displayed prior to Autoscale issuing a logoff request.

- AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak (System.Int32)

  Minimum time that needs to elapse before Autoscale logs off active sessions on a draining machine in the delivery group during off-peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

- AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak (System.Int32)

  Minimum time that needs to elapse before Autoscale logs off active sessions on a draining machine in the delivery group during peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

- AutoscalingEnabled (System.Boolean)

  Specifies whether machines in this desktop group can be Autoscaled.

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth)

  Default color depth of sessions started with machines in the desktop group. Possible values are: FourBit, EightBit, SixteenBit, TwentyFourBit.

- ConfigurationSlotUids (System.Int32[])

  Uids of any configuration slots which hold machine configurations associated with the desktop group. The order of slot UIDs in this list correspond with the order of items in the associated MachineConfigurationNames and MachineConfigurationUids list properties, and so the same slot UID can appear more than once.

- DeliveryType (Citrix.Broker.Admin.SDK.DeliveryType)

  The type of resources being published. Possible values are:
  DesktopsOnly, AppsOnly, DesktopsAndApps.

- Description (System.String)

  Description of the desktop group.

- DesktopGroupName (System.String)

  Name of the desktop group (must be unique within a Folder)

- DesktopKind (Citrix.Broker.Admin.SDK.DesktopKind)

  The kind of the desktops being published, possible values are:
  Private and Shared.

- DesktopsAvailable (System.Int32)

  The number of machines in the desktop group in state Available; this is the number of machines with no sessions present.

- DesktopsDisconnected (System.Int32)

  The number of disconnected sessions present on machines in the desktop group.

- DesktopsFaulted (System.Int32)

  The number of machines in the desktop group whose FaultState is not None.

- DesktopsInUse (System.Int32)

  The number of machines in the desktop group in state InUse; this is the number of machines with at least one session present.

- DesktopsNeverRegistered (System.Int32)

  The number of machines in the desktop group that have never registered with the current site.

- DesktopsPreparing (System.Int32)

  This property is no longer supported.

- DesktopsUnregistered (System.Int32)

  The number of machines in the desktop group that are currently unregistered.

- DisconnectOffPeakIdleSessionAfterSeconds (System.Int32)

  Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during off-peak time.

- DisconnectPeakIdleSessionAfterSeconds (System.Int32)

  Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during peak time.

- Enabled (System.Boolean)

  Specifies whether the desktop group is enabled or not; disabled desktop groups do not appear to users.

- IconUid (System.Int32)

  The Uid of the icon to be used as a default for desktops in the desktop group. Individual desktop objects can override this default by setting the IconUid parameter on the desktop object.

- InMaintenanceMode (System.Boolean)

  Specifies whether the machines in the desktop group are in maintenance mode or not.

- IsRemotePC (System.Boolean)

  Specifies whether the desktop group is a Remote PC desktop group.

- IsUsedByGpo (System.Boolean?)

  Indicate if the desktop group is used by group policy.

- LicenseModel (Citrix.Broker.Admin.SDK.LicenseModel?)

  Specifies the license model for this desktop group. If none is specified, then the site-wide license model is used.

- LogoffOffPeakDisconnectedSessionAfterSeconds (System.Int32)

  Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during off-peak time.

- LogoffPeakDisconnectedSessionAfterSeconds (System.Int32)

  Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during peak time.

- MachineConfigurationNames (System.String[])

  The MachineConfiguration names associated with the desktop group.

- MachineConfigurationUids (System.Int32[])

  The MachineConfiguration uids associated with the desktop group.

- MachineCost (System.Decimal)

  The per-hour instance cost of machines in this desktop group.

- MachineLogOnType (Citrix.Broker.Admin.SDK.MachineLogOnType?)

  Specifies the login type (activedirectory/localmappedaccount) for machines in this desktop group.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata associated with the desktop group.

- MinimumFunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel)

  The minimum FunctionalLevel required for the machines in the desktop group to be able to register with the Citrix Broker Service.

- Name (System.String)

  Site-wide unique full path name of the desktop group including all containing folders, for example, Folder1\Folder2\MyDesktopGroup.

- OffPeakBufferSizePercent (System.Int32)

  The percentage of single-session machines that are kept available in an idle state, or for multi-session machines, the percentage of the total load capacity to be kept available outside peak hours.

- OffPeakDisconnectAction (Citrix.Broker.Admin.SDK.SessionChangeHostingAction)

  The action that is performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend or Shutdown.

- OffPeakDisconnectTimeout (System.Int32)

  The number of minutes before the configured action is performed after a user session disconnects outside peak hours.

- OffPeakExtendedDisconnectAction (Citrix.Broker.Admin.SDK.SessionChangeHostingAction)

  The action performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

- OffPeakExtendedDisconnectTimeout (System.Int32)

  The number of minutes before the second configured action is performed after a user session disconnects outside peak hours.

- OffPeakLogOffAction (Citrix.Broker.Admin.SDK.SessionChangeHostingAction)

  The action performed after a configurable period of a user session ending outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

- OffPeakLogOffTimeout (System.Int32)

  The number of minutes before the configured action is performed after a user session ends outside peak hours.

- PeakAutoscaleAssignedPowerOnIdleAction (System.String)

  The action to be performed on an assigned machine started by Autoscale if that machine then remains unused for a defined period of time.

- PeakAutoscaleAssignedPowerOnIdleTimeout (System.Int32)

  The number of minutes before the configured action is performed on an assigned machine previously started by autoscale that subsequently remains unused.

- PeakBufferSizePercent (System.Int32)

The percentage of single-session machines that are kept available in an idle state, or for multi-session machines, the percentage of the total load capacity to be kept available in peak hours.

- PeakDisconnectAction (Citrix.Broker.Admin.SDK.SessionChangeHostingAction)

  The action performed after a configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

- PeakDisconnectTimeout (System.Int32)

  The number of minutes before the configured action is performed after a user session disconnects in peak hours.

- PeakExtendedDisconnectAction (Citrix.Broker.Admin.SDK.SessionChangeHostingAction)

  The action performed after a second configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

- PeakExtendedDisconnectTimeout (System.Int32)

  The number of minutes before the second configured action is performed after a user session disconnects in peak hours.

- PeakLogOffAction (Citrix.Broker.Admin.SDK.SessionChangeHostingAction)

  The action performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

- PeakLogOffTimeout (System.Int32)

  The number of minutes before the configured action is performed after a user session ends in peak hours.

- PolicySetGuid (System.Guid?)

  The policy set assigned to this delivery group. If this is null, the policy set of the site is used.

- PowerOffDelay (System.Int32)

  The number of minutes following a power-on operation that Auto Scale will wait before attempting to power off that same machine. Possible values are in the range 0 - 60.

- ProductCode (System.String)

  Specifies the licensing product code for this desktop group. If none is specified, then the site-wide product code is used.

- ProtocolPriority (System.String[])

  A list of protocol names in the order in which they are attempted for use during connection.

- PublishedName (System.String)

  The name of the desktop group as it is to appear to the user in StoreFront.

- RequiredSleepCapability (System.String)

  The sleep capability of this desktop group. Possible values are None, or Suspend.

- ResourceLeasingEnabled (System.Boolean)

  Indicates if this desktop group is enabled for resource leasing.

- RestrictAutoscaleMinIdleUntaggedPercentDuringOffPeak (System.Int32)

  This indicates the percentage that the number of untagged single-session machines in an idle state, or for multi-session machines, the untagged available load capacity must fall below before Autoscale powers on and manages 'tagged'machines, as per policy, in off-peak. If the number of untagged machines in an idle state, or the untagged available load capacity goes above this threshold value, Autoscale will attempt to shut down 'tagged'machines. Possible values are in the range -1 - 100, where -1 (default) disables this behavior. This is only relevant for desktop groups configured for Restrict Autoscaling.

- RestrictAutoscaleMinIdleUntaggedPercentDuringPeak (System.Int32)

  This indicates the percentage that the number of untagged single-session machines in an idle state, or for multi-session machines, the untagged available load capacity must fall below before Autoscale powers on and manages 'tagged'machines, as per policy, in peak time. If the number of untagged machines in an idle state, or the untagged available load capacity goes above this threshold value, Autoscale will attempt to shut down 'tagged'machines. Possible values are in the range -1 - 100, where -1 (default) disables this behavior. This is only relevant for desktop groups configured for Restrict Autoscaling.

- RestrictAutoscaleTagUid (System.Int32?)

  If set to a Tag UID, only machines that have this tag will be auto scaled.

- ReuseMachinesWithoutShutdownInOutage (System.Boolean)

  Specifies whether desktops should not be shut down after being used during outage mode.

- Scopes (Citrix.Fma.Sdk.DelegatedAdminInterfaces.ScopeReference[])

  The list of the delegated admin scopes to which the desktop group belongs.

- SecureIcaRequired (System.Boolean)

  Flag that specifies if the SecureICA encryption of the HDX protocol is required for sessions of desktops in the desktop group.

- Sessions (System.Int32)

  The total number of user sessions currently running on all of the machines in the desktop group.

- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport)

Specifies the session support (single/multi) of the machines in the desktop group. Machines with the incorrect session support for the desktop group will be unable to register with the Citrix Broker Service.

- SettlementPeriodBeforeAutoShutdown (System.TimeSpan)

  Time after a session ends during which automatic shutdown requests (for example, shutdown after use, idle pool management) are deferred. Any outstanding shutdown request takes effect after the settlement period expires. This is typically used to configure time to allow logoff scripts to complete.

- SettlementPeriodBeforeUse (System.TimeSpan)

  Idle period before a machine can be selected to host a new session after registration or the end of a previous session. This is typically used to allow a machine to become idle following processing associated with start-up or logoff actions. A machine may still be selected during the idle period if no other machine is available for immediate use.

- ShutdownDesktopsAfterUse (System.Boolean)

  Specifies if the desktops will shut down after they have been used and there are no sessions running on the machine. The machines will not shut down if they are placed into maintenance mode, even if this flag is set to $true. The machines, however, will shutdown after the machine is taken out of maintenance mode if the flag is still set.

- Tags (System.String[])

  Tags associated with the desktop group.

- TenantId (System.Guid?)

  Identity of tenant associated with desktop group. Not applicable (always blank) in non-multitenant sites.

- TimeZone (System.String)

  The timezone that desktops in the desktop group are in (for power policy purposes).

- TotalApplicationGroups (System.Int32)

  Total number of application groups associated with the desktop group.

- TotalApplications (System.Int32)

  Total number of applications associated with the desktop group.

- TotalDesktops (System.Int32)

  Total number of machines in the desktop group.

- TurnOnAddedMachine (System.Boolean)

Specifies whether the broker should attempt to turn on power-managed machines when they are added to the desktop group.

- Uid (System.Int32)

  Uid of the desktop group.

- UseVerticalScaling (System.Boolean?)

  Indicates whether to use vertical scaling when finding an RDS machine in the desktop group for a session launch.

- UUID (System.Guid)

  UUID of the desktop group.

- ZonePreferences (Citrix.Broker.Admin.SDK.ZonePreference[])

  Ordered list of zone preferences taken into account when launching resources from this desktop group. Possible values for each preference are UserLocation, UserHome, UserHomeOnly and ApplicationHome.

Examples

EXAMPLE 1

Finds all desktop groups with published names starting with "EMEA".

```
1  Get-BrokerDesktopGroup -PublishedName EMEA*
```

EXAMPLE 2

Finds all desktop groups in maintenance mode.

```
1  Get-BrokerDesktopGroup -InMaintenanceMode $true
```

Parameters

-Uid

Gets desktop groups with the specified value of Uid.

Type:	Int32
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets desktop groups whose full path name matches the supplied pattern.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderName

Gets desktop groups that are in admin folders matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminFolderUid

Gets desktop groups that are in the specified admin folder.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowReconnectInMaintenanceMode

Gets desktop groups which allows session reconnection while in Maintenance mode.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppDisk

Gets only desktop groups using the specified application disk.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppDnaAnalysisState

Gets only desktop groups with specified value of AppDnaAnalysisState

Type:	AppDnaAnalysisState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppDnaCompatibility

Gets only desktop groups with specified value of AppDnaCompatibility

Type:	AppDnaCompatibility
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionKeyLoggingRequired

Specifies whether key logging app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionScreenCaptureRequired

Specifies whether screen capture app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomaticPowerOnForAssigned

Gets only desktop groups with the specified value of AutomaticPowerOnForAssigned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomaticPowerOnForAssignedDuringPeak

Gets only desktop groups with the specified value of AutomaticPowerOnForAssignedDuringPeak.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomaticRestartForUntaggedMachines

Gets desktop groups with the specified value of AutomaticRestartForUntaggedMachines.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderEnabled

Gets the value indicating whether the warning messages should be sent on an interval to nudge a logoff should be sent on an interval when autoscale is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderIntervalSecondsOffPeak

Gets the interval in seconds which represents the time interval at which messages are sent to the user during off peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderIntervalSecondsPeak

Gets the interval in seconds which represents the time interval at which messages are sent to the user during peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderMessage

Gets the notification message to display to users in active sessions belonging to machines needed by Autoscale for shutdown.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AutoscaleLogOffReminderTitle

Gets the notification message dialog title displayed when Autoscale issues a logoff reminder request.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-AutoscaleLogOffWarningMessage

Gets the warning message to display to users in active sessions prior to Autoscale issuing a logoff request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AutoscaleLogOffWarningTitle

Gets the warning message dialog title displayed prior to Autoscale issuing a logoff request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak

Gets the minimum seconds that need to elapse before Autoscale logs off the active sessions on the draining machines belonging to the delivery group during off-peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak

Gets the minimum seconds that need to elapse before Autoscale logs off the active sessions on the draining machines belonging to the delivery group during peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscalingEnabled

Specifies whether machines in this desktop group can be Autoscaled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Gets only desktop groups with the specified color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeliveryType

Gets desktop groups according to their delivery type.

Valid values are DesktopsOnly, AppsOnly and DesktopsAndApps.

Type:	DeliveryType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets desktop groups whose description matches the supplied pattern.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-DesktopGroupName

Gets Desktop groups that match the specified simple name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopKind

Gets desktops of a particular kind.

Valid values are Private and Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisconnectOffPeakIdleSessionAfterSeconds

Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during off-peak time.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisconnectPeakIdleSessionAfterSeconds

Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets desktop groups with the specified value of Enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets desktop groups with the specified value of InMaintenanceMode.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsRemotePC

Gets desktop groups with the specified IsRemotePC value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsUsedByGpo

Gets desktop groups that are used by group policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseModel

Gets desktop groups with the specified license model.

Type:	LicenseModel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffOffPeakDisconnectedSessionAfterSeconds

Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during off-peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffPeakDisconnectedSessionAfterSeconds

Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineCost

The per-hour instance cost of machines in this desktop group.

Type:	Decimal
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineLogOnType

Gets desktop groups that have the specified login type. Values can be:

- ActiveDirectory - Perform Active Directory login on the machine.
- LocalMappedAccount - Perform local mapped account login on the machine.

Type:	MachineLogOnType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MinimumFunctionalLevel

Gets desktop groups with a specific MinimumFunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakBufferSizePercent

Gets desktop groups with the specified value of OffPeakBufferSizePercent.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakDisconnectAction

Gets desktop groups with the specified value of OffPeakDisconnectAction.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakDisconnectTimeout

Gets desktop groups with the specified value of OffPeakDisconnectTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakExtendedDisconnectAction

Gets desktop groups with the specified value of OffPeakExtendedDisconnectAction.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakExtendedDisconnectTimeout

Gets desktop groups with the specified value of OffPeakExtendedDisconnectTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakLogOffAction

Gets desktop groups with the specified value of OffPeakLogOffAction.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakLogOffTimeout

Gets desktop groups with the specified value of OffPeakLogOffTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakAutoscaleAssignedPowerOnIdleAction

Gets desktop groups with the specified value of PeakAutoscaleAssignedPowerOnIdleAction.

Type:	String
Accepted values:	Nothing, Shutdown, Suspend
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakAutoscaleAssignedPowerOnIdleTimeout

Gets desktop groups with the specified value of PeakAutoscaleAssignedPowerOnIdleTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakBufferSizePercent

Gets desktop groups with the specified value of PeakBufferSizePercent.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakDisconnectAction

Gets desktop groups with the specified value of PeakDisconnectAction.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakDisconnectTimeout

Gets desktop groups with the specified value of PeakDisconnectTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakExtendedDisconnectAction

Gets desktop groups with the specified value of PeakExtendedDisconnectAction.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakExtendedDisconnectTimeout

Gets desktop groups with the specified value of PeakExtendedDisconnectTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakLogOffAction

Gets desktop groups with the specified value of PeakLogOffAction.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakLogOffTimeout

Gets desktop groups with the specified value of PeakLogOffTimeout.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicySetGuid

Gets the policy set assigned to this delivery group.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerOffDelay

The number of minutes following a power-on operation that Auto Scale will wait before attempting to power off that same machine. Possible values are in the range 0 - 60.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductCode

Gets desktop groups with the specified licensing product code.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PublishedName

Gets desktop groups whose published name matches the supplied pattern.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RequiredSleepCapability

Gets desktop groups with the specified value of RequiredSleepCapability.

Type:	String
Accepted values:	None, Suspend
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLeasingEnabled

Gets desktop groups with the specified value of ResourceLeasingEnabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictAutoscaleMinIdleUntaggedPercentDuringOffPeak

Gets desktop groups with the specified value of RestrictAutoscaleMinIdleUntaggedPercentDuringOff-Peak.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictAutoscaleMinIdleUntaggedPercentDuringPeak

Gets desktop groups with the specified value of RestrictAutoscaleMinIdleUntaggedPercentDuring-Peak.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictAutoscaleTagUid

If set to a Tag UID, only machines that have this tag will be auto scaled.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ReuseMachinesWithoutShutdownInOutage

Gets only desktop groups that won't shut down machines after they been used during outage.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeId

Gets desktop groups that are associated with the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets desktop groups that are associated with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-SecureIcaRequired

Gets desktop groups with the specified value of SecureIcaRequired.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

Gets desktop groups that have the specified session capability. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettlementPeriodBeforeAutoShutdown

Gets desktop groups with the specified value of SettlementPeriodBeforeAutoShutdown.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettlementPeriodBeforeUse

Gets desktop groups with the specified value of SettlementPeriodBeforeUse.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ShutdownDesktopsAfterUse

Gets desktop groups with the specified value of ShutdownDesktopsAfterUse.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

Gets desktop groups tagged with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantId

Gets desktop groups associated with the specified tenant identity.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TimeZone

Gets desktop groups with the specified value of TimeZone.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TotalApplicationGroups

Gets desktop groups that are acting as delivery groups for the specified number of application groups.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TotalApplications

Gets desktop groups that are acting as delivery groups for the specified number of applications.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TurnOnAddedMachine

Gets desktop groups with the specified value of TurnOnAddedMachine value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseVerticalScaling

Gets desktop groups with the specified value of UseVerticalScaling.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets desktop groups with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZonePreference

Gets desktop groups with a zone preference list containing the specified zone preference.

Type:	ZonePreference
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationGroupUid

Gets only desktop groups with which the specified application group has been associated.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets desktop groups that publish the specified application (identified by Uid)

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TagUid

Gets desktop groups to which the specified tag (identified by its Uid) has been added to help identify it - see Add-BrokerTag for more information.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerTimeSchemeUid

Gets desktop groups associated with the specified power time scheme (identified by its Uid).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineConfigurationUid

Gets desktop groups with the specified value of MachineConfiguration.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemotePCCatalogUid

Gets Remote PC desktop groups associated with the specified catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.DesktopGroup

Get-BrokerDesktopGroup returns an object for each matching desktop group.

Notes

To perform greater-than or less-than comparisons, use -Filter. For more information, see about_Broker_Filtering and the examples.

Get-BrokerDesktopGroupAnalysisReport

March 11, 2024

Gets the detailed AppDNA compatibility report for AppDisk(s) associated with a particular Desktop Group.

Syntax

```
Get-BrokerDesktopGroupAnalysisReport
    [-InputObject] <DesktopGroup[]>
    [[-AppDiskUid] <Guid>]
    [-RetrieveReportContentsAsMHT]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the detailed AppDNA compatibility report for an AppDisk associated with a particular Desktop Group.

Examples

EXAMPLE 1

Retrieves the report for the desktop group with Uid 36

```
Get-BrokerDesktopGroupAnalysisReport -InputObject 36
```

EXAMPLE 2

Retrieves the report for the desktop group with Uid 36 filtered down to AppDisk “MyAppDisk”

```
$appDisk = Get-AppLibAppDisk -AppDiskName "MyAppDisk"
Get-BrokerDesktopGroupAnalysisReport -InputObject 36 -AppDiskUid
    $appDisk.AppDiskUid
```

Parameters

-InputObject

The desktop group(s) on which to retrieve the detailed reports

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-RetrieveReportContentsAsMHT

Retrieve the report as a MHT file

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppDiskUid

AppDisk unique identifier. If set, the report will be filtered down to only include this AppDisk.

Type:	Guid
Position:	3
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

You can pipe the desktop groups to Get-BrokerDesktopGroupAnalysisReport.

Outputs

Citrix.Broker.Admin.SDK.AnalysisReport

The analysis reports for the desktop groups

Get-BrokerDesktopGroupAppDisk

March 11, 2024

Gets the AppDisks that are being used by desktop group

Syntax

```
Get-BrokerDesktopGroupAppDisk
   [[-DesktopGroupName] <String>]
   [-AppDiskUid <Guid>]
   [-AppDnaCompatibility <AppDnaCompatibility>]
   [-DesktopGroupUid <Int32>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
```

```
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerDesktopGroupAppDisk cmdlet returns all the AppDisks that are currently being used by the desktop groups and if they are compatible with their desktop group

————————————BrokerDesktopGroupAppDisk Object

The BrokerDesktopGroupAppDisk object represents a single instance of a desktop group and AppDisk and if they are compatible

- AppDiskUid (System.Guid)

  The Uid of the AppDisk

- AppDnaCompatibility (Citrix.Broker.Admin.SDK.AppDnaCompatibility?)

  Specifies if the AppDisk is compatible with the desktop group

- DesktopGroupName (System.String)

  The name of the desktop group

- DesktopGroupUid (System.Int32)

  The Uid of the desktop group

Examples

EXAMPLE 1

Gets all the AppDisks that are assocated to the desktop group MyGroup

```
Get-BrokerDesktopGroupAppDisk -DesktopGroupName MyGroup
```

Parameters

-DesktopGroupName

Gets only the entries that match the specified Desktop Group Name

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AppDiskUid

Gets only the entries that match the specified AppDisk Uid

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppDnaCompatibility

Gets only the entries that match the specified AppDnaCompatibility

Type:	AppDnaCompatibility
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Gets only the entries that match the specified Desktop Group Uid

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.DesktopGroupAppDisk

Returns an object for each enumerated Desktop Group and AppDisk combination.

Get-BrokerDesktopGroupWebhook

March 11, 2024

Gets the webhook configured for desktop group

Syntax

```
Get-BrokerDesktopGroupWebhook
    [-Address <String>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-OnEvent <WebhookTrigger>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
```

```
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerDesktopGroupWebhook
   -Uid <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The cmdlet returns the webhook that are currently being configured for desktop groups. Each desktop group can have up to one webhook.

——————————BrokerDesktopGroupWebhook Object

The BrokerDesktopGroupWebhook object represents a webhook of a desktop group that is invoked upon certain events, currently the only supported event is MachineRegistration.

- Address (System.String)

  URL of the webhook

- DesktopGroupName (System.String)

  The name of the desktop group

- DesktopGroupUid (System.Int32)

  The Uid of the desktop group

- OnEvent (Citrix.Broker.Admin.SDK.WebhookTrigger)

  The event upon that the webhook is triggered

- Uid (System.Int32)

  The Uid of the webhook

Examples

EXAMPLE 1

Gets the webhook that is associated to the desktop group 1

```
Get-BrokerDesktopGroupWebhook -DesktopGroupUid 1
```

Parameters

-Uid

Get only webhooks that match the specified Webhook Uid

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Address

Gets only webhooks whose URL matches that specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupName

Gets only webhooks associated with desktop groups whose names match that specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-DesktopGroupUid

Gets only webhooks associated with the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OnEvent

Gets only webhooks that match the specified OnEvent.

Type:	WebhookTrigger
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet

Outputs

Citrix.Broker.Admin.SDK.DesktopGroupWebhook

Returns an object for each enumerated Desktop Group and an Webhook combination

- Get-BrokerDesktopGroup

Get-BrokerDesktopUsage

March 11, 2024

Get usage history of desktop groups.

Syntax

```
Get-BrokerDesktopUsage
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-InUse <Int32>]
    [-Timestamp <DateTime>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns information, recorded by the broker on an hourly basis, about the number of desktops in use for each desktop group. Analyzing the historical usage records can give some guidance on usage patterns and help choosing idle pool settings.

Without parameters, Get-BrokerDesktopUsage returns the first 250 records. By using parameters, you can be more selective about the records that are returned.

To retrieve more than the default 250 records, use the -MaxRecordCount parameter. To select data for a specific desktop group, use either the -DesktopGroupName or -DesktopGroupUid parameters.

See the examples for this cmdlet and about_Broker_Filtering for details of how to perform advanced filtering.

————————BrokerDesktopUsage Object

Desktop usage object contains information to tell how many desktops in a desktop group are in use at a given time (identified by a timestamp).

- DesktopGroupUid (System.Int32)

  Uid of the desktop group that the usage data corresponds to.

- InUse (System.Int32)

  Specifies how many desktop are in use at the time the timestamp corresponds to.

- Timestamp (System.DateTime)

  Date and time the desktop usage information corresponds to.

Examples

EXAMPLE 1

Returns the last 24 hours of usage information for desktop group TestGroup, formatting it as two columns labeled Time and InUse.

```
Get-BrokerDesktopUsage -DesktopGroupName TestGroup -MaxRecordCount 24 -
    SortBy '-Timestamp' | ft -a @{
 Name='Time';Expression={
 '{
 0:t }
 ' -f $_.Timestamp }
  }
 ,InUse
```

EXAMPLE 2

Returns today's usage information for desktop group TestGroup.

```
$d = Get-Date -Hour 0 -Minute 0 -Second 0
Get-BrokerDesktopUsage -Filter {
  DesktopGroupName -eq 'TestGroup' -and Timestamp -ge $d  }
```

EXAMPLE 3

Retrieves the usage history for desktop group TestGroup and adds a column showing the number of desktops in that group in use, as a percentage.

```
$dg = Get-BrokerDesktopGroup TestGroup
Get-BrokerDesktopUsage -DesktopGroupUid $dg.Uid | Select Timestamp,
    InUse,@{
```

```
Name='Percent';Expression={
'{
0:P0 }
' -f ($_.InUse / $dg.TotalDesktops) }
 }
```

Parameters

-DesktopGroupName

Gets usage records for the named desktop group or for multiple desktop groups if wildcards have been specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets usage records for a specific desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InUse

Gets usage records where the in-use count matches the specified value. This is useful when checking for zero or when used inside a -Filter expression.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Timestamp

Gets usage records that occurred at the given time.

In general, Citrix recommends, using -Filter and relative comparisons. For a demonstration, see the examples.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.DesktopUsage

Get-BrokerDesktopUsage returns an object for each matching record.

Notes

Desktop usage information is automatically deleted after 7 days.

- about_Broker_Filtering

Get-BrokerEntitlementPolicyRule

March 11, 2024

Gets desktop rules from the site's entitlement policy.

Syntax

```
Get-BrokerEntitlementPolicyRule
    [[-Name] <String>]
    [-BrowserName <String>]
    [-ColorDepth <ColorDepth>]
    [-Description <String>]
    [-DesktopGroupUid <Int32>]
    [-Enabled <Boolean>]
    [-ExcludedUser <User>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-IconUid <Int32>]
    [-IncludedUser <User>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-LeasingBehavior <LeasingBehavior>]
    [-MaxPerEntitlementInstances <Int32>]
    [-Metadata <String>]
    [-PublishedName <String>]
    [-RestrictToTag <String>]
    [-SecureIcaRequired <Boolean>]
    [-SessionReconnection <SessionReconnection>]
    [-UUID <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerEntitlementPolicyRule
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns desktop rules matching the specified search criteria from the site's entitlement policy. If no search criteria are specified, all desktop rules in the entitlement policy are obtained.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

——————————BrokerEntitlementPolicyRule Object

The BrokerEntitlementPolicyRule object represents a single desktop rule within the site's entitlement policy. It contains the following properties:

- BrowserName (System.String)

  Site-wide unique name identifying this desktop entitlement to other components (for example StoreFront).

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth?)

  The color depth of any desktop session launched by the user from the entitlement. If null, the equivalent setting from the rule's desktop group is used.

- Description (System.String)

  Optional description of the rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

- DesktopGroupUid (System.Int32)

  The unique ID of the desktop group to which the rule applies.

- Enabled (System.Boolean)

  Indicates whether the rule is enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

- ExcludedUserFilterEnabled (System.Boolean)

  Indicates whether the excluded users filter is enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

- ExcludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

- IconUid (System.Int32?)

  The unique ID of the icon used to display the desktop entitlement to the user. If null, the equivalent setting from the rule's desktop group is used.

- IncludedUserFilterEnabled (System.Boolean)

  Indicates whether the included users filter is enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the rule.

- IncludedUsers (Citrix.Broker.Admin.SDK.ChbUser[])

  The included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

- LeasingBehavior (Citrix.Broker.Admin.SDK.LeasingBehavior)

  Defines the desired connection leasing behavior applied to sessions launched using this entitlement. Possible values are:
  Allowed and Disallowed.

- MaxPerEntitlementInstances (System.Int32)

  Maximum allowed concurrently running instances of the desktop associated with this entitlement in the site . A value of zero allows unlimited usage.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  A collection of arbitrary key/value pairs that can be associated with the rule. The administrator can use these values for any purpose; they are not used by the site itself in any way.

- Name (System.String)

  The administrative name of the rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

- PublishedName (System.String)

  The name of the desktop session entitlement as seen by the user. If null, the equivalent setting from the rule's desktop group is used.

- RestrictToTag (System.String)

  Optional tag that may be used further to restrict which machines may be made accessible to a user by an entitlement policy rule. A machine may be made accessible by an entitlement policy rule only if either the rule has no tag restriction or the rule does have a tag restriction and the machine is tagged with the same tag.

- SecureIcaRequired (System.Boolean?)

  Indicates whether the rule requires the SecureICA protocol for desktop sessions launched using the entitlement. If null, the equivalent setting from the rule's desktop group is used.

- SessionReconnection (Citrix.Broker.Admin.SDK.SessionReconnection)

Defines reconnection (roaming) behavior for sessions launched using this rule. Possible values are:
Always, DisconnectedOnly, and SameEndpointOnly.

- Uid (System.Int32)

  The unique ID of the rule itself.

- UUID (System.Guid)

  UUID of the rule.

Examples

EXAMPLE 1

Returns all desktop rules from the entitlement policy. This offers a complete description of the current site's entitlement policy with respect to desktops published from shared desktop groups.

```
Get-BrokerEntitlementPolicyRule
```

EXAMPLE 2

Returns all desktop rules in the entitlement policy that give users entitlements to desktop sessions in the Customer Support desktop group.

```
$dg = Get-BrokerDesktopGroup 'Customer Support'
Get-BrokerEntitlementPolicyRule -DesktopGroupUid $dg.Uid
```

Parameters

-Uid

Gets the desktop rule with the specified unique ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only desktop rules with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BrowserName

Gets only desktop rules with browser names matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ColorDepth

Gets only desktop rules with the specified color depth.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets only desktop rules with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only desktop rules that apply to the desktop group with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets only desktop rules that are in the specified state, either enabled ($true), or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUser

Gets only desktop rules that have the specified user in their excluded users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Gets only desktop rules that have their excluded user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets only desktop rules using the icon with the specified unique ID.

Type:	Int32

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUser

Gets only desktop rules that have the specified user in their included users filter (whether the filter is enabled or not).

Type:	User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Gets only desktop rules that have their included user filter enabled ($true) or disabled ($false).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LeasingBehavior

Gets only application rules with the specified connection leasing behavior. Possible values are:

Allowed and Disallowed.

Type:	LeasingBehavior
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPerEntitlementInstances

Maximum allowed concurrently running instances of the desktop associated with this entitlement in the site . A value of zero allows unlimited usage.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-PublishedName

Gets only desktop rules with the specified published name, that is, the desktop session entitlement name that the end user sees.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RestrictToTag

Gets only desktop rules with the specified tag restriction.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SecureIcaRequired

Gets only desktop rules that require the desktop session to use the SecureICA protocol ($true) or not ($false).

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionReconnection

Gets only desktop rules with the specified session reconnection behavior. Possible values are: Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets rules with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

Get-BrokerEntitlementPolicyRule returns all desktop entitlement policy rules that match the specified selection criteria.

Get-BrokerGpoFilter

March 11, 2024

Gets GPO filters for a policy.

Syntax

```
Get-BrokerGpoFilter
   [-FilterData <String>]
   [-FilterType <String>]
   [-IsAllowed <Boolean>]
   [-IsEnabled <Boolean>]
   [-PolicyGuid <Guid>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerGpoFilter
   -FilterGuid <Guid>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve GPO filters that meet certain criteria.

————————BrokerGpoFilter Object

A GPO filter specifies how the policy should be applied based on the properties of a user session and/or the VDA hosting the session.

- FilterData (System.String)

  Filter data.

- FilterGuid (System.Guid)

  The GUID of the filter.

- FilterType (System.String)

  The type of the filter.

- IsAllowed (System.Boolean)

  Is filter mode set to allowed.

- IsEnabled (System.Boolean)

  Is filter enabled.

- PolicyGuid (System.Guid)

  The GUID of the policy that owns the filter.

Examples

EXAMPLE 1

Gets the filters defined for a policy.

```
Get-BrokerGpoFilter -PolicyGuid ([Guid]"12345678-...")
```

EXAMPLE 2

Gets a specific filter.

```
Get-BrokerGpoFilter -FilterGuid ([Guid]"12345678-...")
```

Parameters

-FilterGuid

Gets specified filter. If this parameter is not specified, all filters are returned.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterData

Gets filter that has the specified data.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FilterType

Gets filter of the specified type.

Type:	String
Accepted values:	AccessControl, BranchRepeater, ClientIP, ClientName, DesktopGroup, DesktopKind, DesktopTag, OU, User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsAllowed

Gets allowed filters.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsEnabled

Gets enabled filters.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicyGuid

Gets filters that are defined for the policy.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoFilter

Get-BrokerGpoFilter returns an object for each matching GPO filter object.

Get-BrokerGpoPolicy

March 11, 2024

Gets GPO policies configured for this site.

Syntax

```
Get-BrokerGpoPolicy
   [[-Name] <String>]
   [-Description <String>]
   [-IsEnabled <Boolean>]
   [-PolicySetGuid <Guid>]
   [-Priority <Int32>]
```

```
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerGpoPolicy
    [-PolicyGuid] <Guid>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve GPO policies matching the specified criteria. If no parameters are specified this cmdlet enumerates all GPO policies.

A GPO policy contains settings that control VDA behaviors.

————————BrokerGpoPolicy Object

A GPO policy object is a collection of VDA configurations that control how a VDA should behave. The filters in a policy are used to determine which VDAs are to be enforced with the specified configuration settings. Policy priorities determine how the policies should be applied together.

- Description (System.String)

  A short description.

- IsEnabled (System.Boolean)

  Specifies whether the policy is enabled. A disabled policy is not used to enforce its settings by VDAs.

- Name (System.String)

  The name of the policy object. Names for each policy object must be unique in a policy set.

- PolicyGuid (System.Guid)

  The GUID of the policy object.

- PolicySetGuid (System.Guid)

  The GUID of the policy set that contains this policy.

- Priority (System.Int32)

Specifies the priority of this policy among all the other policies in the policy set that contains this policy. The value is 1-based and the maximal value is the number of policies in the policy set.

Examples

EXAMPLE 1

Finds the policy named as 'Security settings'.

```
Get-BrokerGpoPolicy -Name 'Security settings'
```

EXAMPLE 2

Finds all policies in the default site policy set.

```
Get-BrokerGpoPolicy
```

Parameters

-PolicyGuid

Gets only the policy object with the specified GUID.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only the policy object with the specified name.

Type:	String
Position:	2

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets the policy that has the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsEnabled

Gets policies that are enabled or disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicySetGuid

Gets only the policies in the policy set.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Priority

Gets the policy that has the specified priority.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoPolicy

Get-BrokerGpoPolicy returns an object for each matching policy.

Get-BrokerGpoPolicySet

March 11, 2024

Gets GPO policy sets defined in site.

Syntax

```
Get-BrokerGpoPolicySet
    [[-Name] <String>]
    [-Description <String>]
    [-IsAssigned <Boolean>]
    [-PolicyCount <Int32>]
    [-PolicySetType <String>]
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerGpoPolicySet
    [-PolicySetGuid] <Guid>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve information about all policy sets or a specified policy set.

———————BrokerGpoPolicySet Object

A GPO policy set is a container of GPO policies. There is always a site policy set, which contains all the site policies. There is also a policy set that contains all the policy templates. Other policy sets are private policy sets used by individual components for special configurations.

- Description (System.String)

  A short description of the policy set.

- IsAssigned (System.Boolean)

  True if the policy set is assigned to a delivery group.

- LastError (System.String)

  If neither nor empty, an error string indicating the reason why the most recent conversion from the policy set to VDA blob failed.

- Name (System.String)

  The name of the policy set. This must be unique among all policy sets.

- PolicyCount (System.Int32)

  Number of policies in the policy set.

- PolicySetGuid (System.Guid)

  The ID of the configuration policy set.

- PolicySetType (System.String)

  The policy set type.

- Scopes (Citrix.Fma.Sdk.DelegatedAdminInterfaces.ScopeReference[])

  The list of the delegated admin scopes to which the policy set belongs.

Examples

EXAMPLE 1

Lists the policy sets currently defined for the site.

```
1  Get-BrokerGpoPolicySet
```

Parameters

-PolicySetGuid

Gets specified policy set. If this parameter is not specified, all policy sets are returned.

Type:	Guid
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets specified policy set. If this parameter is not specified, all policy sets are returned.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets the policy set that has the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsAssigned

Gets policy sets that are currently assigned to at least one delivery group or not assigned to any delivery group.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicyCount

Gets the policy set that has the specified number of policies.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicySetType

Gets the policy sets of the specified type.

Type:	String
Accepted values:	CustomTemplates, DeliveryGroupPolicies, SitePolicies, SiteTemplates
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeId

Gets the policy sets that are associated with the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets the policy sets that are associated with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoPolicySet

Get-BrokerGpoPolicySet returns the matching policy set object.

Get-BrokerGpoSetting

March 11, 2024

Gets GPO settings for a policy.

Syntax

```
Get-BrokerGpoSetting
    [[-SettingName] <String>]
    [-PolicyGuid <Guid>]
    [-SettingValue <String>]
    [-UseDefault <Boolean>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerGpoSetting
    [-SettingGuid] <Guid>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve GPO settings that meet certain criteria.

————————BrokerGpoSetting Object

A GPO setting specifies a configuration setting that controls how a VDA behaves.

- PolicyGuid (System.Guid)

  The GUID of the policy that owns the setting.

- SettingGuid (System.Guid)

  The GUID of the setting.

- SettingName (System.String)

  The name of the setting.

- SettingValue (System.String)

  The setting value.

- UseDefault (System.Boolean)

  Indicate if the default value of the setting is used. Ignored if setting is Boolean.

Examples

EXAMPLE 1

Gets the specified setting.

```
Get-BrokerGpoSetting -SettingGuid ([Guid]"1234abcd-...")
```

EXAMPLE 2

The value of the setting in the output may be produced if a setting with the value [“a”, “b”] has been created previously.

SettingValue : [“a”, “b”]

```
Get-BrokerGpoSetting -SettingValue '*"a"*"b"*'
```

Parameters

-SettingGuid

Gets specified setting. If this parameter is not specified, all settings that belong to the policy are returned.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SettingName

Gets specified setting if this parameter is specified.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PolicyGuid

Specifies the policy for which the settings are retrieved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettingValue

Gets the setting with the specified value.

Getting one or more setting objects is a SQL search operation. The parameters are used as the conditions in a SQL WHERE clause. If the value of a setting contains characters that are used as SQL meta characters, for example, if the value of a setting is a JSON string [“a”, “b”], because the [,], and ‘‘are meta characters, searching using such a string may not yield the expected result. In general, it is not necessary to search by value when the GUID of a setting is known, or when the GUID of a policy and the name of a setting in the policy is known.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UseDefault

Gets the settings that use the default value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoSetting

Get-BrokerGpoSetting returns an object for each matching setting object.

Get-BrokerHostingPowerAction

March 11, 2024

Gets power actions queued for machines.

Syntax

```
Get-BrokerHostingPowerAction
    [[-MachineName] <String>]
    [-Action <PowerManagementAction>]
    [-ActionCompletionTime <DateTime>]
    [-ActionStartTime <DateTime>]
    [-ActualPriority <Int32>]
    [-BasePriority <Int32>]
    [-DNSName <String>]
    [-FailureReason <String>]
    [-HostedMachineId <String>]
    [-HostedMachineName <String>]
    [-HypervisorConnectionName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-HypHypervisorConnectionUid <Guid>]
    [-Metadata <String>]
    [-Origin <PowerActionPriority>]
    [-RequestTime <DateTime>]
    [-Sid <String>]
    [-State <PowerActionState>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerHostingPowerAction
    [-Uid] <Int64>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Finds power actions matching the specified search criteria from the queue of all known power actions. These power actions can be waiting to be dealt with or can be part way through being processed by the relevant hypervisor, or they can be recently completed actions. Completed actions are removed from the queue after a configured period, the default being one hour.

If no search criteria are specified all actions in the queue are obtained.

A Hosting Power Action record defines the action that is to be performed or has been performed, the machine that the action is to be applied to, the priority of the action in relation to other actions in the queue, times for points in the life of the action, and any results if the action has completed.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement' .

————————————BrokerHostingPowerAction Object

The BrokerHostingPowerAction object represents an instance of a power action. It contains the following properties:

- Action (Citrix.Broker.Admin.SDK.PowerManagementAction)

  The power action to be performed. Possible values are: TurnOn, TurnOff, Shutdown, Reset, Restart, Suspend, Resume.

- ActionCompletionTime (System.DateTime?)

  The time when the power action was completed by the hypervisor connection.

- ActionStartTime (System.DateTime?)

  The time when the power action was started to be processed by the hypervisor.

- ActualPriority (System.Int32)

  The current priority of the operation after any priority boosting.

- BasePriority (System.Int32)

  The starting priority of the operation.

- DNSName (System.String)

  The fully qualified DNS name of the machine that the power action applies to.

- FailureReason (System.String)

  For failed, lost, canceled or deleted actions, an indication of why the action did not complete.

- HostedMachineId (System.String)

  The hypervisor's ID for the machine that the power action applies to.

- HostedMachineName (System.String)

  The hypervisor's name for the machine that the power action applies to.

- HypervisorConnectionUid (System.Int32)

  The unique identifier of the hypervisor connection that is associated with the target machine.

- HypHypervisorConnectionUid (System.Guid)

  The UUID of the hypervisor connection that the machine's hosting server is accessed through. This is the identifier used by the Host and Provisioning services.

- MachineName (System.String)

  The name of the machine that the power action applies to, in the form domain\machine.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this power action.

- Origin (Citrix.Broker.Admin.SDK.PowerActionPriority)

  The origin of the power action.

- RequestTime (System.DateTime)

  The timestamp of when the action was created and placed in the queue.

- Sid (System.String)

  The SID of the machine to which the power action applies.

- State (Citrix.Broker.Admin.SDK.PowerActionState)

  The current state of this power action. Possible values are: Pending, Started, Completed, Failed, Canceled, Deleted, Lost.

- Uid (System.Int64)

  The unique identifier of the power action.

Examples

EXAMPLE 1

Fetches records for all known power actions either waiting to be processed, or currently being processed, or which have been processed in the last hour.

```
Get-BrokerHostingPowerAction
```

EXAMPLE 2

Fetches records for all power actions that are waiting to be processed and where the action is for a virtual machine that is hosted by the hypervisor called 'XenPool5'.

```
Get-BrokerHostingPowerAction -State Pending -HypervisorConnectionName '
    XenPool5'
```

Parameters

-Uid

Gets only the single action record whose ID matches the specified value.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets only the records for actions that are for machines whose name (of the form domain\machine) matches the specified string.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Action

Gets only action records with the specified action type.

Valid values are TurnOn, TurnOff, ShutDown, Reset, Restart, Suspend and Resume.

Type:	PowerManagementAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ActionCompletionTime

Gets only action records reported as having completed successfully at the specified time. This is useful with advanced filtering; for more information, see about_Broker_Filtering.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ActionStartTime

Gets only action records reported as starting to be processed by the relevant hypervisor at the specified time. This is useful with advanced filtering; for more information, see about_Broker_Filtering.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ActualPriority

Gets only the records for actions whose current active priority matches the specified value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-BasePriority

Gets only the records for actions whose original priority matches the specified value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets only the records for actions that are for machines whose DNS name matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FailureReason

Gets only actions that did not complete successfully and whose failure reason value matches the specified string.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineId

Gets only actions for machines whose hosting ID (the ID used by the hypervisor) matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineName

Gets only actions for machines whose hosting name (the name used by the hypervisor) matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionName

Gets only the records for actions for machines hosted via a hypervisor connection whose name matches the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets only the records for actions for machines hosted via a hypervisor connection whose UID matches the specified value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypHypervisorConnectionUid

Gets only the records for actions for machines hosted via a hypervisor connection whose UUID matches the specified value.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Origin

Gets only actions whose origin matches the specified string.

Valid values are Reset, Schedule, Launch, Admin, Untaint, Policy and IdlePool.

Type:	PowerActionPriority
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RequestTime

Gets only the records for actions created and added to the queue at the specified time. This is useful with advanced filtering; for more information, see about_Broker_Filtering.

Type:	DateTime
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Gets only actions for machines whose SIDs match the specified string.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-State

Gets only the records for actions with the specified current state.

Valid values are Pending, Started, Completed, Failed, Canceled, Deleted and Lost.

Type:	PowerActionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.HostingPowerAction

Get-BrokerHostingPowerAction returns all power actions that match the specified selection criteria.

Get-BrokerHypervisorAlert

March 11, 2024

Gets hypervisor alerts recorded by the controller.

Syntax

```
Get-BrokerHypervisorAlert
   [-HostingServerName <String>]
   [-HypervisorConnectionUid <Int32>]
   [-Metadata <String>]
   [-Metric <AlertMetric>]
   [-Severity <AlertSeverity>]
   [-Time <DateTime>]
   [-TriggerInterval <TimeSpan>]
   [-TriggerLevel <Double>]
   [-TriggerPeriod <TimeSpan>]
   [-TriggerValue <Double>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerHypervisorAlert
   -Uid <Int64>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Get-BrokerHypervisorAlert cmdlet gets alert objects reported by the hypervisors that the controller is monitoring.

Without parameters, Get-BrokerHypervisorAlert gets all of the alerts recorded. Use parameters to select which alerts are returned.

Once you have configured suitable alerts in your hypervisor, and configured the controller with your hypervisor details (see New-BrokerHypervisorConnection), the controller monitors each hypervisor for new alerts.

Four hypervisor alert metrics are recorded; these relate to the hypervisor host, not individual virtual machines:

- Cpu: Reports excessive CPU usage.
- Memory: Reports excessive memory usage.
- Network: Reports high network activity.
- Disk: Reports high disk activity.

Each alert also includes information about where and when the alert occurred, the severity of the alert (Red/Yellow), and the configuration of the triggered alert.

The following metrics are supported with these hypervisors:

- VMware ESX (Cpu, Memory, Network, Disk)
- Citrix XenServer (Cpu, Network)
- Microsoft Hyper-V (None)

——————————BrokerHypervisorAlert Object

The BrokerHypervisorAlert represents a hypervisor alert object. It contains the following properties:

- HostingServerName (System.String)

  The name of the hypervisor hosting this machine.

- HypervisorConnectionUid (System.Int32)

  The Uid of the hypervisor connection that reported this alert.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this hypervisor alert.

- Metric (Citrix.Broker.Admin.SDK.AlertMetric)

  The metric this alert relates to: Cpu, Memory, Network, Disk, HostConnection or HostReboot.

- Severity (Citrix.Broker.Admin.SDK.AlertSeverity)

  Severity of the alert (Red or Yellow). Red is more serious than Yellow.

- Time (System.DateTime)

  Time that the alert occurred.

- TriggerInterval (System.TimeSpan?)

  Number of ticks (100ns) before the alert can be raised again.

- TriggerLevel (System.Double?)

  Threshold level that the alert was configured to trigger at.

- TriggerPeriod (System.TimeSpan?)

  Duration the value was above the trigger level.

- TriggerValue (System.Double?)

  The value of the monitored metric that triggered the alert.

- Uid (System.Int64)

  The unique internal identifier of this alert.

Examples

EXAMPLE 1

Returns all serious (Red) alerts for any hosting server with a name that starts with 'TestHyp'.

```
Get-BrokerHypervisorAlert -HostingServerName TestHyp* -Severity Red
```

EXAMPLE 2

Returns all CPU usage alerts that occurred in the last hour.

```
Get-BrokerHypervisorAlert -Filter {
  Metric -eq 'Cpu' -and Time -ge '-1:0'  }
```

Parameters

-Uid

Gets the hypervisor alert with the specified UID.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingServerName

Gets alerts for the specified hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets alerts for the specified hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metric

Gets alerts for a specified metric.

Valid values are: Cpu, Memory, Network and Disk.

Type:	AlertMetric
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Severity

Gets alerts with the specified severity.

Valid values are: Red and Yellow.

Type:	AlertSeverity
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Time

Gets alerts that occurred at a specific time.

You can also use -Filter and relative comparisons; see the examples for more information.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TriggerInterval

Gets alerts with a specific trigger interval. This is the interval before the alert is raised again.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TriggerLevel

Gets alerts with a specific trigger threshold level.

Type:	Double
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TriggerPeriod

Gets alerts with a specific trigger period. This is the duration the threshold level was exceeded for, prior to the alert triggering.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TriggerValue

Gets the value of the monitored metric that triggered the alert.

Type:	Double
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.HypervisorAlert

Get-BrokerHypervisorAlert returns an object for each matching alert.

Get-BrokerHypervisorConnection

March 11, 2024

Gets hypervisor connections matching the specified criteria.

Syntax

```
Get-BrokerHypervisorConnection
   [[-Name] <String>]
   [-ExplicitPreferredController <Boolean>]
   [-ExtraSpinUpTimeSecs <Int32>]
   [-FaultReason <String>]
   [-FaultState <String>]
   [-FaultStateDuration <TimeSpan>]
   [-HypHypervisorConnectionUid <Guid>]
   [-HypHypervisorType <String>]
   [-IsReady <Boolean>]
   [-MachineCount <Int32>]
   [-MaxAbsoluteActiveActions <Int32>]
   [-MaxAbsoluteNewActionsPerMinute <Int32>]
   [-MaxAbsolutePvdPowerActions <Int32>]
   [-MaxPercentageActiveActions <Int32>]
   [-MaxPvdPowerActionsPercentageOfDesktops <Int32>]
   [-Metadata <String>]
```

```
    [-PreferredController <String>]
    [-State <HypervisorConnectionState>]
    [-TimeFaultStateEntered <DateTime>]
    [-ZoneExternalUid <Guid>]
    [-ZoneHealthy <Boolean>]
    [-ZoneUid <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerHypervisorConnection
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerHypervisorConnection cmdlet gets hypervisor connections matching the specified criteria. If no parameters are specified this cmdlet enumerates all hypervisor connections.

————————BrokerHypervisorConnection Object

The BrokerHypervisorConnection represents hypervisor connection object. It contains the following properties:

- Capabilities (System.String[])

  The set of capabilities as reported by the hypervisor.

- ExplicitPreferredController (System.Boolean?)

  Whether the PreferredController property was explicity set through the SDK or automatically chosen.

- ExtraSpinUpTimeSecs (System.Int32?)

  The extra time a VM is allowed to start before it is marked as failed on session launch

- FaultReason (System.String)

  Detailed fault state description if connection is currently in a fault state.

- FaultState (System.String)

Current fault state indicator associsted with hypervisor connection, or 'None'if connection is operating normally.

- FaultStateDuration (System.TimeSpan?)

  Period for which the hypervisor has been in fault state

- HypervisorCapabilities (System.String[])

  The set of hypervisor capabilities as reported by the hypervisor.

- HypHypervisorConnectionUid (System.Guid)

  The Guid that identifies the hypervisor connection.

- HypHypervisorType (System.String)

  The type of hypervisor connected to.

- IsReady (System.Boolean)

  Indicates that the connection is ready to be used in the configuration of managed machines.

- MachineCount (System.Int32)

  Count of machines associated with this hypervisor connection.

- MaxAbsoluteActiveActions (System.Int32?)

  Maximum number of active power actions allowed at any one time (defined in the metadata named 'Citrix_Broker_MaxAbsoluteActiveActions'on the hypervisor connection in the Citrix Hosting Service).

- MaxAbsoluteNewActionsPerMinute (System.Int32?)

  Maximum number of new actions that can be fired off to the hypervisor in any one minute (defined in the metadata named 'Citrix_Broker_MaxAbsoluteNewActionsPerMinute'on the hypervisor connection in the Citrix Hosting Service).

- MaxAbsolutePvdPowerActions (System.Int32?)

  This property is no longer supported.

- MaxPercentageActiveActions (System.Int32?)

  Maximum percentage of machines on the connection that can have active power actions at any one time (defined in the metadata named 'Citrix_Broker_MaxPowerActionsPercentageOfDesktops' on the hypervisor connection in the Citrix Hosting Service).

- MaxPvdPowerActionsPercentageOfDesktops (System.Int32?)

  This property is no longer supported.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Collection of all the metadata associated to the hypervisor connection.

- Name (System.String)

  The display name of the hypervisor connection.

- PreferredController (System.String)

  The name of the controller which is preferred to be used, when available, to perform all communication to the hypervisor. The name is in DOMAIN\machine form. A preferred controller may have been automatically chosen when the hypervisor connection was created.

- State (Citrix.Broker.Admin.SDK.HypervisorConnectionState)

  The state of the hypervisor connection.

- TimeFaultStateEntered (System.DateTime?)

  Time at which the hypervisor entered fault state

- Uid (System.Int32)

  Unique internal identifier of hypervisor connection.

- ZoneExternalUid (System.Guid?)

  The Guid that is the external zone uid of the hypervisor connection.

- ZoneHealthy (System.Boolean?)

  Health state of the Zone associated with this hypervisor connection.

- ZoneUid (System.Guid?)

  The Guid that identifies the zone associated with the hypervisor connection.

Examples

EXAMPLE 1

Gets a hypervisor connection by name.

```
1  $hvConn = Get-BrokerHypervisorConnection -Name "hvConnectionName"
```

EXAMPLE 2

Gets hypervisor connections by preferred controller.

```
1  $hvConn = Get-BrokerHypervisorConnection -PreferredController "
       domainName\controllerName"
```

EXAMPLE 3

Gets hypervisor connection used by a (power managed) machine.

```
$machine = Get-BrokerMachine -Uid $machineUid
$hvConn = Get-BrokerHypervisorConnection -Uid $machine.
    HypervisorConnectionUid
```

Parameters

-Uid

Gets the hypervisor connection with the specified internal id.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets hypervisor connections with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExplicitPreferredController

Gets hypervisor connections based on whether their preferred controller was explicitly specified or not

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExtraSpinUpTimeSecs

Gets the extra time a VM is allowed to start before it is marked as failed on session launch

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FaultReason

Gets hypervisor connections with fault reasons matching that specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FaultState

Gets hypervisor connections with fault states matching that specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FaultStateDuration

Period for which the hypervisor has been in fault state

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypHypervisorConnectionUid

Gets hypervisor connections with the specified Guid.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypHypervisorType

Gets hypervisor connections with the specified value of the hypervisor type.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsReady

Gets hypervisor connections with the specified value of the IsReady flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineCount

Gets hypervisor connections with the specified machine count.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAbsoluteActiveActions

Gets hypervisor connections with the specified MaxAbsoluteActiveActions value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAbsoluteNewActionsPerMinute

Gets hypervisor connections with the specified MaxAbsoluteNewActionsPerMinute value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAbsolutePvdPowerActions

This property is no longer supported.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPercentageActiveActions

Gets hypervisor connections with the specified MaxPercentageActiveActions value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPvdPowerActionsPercentageOfDesktops

This property is no longer supported.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreferredController

Gets hypervisor connections with the specified preferred controller. Specify the SAM name of the controller.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-State

Gets hypervisor connections with the specified connection state. Values can be can be:

- Unavailable - The broker is unable to contact the hypervisor.
- InMaintenanceMode - The hosting server is in maintenance mode.
- On - The broker is in contact with the hypervisor.

Type:	HypervisorConnectionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TimeFaultStateEntered

Time at which the hypervisor entered fault state

Type:	DateTime
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneExternalUid

Gets the hypervisor connections with the specified zone external uid.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneHealthy

Health state of the Zone associated with this hypervisor connection.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

Gets the hypervisor connections with the specified zone uid.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.HypervisorConnection

Get-BrokerHypervisorConnection returns an object for each matching hypervisor connection.

Get-BrokerHypervisorConnectionStatus

March 11, 2024

Gets connection status and power management stats for the hypervisor.

Syntax

```
Get-BrokerHypervisorConnectionStatus
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The GetBrokerHypervisorConnectionStatus cmdlet retrieves the power management statistics and connection status for all hypervisors on the DDC

————————————BrokerHypervisorConnectionStatus Object

Retrieves power management statistics and connection status for all hypervisors on the DDC

- CredentialsValid (System.Boolean?)

  Indicates whether the credentials are valid or not
- HclCurrentlyConnected (System.Boolean?)

  Indicates whether HCL is currently connected
- HypervisorConnectionGuid (System.Guid?)

  Gives the hypervisor connection GUID
- HypervisorConnectionUid (System.Int32)

  Gives the hypervisor connection UID
- HypervisorType (System.String)

  Type of hypervisor connection
- HypervisorZone (System.Guid?)

  Zone of the hypervisor connection
- InMaintenanceMode (System.Boolean?)

  Indicates whether the hypervisor is in maintenance mode or not
- InProgressActions (System.Int32?)

  Number of power actions in progress
- LastActionCompletedTime (System.DateTime?)

  Time when the last power action completed
- LastActionFailedTime (System.DateTime?)

  Time when the last power action failed
- LastActionStartTime (System.DateTime?)

  Time when the last power action started
- LastMachineManagerCreationTime (System.DateTime?)

  Time when the last machine manager was created

- LastPowerStateUpdateEventTime (System.DateTime?)

  Time when the last power state update event was created

- LastPowerStateUpdateTime (System.DateTime?)

  Time when the power state was last updated

- LastSiteServiceStartTime (System.DateTime?)

  Time when site services last started

- LastToolStateUpdateEventTime (System.DateTime?)

  Time when the last tool state update event was created

- LastToolStateUpdateTime (System.DateTime?)

  Time when the last tool state was updated

- NextPendingAction (System.Int64?)

  The next pending power action

- PendingActions (System.Int32?)

  Number of pending power actions

- TotalMachineManagersCreated (System.Int32?)

  Number of machine managers created

- TotalMachineManagersFailed (System.Int32?)

  Number of machine managers which failed

- TotalMachines (System.Int32?)

  Total number of machines present in the connection

Examples

Parameters

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GetBrokerHypervisorConnectionStatus

Get-BrokerHypervisorConnectionStatus returns an object for each hypervisor connection present in the DDC.

Get-BrokerIcon

March 11, 2024

Get stored icons.

Syntax

```
Get-BrokerIcon
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerIcon
    -Uid <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerIcon
    -FileName <String>
    [-ServerName <String>]
    [-Index <Int32>]
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Reads a specific icon by Uid, or enumerates icons by passing no Uid.

————————BrokerIcon Object

The BrokerIcon object represents a single instance of an icon. It contains the following properties:

- EncodedIconData (System.String)

  The Base64 encoded .ICO format of the icon.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this command

- Uid (System.Int32)

  The UID of the icon itself.

Examples

EXAMPLE 1

Enumerate all icons.

```
Get-BrokerIcon
```

EXAMPLE 2

Get the icon with Uid 1.

```
Get-BrokerIcon -Uid 1
```

EXAMPLE 3

Retrieves the icon data from a file named “icon1.dll”on this computer. If this DLL contains multiple icons, all of them are returned in sequence.

```
Get-BrokerIcon -FileName icon1.dll
```

EXAMPLE 4

Retrieves only the first icon from the “c:\icons\icon1.dll”file on Server1.

```
Get-BrokerIcon -FileName c:\icons\icon1.dll -ServerName Server1 -Index
    0
```

EXAMPLE 5

Retrieves the icon data for an application named “app1.exe”, contained in an application profile named “app1.profile”located on a file share path “\\SERVER1\Share”. Returns only the first icon associated with that profiled application.

```
Get-BrokerIcon -FileName \\Server1\Share\app1.profile app1.exe -Index 0
```

Parameters

-Uid

Gets only the icon specified by unique identifier.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FileName

Specifies the name of a file from which to read the icon data. If the ServerName parameter is used, the FileName must be an absolute path.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Specifies the name of the server. If the -FileName parameter refers to content or to a URL, the icon associated with the file type or URL is retrieved from the given server. Therefore, the server specified should have a file type handler installed for the given file type. If a local file path is specified, the server name refers to the server on which the file is located. If a UNC path is specified, the server name is unused.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Index

Specifies the zero-based icon resource index. For example, to select the first icon, specify an index of 0. Alternatively, to select the third icon, specify an index of 2. If the specified index is larger than the number of icons in the source file or profiled application, an error will be returned.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Icon

Returns an Icon object for each enumerated icon.

CtxIcon

Returns a list of zero or more icons, each in CtxIcon format. The CtxIcon.IconData property is the icon in standard Microsoft ICO format.

Get-BrokerImportedFTA

March 11, 2024

Gets the imported file type associations.

Syntax

```
Get-BrokerImportedFTA
   [[-ExtensionName] <String>]
   [-ContentType <String>]
   [-Description <String>]
   [-DesktopGroupUid <Int32>]
   [-Edit <String>]
   [-EditArguments <String>]
   [-EditExecutableName <String>]
   [-HandlerName <String>]
   [-Open <String>]
   [-OpenArguments <String>]
   [-OpenExecutableName <String>]
   [-PerceivedType <String>]
   [-Print <String>]
   [-PrintTo <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
```

```
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerImportedFTA
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns the file type associations the system imports from worker machines.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Initially the system is not aware of any extensions, and they must be imported by the Citrix administrator. See the Update-BrokerImportedFTA cmdlet for more information.

After file type extensions are imported, this cmdlet lets the administrator review which file type associations the system is aware of. ImportedFTA objects are also used when configuring content redirection. See the New-BrokerConfiguredFTA cmdlet for more information.

The imported file type associations are grouped according to the desktop group to which they belong, because the system expects all machines in the same desktop group to have the same file type associations. That may not be true, however, across desktop groups.

Note that the ImportedFTA object has several fields that are not currently used. Only those fields that are shared with the ConfiguredFTA object are actually used in some capacity.

——————————BrokerImportedFTA Object

The BrokerImportedFTA object represents a file type association imported from worker machines. It contains the following properties:

- ContentType (System.String)

Content type of the file, such as “text/plain”or “application/vnd.ms-excel”.

- Description (System.String)

  File type description, such as “Test Document”, “Microsoft Word Text Document”, etc.

- DesktopGroupUid (System.Int32)

  The desktop group this file type belongs to.

- Edit (System.String)

  Edit command with full path to executable: “C:\Program Files (x86)\Microsoft Office\Office12\WINWORD.EXE”
  /n /dde

- EditArguments (System.String)

  The arguments used for the ‘edit’action on files of this type. These are extracted from the full edit command, and may be empty.

- EditExecutableName (System.String)

  The executable name extracted from the Edit property, no path included. This is used for matching with published apps’executable when searching for the list of extensions an application is capable of handling.

- ExtensionName (System.String)

  A single file extension, such as .txt. Unique within the scope of a desktop group.

- HandlerName (System.String)

  File type handler name, e.g. “Word.Document.8”or TXTFILE.

- Open (System.String)

  Open command with full path to executable: “C:\Program Files (x86)\Microsoft Office\Office12\WINWORD.EX
  /n /dde

- OpenArguments (System.String)

  The arguments used for the ‘open’action on files of this type. These are extracted from the full open command, and may be empty.

- OpenExecutableName (System.String)

  The executable name extracted from the Open property, no path included. This is used for matching with published apps’executable when searching for the list of extensions an application is capable of handling.

- PerceivedType (System.String)

  Perceived type, such as “text”.

- Print (System.String)

  Print command: “C:\Program Files (x86)\Microsoft Office\Office12\WINWORD.EXE”/x /n /dde

- PrintTo (System.String)

  PrintTo command: “C:\Program Files (x86)\Microsoft Office\Office12\WINWORD.EXE”/n /dde

- Uid (System.Int32)

  Unique internal identifier of imported file type association.

Examples

EXAMPLE 1

Invoking this cmdlet with no arguments simply returns
all of the imported file type association objects. By default, only
the first 250 objects are returned. See the -MaxRecordCount and
-Skip parameters for information about modifying this.

```
Get-BrokerImportedFTA
```

EXAMPLE 2

Retrieves all imported file type associations that have
the extension “.txt”. Note that because imported file type associations
are per-desktop group, multiple instances may be returned.

```
Get-BrokerImportedFTA -ExtensionName ".txt"
```

Parameters

-Uid

Gets only the imported file type associations with the
specified unique identifier.

Type:	Int32
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ExtensionName

Gets only the imported file type associations with the specified extension name. For example, “.txt”or “.png”.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ContentType

Gets only the imported file type associations with the specified content type (as listed in the Registry). For example, “application/msword”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets only the imported file type associations with the specified description (as listed in the Registry). For example, “Text Document”or “Microsoft Word text document”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only the file type associations imported from a worker machine belonging to the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Edit

Gets only the imported file type associations with the specified Edit command, that includes both the executable name and path, and any arguments to that executable.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EditArguments

Gets only the imported file type associations with the specified arguments to the Edit command.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EditExecutableName

Gets only the imported file type associations with the specified executable for the Edit command.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HandlerName

Gets only the imported file type associations with the specified handler name (as listed in the Registry). For example, "TXTFILE"or "Word.Document.8".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Open

Gets only the imported file type associations with the specified Open command, that includes both the executable name and path, and any arguments to that executable.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OpenArguments

Gets only the imported file type associations with the specified arguments to the Open command.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OpenExecutableName

Gets only the imported file type associations with the specified executable for the Open command.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PerceivedType

Gets only the imported file type associations with the specified perceived type (as listed in the Registry). For example, “document”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Print

Gets only the imported file type associations with the

specified Print command.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PrintTo

Gets only the imported file type associations with the

specified PrintTo command.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

This cmdlet does not accept any input from the pipeline.

Outputs

Citrix.Broker.Admin.SDK.ImportedFTA

One or more ImportedFTA objects are returned as output.

Get-BrokerInstalledDbVersion

March 11, 2024

Gets a list of all available database schema versions for the Broker Service.

Syntax

```
Get-BrokerInstalledDbVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Broker Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-BrokerDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Broker Service database schema version number.

```
Get-BrokerInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Broker Service database schema for which upgrade scripts are supplied.

```
Get-BrokerInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-BrokerInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Broker

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerLease

March 11, 2024

Gets stored leases.

Syntax

```
Get-BrokerLease
    [[-Key] <String>]
    [-Expiration <DateTime>]
    [-LastModified <DateTime>]
    [-LeaseType <BrokerLeaseType>]
    [-OwnerSAMName <String>]
    [-OwnerSID <String>]
    [-OwnerUPN <String>]
    [-ZoneUid <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerLease
    [-Uid] <Int64>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets leases filtered by specific Uid or Owner information.

——————————BrokerLease Object

The BrokerLease object represents a single instance of a lease. It contains the following properties:

- Expiration (System.DateTime)

  The expiration time of the lease.

- Key (System.String)

  The SHA1 representation of the lease key.

- LastModified (System.DateTime)

  The modification time of the lease.

- LeaseType (Citrix.Broker.Admin.SDK.BrokerLeaseType)

  The type of lease.

- OwnerSAMName (System.String)

  The SAM name of the user associated with the lease.

- OwnerSID (System.String)

  The SID of the user associated with the lease.

- OwnerUPN (System.String)

  The UPN of the user associated with the lease.

- Uid (System.Int64)

  The UID of the lease itself.

- Value (System.String)

  The serialized lease data in XML.

- ZoneName (System.String)

  Name of the Zone this resource belongs to.

- ZoneUid (System.Guid?)

  Uid of the Zone this resource belongs to.

Examples

EXAMPLE 1

Gets the lease with internal Uid 1.

```
$lease = Get-BrokerLease -Uid 1
```

EXAMPLE 2

Gets the leases associated with the specified user.

```
$leases = Get-BrokerLease -OwnerSAMName Domain\User
```

Parameters

-Uid

Gets only the lease specified by unique identifier.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Key

Gets only the leases matching the specified lease key pattern.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Expiration

Gets only the leases matching the specified expiration date and time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastModified

Gets only the leases matching the specified modified date and time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LeaseType

Gets only leases of a specific type. Possible values Enumeration, Launch.

Type:	BrokerLeaseType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OwnerSAMName

Gets only the leases associated with the specified Domain\User.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OwnerSID

Gets only the leases associated with the specified user SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OwnerUPN

Gets only the leases associated with the specified user UPN.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneUid

Gets only the leases of resources beloning to Zone with specified Uid.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Lease

Returns an Lease object for each enumerated lease.

Related Links

- Remove-BrokerLease
- Update-BrokerLocalLeaseCache

Get-BrokerMachine

March 11, 2024

Gets machines belonging to this site.

Syntax

```
Get-BrokerMachine
    [[-MachineName] <String>]
    [-AgentVersion <String>]
    [-AllocationType <AllocationType>]
    [-ApplicationInUse <String>]
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
    [-AssignedUserSID <String>]
    [-AssociatedTenantId <Guid>]

Description

Retrieves machines matching the specified criteria. If no parameters are specified, this cmdlet enumerates all machines.

Get-BrokerMachine returns objects that combine machine configuration and state information.

For single-session machines, session information is displayed if present. If "fast user switching"is enabled, more than one session may be present on single-session machines. Because this cmdlet returns information only for a single session, if two sessions are present it will return information about the brokered session (rather than, for example, an unbrokered direct RDP session). If there is no session running, session-related fields return $null.

For multi-session machines, no session information about single sessions is displayed by this cmdlet, and so are always $null. Get-BrokerSession can be used to get information about sessions on both multi-session and single-session machines.

To count machines, rather than retrieve full details of each machine, use Group-BrokerMachine instead.

See about_Broker_Filtering for information about advanced filtering options, and about_Broker_Machines for background information about machines.

——————————BrokerMachine Object

The machine object returned represents a physical or virtual machine, which has been configured in the site.

- AgentVersion (System.String)

  Version of the Citrix Virtual Delivery Agent (VDA) installed on the machine.

- AllocationType (Citrix.Broker.Admin.SDK.AllocationType)

  Describes how the machine is allocated to the user, can be Random or Static.

- ApplicationsInUse (System.String[])

  List of applications in use on the machine (in the form of browser name).

- AssignedClientName (System.String)

  The name of the endpoint client device that the machine has been assigned to.

- AssignedIPAddress (System.String)

  The IP address of the endpoint client device that the machine has been assigned to.

- AssignedUserSIDs (System.String[])

  The SIDs of the users that have been assigned to the machine (private machines only).

- AssociatedTenantId (System.Guid?)

  Tenant associated with the machine. Once a tenant is associated with a machine it can only host sessions for that tenant and no other. Tenant associations are transient and are cleared when the machine's image is reset.

- AssociatedUserFullNames (System.String[])

  Full names of the users that have been associated with the machine (usually in the form "First-name Lastname").
  Associated users are the current user(s) for shared machines and the assigned users for private machines.

- AssociatedUserNames (System.String[])

  Usernames of the users that have been associated with the machine (in the form "domain\user").
  Associated users are the current user(s) for shared machines and the assigned users for private machines.

- AssociatedUserSIDs (System.String[])

  The SIDs of the users that have been associated with the machine.
  Associated users are the current user(s) for shared machines and the assigned users for private machines.

- AssociatedUserUPNs (System.String[])

  The User Principal Names of the users associated with the machine (in the form user@domain).
  Associated users are the current user(s) for shared machines and the assigned users for private machines.

- AzureADJoinedMode (System.String)

  The type of Azure AD Domain join that took place in VDA.
  This will be NotAadJoined when the VDA is not Azure AD domain joined.

- AzureDeviceId (System.String)

  The Azure DeviceId for this worker. Available if the worker is
  is registered with AzureAD.

- BrowserName (System.String)

  Site-wide unique name identifying associated desktop to other components (for example StoreFront). This is typically non-null only for machines backing assigned private desktops.

- Capabilities (System.String[])

  List of the capabilities that the machine supports. Valid capabilities are:

  - MultiSession: Indicates an RDS- (Terminal Services-) based machine, which supports multiple active sessions from different users.
  - CBP1_5: Indicates the machine can use the CBP 1.5 protocol for communication.

- CatalogName (System.String)

  Name of the catalog the machine is a member of.

- CatalogUid (System.Int32)

  UID of the catalog the machine is a member of.

- CatalogUUID (System.Guid)

  UUID of the catalog the machine is a member of.

- CbpVersion (Citrix.Broker.Admin.SDK.CBPVersion?)

  The version of CBP that the VDA is currently registered with. This will be null when the VDA is not registered.

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth?)

  The color depth setting configured on the machine, possible values are:
  $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

- ControllerDNSName (System.String)

  The DNS host name of the controller that the machine is registered to.

- DeliveryType (Citrix.Broker.Admin.SDK.DeliveryType?)

  Denotes whether the machine delivers desktops only, apps only or both.

- Description (System.String)

  Description of the machine.

- DesktopConditions (System.String[])

  List of outstanding desktop conditions for the machine.

- DesktopGroupName (System.String)

  Name of the desktop group the machine is a member of.

- DesktopGroupUid (System.Int32?)

  UID of the desktop group the machine is a member of.

- DesktopGroupUUID (System.Guid?)

  UUID of the desktop group the machine is a member of.

- DesktopKind (Citrix.Broker.Admin.SDK.DesktopKind?)

  Deprecated.
  Denotes whether the machine is private or shared. Use AllocationType instead.

- DesktopUid (System.Int32?)

  The UID of the associated desktop object.

- DNSName (System.String)

  The DNS host name of the machine.

- DrainingUntilShutdown (System.Boolean)

  Flag indicating if this machine is draining and will be shut down after all sessions on the machine have ended. This flag is only ever true on power-managed, multi-session machines.
  Note: The machine will not shut down if it is in maintenance mode; it will shut down only after it is taken out of maintenance mode.

- FaultState (Citrix.Broker.Admin.SDK.MachineFaultState)

  Summary state of any current fault state of the machine. Can be one of the following:

  - None - No fault; machine is healthy.
  - FailedToStart - Last power-on operation for machine failed.
  - StuckOnBoot - Machine does not seem to have booted following power on.
  - Unregistered - Machine has failed to register within expected period, or its registration has been rejected.
  - MaxCapacity - Machine is reporting itself at maximum capacity.

- FunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel?)

  Functional level of the machine, if known.

- HostedMachineId (System.String)

  Unique ID within the hosting unit of the target managed machine.

- HostedMachineName (System.String)

The friendly name of a hosted machine as used by its hypervisor. This is not necessarily the DNS name of the machine.

- HostingServerName (System.String)

  DNS name of the hypervisor that is hosting the machine if managed.

- HypervisorConnectionName (System.String)

  The name of the hypervisor connection that the machine has been assigned to, if managed.

- HypervisorConnectionUid (System.Int32?)

  The UID of the hypervisor connection that the machine's hosting server is accessed through.

- HypHypervisorConnectionUid (System.Guid?)

  The UUID of the hypervisor connection that the machine's hosting server is accessed through

- IconUid (System.Int32?)

  The UID of the machine's icon that is displayed in StoreFront.

- ImageOutOfDate (System.Boolean?)

  Denotes if the VM image for a hosted machine is out of date.

- InMaintenanceMode (System.Boolean)

  Denotes if the machine is in maintenance mode.

- IPAddress (System.String)

  The IP address of the machine.

- IsAssigned (System.Boolean)

  Denotes whether a private desktop has been assigned to a user/users, or a client name/address. Users can be assigned explicitly or by assigning on first use of the machine.

- IsPhysical (System.Boolean)

  This value is true if the machine is physical (ie not power managed by the Citrix Broker service, and false otherwise.

- IsReserved (System.Boolean)

  Indicates if machine is reserved for special use, for example for AppDisk preparation. A reserved machine cannot be a member of a desktop group.

- LastAssignmentTime (System.DateTime?)

  The Datetime of the most recent assignment to a user, client IP address or client name.

- LastConnectionFailure (Citrix.Broker.Admin.SDK.ConnectionFailureReason)

  The reason for the last failed connection between a client and the machine.

- LastConnectionTime (System.DateTime?)

  Time of the last detected connection attempt that either failed or succeeded.

- LastConnectionUser (System.String)

  The SAM name (in the form DOMAIN\user) of the user that last attempted a connection with the machine. If the SAM name is not available, the SID is used.

- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

  The reason for the last deregistration of the machine with the broker. Possible values are: AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

- LastDeregistrationTime (System.DateTime?)

  Time of the last deregistration of the machine from the controller.

- LastErrorReason (System.String)

  The reason for the last error detected in the machine.

- LastErrorTime (System.DateTime?)

  The time of the last detected error.

- LastHostingUpdateTime (System.DateTime?)

  Time of last update to any hosting data (such as power states) or the last completed power action for this machine reported by the hypervisor connection.

- LastPvdErrorReason (System.String)

  This property is no longer supported.

- LastPvdErrorTime (System.DateTime?)

  This property is no longer supported.

- LastRegistrationTime (System.DateTime?)

  Time of last registration of the machine with the controller.

- LoadIndex (System.Int32?)

  Gives current effective load index for multi-session machines.

- LoadIndexes (System.String[])

  Gives the last reported individual load indexes that were used in the calculation of the LoadIndex value. Note that the LoadIndex value may have been subsequently adjusted due to session brokering operations. This value is only set for multi-session machines.

- MacAddress (System.String)

  A string representing the physical address of the network interface corresponding to the IP Address this machine uses to communicate with the Broker.

- MachineInternalState (Citrix.Broker.Admin.SDK.MachineInternalState)

  The internal state of the machine; reported while the machine is registered to a controller, plus some private Citrix Broker Service states while the machine is not registered.

- MachineName (System.String)

  DNS host name of the machine.

- MachineUnavailableReason (System.String)

  Reason reported from the VDA showing why it is not yet available for use even though it is registered

- MaintenanceModeReason (Citrix.Broker.Admin.SDK.MaintenanceModeReason)

  The reason why the machine was placed in maintenance mode (if it is in maintenance mode). Possible values are:

  - None - Machine is not in maintenance mode.
  - Administrator - Machine was manually placed in maintenance mode by an administrator.
  - MaxFailedRegistrations - Machine was automatically placed in maintenance mode due to reaching the maximum failed registration limit.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Any metadata that is associated with the machine.

- NameLookupFailureCount (System.Int32)

  Tracks the number of consecutive directory lookup failures for this account

- OSType (System.String)

  A string that can be used to identify the operating system that is running on the machine.

- OSVersion (System.String)

  A string that can be used to identify the version of the operating system running on the machine, if known.

- PersistUserChanges (Citrix.Broker.Admin.SDK.PersistUserChanges)

  Describes if and how user changes are persisted. Possible values are:

  - OnLocal - Persist the user changes on the local disk of the machine.
  - Discard - Discard user changes.

- PowerActionPending (System.Boolean)

  Indicates if there are any pending power actions for the machine.

- PowerState (Citrix.Broker.Admin.SDK.PowerState)

  The current power state of the machine. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, resuming.

- ProvisioningType (Citrix.Broker.Admin.SDK.ProvisioningType)

  Describes how the machine was provisioned, possible values are:

  - Manual: No automated provisioning.
  - PVS: Machine provisioned by PVS (may be physical, blade, VM,...)
  - MCS: Machine provisioned by MCS (machine must be VM)

- PublishedApplications (System.String[])

  List of applications published by the machine (displayed as browser names).

- PublishedName (System.String)

  The name of the machine that is displayed in StoreFront, if the machine has been published.

- PvdEstimatedCompletionTime (System.DateTime?)

  This property is no longer supported.

- PvdPercentDone (System.Int32?)

  This property is no longer supported.

- PvdStage (Citrix.Broker.Admin.SDK.PvdStage)

  This property is no longer supported.

- PvdUpdateStartTime (System.DateTime?)

  This property is no longer supported.

- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

  Indicates the registration state of the machine. Possible values are: Unregistered, Initializing, Registered, AgentError.

- ScheduledReboot (Citrix.Broker.Admin.SDK.ScheduledReboot)

  Indicates the state of any scheduled reboot operation for a machine. Possible values:

  - None: No reboot is scheduled.
  - Pending: Machine is awaiting reboot but is available for use.
  - Draining: Machine is awaiting reboot and is unavailable for new sessions; reconnections to existing connections are still allowed, however.
  - InProgress: Machine is actively undergoing a scheduled reboot. o Natural: Natural reboot in progress. Machine is awaiting a restart.

- SecureIcaRequired (System.Boolean?)

  Flag indicating whether SecureICA is required or not when starting a session on the machine.

- SessionAutonomouslyBrokered (System.Boolean?)

  Session property indicating if the current session is an HDX session established by direct connection without being brokered.
  Session properties are always null for multi-session machines.

- SessionClientAddress (System.String)

  Session property indicating the IP address of the client connected to the machine.
  Session properties are always null for multi-session machines.

- SessionClientName (System.String)

  Session property indicating the host name of the client connected to the machine.
  Session properties are always null for multi-session machines.

- SessionClientVersion (System.String)

  Session property indicating the version of the Citrix Receiver on the connected client.
  Session properties are always null for multi-session machines.

- SessionConnectedViaHostName (System.String)

  Session property indicating the host name of the connection gateway, router or client.
  Session properties are always null for multi-session machines.

- SessionConnectedViaIP (System.String)

  Session property indicating the IP address of the connection gateway, router or client.
  Session properties are always null for multi-session machines.

- SessionCount (System.Int32)

  Count of number of sessions on the machine.

- SessionDeviceId (System.String)

  Session property indicating a unique identifier for the client device that has most recently been associated with the current session.
  Session properties are always null for multi-session machines.

- SessionHardwareId (System.String)

  Session property indicating a unique identifier for the client hardware that has been most recently associated with the current session.
  Session properties are always null for multi-session machines.

- SessionHidden (System.Boolean?)

  Session property that indicates if a session is hidden.
  Session properties are always null for multi-session machines.

- SessionKey (System.Guid?)

  Session property indicating the key of the current session.
  Session properties are always null for multi-session machines.

- SessionLaunchedViaHostName (System.String)

  Session property that denotes the host name of the StoreFront server used to launch the current brokered session.
  Session properties are always null for multi-session machines.

- SessionLaunchedViaIP (System.String)

  Session property that denotes the IP address of the StoreFront server used to launch the current brokered session.
  Session properties are always null for multi-session machines.

- SessionProtocol (System.String)

  Session property that denotes the protocol that the current session is using, can be either HDX, RDP or Console. Console sessions on XenDesktop 5 VDAs appear with a blank protocol.
  Session properties are always null for multi-session machines.

- SessionSecureIcaActive (System.Boolean?)

  Session property that indicates whether SecureICA is active on the current session or not.
  Session properties are always null for multi-session machines.

- SessionsEstablished (System.Int32)

  Number of established sessions on this machine. For multi-session machines this excludes established sessions which have not yet completed their logon processing.

- SessionSmartAccessTags (System.String[])

  Session property that indicates the Smart Access tags for the current session.
  Session properties are always null on multi-session machines.

- SessionsPending (System.Int32)

Number of pending (brokered but not yet established) sessions on this machine. For multi-session machines this also includes established sessions which have not yet completed their logon processing.

- SessionStartTime (System.DateTime?)

  Session property that indicates the start time of the current session.
  Session properties are always null on multi-session machines.

- SessionState (Citrix.Broker.Admin.SDK.SessionState?)

  Session property indicating the state of the current session, possible values are:
  Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession and Unknown. Session properties are always null for multi-session machines.

- SessionStateChangeTime (System.DateTime?)

  Session property indicating the time of the last state change of the current session.
  Session properties are always null for multi-session machines.

- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport)

  Indicates the session support of the machine.
  Possible values:

  - SingleSession: Single-session only machine.
  - MultiSession: Multi-session capable machine.

- SessionType (Citrix.Broker.Admin.SDK.SessionType?)

  Session property indicating the type of the current session.
  Session properties are always null for multi-session machines.

- SessionUid (System.Int64?)

  Session property indicating the UID of the current session.
  Session properties are always null for multi-session machines.

- SessionUserName (System.String)

  Session property indicates the name of the current session's user (in the form DOMAIN\user).
  Session properties are always null for multi-session machines.

- SessionUserSID (System.String)

  Session property indicates the SID of the current session's user.
  Session properties are always null for multi-session machines.

- SID (System.String)

  The SID of the machine.

- SummaryState (Citrix.Broker.Admin.SDK.DesktopSummaryState)

  Indicates the overall state of the desktop associated with the machine. The overall state is a result of other more specific states such as session state, registration state and power state. Possible values: Off, Unregistered, Available, Disconnected, InUse, Preparing.

- SupportedPowerActions (System.String[])

  A list of power actions supported by this machine.

- Tags (System.String[])

  A list of tags associated with the machine.

- Uid (System.Int32)

  UID of the machine object.

- UUID (System.Guid)

  UUID of the machine object.

- VMToolsState (Citrix.Broker.Admin.SDK.VMToolsState)

  State of the hypervisor tools present on the VM (if any).
  Possible values are:
  NotPresent, Unknown, NotStarted, Running.

- WillShutdownAfterUse (System.Boolean)

  Flag indicating if this machine is tainted and will be shut down after all sessions on the machine have ended. This flag is only ever true on power-managed, single-session machines.
  Note: The machine will not shut down if it is in maintenance mode; it will shut down only after it is taken out of maintenance mode.

- WillShutdownAfterUseReason (Citrix.Broker.Admin.SDK.WillShutdownAfterUseReason)

  The reason why the machine will shutdown after use (if it will shutdown after use). Possible values are:

  - None - Machine will not shutdown after use.
  - ResetDiskImage - Machine will shutdown after use to reset its disk image.
  - ScheduledNaturalReboot - Machine will shutdown after use as part of the scheduled natural reboot process.
  - OnDemandNaturalReboot - Machine will shutdown after use as part of an on-demand natural reboot process.

- WindowsConnectionSetting (Citrix.Broker.Admin.SDK.WindowsConnectionSetting?)

  The logon mode reported by Windows itself (multi-session machines only). For single-session machines the value is always hardwired to LogonEnabled.

Possible values are:
LogonEnabled, Draining, DrainingUntilRestart and LogonDisabled.

- ZoneHealthy (System.Boolean?)

  The health state of the zone in which the machine is located.

- ZoneName (System.String)

  The name of the zone in which the machine is located.

- ZoneUid (System.Guid)

  The UID of the zone in which the machine is located.

Examples

EXAMPLE 1

These commands return all suspended machines. The second form uses advanced filtering (see about_Broker_Filtering).

```
Get-BrokerMachine -PowerState Suspended
Get-BrokerMachine -Filter {
  PowerState -eq 'Suspended'  }
```

EXAMPLE 2

This command returns all machines belonging to the DNS domain mydomain.mycompany.com.

```
Get-BrokerMachine -DNSName '*.mydomain.mycompany.com'
```

EXAMPLE 3

This command returns all registered machines running on the specified hypervisor connection.

```
Get-BrokerMachine -Filter {
  RegistrationState -eq 'Registered' -and HypervisorConnectionUid -eq 5
       }
```

EXAMPLE 4

This command finds all of the machines in MyDomain with names beginning with X and removes them from the specified desktop group.

```
Get-BrokerMachine -MachineName 'MyDomain\X*' | Remove-
    BrokerDesktopGroup 2
```

EXAMPLE 5

This command gets all desktops in a site. Use this instead of the deprecated Get-BrokerDesktop command.

```
Get-BrokerMachine -Filter {
  DesktopGroupUid -ne $null  }
```

Parameters

-Uid

Gets a machine with a specific UID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets machines with a specific machine name (in the form domain\machine).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AgentVersion

Gets machines with a specific Citrix Virtual Delivery Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AllocationType

Gets machines from catalogs with the specified allocation type.

Type:	AllocationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationInUse

Gets machines running a specified published application (identified by browser name).

String comparisons are case-insensitive.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedClientName

Gets machines that have been assigned to the specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedIPAddress

Gets machines that have been assigned to the specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedUserSID

Gets machines with the specific SID of the user to whom the desktop is assigned.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-AssociatedTenantId

Gets machines associated with the specified tenant.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserFullName

Gets machines with an associated user identified by their full name (usually 'first-name last-name').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserName

Gets machines with an associated user identified by their user name (in the form 'domain\user').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserSID

Gets machines with an associated user identified by their Windows SID.

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserUPN

Gets machines with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AzureADJoinedMode

Gets machines with a specific Azure AD Domain Join Type

- NotAadJoined - Machine not joined to Azure AD yet.
- HybridAadJoined - Machine was Hybrid Aad joined.
- PureAadJoined - Machine was Pure Aad joined.

Type:	String
Accepted values:	HybridAadJoined, NotAadJoined, PureAadJoined
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDeviceId

Gets machines with matching Azure DeviceId.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BrowserName

Gets assigned machines backing desktop resources that have browser names matching the specified name.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogName

Gets machines from the catalog with the specific name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogUid

Gets machines from the catalog with the specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUUID

Gets machines from the catalog with the specific UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CbpVersion

The version of CBP that the VDA is currently registered with. This will be null when the VDA is not registered.

Type:	CBPVersion
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Gets machines configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerDNSName

Gets machines with a specific DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DeliveryType

Gets machines of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Type:	DeliveryType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets machines with a specific description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopCondition

Gets machines with an outstanding desktop condition.

Valid values are:

- CPU: Indicates the machine has high CPU usage
- ICALatency: Indicates the network latency is high
- UPMLogonTime: Indicates that the profile load time was high

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupName

Gets machines from a desktop group with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets machines from a desktop group with a specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUUID

Gets machines from a desktop group with a specific UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopKind

Deprecated: Use AllocationType parameter.

Gets machines of a particular kind.

Valid values are Private, Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopUid

Gets the machine that corresponds to the desktop with the specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets machines with the specific DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DrainingUntilShutdown

Gets machines depending on whether they are draining until shutdown or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FaultState

Gets machines currently in the specified fault state.

Type:	MachineFaultState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

Gets machines with a specific FunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineId

Gets machines with the specific machine ID known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineName

Gets machines with the specific machine name known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostingServerName

Gets machines by the name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionName

Gets machines with the specific name of the hypervisor connection hosting them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets machines with the specific UID of the hypervisor connection hosting them.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypHypervisorConnectionUid

Gets machines with the specific UUID of the hypervisor connection hosting them.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets machines by configured icon. Note that machines with a null IconUid use the icon of the desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageOutOfDate

Gets machines depending on whether their disk image is out of date or not (for machines provisioned using MCS only).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets machines by whether they are in maintenance mode or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Gets machines with a specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsAssigned

Gets machines according to whether they are assigned or not. Machines may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsPhysical

Gets machines according to whether they can be power managed by XenDesktop or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsReserved

Gets machines that are reserved for special use, for example, for AppDisk preparation.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastAssignmentTime

Gets machines with the specific LastAssignmentTime.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionFailure

Gets machines with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the desktop yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Type:	ConnectionFailureReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionTime

Gets machines on which a user session connection occurred at a specific time. This is the time at which the broker detected that the connection attempt either succeeded or failed.

Type:	DateTime
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionUser

Gets machines where a specific user name last attempted a connection (in the form 'domain\user').

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastDeregistrationReason

Gets machines whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Type:	DeregistrationReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LastDeregistrationTime

Gets machines by the time that they were last deregistered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastErrorReason

Gets machines with the specified last error reason.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastErrorTime

Gets machines with the specified last error time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LastHostingUpdateTime

Gets machines with a specific time that the hosting information was last updated or the completion of the last power action.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastPvdErrorReason

This property is no longer supported.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastPvdErrorTime

This property is no longer supported.

Type:	DateTime
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastRegistrationTime

Gets machines by the time that they last registered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoadIndex

Gets machines by their current load index.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MacAddress

Gets machines with a specific MAC address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineInternalState

Gets machines with the specified internal state.

Type:	MachineInternalState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUnavailableReason

Gets machines that corresponds to a particular MachineUnavailable Reason

- None - No detailed reason specified.
- LoadManagementInitializing - VDA load management logic currently initialising. Only occurs for multi-session capable VDAs.
- GctConnectionInitializing - VDA is still initializing control connection with NGS.
- AzureADJoinInitializing - VDA is still initializing Aad domain join.

Type:	String
Accepted values:	AzureADJoinInitializing, CtxUviDisabled, GctConnectionInitializing, IntuneEnrollPending, LoadManagementInitializing, None, PvdFailed, PvdInitializing

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaintenanceModeReason

Gets machines by the maintenance mode reason. Valid values are:

- None - Machine is not in maintenance mode.
- Administrator - Machine was manually placed in maintenance mode by an administrator.
- MaxFailedRegistrations - Machine was automatically placed in maintenance mode due to reaching the maximum failed registration limit.

Type:	MaintenanceModeReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NameLookupFailureCount

Tracks the number of consecutive directory lookup failures for this account.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets machines by the type of operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OSVersion

Gets machines by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PersistUserChanges

Gets machines by the location where the user changes are persisted.

- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerActionPending

Gets machines depending on whether a power action is pending or not.

Valid values are $true or $false.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerState

Gets machines with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

Gets machines that are in a catalog with a particular provisioning type. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical,

blade, VM,…).

- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedApplication

Gets machines with a specific application published to them (identified by its browser name).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PublishedName

Gets desktops with a specific published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PvdEstimatedCompletionTime

This property is no longer supported.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdPercentDone

This property is no longer supported.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdStage

This property is no longer supported.

Type:	PvdStage
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdUpdateStartTime

This property is no longer supported.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RegistrationState

Gets machines in a specific registration state.

Valid values are Unregistered, Initializing, Registered, and AgentError.

Type:	RegistrationState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledReboot

Gets machines according to their current status with respect to any scheduled reboots (for either scheduled desktop group reboots or image rollout purposes). Valid values are:

- None - No reboot currently scheduled.
- Pending - Reboot scheduled but machine still available for use.
- Draining - Reboot scheduled. New logons are disabled, but reconnections to existing sessions are allowed.
- InProgress - Machine is actively being rebooted.
- Natural - Natural reboot in progress. Machine is awaiting a restart.

Type:	ScheduledReboot
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Gets machines configured with a particular SecureIcaRequired setting. Note that the machine setting of $null indicates that the desktop group value is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionAutonomouslyBrokered

Gets machines according to whether their current session is autonomously brokered or not. Autonomously brokered sessions are HDX sessions established by direct connection without being brokered.

Session properties are always null for multi-session machines.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionClientAddress

Gets machines with a specific client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionClientName

Gets machines with a specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionClientVersion

Gets machines with a specific client version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionConnectedViaHostName

Gets machines with a specific incoming connection host name. This is usually a proxy or Citrix Access Gateway server.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-SessionConnectedViaIP

Gets machines with a specific incoming connection IP address.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionCount

Gets machines according to the total number of both pending and established user sessions on the machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionDeviceId

Gets machines with a specific client device ID.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionHardwareId

Gets machines with a specific client hardware ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionHidden

Gets machines depending on whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions using XenDesktop; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionKey

Gets machine running the session with a specified unique key.

Session properties are always null for multi-session machines.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionLaunchedViaHostName

Gets machines with a specific host name of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionLaunchedViaIP

Gets machines with a specific IP address of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-SessionProtocol

Gets machines with connections using a specific protocol, for example HDX, RDP, or Console.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionSecureIcaActive

Gets machines depending on whether the current session uses SecureICA or not.

Session properties are always null for multi-session machines.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionsEstablished

Gets machines according to the number of established user sessions present on the machine.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSmartAccessTag

Gets machines where the session has the specific SmartAccess tag.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionsPending

Get machines according to the number of pending user sessions for the machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStartTime

Gets machines with a specific session start time.

Session properties are always null for multi-session machines.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionState

Gets machines with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.

Session properties are always null for multi-session machines.

Type:	SessionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStateChangeTime

Gets machines whose sessions last changed state at a specific time.

Session properties are always null for multi-session machines.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-SessionSupport

Gets machines that have the specified session capability. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionType

Gets machines with a specific session state.

Session properties are always null for multi-session machines.

Type:	SessionType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Gets machines with a specific session UID ($null for no session).

Session properties are always null for multi-session machines.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUserName

Gets machines with a specific user name for the current session (in the form 'domain\user').

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SessionUserSID

Gets machines with a specific SID of the current session user.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SID

Gets machines with a specific machine SID.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SummaryState

Gets machines with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

Type:	DesktopSummaryState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SupportedPowerAction

Gets machines that support the specified power action.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-Tag

Gets machines associated with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UUID

Gets machines with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMToolsState

Gets machines with a specific VM tools state.

Valid values are NotPresent, Unknown, NotStarted, and Running.

Type:	VMToolsState
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WillShutdownAfterUse

Gets machines depending on whether they shut down after use or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WillShutdownAfterUseReason

Gets machines by the will shutdown after use reason. Valid values are:

- None - Machine will not shutdown after use.
- ResetDiskImage - Machine will shutdown after use to reset its disk image.
- ScheduledNaturalReboot - Machine will shutdown after use as part of the scheduled natural reboot process.
- OnDemandNaturalReboot - Machine will shutdown after use as part of an on-demand natural reboot process.

Type:	WillShutdownAfterUseReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WindowsConnectionSetting

Gets machines according to their current Windows connection setting (logon mode). Valid values are:

- LogonEnabled - All logons are enabled.
- Draining - New logons are disabled, but reconnections to existing sessions are allowed.
- DrainingUntilRestart - Same as Draining, but setting reverts to LogonEnabled when machine next restarts.
- LogonDisabled - All logons and reconnections are disabled.

This is a Windows setting and is not controlled by XenDesktop. It applies only to multi-session machines; for single-session machines its value is always LogonEnabled.

Type:	WindowsConnectionSetting
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneHealthy

Gets machines located in the zone with the specified health state.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Gets machines located in the zone with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneUid

Gets machines located in the zone with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String

Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Machine

Get-BrokerMachine returns an object for each matching desktop.

Notes

It is generally better to compare dates and times using -Filter and relative comparisons. See about_Broker_Filtering and the examples in this topic for more information.

Get-BrokerMachineCommand

March 11, 2024

Get the list of commands queued for delivery to a desktop.

Syntax

```
Get-BrokerMachineCommand
   [-Category <String>]
   [-CommandName <String>]
   [-CompletionTime <DateTime>]
   [-MachineName <String>]
   [-MachineUid <Int32>]
   [-Metadata <String>]
   [-RequestTime <DateTime>]
   [-SendDeadline <TimeSpan>]
   [-SendDeadlineTime <DateTime>]
   [-SendTrigger <MachineCommandTrigger>]
   [-SessionUid <Int64>]
   [-State <MachineCommandState>]
   [-User <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerMachineCommand
   -Uid <Int64>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Get the list of commands queued for delivery to a desktop. Commands are batched and can be configured to be delivered at various times during a desktop session's lifetime. Normally commands are sent within a few minutes of being queued, but it is also possible to queue a command for a user who is not currently logged on or a desktop that is currently switched off.

See about_Broker_Filtering for information about advanced filtering options.

——————————BrokerMachineCommand Object

The command object returned represents a command handled by a specific service on a desktop as determined by the Category property.

- Category (System.String)

  Category of the command.

- CommandData (System.Byte[])

  Additional binary data included when the command is sent.

- CommandName (System.String)

  Name of the command.

- CompletionTime (System.DateTime?)

  Time at which the command was sent, expired or canceled.

- DesktopGroupNames (System.String[])

  List of desktop group names that the command was restricted to.

- MachineName (System.String)

  Name of the machine this command is targeted at.

- MachineUid (System.Int32?)

  Unique ID of the machine this command is targeted at.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this command.

- RequestTime (System.DateTime)

  Time at which this command was created.

- SendDeadline (System.TimeSpan)

  Duration after which this command expires if it has not been sent yet.

- SendDeadlineTime (System.DateTime?)

  Time at which this command expires if it has not been sent yet.

- SendTrigger (Citrix.Broker.Admin.SDK.MachineCommandTrigger?)

  Event that triggers the sending of the command. Valid values are NextContact, Broker, LogOn, Logoff, Disconnect and Reconnect.

- SessionUid (System.Int64?)

  Unique ID of the session this command is targeted at.

- State (Citrix.Broker.Admin.SDK.MachineCommandState)

  Indicates whether the command is pending, sent, expired or canceled.

- Synchronous (System.Boolean)

  Flag that indicates if this is a synchronous command.

- Uid (System.Int64)

  Unique identifier of this machine command.

- User (System.String)

  Name of the user this command is targeted at.

Examples

EXAMPLE 1

Returns all pending, canceled, expired and sent commands.

```
Get-BrokerMachineCommand
```

EXAMPLE 2

Returns all queued commands.

```
Get-BrokerMachineCommand -State Pending
```

Parameters

-Uid

Get only the command with the specified unique identifier.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Category

Get only commands targeted to the specified service category.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CommandName

Get only commands with the specified command name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CompletionTime

Get only commands that entered the Sent, Failed, Canceled or Expired state at the specified time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Get only commands targeted to the specified machine.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineUid

Get only commands targeted to the specified machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RequestTime

Get only commands that were requested at the specified time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SendDeadline

Get only commands that expire after the specified time span.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SendDeadlineTime

Get only commands that have the specified deadline time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SendTrigger

Get only commands that are due to be sent when the specified trigger occurs. Valid values are NextContact, Broker, LogOn, Logoff, Disconnect and Reconnect.

Type:	MachineCommandTrigger
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Get only commands targeted to the specified session.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-State

Get only commands in the specified state. Valid values are Pending, Sent, Failed, Canceled and Expired.

Type:	MachineCommandState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-User

Get only commands targeted to the specified user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

No parameter is accepted from the input pipeline.

Outputs

Citrix.Broker.Admin.SDK.MachineCommand

Returns Command objects matching all specified selection criteria.

Get-BrokerMachineConfiguration

March 11, 2024

Gets machine configurations defined for this site.

Syntax

```
Get-BrokerMachineConfiguration
   [[-Name] <String>]
   [-ConfigurationSlotUid <Int32>]
   [-LeafName <String>]
   [-Metadata <String>]
   [-ApplicationUid <Int32>]
   [-DesktopGroupUid <Int32>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerMachineConfiguration
   [-Uid] <Int32>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieves machine configurations matching the specified criteria. If no parameters are specified this cmdlet enumerates all machine configurations.

Machine configurations contain binary arrays of settings data that are managed using SDK snap-ins. Each machine configuration is associated with a configuration slot and referenced by Name. The configuration slot restricts the settings that can be held by the machine configuration. For example, only configurations for Citrix User Profile Manager can be associated with the "User Profile Manager"slot.

See about_Broker_Filtering for information about advanced filtering options.

——————————BrokerMachineConfiguration Object

The machine configuration object returned represents a named collection of related settings values that are applied to a desktop group.

- ApplicationUids (System.Int32[])

  List of application Uids that this machine configuration has been added to.

- ConfigurationSlotUid (System.Int32)

  Uid of the associated configuration slot.

- Description (System.String)

  Optional description of the machine configuration.

- DesktopGroupUids (System.Int32[])

  List of desktop group Uids that this machine configuration has been added to.

- LeafName (System.String)

  Name of this machine configuration.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Map of metadata associated with this machine configuration.

- Name (System.String)

  Unique "SlotName\MachineConfigurationName"for this machine configuration.

- Policy (System.Byte[])

  A binary array of encoded settings.

- Uid (System.Int32)

  Uid of this machine configuration.

Examples

EXAMPLE 1

Retrieves a list of every defined machine configuration.

```
Get-BrokerMachineConfiguration
```

EXAMPLE 2

Retrieves the machine configuration named “Receiver\Engineering”.

```
Get-BrokerMachineConfiguration -Name Receiver\Engineering
```

EXAMPLE 3

Retrieves a list of every machine configuration associated with the configuration slot named “UPM”
.

```
Get-BrokerMachineConfiguration -Name UPM\*
```

EXAMPLE 4

Retrieves a list of every machine configuration with a LeafName that starts with “Dept”, regardless of the associated configuration slot.

```
Get-BrokerMachineConfiguration -LeafName "Dept*"
```

Parameters

-Uid

Get only the machine configuration with the specified unique identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Get only the machine configuration with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ConfigurationSlotUid

Get only the machine configurations associated with the specified configuration slot.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LeafName

Get only the machine configurations that have the specified leaf name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Get only the machine configurations that have been assigned to the specified application.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Get only the machine configurations that have been assigned to the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.MachineConfiguration

Get-BrokerMachineConfiguration returns an object for each matching machine configuration.

Get-BrokerMachineStartMenuShortcutIcon

March 11, 2024

Retrieves a Start Menu Shortcut icon from the specified machine.

Syntax

```
Get-BrokerMachineStartMenuShortcutIcon
   [-MachineName] <String>
   [-Path] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieves the icon associated with a particular shortcut on a particular machine. This icon is usually used to help create a published application to access the shortcut.

Examples

EXAMPLE 1

This example retrieves all Start Menu Shortcuts from 'MyDomain\MyMachine', and then the icon for the first shortcut from the returned list. The icon is then associated with a published application called 'Notepad'.

```
$shortcuts =  Get-BrokerMachineStartMenuShortcuts -MachineName '
    MyDomain\MyMachine'
$encodedIconData =  Get-BrokerMachineStartMenuShortcutIcon -MachineName
     'MyDomain\MyMachine' -Path $shortcuts[0].ShortcutPath
$brokerIcon = New-BrokerIcon -EncodedIconData $encodedIconData
Set-BrokerApplication 'Notepad' -IconUid $brokerIcon.Uid
```

Parameters

-MachineName

Specify the name of the machine to use for icon retrieval for the specified shortcut path. The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Path

The location of the shortcut in the specified machine whose icon is being fetched.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Get-BrokerMachineStartMenuShortcutIcon generates a Base64 encoded string containing the icon for the specified shortcut. This can be used as input to New-BrokerIcon cmdlet.

Get-BrokerMachineStartMenuShortcuts

March 11, 2024

Retrieves the Start Menu Shortcuts from the specified machine.

Syntax

```
Get-BrokerMachineStartMenuShortcuts
   [-MachineName] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieves the shortcuts defined for all the start menu items on a particular machine. The shortcuts obtained are from the 'All users'start menu; user-specific shortcuts are not found.

Examples

EXAMPLE 1

This example retrieves all Start Menu Shortcuts from 'MyDomain\MyMachine'.

```
$shortcuts = Get-BrokerMachineStartMenuShortcuts -MachineName 'MyDomain
   \MyMachine'
```

Parameters

-MachineName

Specify the name of the machine to use for shortcut retrieval. The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.StartMenuShorcut

Get-BrokerMachineStartMenuShortcuts generates an array of Citrix.Broker.Admin.SDK.StartMenuShortcut objects.

Get-BrokerMachineStatus

March 11, 2024

Gets detailed machine brokering and power management status

Syntax

```
Get-BrokerMachineStatus
    [[-MachineName] <String>]
    [-CatalogUid <Int32>]
    [-DesktopGroupUid <Int32>]
    [-IdlePoolStatus <String>]
    [-LaunchReadiness <String>]
    [-Sid <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerMachineStatus
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerMachineStatus cmdlet retrieves detailed internal status of machines relating to their readiness to accept new sessions or undertake power management operations. This information is for diagnostic purposes only.

————————BrokerMachineStatus Object

Each machine status object returned represents the detailed status of a physical or virtual machine configured in the site with respect to its readiness for brokering or power management.

- CatalogUid (System.Int32)

  The UID of the catalog containing the machine.

- CurrentSessions (System.Int32)

  The number of currently established sessions on the machine.

- DesktopGroupUid (System.Int32?)

  The UID of the desktop group containing the machine.

- DoNotShutdownBefore (System.DateTime)

  Time before which machine should not be shutdown by automatic power management.

- DrainingUntilReboot (System.Boolean)

  Whether no new sessions can be started on the machine as it is drained of sessions pending a reboot as part of a reboot cycle.

- DrainingUntilShutdown (System.Boolean)

  Whether no new sessions can be started on the machine as it is drained of sessions pending a shutdown.

- EffectiveLoadIndex (System.Int32?)

  The machine's effective load index (0 - 10000, RDS only).

- FreeSessions (System.Int32)

  The number of additional sessions the machine can accept before it reaches its configured session limit (always 0 or 1 for VDI machines).

- HasPendingPowerActions (System.Boolean)

  Whether the machine currently has outstanding, not yet started or completed, power actions.

- HasRegisteredInPeakTime (System.Boolean)

  Machine has registered in current peak time period.

- HasRegisteredSinceOutage (System.Boolean)

  Machine has registered since last recorded site outage.

- HypervisorInMaintenanceMode (System.Boolean)

  Whether the machine's hypervisor connection (if any) is in maintenance mode.

- IdlePoolStatus (System.String)

  Status of machine with respect to possible idle pool power management operations.

- IdleTimeBeforeUsageSecs (System.Int32?)

  Number of seconds for which the machine should ideally be left idle before it is selected for a new session (for example, after registration).

- ImageOutOfDate (System.Boolean)

  Whether the MCS master disk image currently being used by the machine is out of date.

- InMaintenanceMode (System.Boolean)

  Whether the machine is currently in maintenance mode.

- LastIdlePeriodStartTime (System.DateTime)

  Start time of the last idle period (see IdleTimeBeforeUsageSecs).

- LastPowerManagementActionUid (System.Int64?)

  UID of last power management action performed by this machine (persists after action has completed).

- LastPowerOnTime (System.DateTime)

  Time at which machine was last seen to power on.

- LastShutdownTime (System.DateTime)

  Time at which machine was last seen to power off.

- LastUserDrivenResetTime (System.DateTime)

  Time of last user 'restart'operation requested via CWA/SF.

- LaunchReadiness (System.String)

  Summary state of the machine's readiness to accept a new session.

- LogonsInProgress (System.Int32?)

  The number of session logons currently in progress on the machine (RDS only).

- MachineFaultState (System.String)

  Indicates any diagnostic fault state of the machine, or None otherwise.

- MachineName (System.String)

  The name of the machine (domaine
  ame).

- NeedsStart (System.Boolean)

  Whether the machine will be restarted when next convenient (a 'natural'reboot).

- NeedsStartReason (System.String)

  Reason why the machine will be restarted when next convenient (if any).

- PendingSessions (System.Int32)

  Number of outstanding sessions brokered to the machine that have not yet been established (client has not connected to the machine).

- PowerManagementActionUid (System.Int64?)

  UID of any power management action currently in progress for this machine.

- PowerOffExpectedSoonAfter (System.DateTime?)

  When not null and machine is On, time of last Shutdown/PowerOff action completed by machine and indicates that it should power off soon.

- PowerSinBinReleaseTime (System.DateTime?)

  If set, time after which automatic pool management may attempt to power on machine again following an earlier failure during power on.

- PowerState (System.String)

  The last reported power state of the machine.

- RebootCycleUid (System.Int64?)

  UID of any reboot cycle in which the machine is currently participating.

- SessionSupport (System.String)

  Whether the machine is a VDI (single session) or RDS (multi-session) machine.

- Sid (System.String)

  The Windows SID of the machine.

- SinBinReleaseTime (System.DateTime?)

  When set, indicates that the machine can not be selected for new sessions until the indicated time due to an earlier power management problem.

- TagUid (System.String[])

  List of tags associated with the machine (if any).

- TenantId (System.Guid?)

  Tenant ID associated with the machine (if any).

- Uid (System.Int32)

  The UID of the machine.

- Usage (System.String)

  The CVAD allocation type applicable to the machine.

- UserForcedLogOffGracePeriodExpiryTime (System.DateTime?)

  If set, time at which Autoscale will forcibly logoff remaining sessions on machine if users have not already logged off.

- UseVerticalScaling (System.Boolean?)

  If set, indicates that vertical load balancing is in use for machines in this desktop group.

- UseVerticalScalingForRdsLaunches (System.Boolean)

  Specifies the default for the site as to whether horizontal or vertical load balancing is in use for multi-session machines.

- WillShutdownAfterUse (System.Boolean)

  Whether the machine must be shutdown after current session ends.

- WillShutdownAfterUseReason (System.String)

  Reason why the machine must be shutdown after current session ends (if any).

- WindowsConnectionSetting (System.String)

  The Windows ConnectionSetting value reported on the machine (RDS only).

- WorkerState (System.String)

  Internal machine state.

- ZoneHealthy (System.Boolean)

  Whether the machine's zone is currently considered healthy.

- ZoneUid (System.Guid)

  The zone in which the machine resides.

Examples

Parameters

-Uid

Get status details of the machine with the specified UID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets status details of machines having a name matching that specified.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogUid

Gets status details of machines in the specified catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Gets status details of machines in the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdlePoolStatus

Gets status details of machines with the specified idle pool status.

Type:	String
Accepted values:	CanDrainAvailable, CanShutdownAvailable, CanShutdownUnregistered, CanShutdownUsed, CanStartup, Ignore
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchReadiness

Gets status detais of machines with the specified launch readiness.

Type:	String
Accepted values:	Draining, Later, Never, NotApplicable, Now, Soon
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Gets status details of the machine with the specified SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GetBrokerMachineStatus

Get-BrokerMachineStatus returns an object for each selected machine.

Get-BrokerPowerTimeScheme

March 11, 2024

Gets power management time schemes for desktop groups.

Syntax

```
Get-BrokerPowerTimeScheme
   [[-Name] <String>]
   [-DesktopGroupUid <Int32>]
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerPowerTimeScheme
   [-Uid] <Int32>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Finds power time schemes matching the specified search criteria. Each desktop group in the site can have a number of power time schemes associated with it, and these time schemes control how the power states of machines in the group are managed.

If no search criteria are specified all power time schemes for all desktop groups are obtained.

Each power time scheme covers one or more days of the week, and defines which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For any day of the week not covered by any power time scheme, it is assumed that all hours are off-peak and no pool size management is required for any of the hours.

PeakHours is deprecated, and PeakHalfHours should be used instead.

PoolSize is deprecated, and PoolSizeHalfHours should be used instead.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

——————————BrokerPowerTimeScheme Object

The BrokerPowerTimeScheme object represents a power time scheme, defining peak/off-peak hours and idle pool sizes for desktop groups. It contains the following properties:

- DaysOfWeek (Citrix.Broker.Admin.SDK.TimeSchemeDays)

  The days of the week for which this scheme applies to (Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Weekdays, Weekend).

- DesktopGroupUid (System.Int32)

  The desktop group that this time scheme is for.

- DisplayName (System.String)

  The name of this time scheme, as displayed in the Studio console.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this power time scheme.

- Name (System.String)

  The unique name of this time scheme.

- PeakHalfHours (System.Boolean[])

A set of 48 boolean flag values, one for each hour half of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. If the flag is $true it means that the associated half hour of the day is considered a peak time; if $false it means that it is considered off-peak.

- PeakHours (System.Boolean[])

  A set of 24 boolean flag values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag is $true it means that the associated hour of the day is considered a peak time; if it is $false it means that it is considered off-peak.

- PoolSize (System.Int32[])

  For single-session desktop groups, a set of 24 integer values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. For multi-session desktop groups, a set of 48 integer values, one for each half hour of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of -1 has special meaning: pool size management does not apply during such hours.

- PoolSizeHalfHours (System.Int32[])

  A set of 48 integer values, one for each half hour of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of -1 has special meaning: pool size management does not apply during such half hours.

- PoolUsingPercentage (System.Boolean?)

  A boolean flag to indicate whether the integer values in the pool size array are to be treated as absolute values (if this value is $false) or as percentages of the number of machines in the desktop group (if this value is $true).

- Uid (System.Int32)

  Unique internal identifier of a time scheme.

Examples

EXAMPLE 1

Fetches all known power time schemes for all desktop groups in the site.

```
Get-BrokerPowerTimeScheme
```

EXAMPLE 2

Fetches all the power time schemes for the desktop group called 'Sales Desktops'.

```
Get-BrokerPowerTimeScheme -DesktopGroupUid ( Get-BrokerDesktopGroup '
    Sales Desktops' ).Uid
```

Parameters

-Uid

Gets only the power time scheme with the specified Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets only power time schemes with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets only the power time schemes associated with the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.PowerTimeScheme

Get-BrokerPowerTimeScheme returns all power time schemes that match the specified selection criteria.

Get-BrokerPrivateDesktop

March 11, 2024

Get private desktops configured for this site.

Syntax

```
Get-BrokerPrivateDesktop
    [[-MachineName] <String>]
    [-AgentVersion <String>]
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
    [-ColorDepth <ColorDepth>]
    [-ControllerDNSName <String>]
    [-Description <String>]
    [-DesktopGroupUid <Int32>]
    [-DNSName <String>]
    [-HostedMachineId <String>]
    [-HostedMachineName <String>]
    [-HostingServerName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-IconUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-IPAddress <String>]
    [-IsAssigned <Boolean>]
    [-LastDeregistrationReason <DeregistrationReason>]
```

```
    [-LastDeregistrationTime <DateTime>]
    [-LastHostingUpdateTime <DateTime>]
    [-OSType <String>]
    [-OSVersion <String>]
    [-PowerState <PowerState>]
    [-PublishedName <String>]
    [-RegistrationState <RegistrationState>]
    [-SecureIcaRequired <Boolean>]
    [-SID <String>]
    [-Tag <String>]
    [-WillShutdownAfterUse <Boolean>]
    [-AssignedUserSID <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerPrivateDesktop
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet is deprecated, please use the Get-BrokerMachine cmdlet instead.

Retrieve private desktops matching the specified criteria. If no parameters are specified, this cmdlet enumerates all private desktops.

Get-BrokerPrivateDesktop returns configuration information only for private desktops (a DesktopKind of 'Private'). For more state information about desktops, or other types of desktop, use the Get-BrokerMachine cmdlet instead.

For information about advanced filtering options, see about_Broker_Filtering; for more information about desktops, see about_Broker_Desktops.

——————————BrokerPrivateDesktop Object

Private desktops are machines that have been configured with a DesktopKind of 'Private'. They are allocated to either a user/users or a client name/address (but cannot be allocated to both).

- AgentVersion (System.String)

  Version of the Citrix Virtual Delivery Agent (VDA) installed on the desktop.

- AssignedClientName (System.String)

  Client name the desktop has been assigned to.

- AssignedIPAddress (System.String)

  IP Address the desktop has been assigned to.

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth?)

  The color depth setting configured on the desktop, possible values are:
  $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

- ControllerDNSName (System.String)

  The DNS host name of the controller that the desktop is registered to.

- Description (System.String)

  Description of the private desktop.

- DesktopGroupUid (System.Int32)

  Uid of the desktop group the desktop has been assigned to.

- DNSName (System.String)

  The DNS host name of the desktop.

- HostedMachineId (System.String)

  Unique ID within the hosting unit of the target managed desktop.

- HostedMachineName (System.String)

  The friendly name of a hosted desktop as used by its hypervisor. This is not necessarily the DNS name of the desktop.

- HostingServerName (System.String)

  DNS name of the hypervisor that is hosting the desktop if managed.

- HypervisorConnectionUid (System.Int32?)

  The UID of the hypervisor connection that the desktop has been assigned to, if managed.

- IconUid (System.Int32?)

  The UID of the desktop's icon that is displayed in StoreFront. If this is $null then the desktop will use the icon specified by the desktop group.

- InMaintenanceMode (System.Boolean)

  Denotes whether the desktop is in maintentance mode.

- IPAddress (System.String)

  The IP address of the desktop.

- IsAssigned (System.Boolean)

  Denotes whether a private desktop has been assigned to a user/users, or a client name/address. Users can be assigned explictitly or by assigning on first use of the desktop.

- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

  The reason for the last deregistration of the desktop with the broker. Possible values are: AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

- LastDeregistrationTime (System.DateTime?)

  Time of the last deregistration of the desktop from the controller.

- LastHostingUpdateTime (System.DateTime?)

  Time of last update to any hosting data for this desktop reported by the hypervisor connection.

- MachineName (System.String)

  DNS host name of the machine associated with the desktop.

- OSType (System.String)

  A string that can be used to identify the operating system that is running on the desktop.

- OSVersion (System.String)

  A string that can be used to identify the version of the operating system running on the desktop, if known.

- PowerState (Citrix.Broker.Admin.SDK.PowerState)

  The current power state of the desktop. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, Resuming.

- PublishedName (System.String)

  The name of the desktop that is displayed in StoreFront, if the desktop is published.

- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

Indicates the registration state of the desktop. Possible values are: Unregistered, Initializing, Registered, AgentError.

- SecureIcaRequired (System.Boolean?)

  Flag indicating whether SecureICA is required or not when starting a session on the desktop.

- SID (System.String)

  Security identifier of the private desktop.

- Uid (System.Int32)

  Unique identifier of the private desktop.

- WillShutdownAfterUse (System.Boolean)

  Flag indicating whether this desktop is tainted and will be shutdown after all sessions on the desktop have ended. This flag should only ever be true on power managed, single-session desktops.
  Note: The desktop will not shut down if it is in maintenance mode, but will shut down after the desktop is taken out of maintenance mode.

Examples

EXAMPLE 1

Get all private desktops that are turned on, or are turning on (assuming unmanaged desktops are powered on).

```
$list = 'Unmanaged','On','TurningOn','Resuming'
Get-BrokerPrivateDesktop -Filter {
  PowerState -in $list  }
  | ft -a DNSName,PowerState
```

EXAMPLE 2

Retrieve all private desktops tagged with the 'TestTag'tag.

```
Get-BrokerPrivateDesktop -Tag TestTag
```

Parameters

-Uid

Gets desktops by Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets desktops by machine name (in the form 'domain\machine').

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AgentVersion

Gets desktops with a specific Citrix Virtual Delivery Agent (VDA) version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedClientName

Gets desktops assigned to a specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssignedIPAddress

Gets desktops assigned to a specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ColorDepth

Gets desktops configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerDNSName

Gets desktops by the DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets desktops by description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets desktops from a desktop group with a specific Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets desktops by DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineId

Gets desktops by the machine id known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineName

Gets desktops by the machine name known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostingServerName

Gets desktops by the name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets desktops by the uid of the hosting hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets desktops by configured icon. Note that desktops with a $null IconUid use the icon of the desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets desktops by the InMaintenanceMode setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Get desktops by their IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsAssigned

Gets desktops depending on whether they are assigned or not. Private desktops can be assigned to either a user/users or client names/addresses.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationReason

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Type:	DeregistrationReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationTime

Gets desktops by the time that they were last deregistered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastHostingUpdateTime

Gets desktops by the time that the hosting information was last updated.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets desktops by the type of operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OSVersion

Gets desktops by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PowerState

Gets desktops by power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Gets desktops by published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RegistrationState

Gets desktops by registration state.

Valid values are Registered, Unregistered, and AgentError.

Type:	RegistrationState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Gets desktops configured with a particular SecureIcaRequired setting. Note that the desktop setting of $null indicates that the desktop group value is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SID

Gets desktops by machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Tag

Gets desktops tagged with the given tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-WillShutdownAfterUse

Gets desktops depending on whether they will be automatically shut down when the current session ends or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedUserSID

Gets desktops with the given assigned user (specified by SID).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.PrivateDesktop

Get-BrokerPrivateDesktop returns an object for each matching private desktop.

Notes

To compare dates/times, use -Filter and relative comparisons. See about_Broker_Filtering for details.

Get-BrokerProjectedAutoscaleMachines

March 11, 2024

Gets the projected number of machines that Autoscale will keep powered on over the specified period

Syntax

```
Get-BrokerProjectedAutoscaleMachines
   [-DesktopGroupUid] <Int32>
   [-FromDate <String>]
   [-NumberOfDays <Int32>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Get-BrokerProjectedAutoscaleMachines cmdlet retrieves the projected number of machines that Autoscale will keep powered on for each half hour over a specified period.

————————BrokerProjectedAutoscaleMachines Object

The projected Autoscale machines object returned represents the detailed projection of the number of machines that Autoscale will keep powered on for each half hour over a specified period.

- DesktopGroupUid (System.Int32)

  The UID of the desktop group

- ManagedMachineCount (System.Int32)

  The number of machines in the desktop group that would be managed by Autoscale.

- ProjectedMachines (System.String)

  The number of machines that Autoscale will keep powered on for each half hour over the specified period.

Examples

Parameters

-DesktopGroupUid

Gets projected Autoscale machines in the specified desktop group.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FromDate

Gets projected Autoscale machines for the period starting at the specified date (YYYY-MM-DD).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-NumberOfDays

Gets projected Autoscale machines for the period consisting of the specified number of days.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ProjectedAutoscaleMachines

Get-BrokerProjectedAutoscaleMachines returns a ProjectedAutoscaleMachines object.

Related Links

Get-BrokerRebootCycle

March 11, 2024

Gets one or more reboot cycles.

Syntax

```
Get-BrokerRebootCycle
    [-CatalogName <String>]
    [-CatalogUid <Int32>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-EndTime <DateTime>]
    [-IgnoreMaintenanceMode <Boolean>]
    [-MachinesCompleted <Int32>]
    [-MachinesFailed <Int32>]
    [-MachinesInProgress <Int32>]
    [-MachinesPending <Int32>]
    [-MachinesSkipped <Int32>]
    [-Metadata <String>]
    [-RebootDuration <Int32>]
    [-RebootScheduleName <String>]
    [-RebootScheduleUid <Int32>]
    [-RestrictToTag <String>]
    [-StartTime <DateTime>]
    [-State <RebootCycleState>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerRebootCycle
   -Uid <Int64>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerRebootCycle cmdlet is used to enumerate reboot cycles that match all of the supplied criteria.

See about_Broker_Filtering for information about advanced filtering options.

————————BrokerRebootCycle Object

The reboot cycle object returned represents a single occurrence of the process of rebooting a portion (or all) of the machines in a desktop group.

- CatalogName (System.String)

  Name of the catalog whose machines are rebooted by this cycle if the cycle is associated with a catalog.

- CatalogUid (System.Int32?)

  Uid of the catalog whose machines are rebooted by this cycle if the cycle is associated with a catalog.

- DesktopGroupName (System.String)

  Name of the desktop group whose machines are rebooted by this cycle.

- DesktopGroupUid (System.Int32)

  Uid of the desktop group whose machines are rebooted by this cycle.

- EndTime (System.DateTime?)

  Time at which this cycle was completed, canceled or abandoned.

- IgnoreMaintenanceMode (System.Boolean)

  Boolean value to optionally reboot machines in maintenance mode

- MachinesCompleted (System.Int32)

  Number of machines successfully rebooted by this cycle.

- MachinesFailed (System.Int32)

  Number of machines issued with reboot requests where either the request failed or the operation did not complete within the allowed time.

- MachinesInProgress (System.Int32)

  Number of machines issued with reboot requests but which have not yet completed the operation.

- MachinesPending (System.Int32)

  Number of outstanding machines to be rebooted during the cycle but on which processing has not yet started.

- MachinesSkipped (System.Int32)

  Number of machines scheduled for reboot during the cycle but which were not processed either because the cycle was canceled or abandoned or because the machine was unavailable for reboot processing throughout the cycle.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Map of metadata associated with this cycle.

- RebootDuration (System.Int32)

  Approximate maximum number of minutes over which the reboot cycle runs.

- RebootScheduleName (System.String)

  Name of the Reboot Schedule which triggered this cycle if the cycle is associated with a reboot schedule.

- RebootScheduleUid (System.Int32?)

  Uid of the Reboot Schedule which triggered this cycle if the cycle is associated with a reboot schedule.

- RestrictToTag (System.String)

  An optional Tag which limits the reboot cycle to machines within the desktop group with the specified tag.

- StartTime (System.DateTime)

  Time of day at which this reboot cycle was started.

- State (Citrix.Broker.Admin.SDK.RebootCycleState)

  The execution state of this cycle.

- Uid (System.Int64)

  Unique ID of this reboot cycle.

- WarningDuration (System.Int32)

  Number of minutes to display the warning message for.

- WarningMessage (System.String)

  Warning message to display to users in active sessions prior to rebooting the machine.

- WarningRepeatInterval (System.Int32)

  Number of minutes to wait before showing the reboot warning message again.

- WarningTitle (System.String)

  Title of the warning message dialog.

Examples

EXAMPLE 1

Enumerate all reboot cycles.

```
Get-BrokerRebootCycle
```

EXAMPLE 2

Enumerates all reboot cycles that have successfully completed.

```
Get-BrokerRebootCycle -State Completed
```

EXAMPLE 3

Enumerates all reboot cycles related to the desktop group named CallCenter.

```
Get-BrokerRebootCycle -DesktopGroupName CallCenter
```

Parameters

-Uid

Gets reboot cycles that have the specified Uid.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets reboot cycles that relate to the named catalog.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogUid

Gets reboot cycles that relate to the catalog with a particular Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets reboot cycles that relate to the named desktop group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets reboot cycles that relate to the desktop group with a particular Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EndTime

Gets reboot cycles that have the specified time at which the reboot cycle was completed, canceled or abandoned.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreMaintenanceMode

Boolean value to optionally reboot machines in maintenance mode

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesCompleted

Gets reboot cycles that have the specified count of machines successfully rebooted during the cycle.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesFailed

Gets reboot cycles that have the specified count of machines issued with reboot requests where either the request failed or the operation did not complete within the allowed time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesInProgress

Gets reboot cycles that have the specified count of machines issued with reboot requests but which have not yet completed the operation.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-MachinesPending

Gets reboot cycles that have the specified count of outstanding machines to be rebooted during the cycle but on which processing has not yet started.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesSkipped

Gets reboot cycles that have the specified count of machines scheduled for reboot during the cycle but which were not processed either because the cycle was canceled or abandoned or because the machine was unavailable for reboot processing throughout the cycle.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Gets reboot cycles that have the specified approximate maximum duration in minutes over which the reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootScheduleName

Gets reboot cycles which were triggered by the named reboot schedule.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-RebootScheduleUid

Gets reboot cycles which were triggered by the reboot schedule with aparticular Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTag

An optional Tag which limits the reboot cycle to machines within the desktop group with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-StartTime

Gets reboot cycles that have the specified time at which the reboot cycle started.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-State

Gets reboot cycles that have the specified overall state of the reboot cycle. Valid values are Initializing, Active, Completed, Canceled, and Abandoned.

Type:	RebootCycleState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RebootCycle

Returns matching reboot cycles.

Get-BrokerRebootSchedule

March 11, 2024

Gets one or more reboot schedules.

Syntax

```
Get-BrokerRebootSchedule
    [[-DesktopGroupName] <String>]
    [-Active <Boolean>]
    [-Day <RebootScheduleDays>]
    [-Enabled <Boolean>]
    [-Frequency <RebootScheduleFrequency>]
    [-RebootDuration <Int32>]
    [-StartTime <TimeSpan>]
    [-WarningRepeatInterval <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerRebootSchedule
    [-DesktopGroupUid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerRebootSchedule cmdlet is used to enumerate desktop group reboot schedules that match all of the supplied criteria.

A reboot schedule can be configured to cause all of the machines in a desktop group to be rebooted at a particular time each day or each week, with the reboot of the individual machines spread out over the duration of the whole reboot cycle. A specific warning message can be configured to be displayed to users who are running sessions on the machines being rebooted. Note that each desktop group can only have a single reboot schedule configured.

See about_Broker_Filtering for information about advanced filtering options.

——————BrokerRebootSchedule Object

The reboot schedule object returned represents a regularly scheduled reboot of machines in a desktop group.

- Active (System.Boolean)

  True if there is an active reboot cycle for this schedule, false otherwise.

- Day (Citrix.Broker.Admin.SDK.RebootScheduleDays?)

  When the frequency is weekly, day of the week on which the schedule reboot starts.

- DesktopGroupName (System.String)

  Name of the desktop group rebooted by this schedule.

- DesktopGroupUid (System.Int32)

  Uid of the desktop group rebooted by this schedule.

- Enabled (System.Boolean)

  True if this schedule is currently enabled, false otherwise.

- Frequency (Citrix.Broker.Admin.SDK.RebootScheduleFrequency)

  Whether the schedule runs daily or weekly.

- RebootDuration (System.Int32)

  Approximate maximum number of minutes over which the scheduled reboot cycle runs.

- StartTime (System.TimeSpan)

  Time of day at which the scheduled reboot cycle starts.

- WarningDuration (System.Int32)

  Number of minutes to display the warning message for.

- WarningMessage (System.String)

  Warning message to display to users in active sessions prior to rebooting the machine.

- WarningRepeatInterval (System.Int32)

  Number of minutes to wait before displaying the warning message again.

- WarningTitle (System.String)

  Title of the warning message dialog.

Examples

EXAMPLE 1

Enumerates all of the reboot schedules.

```
1  Get-BrokerRebootSchedule
```

EXAMPLE 2

Enumerates all disabled reboot schedules that are scheduled to run daily.

```
Get-BrokerRebootSchedule -Enabled $false -Frequency Daily
```

EXAMPLE 3

Returns the unique reboot schedule for the desktop group having the Uid 11.

```
Get-BrokerRebootSchedule -DesktopGroupUid 11
```

Parameters

-DesktopGroupUid

Gets the reboot schedule for the desktop group having this Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets the reboot schedule for the desktop group having this name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Active

Gets desktop group reboot schedules according to whether they are currently active or not. A schedule is active if there is a reboot cycle currently running that was started as a result of the schedule.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Day

Gets the reboot schedules set to run on the specified day (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets the reboot schedules with the specified Enabled value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Frequency

Gets the reboot schedules with the specified frequency (either Weekly or Daily).

Type:	RebootScheduleFrequency
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Gets the reboot schedules with the specified duration.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Gets the reboot schedules with the specified start time (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Gets the reboot schedules with the specified warning repeat interval.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32

Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RebootSchedule

Returns matching reboot schedules.

Get-BrokerRebootScheduleV2

March 11, 2024

Gets one or more reboot schedules.

Syntax

```
Get-BrokerRebootScheduleV2
    [[-Name] <String>]
    [-Active <Boolean>]
    [-Day <RebootScheduleDays>]
    [-DayInMonth <RebootScheduleDays>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-Enabled <Boolean>]
    [-Frequency <RebootScheduleFrequency>]
    [-FrequencyFactor <Int32>]
    [-IgnoreMaintenanceMode <Boolean>]
    [-MaxOvertimeStartMins <Int32>]
    [-MetadataKey <String>]
    [-Metadata <String>]
    [-RebootDuration <Int32>]
    [-RestrictToTag <String>]
    [-StartDate <String>]
    [-StartTime <TimeSpan>]
    [-UseNaturalReboot <Boolean>]
    [-WarningRepeatInterval <Int32>]
    [-WeekInMonth <RebootScheduleWeeks>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerRebootScheduleV2
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerRebootScheduleV2 cmdlet is used to enumerate desktop group reboot schedules that match all of the supplied criteria.

A reboot schedule can be configured to cause all of the machines in a desktop group to be rebooted at a particular time each day or each week, with the reboot of the individual machines spread out over the duration of the whole reboot cycle. A specific warning message can be configured to be displayed to users who are running sessions on the machines being rebooted.

See about_Broker_Filtering for information about advanced filtering options.

——————————BrokerRebootScheduleV2 Object

The reboot schedule object returned represents a regularly scheduled reboot of machines in a desktop group.

- Active (System.Boolean)

  True if there is an active reboot cycle for this schedule, false otherwise.

- Day (Citrix.Broker.Admin.SDK.RebootScheduleDays?)

  When the frequency is weekly, days of the week on which the schedule reboot starts.

- DayInMonth (Citrix.Broker.Admin.SDK.RebootScheduleDays?)

  When the frequency is monthly, day in the month on which the schedule reboot starts.

- Description (System.String)

  An optional description for the reboot schedule.

- DesktopGroupName (System.String)

  Name of the desktop group rebooted by this schedule.

- DesktopGroupUid (System.Int32)

  Uid of the desktop group rebooted by this schedule.

- Enabled (System.Boolean)

  True if this schedule is currently enabled, false otherwise.

- Frequency (Citrix.Broker.Admin.SDK.RebootScheduleFrequency)

  Whether the schedule runs daily or weekly or monthly.

- FrequencyFactor (System.Int32)

  The frequency factor for the reboot schedule. It indicates how often the schedule should run with respect to the frequency. For example, if the FrequencyFactor is set to 2, it means every two days from the StartDate when the Frequency is Daily, every two weeks from the StartDate when the Frequency is Weekly, and similarly for monthly.

- IgnoreMaintenanceMode (System.Boolean)

  Boolean value to reboot machines in maintenance mode

- MaxOvertimeStartMins (System.Int32)

  Maximum delay in minutes after which the scheduled reboot will not take place

- MetadataKeys (System.String[])

  All key names of metadata items associated with this application.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Metadata for this application.

- Name (System.String)

  Name of the reboot schedule.

- RebootDuration (System.Int32)

  Approximate maximum number of minutes over which the scheduled reboot cycle runs.

- RestrictToTag (System.String)

  If set the reboot schedule only applies to machines in the desktop group with the specified tag.

- StartDate (System.String)

  The date on which the first schedule is expected to run, date is in ISO 8601 Format (YYYY-MM-DD).

- StartTime (System.TimeSpan)

  Time of day at which the scheduled reboot cycle starts.

- Uid (System.Int32)

  Uid of the reboot schedule.

- UseNaturalReboot (System.Boolean)

  Boolean value indicating whether the machines should reboot whenever they happen to have no sessions, rather than at equally spaced times within the cycle duration.

- WarningDuration (System.Int32)

  Number of minutes to display the warning message for.

- WarningMessage (System.String)

  Warning message to display to users in active sessions prior to rebooting the machine.

- WarningRepeatInterval (System.Int32)

  Number of minutes to wait before displaying the warning message again.

- WarningTitle (System.String)

  Title of the warning message dialog.

- WeekInMonth (Citrix.Broker.Admin.SDK.RebootScheduleWeeks?)

  When the frequency is monthly, week in the month on which the schedule reboot starts.

Examples

EXAMPLE 1

Enumerates all of the reboot schedules.

```
Get-BrokerRebootScheduleV2
```

EXAMPLE 2

Enumerates all disabled reboot schedules that are scheduled to run daily.

```
Get-BrokerRebootScheduleV2 -Enabled $false -Frequency Daily
```

EXAMPLE 3

Returns the reboot schedules for the desktop group having the Uid 11.

```
Get-BrokerRebootScheduleV2 -DesktopGroupUid 11
```

Parameters

-Uid

Gets the reboot schedule with the specified Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets the reboot schedule with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Active

Gets desktop group reboot schedules according to whether they are currently active or not. A schedule is active if there is a reboot cycle currently running that was started as a result of the schedule.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Day

Gets the reboot schedules set to run on the specific days of week (one or more of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DayInMonth

Gets the reboot schedules set to run on the specified day in month.

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets the reboot schedules for the desktop group having this name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets the reboot schedules for the desktop group having this Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Gets the reboot schedules with the specified Enabled value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Frequency

Gets the reboot schedules with the specified frequency (either Weekly or Daily or Monthly).

Type:	RebootScheduleFrequency
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FrequencyFactor

Gets the reboot schedules with the specified frequency factor.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreMaintenanceMode

Boolean value to reboot machines in maintenance mode

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxOvertimeStartMins

Maximum delay in minutes after which the scheduled reboot will not take place

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MetadataKey

All key names of metadata items associated with this application.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Gets the reboot schedules with the specified duration.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTag

Gets the reboot schedules with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-StartDate

Gets the reboot schedules with the specified start date (YYY-MM-DD).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-StartTime

Gets the reboot schedules with the specified start time (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseNaturalReboot

Gets the reboot schedules with the specified UseNaturalReboot value.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Gets the reboot schedules with the specified warning repeat interval.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WeekInMonth

Gets the reboot schedules with the specified week in a month.

Type:	RebootScheduleWeeks
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RebootScheduleV2

Returns matching reboot schedules.

Get-BrokerRemotePCAccount

March 11, 2024

Get RemotePCAccount entries configured for this site.

Syntax

```
Get-BrokerRemotePCAccount
   [-AllowSubfolderMatches <Boolean>]
   [-CatalogUid <Int32>]
   [-OU <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerRemotePCAccount
   -Uid <Int32>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieves RemotePCAccounts matching the specified criteria. If no parameters are specified this cmdlet enumerates all RemotePCAccounts. Each RemotePCAccount object defines a set of machines

either by machine name patterns or by where the machines are placed in Active Directory, and which RemotePC catalog the machines are to be associated with when they are discovered.

————————BrokerRemotePCAccount Object

RemotePCAccounts define a set of machines either by machine name patterns or by where the machines are placed in Active Directory, and which RemotePC catalog the machines are to be associated with when they are discovered.

- AllowSubfolderMatches (System.Boolean)

  Specifies whether machines subfolders of specified AD OUs are to be considered part of the RemotePCAccount.

- CatalogUid (System.Int32)

  The Uid of the RemotePC catalog to which machines in the RemotePCAccount automatically join during registration.

- MachinesExcluded (System.String[])

  A list of machines which are to be excluded from the RemotePCAccount. Wildcard matching is supported.

- MachinesIncluded (System.String[])

  A list of machines which are to be included in the RemotePCAccount. Wildcard matching is supported.

- OU (System.String)

  Machines within this specified AD OU are considered part of the RemotePCAccount, unless they are in they match the MachinesExcluded

- Uid (System.Int32)

  The Uid of the RemotePCAccount object.

Examples

EXAMPLE 1

Find all RemotePCAccounts.

```
1 Get-BrokerRemotePCAccount
```

EXAMPLE 2

Find RemotePCAccounts belonging to Remote PC catalog 42.

```
1  Get-BrokerRemotePCAccount -CatalogUid 42
```

Parameters

-Uid

Gets the RemotePCAccount with the specified unique ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowSubfolderMatches

Gets RemotePCAccounts with the specified value of AllowSubfolderMatches.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUid

Gets RemotePCAccounts belonging to the specified Remote PC catalog.

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OU

Gets the RemotePCAccount with the specified OU.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RemotePCAccount

Get-BrokerRemotePCAccount returns an object for each matching RemotePCAccount.

Get-BrokerResource

March 11, 2024

Gets resources that a user can broker connections to.

Syntax

```
Get-BrokerResource
    [-User] <String>
    [-Groups <String[]>]
    [-TenantId <Guid>]
    [-ClientName <String>]
    [-ClientIP <String>]
    [-ViaAG <Boolean>]
    [-SmartAccessTags <String[]>]
    [-AppProtectionCapable <Boolean>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve a list of resources that a user has access to, taking into account the site access policy, configuration of desktop groups, assignments, entitlements, and applications.

What a user has access to depends on a number of attributes:

- User's name or security identifier.
- Groups that the user is a member of (names or security identifiers).
- IP address of the client the user connects from.
- Name of the client that the user connects from.
- Whether the user is connecting via Citrix Access Gateway.
- SmartAccess tags when connecting via Citrix Access Gateway.

You must always specify the user's name or security identifier, but you will not always be able to predict what some of the other values will be. By omitting these values the corresponding access checks are ignored.

Consider for example, a site configuration that uses IP address ranges to allow access to private desktop A when connecting from the local network and private desktop B when connecting from home. Running this cmdlet without specifying a client IP address would return both A and B.

The output of this cmdlet depends on the available resources:

- Assigned private desktops are returned as PrivateDesktop objects.
- Shared desktops are returned as EntitlementPolicyRule objects.
- Assign-On-First-Use desktops that have not been assigned yet are returned as AssignmentPolicyRule objects.
- Application resources produce Application objects.

If more than one type of resource is available, the output pipeline contains a mixture of the above objects, in no particular order.

Only resources accessible based on the specified parameters, and visible to the administrator running this cmdlet are returned.

Examples

EXAMPLE 1

List resources visible by User1 assuming membership of a couple of groups.

```
Get-BrokerResource -User MYDOMAIN\User1 -Groups MYDOMAIN\Accounts,
    MYDOMAIN\Managers
```

EXAMPLE 2

Get all of the desktop groups supporting the resources accessible by User1, outputting the uid and name of each desktop group.

```
[int[]]$groups = (Get-BrokerResource -User MYDOMAIN\User1 | %{
  $_.DesktopGroupUid  }
 )
Get-BrokerDesktopGroup -Filter {
  Uid -in $groups  }
  -Property Uid,Name
```

Parameters

-User

Gets resources given the specified user name or security identifier.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Groups

Get resources accessible given a list of group names or security identifiers.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Specifies identity of tenant associated with the user and groups. Can only be used in multitenant sites.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientName

Get resources given the specified client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientIP

Get resources given the specified client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ViaAG

Gets resources given the specified ViaAG setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SmartAccessTags

Get resources given the specified SmartAccess tags.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionCapable

Get Resources given the specified app protection capability of the client.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Application

Get-BrokerResource returns an Application object for each accessible application.

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

Get-BrokerResource returns an AssignmentPolicyRule object for each accessible Assign-On-First-Use desktop.

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

Get-BrokerResource returns an EntitlementPolicyRule object for each accessible entitlement to a shared desktop.

Citrix.Broker.Admin.SDK.PrivateDesktop

Get-BrokerResource returns a PrivateDesktop for each accessible assigned private desktop.

Get-BrokerScopedObject

March 11, 2024

Gets the details of the scoped objects for the Broker Service.

Syntax

```
Get-BrokerScopedObject
   [-Description <String>]
   [-ObjectId <String>]
   [-ObjectName <String>]
   [-ObjectType <ScopedObjectType>]
   [-ScopeName <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerScopedObject
   -ScopeId <Guid>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

——————————BrokerScopedObject Object

A scoped, or scopeable object configured in the Broker.

- Description (System.String)

  Description of the object (possibly $null if the object type does not have a description).

- ObjectId (System.String)

  Unique identifier of the object.

- ObjectName (System.String)

  Display name of the object.

- ObjectType (Citrix.Broker.Admin.SDK.ScopedObjectType)

  Type of the object this entry relates to.

- ScopeId (System.Guid?)

  Specifies the unique identifier of the scope.

- ScopeName (System.String)

  Specifies the display name of the scope.

Examples

EXAMPLE 1

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in

any scope. The ScopeId and ScopeName values returned are null in the final record.

```
Get-BrokerScopedObject -ObjectType Scheme

    ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
    ScopeName   : Sales
    ObjectType  : Scheme
    ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
    ObjectName  : MyExampleScheme
    Description : Test scheme

    ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
    ScopeName   : Finance
    ObjectType  : Scheme
    ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
    ObjectName  : MyExampleScheme
    Description : Test scheme

    ScopeId     :
    ScopeName   :
    ObjectType  : Scheme
    ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
    ObjectName  : AnotherScheme
    Description : Another scheme in no scopes
```

Parameters

-ScopeId

Gets scoped object entries for the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets scoped object entries for objects with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ObjectId

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ObjectName

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ObjectType

Gets scoped object entries for objects of the given type.

Type:	ScopedObjectType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets scoped object entries with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Sdk.ScopedObject

The Get-BrokerScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Broker Service on the controller.

Syntax

```
Get-BrokerServiceAddedCapability
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables updates to the Broker Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Broker Service.

```
Get-BrokerServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerServiceConfigurationData

March 11, 2024

View the Service configuration data objects.

Syntax

```
Get-BrokerServiceConfigurationData
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerServiceConfigurationData
    -SettingName <String>
    [-Property <String[]>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

View the Service configuration data objects stored in the broker database. These objects if set correctly, overrride the values present in the windows registry

————————————BrokerServiceConfigurationData Object

The service configuration object. It is a key value pair that can be used to tweek some settings in the broker

- SettingName (System.String)

  Name of the ServiceConfigurationData setting

- SettingValue (System.String)

  Value of the ServiceConfigurationData setting. Note that it need to be in the permissible range to correctly set it in the broker. The system will pickup defaults in all other cases.

Examples

EXAMPLE 1

Lists all the service configuration data configured by the admins in the broker

```
Get-BrokerServiceConfigurationData
```

Parameters

-SettingName

The canonical name of the service setting that can be overridden and stored in the database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32

Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ServiceConfigurationData

Returns the service settings set in the broker database

- Set-BrokerServiceConfigurationData

Get-BrokerServiceInstance

March 11, 2024

Gets the service instance entries for the Broker Service.

Syntax

```
Get-BrokerServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Broker Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Broker Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1  Get-BrokerServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Sdk.ServiceInstance

The Get-BrokerServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Broker.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Broker.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerServiceStatus

March 11, 2024

Gets the current state of the Broker Service on the controller.

Syntax

```
Get-BrokerServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Broker Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Broker Service.

```
Get-BrokerServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-BrokerServiceStatus command returns an object containing the status of the Broker Service together with extra diagnostics information.

DBUnconfigured

The Broker Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Broker Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Broker Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Broker is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Broker is connected to a database that is valid, but it does not have the full functionality required so the Broker cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Broker Service currently in use is incompatible with the version of the Broker Service schema on the database. Upgrade the Broker Service to a more recent version.

DBOlderVersionThanService

The version of the Broker Service schema on the database is incompatible with the version of the Broker Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Broker Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Broker Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Broker and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Broker service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-BrokerSession

March 11, 2024

Gets a list of sessions.

Syntax

```
Get-BrokerSession
   [[-SessionKey] <Guid>]
   [-AgentVersion <String>]
   [-AnonymousUserId <String>]
   [-ApplicationInUse <String>]
   [-AppState <SessionAppState>]
   [-AppStateLastChangeTime <DateTime>]
   [-AutonomouslyBrokered <Boolean>]
   [-BrokeringDuration <Int32>]
```

```
    [-BrokeringTime <DateTime>]
    [-BrokeringUserName <String>]
    [-BrokeringUserSID <String>]
    [-CatalogName <String>]
    [-CbpVersion <CBPVersion>]
    [-ClientAddress <String>]
    [-ClientName <String>]
    [-ClientPlatform <String>]
    [-ClientProductId <Int32>]
    [-ClientVersion <String>]
    [-ConnectedViaHostName <String>]
    [-ConnectedViaIP <String>]
    [-ConnectionMode <ConnectionMode>]
    [-ControllerDNSName <String>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-DesktopKind <DesktopKind>]
    [-DesktopSID <String>]
    [-DesktopUid <Int32>]
    [-DeviceId <String>]
    [-DNSName <String>]
    [-EntitlementPolicyRuleUid <Int32>]
    [-EstablishmentDuration <Int32>]
    [-EstablishmentTime <DateTime>]
    [-HardwareId <String>]
    [-Hidden <Boolean>]
    [-HostedMachineName <String>]
    [-HostingServerName <String>]
    [-HypervisorConnectionName <String>]
    [-IdleDuration <TimeSpan>]
    [-IdleSince <DateTime>]
    [-ImageOutOfDate <Boolean>]
    [-InMaintenanceMode <Boolean>]
    [-IPAddress <String>]
    [-IsAnonymousUser <Boolean>]
    [-IsPhysical <Boolean>]
    [-LaunchedViaHostName <String>]
    [-LaunchedViaIP <String>]
    [-LaunchedViaPublishedName <String>]
    [-LaunchedViaWorkspace <Boolean>]
    [-LogoffInProgress <Boolean>]
    [-LogonInProgress <Boolean>]
    [-MachineName <String>]
    [-MachineSummaryState <DesktopSummaryState>]
    [-MachineUid <Int32>]
    [-Metadata <String>]
    [-OSType <String>]
    [-PersistUserChanges <PersistUserChanges>]
    [-PowerState <PowerState>]
    [-PreferredZoneName <String>]
    [-PreferredZoneUid <Guid>]
    [-Protocol <String>]
    [-ProvisioningType <ProvisioningType>]
```

```
    [-ReceiverIPAddress <String>]
    [-ReceiverName <String>]
    [-SecureIcaActive <Boolean>]
    [-SessionId <Int32>]
    [-SessionReconnection <SessionReconnection>]
    [-SessionState <SessionState>]
    [-SessionStateChangeTime <DateTime>]
    [-SessionSupport <SessionSupport>]
    [-SessionType <SessionType>]
    [-StartTime <DateTime>]
    [-TenantId <Guid>]
    [-UntrustedUserName <String>]
    [-UserFullName <String>]
    [-UserName <String>]
    [-UserSID <String>]
    [-UserUPN <String>]
    [-ZoneName <String>]
    [-ZoneUid <Guid>]
    [-ApplicationUid <Int32>]
    [-SharedDesktopUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerSession
    [-Uid] <Int64>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves sessions matching all the specified criteria. If no parameters are specified this cmdlet enumerates all sessions.

————————BrokerSession Object

The session object returned represents a session on a machine in the site. The session could be for a desktop or application

- AgentVersion (System.String)

  Version of the Citrix Virtual Delivery Agent (VDA) installed on the machine.

- AnonymousUserId (System.String)

User ID associated with an anonymous session. This is a non-Windows identity and does not relate to the user account under which the session is running. Not all anonymous sessions have associated user IDs.

- ApplicationsInUse (System.String[])

  List of applications in use in the session. Applications are identified by their administrative name.

- AppState (Citrix.Broker.Admin.SDK.SessionAppState)

  The app state of the session. Valid values are PreLogon, PreLaunched, Active, Desktop, Lingering and NoApps.

- AppStateLastChangeTime (System.DateTime?)

  The time when the session entered the current app state.

- AutonomouslyBrokered (System.Boolean)

  Indicates whether this is an HDX session established by direct connection without being brokered.

- BrokeringDuration (System.Int32?)

  Time taken to broker the session (in milliseconds).

- BrokeringTime (System.DateTime?)

  Time at which the session was brokered.

- BrokeringUserName (System.String)

  The user name of the brokering user.

- BrokeringUserSID (System.String)

  The SID of the brokering user.

- CatalogName (System.String)

  The name of the catalog that the machine hosting the session is assigned to.

- CbpVersion (Citrix.Broker.Admin.SDK.CBPVersion?)

  The version of CBP that the VDA is currently registered with. This will be null when the VDA is not registered.

- ClientAddress (System.String)

  The IP address of the client connected to the session.

- ClientName (System.String)

  The host name of the client connected to the session.

- ClientPlatform (System.String)

  The name of client platform, as indicated by client product ID.

- ClientProductId (System.Int32?)

  The product ID of the client connected to the session.

- ClientVersion (System.String)

  The version of the Citrix Receiver running on the client connected to the session.

- ConnectedViaHostName (System.String)

  The host name of the incoming connection. This is usually a gateway, router or client.

- ConnectedViaIP (System.String)

  The IP address of the incoming connection This is usually a gateway, router or client.

- ConnectionMode (Citrix.Broker.Admin.SDK.ConnectionMode?)

  The way in which the most recent connection to the session was established. Valid modes are:

  - Brokered: established through the XenDesktop Broker (for example, using StoreFront).
  - Unbrokered: direct connection (for example, using the console or direct RDP/HDX).
  - LeasedConnection: established through the XenDesktop Broker using a connection lease.
  - VdaHighAvailabilityMode: direct connection while VDA in high-availability mode.
  - ThirdPartyBroker: established through a third-party Broker.
  - ThirdPartyBrokerWithLicensing: established and licensed through a third-party Broker.

- ControllerDNSName (System.String)

  The DNS host name of the controller that the session's hosting machine is registered with.

- DesktopGroupName (System.String)

  Name of the desktop group of the machine the session is on.

- DesktopGroupUid (System.Int32)

  UID of the desktop group of the machine the session is on.

- DesktopKind (Citrix.Broker.Admin.SDK.DesktopKind)

  Indicates if the session is shared or private.

- DesktopSID (System.String)

  The Windows SID of the machine the session is on.

- DesktopUid (System.Int32)

  For a desktop session, the unique identifier of the desktop.

- DeviceId (System.String)

  Unique identifier for the client device that has most recently been associated with the session.

- DNSName (System.String)

  The DNS host name of the machine hosting the session.

- EntitlementPolicyRuleUid (System.Int32?)

  The entitlement policy rule that granted the user the entitlement to launch the session. Only present for shared resources.

- EstablishmentDuration (System.Int32?)

  Duration that it took to establish the session.

- EstablishmentTime (System.DateTime?)

  Time at which the session was established.

- HardwareId (System.String)

  Unique identifier for the client hardware that has been most recently associated with the session.

- Hidden (System.Boolean)

  Flag to indicate if the session is currently hidden from the user and not to be reconnected to.

- HostedMachineName (System.String)

  The friendly name of a hosted machine running the session, as used by its hypervisor. This does not necessarily match either the DNS or AD name of the machine.

- HostingServerName (System.String)

  DNS name of the hypervisor that is hosting the machine hosting the session.

- HypervisorConnectionName (System.String)

  The name of the hypervisor connection that the machine hosting the session has been assigned to.

- IdleDuration (System.TimeSpan?)

  Period for which session has been idle, or null if it is not considered idle.

- IdleSince (System.DateTime?)

  Time at which session went idle

- ImageOutOfDate (System.Boolean?)

  Denotes whether the VM image for a hosted machine is out of date and due to be updated to a new master image when the machine next reboots.

- InMaintenanceMode (System.Boolean)

  Denotes whether the machine hosting the session is in maintentance mode.

- IPAddress (System.String)

  The IP address of the machine hosting the session.

- IsAnonymousUser (System.Boolean)

  Indicates whether the session was established anonymously (without user credentials), in this case a temporary local user account on the machine is used.

- IsPhysical (System.Boolean)

  This value is false if the machine hosting the session can be power managed, and true otherwise

- LaunchedViaHostName (System.String)

  The host name of the StoreFront server used to launch the session. This is blank if the session was launched via Workspace.

- LaunchedViaIP (System.String)

  The IP address of the StoreFront server used to launch the session. This is blank if the session was launched via Workspace.

- LaunchedViaPublishedName (System.String)

  The published name of the resource originally used to launch the session. This is the name selected by the user in Receiver. For application sessions this is the name of the first application launched into the session even if that application has since terminated. The name here does not change if the resource is later renamed or removed.

- LaunchedViaWorkspace (System.Boolean?)

  Indicates whether the session was launched via Citrix Workspace.

- LogoffInProgress (System.Boolean)

  Indicates whether the session is in the process of being logged off.

- LogonInProgress (System.Boolean)

  Indicates whether the session is still executing user logon processing or not.

- MachineName (System.String)

  DNS host name of the machine hosting the session.

- MachineSummaryState (Citrix.Broker.Admin.SDK.DesktopSummaryState)

  The summary state of the machine (will be Unregistered, Disconnected, or InUse)

- MachineUid (System.Int32)

  UID of the machine hosting the session.

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  Map of metadata for this session.

- OSType (System.String)

  A string that can be used to identify the operating system that is running on the machine hosting the session.

- PersistUserChanges (Citrix.Broker.Admin.SDK.PersistUserChanges)

  Describes whether/how the user changes are persisted. Possible values are:

  - OnLocal - Persist the user changes locally.
  - Discard - Discard user changes.

- PowerState (Citrix.Broker.Admin.SDK.PowerState)

  The current power state of the machine hosting the session. Possible values are: Unmanaged, Unknown, Unavailable, On, Suspended, TurningOn, TurningOff, Suspending and Resuming.

- PreferredZoneName (System.String)

  The name of preferred zone used for the original session launch. This may differ from the actual ZoneName if no resources were available in the preferred zone at launch time.

- PreferredZoneUid (System.Guid?)

  The UID of preferred zone used for the original session launch. This may differ from the actual ZoneUid if no resources were available in the preferred zone at launch time.

- Protocol (System.String)

  The protocol that the session is using, can be HDX, RDP, or Console. Console sessions on XenDesktop 5 VDAs appear with a blank protocol.

- ProvisioningType (Citrix.Broker.Admin.SDK.ProvisioningType)

  Describes how the machine hosting the session was provisioned, possible values are:

  - Manual: No provisioning.
  - PVS: Machine provisioned by PVS (may be physical, blade, VM,...)
  - MCS: Machine provisioned by MCS (machine must be VM)

- ReceiverIPAddress (System.String)

  The IP address of the client as supplied by Receiver (for example, StoreFront) when the session was launched, or reconnected.

- ReceiverName (System.String)

  The name of the client as supplied by Receiver (for example, StoreFront) when the session was launched, or reconnected.

- SecureIcaActive (System.Boolean?)

  Indicates whether SecureICA is active on the session.

- SessionId (System.Int32)

  Deprecated. A unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

- SessionKey (System.Guid)

  GUID that provides a unique identifier for this session.

- SessionReconnection (Citrix.Broker.Admin.SDK.SessionReconnection?)

  Describes the session reconnection (roaming) behavior for this session. Possible values are: Always, DisconnectedOnly, and SameEndpointOnly.

- SessionState (Citrix.Broker.Admin.SDK.SessionState)

  The state of the session. Valid values are Connected, Active or Disconnected.
  For a session on a machine with functional level below L7, the additional states PreparingSession, Reconnecting, NonBrokeredSession, Other, and Unknown can also occur.

- SessionStateChangeTime (System.DateTime)

  The time of the most recent state change for the session.

- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport)

  Indicates if the machine hosting the session supports multiple or single sessions.

- SessionType (Citrix.Broker.Admin.SDK.SessionType)

  Indicates if this is an Application or Desktop session.

- SmartAccessTags (System.String[])

  The Smart Access tags for this session.

- StartTime (System.DateTime?)

  Indicates when the session was started.

- TenantId (System.Guid?)

  The tenant associated with the session.

- Uid (System.Int64)

  Unique identifier of this session.

- UntrustedUserName (System.String)

  The name of the logged-on user reported directly from the machine. This may be useful where the user is logged in to a non-domain account, however the name cannot be verified and must be considered untrusted. The name is typically in the form DOMAIN\account, however in certain situations it may be reported as a UPN, that is, user@domain.

- UserFullName (System.String)

  The full name of the user.

- UserName (System.String)

  The name of the user.

- UserSID (System.String)

  The user's Windows SID.

- UserUPN (System.String)

  The user's User Principal Name

- ZoneName (System.String)

  The name of zone in which the machine hosting the session is located.

- ZoneUid (System.Guid)

  The UID of the zone in which the machine hosting the session is located.

Examples

EXAMPLE 1

Enumerate all sessions.

```
1  Get-BrokerSession
```

EXAMPLE 2

Get all disconnected sessions for a specific user.

```
1  Get-BrokerSession -UserName MyDomain\MyAccount -SessionState
       Disconnected
```

Parameters

-Uid

Get session by its Uid.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionKey

Gets session having the specified unique key.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AgentVersion

Gets sessions with a specific Virtual Desktop Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-AnonymousUserId

Gets anonymous session associated with the specified user ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ApplicationInUse

Gets sessions running specific applications (identified by their SDK Name property).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AppState

Get sessions by their app state.

Valid values are PreLogon, PreLaunched, Active, Desktop, Lingering and NoApps.

Type:	SessionAppState
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppStateLastChangeTime

Get sessions by their app state change time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutonomouslyBrokered

Gets sessions according to whether they are autonomously brokered or not. Autonomously brokered sessions are HDX sessions established by direct connection without being brokered.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringDuration

Gets session with a specific time taken to broker. In general, Citrix recommends using -Filter and relative comparisons.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringTime

Get sessions brokered at a specific time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringUserName

Get sessions by brokering user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BrokeringUserSID

Get sessions by brokering user SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogName

Gets sessions on machines from a specific catalog name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CbpVersion

The version of CBP that the VDA is currently registered with. This will be null when the VDA is not registered.

Type:	CBPVersion
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientAddress

Get sessions by client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientName

Get sessions by client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientPlatform

Get sessions by client platform.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ClientProductId

Get sessions by client product ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientVersion

Get sessions by client version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ConnectedViaHostName

Get sessions by host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ConnectedViaIP

Get sessions by IP address of the incoming connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ConnectionMode

Gets sessions by the way in which the most recent connection to the session was established.

Valid modes are Brokered, Unbrokered, LeasedConnection, VdaHighAvailabilityMode, ThirdPartyBroker, and ThirdPartyBrokerWithLicensing.

Type:	ConnectionMode
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerDNSName

Gets sessions that are hosted on machines which are registered with a specific controller.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-DesktopGroupName

Gets sessions from a desktop group with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets sessions from a desktop group with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopKind

Gets sessions on a desktop of a particular kind.

Valid values are Private and Shared.

Type:	DesktopKind
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopSID

Get sessions by desktop SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopUid

Get sessions by desktop Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeviceId

Get sessions by client device id.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DNSName

Gets sessions by their machine's DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EntitlementPolicyRuleUid

Gets sessions where the user was granted the entitlement to launch the session from the specified entitlement policy rule.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EstablishmentDuration

Gets sessions which took a specific time to establish. In general, Citrix recommends using -Filter and relative comparisons.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EstablishmentTime

Gets sessions which became established at a particular time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HardwareId

Get sessions by client hardware id.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Hidden

Get sessions by whether they are hidden or not. Hidden sessions are treated as though they do not exist when brokering sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineName

Gets sessions by their machine's name as known to its hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostingServerName

Gets sessions hosted by a machine with a specific name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-HypervisorConnectionName

Gets sessions hosted by a machine with a specific name of the hosting hypervisor connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IdleDuration

Gets sessions that have been idle for the specified period

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdleSince

Time at which session went idle

Type:	DateTime
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ImageOutOfDate

Gets sessions hosted by a machine with a specific ImageOutOfDate setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets sessions hosted by a machine with a specific InMaintenanceMode setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Gets sessions hosted by a machine with a specific IP address.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsAnonymousUser

Gets sessions depending on whether they were established anonymously ($true) or not ($false). An anonymous session is established without user credentials and a temporary local user account is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsPhysical

Gets sessions hosted on machines where the flag indicating if the machine can be power managed by the Citrix Broker Service matches the requested value. Where the power state of the machine cannot be controlled, specify $true, otherwise $false.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaHostName

Get sessions by the host name of the StoreFront server from which a user launches a session.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LaunchedViaIP

Get sessions by the IP address of the StoreFront server from which a user launches a session.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LaunchedViaPublishedName

Gets sessions originally launched using a resource having a name matching the specified published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LaunchedViaWorkspace

Gets sessions by whether they were launched via Citrix Workspace or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffInProgress

Gets sessions by whether they are in the process of being logged off or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogonInProgress

Gets sessions by whether they are still executing user logon processing or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets sessions by their machine name (in the form DOMAIN\machine).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineSummaryState

Gets sessions on a machine with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, Preparing, and InUse.

Type:	DesktopSummaryState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets sessions on a machine with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets sessions with a specific type of operating system.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PersistUserChanges

Gets sessions where the user changes are persisted in a particular manner. Values can be:

- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerState

Gets sessions on machines in the specified power state.

Valid values are Unmanaged, Unknown, Unavailable, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreferredZoneName

Gets sessions originally launched with the specified preferred zone name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PreferredZoneUid

Gets sessions originally launched with the specified preferred zone Uid.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Protocol

Get sessions by connection protocol. Valid values are HDX, RDP, or Console.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningType

Gets sessions hosted on machines provisioned in a particular manner. Values can be:

- Manual - No automated provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).
- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ReceiverIPAddress

Gets sessions with the specified client IP address supplied by Receiver (for example, StoreFront) when the session was launched, or reconnected.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReceiverName

Gets sessions with the specified client name supplied by Receiver (for example, StoreFront) when the session was launched, or reconnected.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SecureIcaActive

Get sessions by their use of SecureICA.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionId

Deprecated.

Gets sessions by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionReconnection

Get sessions by their session reconnection (roaming) behavior. Possible values are:

Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionState

Get sessions by their state.

Valid values are Other, PreparingNewSession, Connected, Active, Disconnected, Reconnecting, Non-BrokeredSession, and Unknown.

Type:	SessionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStateChangeTime

Get sessions by their last state change time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

Gets sessions hosted on machines which support the required pattern of sessions. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionType

Get sessions by their type.

Valid values are Application and Desktop.

Type:	SessionType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Get sessions by their start time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Gets sessions associated with the specified tenant.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UntrustedUserName

Gets sessions by the untrusted user name reported directly from the machine.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserFullName

Gets sessions by user's full name (usually 'first-name last-name').

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserName

Get sessions by user name (in the form DOMAIN\user).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserSID

Get sessions by user's Windows SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserUPN

Gets sessions by user's User Principal Name (in the form user@domain).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneName

Gets sessions hosted on machines located in the zone with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneUid

Gets sessions hosted on machines located in the zone with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Get sessions running the application with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SharedDesktopUid

Get sessions by SharedDesktop Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Session

Returns sessions matching the specified criteria.

Get-BrokerSessionLinger

March 11, 2024

Gets one or more session lingering settings.

Syntax

```
Get-BrokerSessionLinger
    [[-DesktopGroupName] <String>]
    [-AssociatedUserFullName <String>]
    [-AssociatedUserName <String>]
    [-AssociatedUserSID <String>]
    [-AssociatedUserUPN <String>]
```

```
    [-Enabled <Boolean>]
    [-MaxAverageLoadThreshold <Int32>]
    [-MaxLoadPerMachineThreshold <Int32>]
    [-MaxTimeBeforeDisconnect <TimeSpan>]
    [-MaxTimeBeforeTerminate <TimeSpan>]
    [-UserFilterEnabled <Boolean>]
    [-UserSID <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerSessionLinger
    [-DesktopGroupUid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerSessionLinger cmdlet is used to enumerate desktop group session linger settings that match all of the supplied criteria.

Without parameters, Get-BrokerSessionLinger gets all the session linger settings that have been created. You can also use the parameters of Get-BrokerSessionLinger to filter the results to just the desktop group you're interested in.

Note that each desktop group can only have a single session linger setting. Session lingering only applies to application sessions.

See about_Broker_Filtering for information about advanced filtering options.

————————BrokerSessionLinger Object

The session linger object returned represents a session linger setting in a desktop group.

- AssociatedUserFullNames (System.String[])

  List of associated users (full names). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- AssociatedUserNames (System.String[])

  List of associated users (SAM names). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- AssociatedUserSIDs (System.String[])

  List of associated users (SIDs). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- AssociatedUserUPNs (System.String[])

  List of associated users (user principle names). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- DesktopGroupName (System.String)

  Name of the associated desktop group.

- DesktopGroupUid (System.Int32)

  Uid of the associated desktop group.

- Enabled (System.Boolean)

  Specifies whether or not session lingering is enabled for the desktop group.

- MaxAverageLoadThreshold (System.Int32)

  Specifies the average load threshold across the desktop group. After this threshold is hit lingering sessions will be terminated to reduce average load across the group. Sessions that have been lingering the longest will be chosen first.

- MaxLoadPerMachineThreshold (System.Int32)

  Specifies the maximum load threshold per machine in the desktop group. After this threshold is hit lingering sessions on loaded machines will be terminated to reduce load. Sessions that have been lingering the longest will be chosen first.

- MaxTimeBeforeDisconnect (System.TimeSpan)

  Specifies the maximum time by when a lingering session will be disconnected. The disconnect timer cannot be greater than the terminate timer. When the disconnect timer is same as the terminate timer, the session will be directly be terminated. The default value is 15 minutes. A value of 0 disables the disconnect timer.

- MaxTimeBeforeTerminate (System.TimeSpan)

  Specifies the maximum time by when a lingering session will be terminated. When the disconnect timer is same as the terminate timer, the session will be directly be terminated. The default value is 8 hours. A value of 0 disables the terminate timer.

- UserFilterEnabled (System.Boolean)

  Indicates if linger-specific user filter is enabled.

Examples

EXAMPLE 1

Returns the session linger settings associated with the destkop group named 'test'.

```
Get-BrokerSessionLinger -DesktopGroupName "test"
```

Parameters

-DesktopGroupUid

Gets session linger setting that is associated with the specified desktop group Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets session linger setting that is associated with the specified desktop group name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserFullName

Gets session linger settings with an associated user identified by their full name (usually 'first-name last-name'). If the 'UserFilterEnabled'property is true then access to the session linger is restricted to

those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserName

Gets session linger settings with an associated user identified by their user name (in the form 'domain\user'). If the 'UserFilterEnabled'property is true then access to the session linger is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserSID

Gets session linger settings with an associated user identified by their Windows SID. If the 'UserFilterEnabled'property is true then access to the session linger is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-AssociatedUserUPN

Gets session linger settings with an associated user identified by their user principle name (in the form 'user@domain'). If the 'UserFilterEnabled'property is true then access to the session linger is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Enabled

Gets only the session linger settings that have the specified value for whether the setting is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAverageLoadThreshold

Gets only the session linger settings that have the specified average load threshold.

Type:	Int32

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxLoadPerMachineThreshold

Gets only the session linger settings that have the specified maximum load threshold per machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeDisconnect

Gets only the session linger settings that have the specified idle disconnect time.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeTerminate

Gets only the session linger settings that have the specified idle terminate time.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Gets only session linger settings whose user filter is in the specified state.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserSID

Gets only session linger settings with their accessibility restricted to include the specified user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.SessionLinger

Get-BrokerSessionLinger returns an object for each session linger setting it gets.

- Remove-BrokerSessionLinger

Get-BrokerSessionPreLaunch

March 11, 2024

Gets one or more session pre-launch settings.

Syntax

```
Get-BrokerSessionPreLaunch
   [[-DesktopGroupName] <String>]
   [-AssociatedUserFullName <String>]
   [-AssociatedUserName <String>]
   [-AssociatedUserSID <String>]
   [-AssociatedUserUPN <String>]
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-UserSID <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
```

```
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerSessionPreLaunch
    [-DesktopGroupUid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerSessionPreLaunch cmdlet is used to enumerate desktop group session pre-launch settings that match all of the supplied criteria.

Without parameters, Get-BrokerSessionPreLaunch gets all the session pre-launch settings that have been created. You can also use the parameters of Get-BrokerSessionPreLaunch to filter the results to just the desktop group you're interested in.

Note that each desktop group can only have a single session pre-launch setting. Session pre-launch only applies to application sessions.

See about_Broker_Filtering for information about advanced filtering options.

————————BrokerSessionPreLaunch Object

The session pre-launch object returned represents a session pre-launch setting in a desktop group.

- AssociatedUserFullNames (System.String[])

  List of associated users (full names). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- AssociatedUserNames (System.String[])

  List of associated users (SAM names). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- AssociatedUserSIDs (System.String[])

  List of associated users (SIDs). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- AssociatedUserUPNs (System.String[])

  List of associated users (user principle names). Associated users is the list of users who are given access using the pre-launch/user mapping filter.

- DesktopGroupName (System.String)

  Name of the associated desktop group.

- DesktopGroupUid (System.Int32)

  Uid of the associated desktop group.

- Enabled (System.Boolean)

  Specifies whether or not session pre-launch is enabled for the desktop group.

- MaxAverageLoadThreshold (System.Int32)

  Specifies the average load threshold across the desktop group. After this threshold is hit pre-launched sessions will be terminated to reduce average load across the group. Sessions that have been pre-launched the longest will be chosen first.

- MaxLoadPerMachineThreshold (System.Int32)

  Specifies the maximum load threshold per machine in the desktop group. After this threshold is hit pre-launched sessions on loaded machines will be terminated to reduce load. Sessions that have been pre-launched the longest will be chosen first.

- MaxTimeBeforeDisconnect (System.TimeSpan)

  Specifies the maximum time by when a pre-launched session will be disconnected. The disconnect timer cannot be greater than the terminate timer. When the disconnect timer is same as the terminate timer, the session will be directly be terminated. The default value is 15 minutes. A value of 0 disables the disconnect timer.

- MaxTimeBeforeTerminate (System.TimeSpan)

  Specifies the maximum time by when a pre-launched session will be terminated. When the disconnect timer is same as the terminate timer, the session will be directly be terminated. The default value is 8 hours. A value of 0 disables the terminate timer.

- UserFilterEnabled (System.Boolean)

  Indicates if pre-launch-specific user filter is enabled.

Examples

EXAMPLE 1

Returns the session pre-launch settings associated with the destkop group named ‘test’.

```
1  Get-BrokerSessionPreLaunch -DesktopGroupName "test"
```

Parameters

-DesktopGroupUid

Gets session pre-launch setting that is associated with the specified desktop group Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets session pre-launch setting that is associated with the specified desktop group name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserFullName

Gets session pre-launch settings with an associated user identified by their full name (usually 'first-name last-name'). If the 'UserFilterEnabled'property is true then access to the session pre-launch is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserName

Gets session pre-launch settings with an associated user identified by their user name (in the form 'domain\user'). If the 'UserFilterEnabled'property is true then access to the session pre-launch is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserSID

Gets session pre-launch settings with an associated user identified by their Windows SID. If the 'User-FilterEnabled'property is true then access to the session pre-launch is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AssociatedUserUPN

Gets session pre-launch settings with an associated user identified by their user principle name (in the form 'user@domain'). If the 'UserFilterEnabled'property is true then access to the session pre-launch is restricted to those users only, otherwise access is unrestricted (but always subject to other policy rules).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Enabled

Gets only the session pre-launch settings that have the specified value for whether the setting is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAverageLoadThreshold

Gets only the session pre-launch settings that have the specified average load threshold.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxLoadPerMachineThreshold

Gets only the session pre-launch settings that have the specified maximum load threshold per machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeDisconnect

Gets only the session pre-launch settings that have the specified idle disconnect time.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeTerminate

Gets only the session pre-launch settings that have the specified idle terminate time.

Type:	TimeSpan
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Gets only session pre-launch settings whose user filter is in the specified state.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserSID

Gets only session pre-launch settings with their accessibility restricted to include the specified user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.SessionPreLaunch

Get-BrokerSessionPreLaunch returns an object for each session pre-launch setting it gets.

Related Links

- New-BrokerSessionPreLaunch
- Set-BrokerSessionPreLaunch
- Remove-BrokerSessionPreLaunch

Get-BrokerSessionRecordingStatus

March 11, 2024

Gets the recording status of the specified session.

Syntax

```
Get-BrokerSessionRecordingStatus
   [-Session] <Session>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the recording status of the specified session.

Examples

EXAMPLE 1

Gets the recording status of the session Uid 1.

```
Get-BrokerSessionRecordingStatus -Session 1
```

Parameters

-Session

The session whose recording status to get.

Type:	Session
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

The session whose recording status to get.

Outputs

String

Get-BrokerSessionRecordingStatus returns a string representing whether or not the target session is being recorded.

Values can be:

- SessionBeingRecorded - Session is being recorded.
- SessionNotRecorded - Session is not being recorded.

Notes

The specified session can be passed using the Session parameter as a session object or a session Uid.

Get-BrokerSharedDesktop

March 11, 2024

Get shared desktops configured for this site.

Syntax

```
Get-BrokerSharedDesktop
    [[-MachineName] <String>]
    [-AgentVersion <String>]
    [-ControllerDNSName <String>]
    [-DesktopGroupUid <Int32>]
    [-DNSName <String>]
    [-HostedMachineId <String>]
    [-HostedMachineName <String>]
    [-HostingServerName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-IPAddress <String>]
    [-LastDeregistrationReason <DeregistrationReason>]
    [-LastDeregistrationTime <DateTime>]
    [-LastHostingUpdateTime <DateTime>]
    [-OSType <String>]
    [-OSVersion <String>]
    [-PowerState <PowerState>]
    [-RegistrationState <RegistrationState>]
    [-SID <String>]
    [-Tag <String>]
    [-WillShutdownAfterUse <Boolean>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerSharedDesktop
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet is deprecated, please use the Get-BrokerMachine cmdlet instead.

Retrieve shared desktops matching the specified criteria. If no parameters are specified, all shared desktops are enumerated.

Get-BrokerSharedDesktop returns configuration information only for shared desktops (a DesktopKind of 'Shared').

For information about advanced filtering options, see about_Broker_Filtering; for information about desktops, see about_Broker_Desktops.

——————————BrokerSharedDesktop Object

Shared desktops are desktops that are assigned randomly to users upon connection from a pool of available machines.

- AgentVersion (System.String)

  Version of the Citrix Virtual Delivery Agent (VDA) installed on the desktop.

- ControllerDNSName (System.String)

  The DNS host name of the controller that the desktop is registered to.

- DesktopGroupUid (System.Int32)

  Uid of the desktop group the desktop has been assigned to.

- DNSName (System.String)

  The DNS host name of the desktop.

- HostedMachineId (System.String)

  Unique ID within the hosting unit of the target managed desktop.

- HostedMachineName (System.String)

  The friendly name of a hosted desktop as used by its hypervisor. This is not necessarily the DNS name of the desktop.

- HostingServerName (System.String)

  DNS name of the hypervisor that is hosting the desktop if managed.

- HypervisorConnectionUid (System.Int32?)

  The UID of the hypervisor connection that the desktop has been assigned to, if managed.

- InMaintenanceMode (System.Boolean)

  Denotes whether the desktop is in maintentance mode.

- IPAddress (System.String)

  The IP address of the desktop.

- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

  The reason for the last deregistration of the desktop with the broker. Possible values are: AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog,

FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

- LastDeregistrationTime (System.DateTime?)

  Time of the last deregistration of the desktop from the controller.

- LastHostingUpdateTime (System.DateTime?)

  Time of last update to any hosting data for this desktop reported by the hypervisor connection.

- MachineName (System.String)

  DNS host name of the machine associated with the desktop.

- OSType (System.String)

  A string that can be used to identify the operating system that is running on the desktop.

- OSVersion (System.String)

  A string that can be used to identify the version of the operating system running on the desktop, if known.

- PowerState (Citrix.Broker.Admin.SDK.PowerState)

  The current power state of the desktop. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, resuming.

- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

  Indicates the registration state of the desktop. Possible values are: Unregistered, Initializing, Registered, AgentError.

- SID (System.String)

  The security identifier of the shared desktop.

- Uid (System.Int32)

  The uid of the shared desktop.

- WillShutdownAfterUse (System.Boolean)

  Flag indicating whether this desktop is tainted and will be shutdown after all sessions on the desktop have ended. This flag should only ever be true on power managed, single-session desktops.
  Note: The desktop will not shut down if it is in maintenance mode, but will shut down after the desktop is taken out of maintenance mode.

Examples

EXAMPLE 1

Get all shared desktops hosted by the hypervisor server BigServer12.

```
Get-BrokerSharedDesktop -HostingServerName BigServer12*
```

EXAMPLE 2

List all shared desktops running Windows XP, including the machine name and OS details.

```
Get-BrokerSharedDesktop -OSType 'Windows XP*' | ft -a MachineName,
    OSType,OSVersion
```

Parameters

-Uid

Gets desktops by Uid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets desktops by machine name (in the form 'domain\machine').

Type:	String
Position:	2
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-AgentVersion

Gets desktops with a specific Virtual Desktop Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ControllerDNSName

Gets desktops by the DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DesktopGroupUid

Gets desktops from a desktop group with a specific Uid.

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets desktops by DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineId

Gets desktops by the machine id known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineName

Gets desktops by the machine name known to the hypervisor.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HostingServerName

Gets desktops by the name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

Gets desktops by the uid of the hosting hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets desktops by the InMaintenanceMode setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Gets desktops by IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastDeregistrationReason

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Type:	DeregistrationReason
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationTime

Gets desktops by the time that they were last deregistered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastHostingUpdateTime

Gets desktops by the time that the hosting information was last updated.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets desktops by the type of operating system they are running.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OSVersion

Gets desktops by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PowerState

Gets desktops by power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RegistrationState

Gets desktops by registration state.

Valid values are Registered, Unregistered, and AgentError.

Type:	RegistrationState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SID

Gets desktops by machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Tag

Get desktops tagged with the given tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-WillShutdownAfterUse

Gets desktops depending on whether they shutdown after use or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.SharedDesktop

Get-BrokerSharedDesktop returns an object for each matching shared desktop.

Notes

To compare dates/times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering.

Get-BrokerSite

March 11, 2024

Gets the current XenDesktop broker site.

Syntax

```
Get-BrokerSite
    [-ReuseMachinesWithoutShutdownInOutageAllowed <Boolean>]
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-BrokerSite cmdlet gets the current broker site.

The broker site is a top-level, logical representation of the XenDesktop site, from the perspective of the brokering services running within the site. It defines various site-wide default attributes used by the brokering services.

A XenDesktop installation has only a single broker site instance.

————————BrokerSite Object

The BrokerSite object represents logical representation of the XenDesktop site. It contains the following properties:

- AlwaysBypassAuthForCachedResources (System.Boolean)

  Allows client to always display cached resources without authentication.

- ApplicationIconUid (System.Int32)

  The default icon used for new applications if one is not explicitly specified.

- BaseOU (System.Guid?)

  The objectGUID property identifying the base OU in Active Directory used for desktop registrations.

- BrokerServiceGroupUid (System.Guid)

  The Uid for the Broker Service Group.

- BypassAuthForCachedResources (System.Boolean)

  Allows client to display cached resources without authentication.

- CloudSiteLicense (System.String)

  Configures the single cloud license chosen to be used as the default one for the site.

- CloudValidLicenses (System.String)

  The valid cloud license SKUs.

- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth)

  The default color depth for new desktop groups.

- ConfigLastChangeTable (System.String)

  The last table that was changed as part of the last change to the broker configuration.

- ConfigLastChangeTime (System.DateTime)

  The time the broker configuration was changed.

- ConfigurationServiceGroupUid (System.Guid?)

  The Uid for the Configuration Service Group.

- ConnectionLeasingEnabled (System.Boolean?)

  Always false. Connection leasing is no longer supported.

- CredentialForwardingToCloudAllowed (System.Boolean)

  The indicator that whether the Connector is allowed to forward user credentials to cloud.

- DefaultMinimumFunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel?)

  The default minimum functional level used for new catalogs and desktop groups when no explicit value is provided.

- DefaultReuseMachinesWithoutShutdownInOutage (System.Boolean)

  The default ReuseMachinesWithoutShutdownInOutage used for new desktop groups when no explicit value is provided.

- DeleteResourceLeasesOnLogOff (System.Boolean)

  Forces client to delete all leases on explicit logoff.

- DesktopGroupIconUid (System.Int32)

  The default icon used for new desktop groups if one is not explicitly specified.

- DnsResolutionEnabled (System.Boolean)

  The setting to configure whether numeric IP address or the DNS name to be present in the ICA file.

- GpoCustomTemplatesGuid (System.Guid)

  The Guid of the GPO policy set that stores the policy templates defined by the site administrator.

- GpoPoliciesGuid (System.Guid)

  The Guid of the GPO policy set that stores the policies for the site.

- GpoTemplatesGuid (System.Guid)

  The Guid of the GPO policy set that stores the policy templates for the site.
- InMemorySchemaAppliedVersion (System.Int32)

  Version of in-memory SQL table optimization applied to database schema.
- InMemorySchemaSupportedVersion (System.Int32)

  Version of in-memory SQL table optimization supported by database schema.
- IsSecondaryBroker (System.Boolean)

  Reserved for internal use.
- LicensedSessionsActive (System.Int32?)

  The count of active licensed session.
- LicenseEdition (System.String)

  The license edition for session brokering.
- LicenseGraceSessionsRemaining (System.Int32?)

  The count of Concurrent License Grace Sessions Remaining
- LicenseModel (Citrix.Broker.Admin.SDK.LicenseModel?)

  The licensing model in use. Values can be 'Concurrent' or 'UserDevice'
- LicenseServerName (System.String)

  The DNS for License Server Name
- LicenseServerPort (System.Int32)

  The port for the License Server
- LicensingBurnIn (System.String)

  The date for the license to end in yyyy.MMdd format
- LicensingBurnInDate (System.DateTime?)

  The date for the license to end
- LicensingGraceHoursLeft (System.Int32?)

  The number of grace hours left after license expiry
- LicensingGracePeriodActive (System.Boolean?)

  The indicator for licensing grace period active
- LicensingOutOfBoxGracePeriodActive (System.Boolean?)

  The indicator for licensing out of the box grace period active

- LocalHostCacheEnabled (System.Boolean)

  The indicator that the Local Host Cache feature is switched on

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  The metadata for this command.

- Name (System.String)

  The name of the site

- PeakConcurrentLicensedDevices (System.Int32?)

  The peak number of concurrent devices

- PeakConcurrentLicenseUsers (System.Int32?)

  The peak number of concurrent license users

- PreferredAccountName (System.String)

  Determines if SAM name or UPN should be displayed for default name of user/group account

- RequireXmlServiceKeyForNFuse (System.Boolean)

  Determines if the NFuse, MCP, and Admin interfaces require authentication with a service key.

- RequireXmlServiceKeyForSta (System.Boolean)

  Determines if the StA interface requires authentication with a service key.

- ResourceLeaseValidityPeriodInDays (System.Int32)

  Validity period for a lease.

- ResourceLeasingEnabled (System.Boolean)

  Enables lease syncing on client.

- ReuseMachinesWithoutShutdownInOutageAllowed (System.Boolean)

  Specifies whether or not power cycle behavior during outage can be overriden on a delivery group level.

- SecureIcaRequired (System.Boolean)

  The default SecureICA usage requirements for new desktop groups.

- TelemetryHeadlessLaunchEnabled (System.Boolean)

  Enables client to perform headless telemetry launches.

- TelemetryLaunchMinTimeIntervalMins (System.Int32)

  Configures minimum time interval (in minutes) between headless telemetry launches.

- TelemetryLaunchShadowDelayMins (System.Int32)

  Configures delay (in minutes) between ICA-HDX launch and headless telemetry launch.

- TotalUniqueLicenseUsers (System.Int32?)

  The total count of license users

- TrustManagedAnonymousXmlServiceRequests (System.Boolean)

  The XML Service managed anonymous settings.

- TrustRequestsSentToTheXmlServicePort (System.Boolean)

  The XML Service trust settings.

- UseVerticalScalingForRdsLaunches (System.Boolean)

  Use vertical scaling when finding an RDS machine for a session launch.

- XmlServiceKey1 (System.String)

  The first XML Service Key

- XmlServiceKey2 (System.String)

  The second XML Service Key

Examples

EXAMPLE 1

Gets the current broker site.

```
Get-BrokerSite
```

Parameters

-ReuseMachinesWithoutShutdownInOutageAllowed

Specifies whether or not power cycle behavior during outage can be overriden on a delivery group level.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Site

Get-BrokerSite returns the single broker site instance.

Get-BrokerStorefrontAddress

March 11, 2024

Gets the high-level description of a configuration for StoreFront addresses, based on a configuration byte array.

Syntax

```
Get-BrokerStorefrontAddress
   [-ByteArray] <Byte[]>
   [<CommonParameters>]
```

Description

Use this command to convert a configuration byte array into a set of named property settings. The byte array will either have been retrieved from the Citrix Broker Service, or from the New-BrokerStorefrontAddress cmdlet.

Examples

EXAMPLE 1

This example shows a new configuration byte array being created to specify a single StoreFront address. The configuration byte array is then provided as input to the Get-BrokerStorefrontAddress command, which interprets and outputs the same fields.

```
$configuration = New-BrokerStorefrontAddress -Url "https://mysite.com/
    Citrix/StoreWeb" -Description "This StoreFront delivers my corporate
     applications" -Name "StoreFront1" -Enabled $true

Get-BrokerStorefrontAddress -ByteArray $configuration

Name               Url                                        Enabled
    Description
----               ---                                        -------
    -----------
StoreFront1        https://mysite.com/Citrix/StoreWeb           True
    This StoreFront delivers my corporate applications.
```

Parameters

-ByteArray

Specifies the low-level byte array (blob) to be interpreted.

Type:	Byte[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Byte[]

The cmdlet accepts the ByteArray parameter as pipeline input.

Outputs

Citrix.Storefront.Sdk.BrokerStorefrontAddress

This cmdlet outputs one BrokerStorefrontAddress object for each address that is configured within the slot. Each object has the following properties:

Name - Specifies the name of the StoreFront.

Url - Specifies the URL to the StoreFront, such as "https://mysite.com/Citrix/StoreWeb".

Enabled - Specifies whether the StoreFront is enabled for users.

Description - Specifies the human-readable name of the StoreFront.

Get-BrokerTag

March 11, 2024

Gets one or more tags.

Syntax

```
Get-BrokerTag
   [[-Name] <String>]
   [-Description <String>]
   [-IsUsedByGpo <Boolean>]
   [-Metadata <String>]
   [-ScopeId <Guid>]
   [-ScopeName <String>]
   [-UUID <Guid>]
   [-ApplicationUid <Int32>]
   [-ApplicationGroupUid <Int32>]
   [-CatalogUid <Int32>]
   [-DesktopUid <Int32>]
   [-DesktopGroupUid <Int32>]
```

```
    [-MachineUid <Int32>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerTag
    [-Uid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets tags that match all of the supplied criteria.

————————BrokerTag Object

The BrokerTag object represents a single instance of a Tag associated to other objects. It contains the following properties:

- Description (System.String)

  Description of the tag

- IsUsedByGpo (System.Boolean?)

  Indicate if the tag is used by group policy

- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

  The metadata for this command.

- Name (System.String)

  The name of the Tag

- Scopes (Citrix.Fma.Sdk.DelegatedAdminInterfaces.ScopeReference[])

  The list of the delegated admin scopes to which the tag belongs.

- Uid (System.Int32)

  The Uid of the Tag

- UUID (System.Guid)

  The UUID associated to the Tag

Examples

EXAMPLE 1

Enumerate all tags.

```
Get-BrokerTag
```

EXAMPLE 2

Get a single specific tag with a Uid of 5.

```
Get-BrokerTag -Uid 5
```

EXAMPLE 3

Get tags associated with machine DOMAIN\Machine.

```
$machine = Get-BrokerMachine DOMAIN\Machine
Get-BrokerTag -MachineUid $machine.Uid
```

Parameters

-Uid

Gets the tag identified by Uid

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Gets tags that match the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets tags with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsUsedByGpo

Gets tags that are used by group policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeId

Gets tags that are associated with the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets tags that are associated with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UUID

Gets tags associated with a given UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets tags associated with the specified application.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationGroupUid

Get tags associated with the specified application group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUid

Gets tags associated with the specified catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopUid

Gets tags associated with the specified desktop.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Gets tags associated with the specified desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets tags associated with the specified machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Tag

Returns matching tags.

Get-BrokerTagUsage

March 11, 2024

Produces a usage report for one or more tags.

Syntax

```
Get-BrokerTagUsage
    [[-TagName] <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerTagUsage
    [-TagUid] <Int32>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns one BrokerTagUsage for each input tag. Each BrokerTagUsage object summarizes the tag's usage throughout the site.

————————BrokerTagUsage Object

Each BrokerTagUsage object summarizes on the usage of a single Tag.

- TaggedApplicationGroups (System.Int32)

  The number of application groups that are tagged with this tag and that are visible to the calling delegated administrator.

- TaggedApplications (System.Int32)

  The number of applications that are tagged with this tag and that are visible to the calling delegated administrator.

- TaggedCatalogs (System.Int32)

  The number of catalogs that are tagged with this tag and that are visible to the calling delegated administrator.

- TaggedDesktopGroups (System.Int32)

  The number of desktop groups that are tagged with this tag and that are visible to the calling delegated administrator.

- TaggedMachines (System.Int32)

  The number of machines that are tagged with this tag and that are visible to the calling delegated administrator.

- TagName (System.String)

  The name of the Tag.

- TagRestrictedApplicationGroups (System.Int32)

  The number of application groups that have this tag restriction and that are visible to the calling delegated administrator.

- TagRestrictedAutoscale (System.Int32)

  The number of desktop groups that have this tag restriction

- TagRestrictedEntitlementPolicyRules (System.Int32)

  The number of desktop rules in the site's entitlement policy that have this tag restriction and that are visible to the calling delegated administrator.

- TagRestrictedRebootSchedules (System.Int32)

  The number of reboot schedules that have this tag restriction.

- TagUid (System.Int32)

  The Uid of the Tag.

- TagUUID (System.Guid)

  The UUID associated to the Tag.

- TotalTaggedObjects (System.Int32)

  The total number of objects that are tagged with this tag.

- TotalTagRestrictedObjects (System.Int32)

  The total number of objects that have this tag restriction.

- UnknownTaggedObjects (System.Int32)

  The number of objects of all types that are tagged with this tag and that are *not* visible to the calling delegated administrator.

- UnknownTagRestrictedObjects (System.Int32)

  The number of objects of all types that have this tag restriction and that are *not* visible to the calling delegated administrator.

Examples

EXAMPLE 1

Reports on the usage of all tags in the site.

```
Get-BrokerTagUsage
```

EXAMPLE 2

Reports on the usage of the tag MyTag.

```
Get-BrokerTagUsage MyTag
```

Parameters

-TagUid

Report on the tag identified by TagUid.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TagName

Report on the tag identified by TagName.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.TagUsage

Summarizes the usage of a single tag.

Notes

If a tag is applied to an object, but that object would not be visible to the calling delegated administrator via the corresponding Get-Broker* cmdlet, then the object is not counted as an object of that type, but is instead reported as an 'unknown' object.

For example, suppose that the caller has invoked Get-BrokerTagUsage MyTag, and that there are three desktop groups and no other objects tagged with MyTag. Two of the desktop groups are visible to the caller, but the other is not. In this case, TotalTaggedObjects is 3, TaggedDesktopGroups is 2, and UnknownTaggedObjects is 1.

Get-BrokerTelemetryData

March 11, 2024

Generates list of registered instances of Public cloud workloads

Syntax

```
Get-BrokerTelemetryData
    [-RegistrationTime <DateTime>]
    [-SID <String>]
    [-Uid <Int64>]
```

```
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns list of Public cloud workloads and their telemetry usage metadata

————————BrokerTelemetryData Object

Data objects for filtering

- Instance (System.String)

  InstanceMetadata Object

- InstanceType (System.String)

  Instance type of the machine provided in a AWS instance

- Location (System.String)

  Location of the hosted machine

- MachineType (System.String)

  Machine type of the instance in a GCP machine

- ProjectId (System.String)

  Project Id of the account in GCP project

- RegistrationTime (System.DateTime?)

  Actual Registration Time of the VDA

- ResourceGroupName (System.String)

  Resource Group name of the resource in an Azure environment

- ResourceId (System.String)

  Resource ID of the resource in Azure environment

- SID (System.String)

  SId of the instance

- SubscriptionId (System.String)

  Subscription record for Azure

- Timestamp (System.DateTime?)

  Metadata timestamp received from the VDA

- Uid (System.Int64)

  Uid of the instance metadata

- VmId (System.String)

  VmId of the instance

- VmSize (System.String)

  VM size of the Azure instance

Examples

EXAMPLE 1

Generates list of all registered VDA for public cloud workloads

```
Get-BrokerTelemetryData
```

Parameters

-RegistrationTime

VDA Registration time of the service instance

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SID

Gets machines with a specific machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Uid

Id of the registered VDA instance

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String

Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet

Outputs

Citrix.Broker.Admin.SDK.TelemetryData

Notes

None

None

Get-BrokerUnconfiguredMachine

March 11, 2024

Gets machines that have registered but are not yet configured in this site.

Syntax

```
Get-BrokerUnconfiguredMachine
    [[-MachineName] <String>]
    [-AgentVersion <String>]
    [-ControllerDNSName <String>]
    [-CurrentlyRegistered <Boolean>]
    [-DNSName <String>]
    [-FunctionalLevel <FunctionalLevel>]
    [-LastDeregistrationTime <DateTime>]
    [-OSType <String>]
    [-OSVersion <String>]
    [-SessionSupport <SessionSupport>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]

```

```
Get-BrokerUnconfiguredMachine
    -SID <String>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve machines matching the specified criteria, where the machine has or was previously registered with a controller in the site, but the machine has not yet been configured to be part of the site. If no parameters are specified, this cmdlet enumerates all such machines that are currently registered.

See about_Broker_Filtering for information about advanced filtering options, and about_Broker_Machines for background information about machines.

——————————BrokerUnconfiguredMachine Object

An unconfigured machine is a machine that has registered with the site but is not configured in either a desktop group or a catalog.

- AgentVersion (System.String)

  Version of the Citrix Virtual Delivery Agent (VDA) installed on the unconfigured machine.

- ControllerDNSName (System.String)

  The DNS name of the controller that the unconfigured machine is registered with. This property's value is null for machines that are no longer registered.

- CurrentlyRegistered (System.Boolean)

  True if the unconfigured machine is currently registered with the site, or false if the unconfigured machine is no longer registered with the site (but was registered at some point in the past).

- DNSName (System.String)

  The DNS name of the unconfigured machine.

- FunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel?)

  The functional level of the unconfigured machine. This is determined by the version of the Citrix VDA software installed on the machine.

- LastDeregistrationTime (System.DateTime?)

  The time when the unconfigured machine last deregistered with the Citrix Broker Service.

- MachineName (System.String)

  The machine name of the unconfigured machine in the form domain\machine.

- OSType (System.String)

  The type of operating system installed on the unconfigured machine.

- OSVersion (System.String)

  The version of the operating sysetem installed on the unconfigured machine.

- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport?)

  The session support of the unconfigured machine. Valid values are:
  SingleSession, MultiSession

- SID (System.String)

  Security identifier of the unconfigured machine.

Examples

EXAMPLE 1

This command returns all unconfigured XP SP3 machines which are registered with the controller called 'Controller1.domain.com'.

```
Get-BrokerUnconfiguredMachine -Filter {
  ControllerDNSName -eq 'Controller1.domain.com' -and OSType -eq '
     Windows XP Service Pack 3'  }
```

EXAMPLE 2

This command returns all unconfigured machines which have registered with the site in the past, but which are not registered at present.

```
Get-BrokerUnconfiguredMachine -CurrentlyRegistered $false
```

EXAMPLE 3

This command returns all unconfigured machines which are currently registered with the site or which have registered with the site in the past.

```
Get-BrokerUnconfiguredMachine -Filter {
  CurrentlyRegistered -eq $true -or CurrentlyRegistered -eq $false  }
```

Parameters

-SID

Gets machines by their machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineName

Gets machines by their machine name (in the form domain\machine).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AgentVersion

Gets machines with a specific Virtual Desktop Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ControllerDNSName

Gets machines by the DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CurrentlyRegistered

Gets machines by whether they are currently registered with the site. If there is no CurrentlyRegistered filter, then the default is to return unconfigured machines that are currently registered.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets machines by their DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FunctionalLevel

Gets machines with a specific FunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LastDeregistrationTime

Gets machines by the time that they were last deregistered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets machines by the type of operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OSVersion

Gets machines by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-SessionSupport

Gets machines that have the specified session capability. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.UnconfiguredMachine

Get-BrokerUnconfiguredMachine returns an object for each matching machine

Notes

It is generally better to compare dates and times using -Filter and relative comparisons. See about_Broker_Filtering and the examples in this topic for more information.

Get-BrokerUniversalClaim

March 11, 2024

Get a broker Universal Claim

Syntax

```
Get-BrokerUniversalClaim
   [-VirtualSid <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerUniversalClaim
   -Claim <String>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Reads a specific UniversalClaim by Claim or VirtualSid, or enumerates UniversalClaims by passing nothing.

———————BrokerUniversalClaim Object

A UniversalClaim object stores the mapping between a Claim and a VirtualSID. A claim can be an arbitrary string up to 450 characters in length. Each Claim is mapped to a Virtual SID. Virtual SIDs are generated by either taking a SHA256 hash of the claim, and storing the hash bytes in a SID format, or in the case of a SID string being used as a Claim, the SID is copied to the VirtualSid.

- Claim (System.String)

  The Claim for this UniversalClaim mapping

- DirectoryContext (System.String)

  The DirectoryContext associated with this UniversalClaim mapping

- UniversalClaimsTenantContext (System.String)

  The UniversalClaimsTenantContext associated with this UniversalClaim mapping

- VirtualSid (System.String)

  The VirtualSid for this UniversalClaim mapping

Examples

EXAMPLE 1

Gets all broker UniversalClaim mappings

```
Get-BrokerUniversalClaim
```

Parameters

-Claim

The Claim for this UniversalClaim mapping

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-VirtualSid

The VirtualSid for this UniversalClaim mapping.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the

output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.UniversalClaim

Get-BrokerUniversalClaim returns an object for each matching broker UniversalClaim mapping.

Get-BrokerUser

March 11, 2024

Gets broker users configured for this site.

Syntax

```
Get-BrokerUser
   [[-Name] <String>]
   [-DirectoryContext <String>]
   [-FullName <String>]
   [-HomeZoneName <String>]
   [-HomeZoneUid <Guid>]
   [-IdentityClaims <String>]
   [-NameLookupFailureCount <Int32>]
   [-PrimaryClaim <String>]
   [-SAMName <String>]
   [-UPN <String>]
   [-ApplicationGroupUid <Int32>]
   [-ApplicationUid <Int32>]
   [-SessionLingerDesktopGroupUid <Int32>]
   [-SessionPreLaunchDesktopGroupUid <Int32>]
   [-MachineUid <Int32>]
   [-PrivateDesktopUid <Int32>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-BrokerUser
   -SID <String>
   [-Property <String[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve broker users matching the specified criteria. If no parameters are specified this cmdlet enumerates all broker users.

For information about advanced filtering options, see about_Broker_Filtering.

——————————BrokerUser Object

The BrokerUser object represents a single instance of an user. It contains the following properties:

- DirectoryContext (System.String)

  The directory context of a user

- FullName (System.String)

  The full name of a user

- HomeZoneName (System.String)

  Name of home zone associated with user

- HomeZoneUid (System.Guid?)

  Home zone associated with this user

- IdentityClaims (System.String)

  The identity claims of a user

- Name (System.String)

  The name of a user

- NameLookupFailureCount (System.Int32)

  Tracks the number of consecutive directory lookup failures for this account

- PrimaryClaim (System.String)

  The primary identity claim of a user

- SAMName (System.String)

  The SAMName of a user

- SID (System.String)

  The SID of a user

- UPN (System.String)

  The UPN of a user

Examples

EXAMPLE 1

Get all broker user objects with names matching the supplied pattern

```
Get-BrokerUser DOMAIN7\*
```

EXAMPLE 2

Get all broker user objects added to the specified private desktop

```
$pdt = Get-BrokerPrivateDesktop DOMAIN\MACHINENAME\n
             Get-BrokerUser -PrivateDesktopUid $pdt.Uid
```

Parameters

-SID

Gets the broker user with the specified SID property value.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Name

Gets the broker user with the specified Name property.

Type:	String
Position:	2
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	True

-DirectoryContext

Gets the broker user with the specified directory context property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FullName

Gets the broker user with the specified FullName property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HomeZoneName

Gets user/group accounts having a home zone preference matching the specified name.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HomeZoneUid

Gets user/group accounts having a home zone preference matching the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityClaims

Gets the broker user with the specified identity claims property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-NameLookupFailureCount

Tracks the number of consecutive directory lookup failures for this account.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrimaryClaim

Gets the broker user with the specified primary claim property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SAMName

Gets the broker user with the specified SAMName property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UPN

Gets the broker user with the specified UPN property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ApplicationGroupUid

Gets broker users associated with the application group with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets broker users associated with the application with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionLingerDesktopGroupUid

Gets broker users associated with the desktop group session linger settings with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionPreLaunchDesktopGroupUid

Gets broker users associated with the desktop group session pre-launch settings with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets broker users associated with the broker machine with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivateDesktopUid

Gets broker users associated with the private desktop with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.User

Get-BrokerUser returns an object for each matching broker user.

Get-BrokerUserZonePreference

March 11, 2024

Gets user/group accounts with zone preferences configured for this site

Syntax

```
Get-BrokerUserZonePreference
    [[-Name] <String>]
    [-DirectoryContext <String>]
    [-FullName <String>]
    [-HomeZoneName <String>]
    [-HomeZoneUid <Guid>]
    [-IdentityClaims <String>]
    [-PrimaryClaim <String>]
```

```
    [-SAMName <String>]
    [-UPN <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-BrokerUserZonePreference
   -SID <String>
    [-Property <String[]>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve user/group account details with a home zone preference specified and matching the specified criteria. If no parameters are specified this cmdlet enumerates all account details with associated home zones preferences.

For information about advanced filtering options, see about_Broker_Filtering.

————————BrokerUserZonePreference Object

The BrokerUserZonePreference object represents a user/group account having an associated home zone preference to be used when launching desktop or application sessions. It contains the following properties:

- DirectoryContext (System.String)

  The directory context of a user

- FullName (System.String)

  Full name of user/group account.

- HomeZoneName (System.String)

  Name of home zone preference associated with user/group account for this site.

- HomeZoneUid (System.Guid)

  Home zone preference associated with user/group account for this site.

- IdentityClaims (System.String)

  The identity claims of a user

- Name (System.String)

  SAM name of user group/account (domain\user).

- PrimaryClaim (System.String)

  The primary identity claim of a user

- SAMName (System.String)

  The SAMName of a user

- SID (System.String)

  SID of user/group account.

- UPN (System.String)

  UPN of user/group account (user@domain).

Examples

EXAMPLE 1

Get all user/group accounts with a home zone preference whose names match the supplied pattern

```
1  Get-BrokerUserZonePreference DOMAIN7\*
```

EXAMPLE 2

Get all user/group accounts with the specified zone as their home zone preference.

```
1  Get-BrokerUserZonePreference -HomeZoneUid 79AD8059-05B7-4BAA-9369-5
       C74EF52D3EB
```

Parameters

-SID

Gets user/group accounts with a home zone preference and the specified SID.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Name

Gets user/group accounts with a home zone preference and the specified SAM name (domain\user).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DirectoryContext

Gets the broker user with the specified directory context property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-FullName

Gets user/group accounts with a home zone preference and the specified full name.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HomeZoneName

Gets user/group accounts having a home zone preference with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-HomeZoneUid

Gets user/group accounts having a home zone preference with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityClaims

Gets the broker user with the specified identity claims property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-PrimaryClaim

Gets the broker user with the specified primary claim property value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SAMName

The SAMName of a user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UPN

Gets user/group accounts with a home zone preference and the specified UPN (user@domain).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.UserZonePreference

Get-BrokerUserZonePreference returns an object for each user/group account with a home zone preference.

Group-BrokerDesktop

March 11, 2024

Groups and counts desktops with the same value for a specified property.

Syntax

```
Group-BrokerDesktop
      [[-MachineName] <String>]
      [-AgentVersion <String>]
      [-ApplicationInUse <String>]
```

```
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
    [-AssociatedUserFullName <String>]
    [-AssociatedUserName <String>]
    [-AssociatedUserUPN <String>]
    [-AutonomouslyBrokered <Boolean>]
    [-CatalogName <String>]
    [-CatalogUid <Int32>]
    [-ClientAddress <String>]
    [-ClientName <String>]
    [-ClientVersion <String>]
    [-ColorDepth <ColorDepth>]
    [-ConnectedViaHostName <String>]
    [-ConnectedViaIP <String>]
    [-ControllerDNSName <String>]
    [-DeliveryType <DeliveryType>]
    [-Description <String>]
    [-DesktopCondition <String>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-DesktopKind <DesktopKind>]
    [-DeviceId <String>]
    [-DNSName <String>]
    [-FunctionalLevel <FunctionalLevel>]
    [-HardwareId <String>]
    [-HostedMachineId <String>]
    [-HostedMachineName <String>]
    [-HostingServerName <String>]
    [-HypervisorConnectionName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-IconUid <Int32>]
    [-ImageOutOfDate <Boolean>]
    [-InMaintenanceMode <Boolean>]
    [-IPAddress <String>]
    [-IsAssigned <Boolean>]
    [-IsPhysical <Boolean>]
    [-LastConnectionFailure <ConnectionFailureReason>]
    [-LastConnectionTime <DateTime>]
    [-LastConnectionUser <String>]
    [-LastDeregistrationReason <DeregistrationReason>]
    [-LastDeregistrationTime <DateTime>]
    [-LastErrorReason <String>]
    [-LastErrorTime <DateTime>]
    [-LastHostingUpdateTime <DateTime>]
    [-LaunchedViaHostName <String>]
    [-LaunchedViaIP <String>]
    [-MachineInternalState <MachineInternalState>]
    [-MachineUid <Int32>]
    [-OSType <String>]
    [-OSVersion <String>]
    [-PersistUserChanges <PersistUserChanges>]
    [-PowerActionPending <Boolean>]
    [-PowerState <PowerState>]
```

```
      [-Protocol <String>]
      [-ProvisioningType <ProvisioningType>]
      [-PublishedApplication <String>]
      [-PublishedName <String>]
      [-PvdStage <PvdStage>]
      [-RegistrationState <RegistrationState>]
      [-SecureIcaActive <Boolean>]
      [-SecureIcaRequired <Boolean>]
      [-SessionHidden <Boolean>]
      [-SessionId <Int32>]
      [-SessionState <SessionState>]
      [-SessionStateChangeTime <DateTime>]
      [-SessionUid <Int64>]
      [-SessionUserName <String>]
      [-SessionUserSID <String>]
      [-SID <String>]
      [-SmartAccessTag <String>]
      [-StartTime <DateTime>]
      [-SummaryState <DesktopSummaryState>]
      [-Tag <String>]
      [-WillShutdownAfterUse <Boolean>]
      [-ApplicationUid <Int32>]
      -Property <String>
      [-ReturnTotalRecordCount]
      [-MaxRecordCount <Int32>]
      [-Skip <Int32>]
      [-SortBy <String>]
      [-Filter <String>]
      [-FilterScope <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Group-BrokerDesktop
      [-Uid] <Int32>
      -Property <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is now deprecated, please use Group-BrokerMachine.

Filters desktops using the specified criteria, then groups and counts matching desktops with the same value for a particular property. The number of desktops in the group, and the property value for the group, is output. For example:

```
Group-BrokerDesktop -Property SummaryState
Count Name
----- ----
   43 Available
   17 InUse
```

```
6       3 Disconnected
```

Filtering supports the same options as the Get-BrokerDesktop cmdlet, and allows filtering on both desktop and session properties.

Group-BrokerDesktop is similar to the standard PowerShell Group-Object, but is faster than piping the output of Get-BrokerDesktop into Group-Object when working with many desktops.

Note that all session information properties for multi-session desktops is always $null, this means that is is not possible to group these desktops by session information using this command. Use Get-BrokerSession to get information on all current sessions.

Also note that the MaxRecordCount, ReturnTotalRecordCount, Skip, and SortBy parameters apply to GroupInfo records output rather than the filtered desktops.

Examples

EXAMPLE 1

Group desktops from the dg1 group by summary state.

```
1 Group-BrokerDesktop -Property SummaryState -DesktopGroupName dg1
```

EXAMPLE 2

For desktops where the last connection attempt failed, list the most common reason for failure, ignoring connections that failed over a week ago.

```
1 Group-BrokerDesktop -Property LastConnectionFailure -Filter {
2   LastConnectionFailure -ne "None" -and LastConnectionTime -ge '-7'  }
3   -MaxRecordCount 1
```

EXAMPLE 3

List alphabetically the hypervisor servers hosting desktops that are currently experiencing high network latency.

```
1 Group-BrokerDesktop -Property HostingServerName -DesktopCondition
      ICALatency -SortBy Name
```

Parameters

-Uid

Gets desktops with a specific UID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Selects the property by which matching desktops are grouped.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets desktops with a specific machine name (in the form ‘domain\machine’).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AgentVersion

Gets desktops with a specific Citrix Virtual Delivery Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationInUse

Gets desktops running a specified published application (identified by browser name).

String comparisons are case-insensitive.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedClientName

Gets desktops assigned to a specific client name.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedIPAddress

Gets desktops assigned to a specific IP address.q

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserFullName

Gets desktops with an associated user identified by their full name (usually in the form ‘first-name last-name’).

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserName

Gets desktops with an associated user identified by their user name (in the form ‘domain\user’).

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserUPN

Gets desktops with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutonomouslyBrokered

Gets desktops according to whether their current session is autonomously brokered or not. Autonomously brokered sessions are HDX sessions established by direct connection without being brokered.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets desktops from the catalog with the specific name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUid

Gets desktops from a catalog with a specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientAddress

Gets desktops with a specific client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientName

Gets desktops with a specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientVersion

Gets desktops with a specific client version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Gets desktops configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectedViaHostName

Gets desktops with a specific host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectedViaIP

Gets desktops with a specific IP address of the incoming connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerDNSName

Gets desktops with a specific DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeliveryType

Gets desktops of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Type:	DeliveryType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Get desktops with a specific description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopCondition

Gets desktop with an outstanding desktop condition condition.

Valid values are:

- CPU: Indicates the machine has high CPU usage
- ICALatency: Indicates the network latency is high
- UPMLogonTime: Indicates that the profile load time was high

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets desktops from a desktop group with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Gets desktops from a desktop group with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopKind

Deprecated: Use AllocationType parameter.

Gets desktops of a particular kind.

Valid values are Private, Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeviceId

Gets desktops with a specific client device ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Get desktops with a specific DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

Gets desktops with a specific FunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HardwareId

Gets desktops with a specific client hardware ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineId

Gets desktops with a specific machine ID known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineName

Gets desktops with a specific machine name known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingServerName

Gets desktops with a specific name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionName

Gets desktops with a specific name of the hosting hypervisor connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionUid

Gets desktops with a specific UID of the hosting hypervisor connection.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets desktops with a specific configured icon. Note that desktops with a null IconUid use the icon of the desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageOutOfDate

Gets desktops if they have an ImageOutOfDate flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets desktops with a specific InMaintenanceMode setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Gets desktops with a specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsAssigned

Gets desktops according to whether they are assigned or not. Desktops may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsPhysical

Specifies if machines in the catalog can be power managed by the Citrix Broker Service. Where the power state of the machine cannot be controlled, specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the deprecated CatalogKind parameter only with a Pvs catalog kind.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionFailure

Gets desktops with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the desktop yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Type:	ConnectionFailureReason

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionTime

Gets desktops that last connected at a specific time. This is the time that the broker detected that the connection attempt either succeeded or failed.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionUser

Gets desktops where a specific user name last attempted a connection (in the form 'domain\user').

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationReason

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Type:	DeregistrationReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationTime

Gets desktops that were last deregistered by a specific time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastErrorReason

Gets desktops with the specified last error reason.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastErrorTime

Gets desktops with the specified last error time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastHostingUpdateTime

Gets desktops with a specific time that the hosting information was last updated.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaHostName

Gets desktops with a specific host name of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaIP

Gets desktops with a specific IP address of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineInternalState

Gets desktops with the specified internal machine state.

Type:	MachineInternalState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets desktops with a specific machine UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets desktops by the type of operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSVersion

Gets desktops by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PersistUserChanges

Gets desktops by the location where the user changes are persisted.

- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerActionPending

Gets desktops with a specific power action pending state.

Valid values are $true or $false.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerState

Gets desktops with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Protocol

Gets desktops with connections using a specific protocol, for example HDX, RDP, or Console.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

Specifies the provisioning type for the catalog. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,…).
- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedApplication

Gets desktops with a specific application published on them (identified by its browser name).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Gets desktops with a specific published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdStage

This property is no longer supported.

Type:	PvdStage
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RegistrationState

Gets desktops with a specific registration state.

Valid values are Unregistered, Initializing, Registered and AgentError.

Type:	RegistrationState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaActive

Gets desktops depending on whether the current session uses SecureICA or not.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Gets desktops configured with a particular SecureIcaRequired setting. Note that the desktop setting of $null indicates that the desktop group value is used.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionHidden

Gets desktops by whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Session properties are always null for multi-session desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionId

Deprecated.

Gets desktops by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionState

Gets desktops with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, Non-BrokeredSession, and Unknown.

Session properties are always null for multi-session desktops.

Type:	SessionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStateChangeTime

Gets desktops whose sessions last changed state at a specific time.

Session properties are always null for multi-session desktops.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Gets desktops with a specific session UID ($null for no session).

Session properties are always null for multi-session desktops.

Type:	Int64
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUserName

Gets desktops with a specific user name for the current session (in the form ‘domain\user’).

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUserSID

Gets desktops with a specific SID of the current session user.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SID

Gets desktops with a specific machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SmartAccessTag

Gets desktops where the session has the specific SmartAccess tag.

Session properties are always null for multi-session desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Gets desktops with a specific session start time.

Session properties are always null for multi-session desktops.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SummaryState

Gets desktops with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

Type:	DesktopSummaryState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

Gets desktops with a specific tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WillShutdownAfterUse

Gets desktops depending on whether they shut down after use or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets desktops with a specific published application (identified by its UID).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

- Count: The count of desktops in this group.
- Name: The value of the property the desktops were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

Notes

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

Group-BrokerMachine

March 11, 2024

Groups and counts machines with the same value for a specified property.

Syntax

```
Group-BrokerMachine
      [[-MachineName] <String>]
      [-AgentVersion <String>]
      [-AllocationType <AllocationType>]
      [-ApplicationInUse <String>]
      [-AssignedClientName <String>]
      [-AssignedIPAddress <String>]
      [-AssignedUserSID <String>]
      [-AssociatedTenantId <Guid>]
      [-AssociatedUserFullName <String>]
```

```
    [-AssociatedUserName <String>]
    [-AssociatedUserSID <String>]
    [-AssociatedUserUPN <String>]
    [-AzureADJoinedMode <String>]
    [-AzureDeviceId <String>]
    [-BrowserName <String>]
    [-CatalogName <String>]
    [-CatalogUid <Int32>]
    [-CatalogUUID <Guid>]
    [-CbpVersion <CBPVersion>]
    [-ColorDepth <ColorDepth>]
    [-ControllerDNSName <String>]
    [-DeliveryType <DeliveryType>]
    [-Description <String>]
    [-DesktopCondition <String>]
    [-DesktopGroupName <String>]
    [-DesktopGroupUid <Int32>]
    [-DesktopGroupUUID <Guid>]
    [-DesktopKind <DesktopKind>]
    [-DesktopUid <Int32>]
    [-DNSName <String>]
    [-DrainingUntilShutdown <Boolean>]
    [-FaultState <MachineFaultState>]
    [-FunctionalLevel <FunctionalLevel>]
    [-HostedMachineId <String>]
    [-HostedMachineName <String>]
    [-HostingServerName <String>]
    [-HypervisorConnectionName <String>]
    [-HypervisorConnectionUid <Int32>]
    [-HypHypervisorConnectionUid <Guid>]
    [-IconUid <Int32>]
    [-ImageOutOfDate <Boolean>]
    [-InMaintenanceMode <Boolean>]
    [-IPAddress <String>]
    [-IsAssigned <Boolean>]
    [-IsPhysical <Boolean>]
    [-IsReserved <Boolean>]
    [-LastAssignmentTime <DateTime>]
    [-LastConnectionFailure <ConnectionFailureReason>]
    [-LastConnectionTime <DateTime>]
    [-LastConnectionUser <String>]
    [-LastDeregistrationReason <DeregistrationReason>]
    [-LastDeregistrationTime <DateTime>]
    [-LastErrorReason <String>]
    [-LastErrorTime <DateTime>]
    [-LastHostingUpdateTime <DateTime>]
    [-LastPvdErrorReason <String>]
    [-LastPvdErrorTime <DateTime>]
    [-LastRegistrationTime <DateTime>]
    [-LoadIndex <Int32>]
    [-MacAddress <String>]
    [-MachineInternalState <MachineInternalState>]
    [-MachineUnavailableReason <String>]
```

```
64        [-MaintenanceModeReason <MaintenanceModeReason>]
65        [-Metadata <String>]
66        [-NameLookupFailureCount <Int32>]
67        [-OSType <String>]
68        [-OSVersion <String>]
69        [-PersistUserChanges <PersistUserChanges>]
70        [-PowerActionPending <Boolean>]
71        [-PowerState <PowerState>]
72        [-ProvisioningType <ProvisioningType>]
73        [-PublishedApplication <String>]
74        [-PublishedName <String>]
75        [-PvdEstimatedCompletionTime <DateTime>]
76        [-PvdPercentDone <Int32>]
77        [-PvdStage <PvdStage>]
78        [-PvdUpdateStartTime <DateTime>]
79        [-RegistrationState <RegistrationState>]
80        [-ScheduledReboot <ScheduledReboot>]
81        [-SecureIcaRequired <Boolean>]
82        [-SessionAutonomouslyBrokered <Boolean>]
83        [-SessionClientAddress <String>]
84        [-SessionClientName <String>]
85        [-SessionClientVersion <String>]
86        [-SessionConnectedViaHostName <String>]
87        [-SessionConnectedViaIP <String>]
88        [-SessionCount <Int32>]
89        [-SessionDeviceId <String>]
90        [-SessionHardwareId <String>]
91        [-SessionHidden <Boolean>]
92        [-SessionKey <Guid>]
93        [-SessionLaunchedViaHostName <String>]
94        [-SessionLaunchedViaIP <String>]
95        [-SessionProtocol <String>]
96        [-SessionSecureIcaActive <Boolean>]
97        [-SessionsEstablished <Int32>]
98        [-SessionSmartAccessTag <String>]
99        [-SessionsPending <Int32>]
100       [-SessionStartTime <DateTime>]
101       [-SessionState <SessionState>]
102       [-SessionStateChangeTime <DateTime>]
103       [-SessionSupport <SessionSupport>]
104       [-SessionType <SessionType>]
105       [-SessionUid <Int64>]
106       [-SessionUserName <String>]
107       [-SessionUserSID <String>]
108       [-SID <String>]
109       [-SummaryState <DesktopSummaryState>]
110       [-SupportedPowerAction <String>]
111       [-Tag <String>]
112       [-UUID <Guid>]
113       [-VMToolsState <VMToolsState>]
114       [-WillShutdownAfterUse <Boolean>]
115       [-WillShutdownAfterUseReason <WillShutdownAfterUseReason>]
116       [-WindowsConnectionSetting <WindowsConnectionSetting>]
```

```
       [-ZoneHealthy <Boolean>]
       [-ZoneName <String>]
       [-ZoneUid <Guid>]
       -Property <String>
       [-ReturnTotalRecordCount]
       [-MaxRecordCount <Int32>]
       [-Skip <Int32>]
       [-SortBy <String>]
       [-Filter <String>]
       [-FilterScope <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Group-BrokerMachine
      [-Uid] <Int32>
      -Property <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Filters machines using the specified criteria, then groups and counts matching machines with the same value for a particular property. The number of machines in the group, and the property value for the group, is output. For example:

C:\PS> Group-BrokerMachine -Property SummaryState

Count Name

---

43 Available

17 InUse

3 Disconnected

Filtering supports the same options as the Get-BrokerMachine cmdlet, and allows filtering on both machine and session properties.

Group-BrokerMachine is similar to the standard PowerShell Group-Object, but is faster than piping the output of Get-BrokerMachine into Group-Object when working with many machines.

Note that the MaxRecordCount, ReturnTotalRecordCount, Skip, and SortBy parameters apply to GroupInfo records output rather than the filtered machines.

Examples

EXAMPLE 1

Group machines from the dg1 group by summary state.

```
Group-BrokerMachine -Property SummaryState -DesktopGroupName dg1
```

EXAMPLE 2

For machines where the last connection attempt failed, list the most common reason for failure, ignoring connections that failed over a week ago.

```
Group-BrokerMachine -Property LastConnectionFailure -Filter {
  LastConnectionFailure -ne "None" -and LastConnectionTime -ge '-7'  }
  -MaxRecordCount 1
```

EXAMPLE 3

List alphabetically the hypervisor servers hosting machines that are currently experiencing high network latency.

```
Group-BrokerMachine -Property HostingServerName -DesktopCondition
    ICALatency -SortBy Name
```

Parameters

-Uid

Gets a machine with a specific UID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Selects the property by which matching machines are grouped.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets machines with a specific machine name (in the form domain\machine).

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AgentVersion

Gets machines with a specific Virtual Delivery Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllocationType

Gets machines from catalogs with the specified allocation type.

Type:	AllocationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationInUse

Gets machines running a specified published application. String comparisons are case-insensitive.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedClientName

Gets machines that have been assigned to the specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedIPAddress

Gets machines that have been assigned to the specific client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedUserSID

Gets machines with the specific SID of the user to whom the desktop is assigned.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedTenantId

Gets machines associated with the specified tenant.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserFullName

Gets machines with an associated user identified by their full name (usually 'first-name last-name').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserName

Gets machines with an associated user identified by their user name (in the form 'domain\user').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserSID

Gets machines with an associated user identified by their Windows SID.

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssociatedUserUPN

Gets machines with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureADJoinedMode

Gets machines with a specific Azure AD Domain Join Type

- NotAadJoined - Machine not joined to Azure AD yet.
- HybridAadJoined - Machine was Hybrid Aad joined.
- PureAadJoined - Machine was Pure Aad joined.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDeviceId

Gets machines with matching Azure DeviceId.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrowserName

Gets assigned machines backing desktop resources that have browser names matching the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets machines from the catalog with the specific name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUid

Gets machines from the catalog with the specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUUID

Gets machines from the catalog with the specific UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CbpVersion

The version of CBP that the VDA is currently registered with. This will be null when the VDA is not registered.

Type:	CBPVersion
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Gets machines configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerDNSName

Gets machines by the DNS name of the controller they are registered with.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeliveryType

Gets machines of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Type:	DeliveryType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Description

Get machines by description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopCondition

Gets machines with an outstanding desktop condition.

Valid values are:

- CPU: Indicates the machine has high CPU usage
- ICALatency: Indicates the network latency is high
- UPMLogonTime: Indicates that the profile load time was high

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets machines from a desktop group with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUid

Gets machines from a desktop group with a specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupUUID

Gets machines from a desktop group with a specific UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopKind

Deprecated: Use AllocationType parameter.

Gets machines of a particular kind.

Valid values are Private, Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopUid

Gets the machine that corresponds to the desktop with the specific UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets machines with the specific DNS name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DrainingUntilShutdown

Gets machines depending on whether they are draining until shutdown or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FaultState

Gets machines currently in the specified fault state.

Type:	MachineFaultState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

Gets machines with a specific FunctionalLevel.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineId

Gets machines with the specific machine ID known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineName

Gets machines with the specific machine name known to the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingServerName

Gets machines by the name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionName

Gets machines with the specific name of the hypervisor connection hosting them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionUid

Gets machines with the specific UID of the hypervisor connection hosting them.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypHypervisorConnectionUid

Gets machines with the specific UUID of the hypervisor connection hosting them.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Gets machines by configured icon. Note that machines with a null IconUid use the icon of the desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageOutOfDate

Gets machines depending on whether their disk image is out of date or not (for machines provisioned using MCS only).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets machines by whether they are in maintenance mode or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-IPAddress

Gets machines with a specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsAssigned

Gets machines according to whether they are assigned or not. Machines may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsPhysical

Gets machines according to whether they can be power managed by XenDesktop or not.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsReserved

Gets machines that are reserved for special use, for example, for AppDisk preparation.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastAssignmentTime

Gets machines with the specific LastAssignmentTime.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionFailure

Gets machines with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the machine yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Type:	ConnectionFailureReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionTime

Gets machines to which a user session connection occurred at a specific time. This is the time that the broker detected that the connection attempt either succeeded or failed.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastConnectionUser

Gets machines where a specific user name last attempted a connection (in the form 'domain\user').

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationReason

Gets machines whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Type:	DeregistrationReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastDeregistrationTime

Gets machines by the time that they were last deregistered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastErrorReason

Gets machines with the specified last error reason.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastErrorTime

Gets machines with the specified last error time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastHostingUpdateTime

Gets machines with a specific time that the hosting information was last updated or the completion of the last power action.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastPvdErrorReason

This property is no longer supported.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastPvdErrorTime

This property is no longer supported.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastRegistrationTime

Gets machines by the time that they last registered.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoadIndex

Gets machines by their current load index.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MacAddress

Gets machines with a specific MAC address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineInternalState

Gets machines with the specified internal state.

Type:	MachineInternalState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUnavailableReason

Gets machines that corresponds to a particular MachineUnavailable Reason

- None - No detailed reason specified
- LoadManagementInitializing - VDA load management logic currently initialising. Only occurs for multi-session capable VDAs.
- GctConnectionInitializing - VDA is still initializing control connection with NGS.
- AzureADJoinInitializing - VDA is still initializing Aad domain join.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaintenanceModeReason

Gets machines by the maintenance mode reason. Valid values are:

- None - Machine is not in maintenance mode.
- Administrator - Machine was manually placed in maintenance mode by an administrator.
- MaxFailedRegistrations - Machine was automatically placed in maintenance mode due to reaching the maximum failed registration limit.

Type:	MaintenanceModeReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NameLookupFailureCount

Tracks the number of consecutive directory lookup failures for this account.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OSType

Gets machines by the type of operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-OSVersion

Gets machines by the version of the operating system they are running.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PersistUserChanges

Gets machines according to the location where user changes are persisted. Values can be:

- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerActionPending

Gets machines depending on whether a power action is pending or not.

Valid values are $true or $false.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerState

Gets machines with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

Specifies the provisioning type for the catalog. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).
- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedApplication

Gets machines with a specific application published to them (identified by its browser name).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Gets desktops with a specific published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdEstimatedCompletionTime

This property is no longer supported.

Type:	DateTime
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdPercentDone

This property is no longer supported.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdStage

This property is no longer supported.

Type:	PvdStage
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvdUpdateStartTime

This property is no longer supported.

Type:	DateTime
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RegistrationState

Gets machines in a specific registration state.

Valid values are Unregistered, Initializing, Registered, and AgentError.

Type:	RegistrationState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledReboot

Gets machines according to their current status with respect to any scheduled reboots (for either scheduled desktop group reboots or image rollout purposes). Valid values are:

- None - No reboot currently scheduled.
- Pending - Reboot scheduled but machine still available for use.
- Draining - Reboot scheduled. New logons are disabled, but reconnections to existing sessions are allowed.
- InProgress - Machine is actively being rebooted.
- Natural - Natural reboot in progress. Machine is awaiting a restart.

Type:	ScheduledReboot
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Gets machines configured with a particular SecureIcaRequired setting. Note that the machine setting of $null indicates that the desktop group value is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionAutonomouslyBrokered

Gets machines according to whether their current session is autonomously brokered or not. Autonomously brokered sessions are HDX sessions established by direct connection without being brokered.

Session properties are always null for multi-session machines.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionClientAddress

Gets machines with a specific client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionClientName

Gets machines with a specific client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionClientVersion

Gets machines with a specific client version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionConnectedViaHostName

Gets machines with a specific host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionConnectedViaIP

Gets machines with a specific IP address of the incoming connection.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionCount

Gets machines according to the total number of both pending and established user sessions on the machine.

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionDeviceId

Gets machines with a specific client device ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionHardwareId

Gets machines with a specific client hardware ID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionHidden

Gets machines by whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions using XenDesktop; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionKey

Gets machine running the session with the specified unique key.

Session properties are always null for multi-session machines.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionLaunchedViaHostName

Gets machines with a specific host name of the Web Interface server from which the user launched the session.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionLaunchedViaIP

Gets machines with a specific IP address of the Web Interface server from which the user launched the session.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionProtocol

Gets machines with connections using a specific protocol, for example HDX, RDP, or Console.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSecureIcaActive

Gets machines depending on whether the current session uses SecureICA or not.

Session properties are always null for multi-session machines.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SessionsEstablished

Gets machines according to the number of established user sessions present on the machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSmartAccessTag

Gets session machines where the session has the specific SmartAccess tag.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionsPending

Get machines according to the number of pending user sessions for the machine.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStartTime

Gets machines with a specific session start time.

Session properties are always null for multi-session machines.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionState

Gets machines with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, Non-BrokeredSession, and Unknown.

Session properties are always null for multi-session machines.

Type:	SessionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStateChangeTime

Gets machines whose sessions last changed state at a specific time.

Session properties are always null for multi-session machines.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

Gets machines that have the specified session capability. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionType

Gets machines with a specific session state.

Session properties are always null for multi-session machines.

Type:	SessionType
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUid

Gets single-session machines with a specific session UID ($null for no session).

Session properties are always null for multi-session machines.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUserName

Gets machines with a specific user name for the current session (in the form 'domain\user').

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionUserSID

Gets machines with a specific SID of the current session user.

Session properties are always null for multi-session machines.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SID

Gets machines with a specific machine SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SummaryState

Gets machines with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

Type:	DesktopSummaryState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SupportedPowerAction

Gets machines that support the specified power action.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

Gets machines where the session has the given SmartAccess tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UUID

Gets machines with the specified value of UUID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMToolsState

Gets machines with a specific VM tools state.

Valid values are NotPresent, Unknown, NotStarted, and Running.

Type:	VMToolsState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WillShutdownAfterUse

Gets machines depending on whether they shut down after use or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WillShutdownAfterUseReason

Gets machines by the will shutdown after use reason. Valid values are:

- None - Machine will not shutdown after use.
- ResetDiskImage - Machine will shutdown after use to reset its disk image.
- ScheduledNaturalReboot - Machine will shutdown after use as part of the scheduled natural reboot process.
- OnDemandNaturalReboot - Machine will shutdown after use as part of an on-demand natural reboot process.

Type:	WillShutdownAfterUseReason
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WindowsConnectionSetting

Gets machines according to their current Windows connection setting (logon mode). Valid values are:

- LogonEnabled - All logons are enabled.
- Draining - New logons are disabled, but reconnections to existing sessions are allowed.
- DrainingUntilRestart - Same as Draining, but setting reverts to LogonEnabled when machine next restarts.
- LogonDisabled - All logons and reconnections are disabled.

This is a Windows setting and is not controlled by XenDesktop. It applies only to multi-session machines; for single-session machines its value is always LogonEnabled.

Type:	WindowsConnectionSetting
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneHealthy

Gets machines located in the zone with the specified health state.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Gets machines located in the zone with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

Gets machines located in the zone with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

- Count: The count of machines in this group.
- Name: The value of the property the machines were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

Notes

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

Group-BrokerSession

March 11, 2024

Groups and counts sessions with the same value for a specified property.

Syntax

```
Group-BrokerSession
      [[-SessionKey] <Guid>]
      [-AgentVersion <String>]
      [-AnonymousUserId <String>]
      [-ApplicationInUse <String>]
      [-AppState <SessionAppState>]
      [-AppStateLastChangeTime <DateTime>]
      [-AutonomouslyBrokered <Boolean>]
      [-BrokeringDuration <Int32>]
      [-BrokeringTime <DateTime>]
      [-BrokeringUserName <String>]
      [-BrokeringUserSID <String>]
      [-CatalogName <String>]
      [-CbpVersion <CBPVersion>]
      [-ClientAddress <String>]
      [-ClientName <String>]
      [-ClientPlatform <String>]
      [-ClientProductId <Int32>]
      [-ClientVersion <String>]
      [-ConnectedViaHostName <String>]
      [-ConnectedViaIP <String>]
      [-ConnectionMode <ConnectionMode>]
      [-ControllerDNSName <String>]
      [-DesktopGroupName <String>]
```

```
25        [-DesktopGroupUid <Int32>]
26        [-DesktopKind <DesktopKind>]
27        [-DesktopSID <String>]
28        [-DesktopUid <Int32>]
29        [-DeviceId <String>]
30        [-DNSName <String>]
31        [-EntitlementPolicyRuleUid <Int32>]
32        [-EstablishmentDuration <Int32>]
33        [-EstablishmentTime <DateTime>]
34        [-HardwareId <String>]
35        [-Hidden <Boolean>]
36        [-HostedMachineName <String>]
37        [-HostingServerName <String>]
38        [-HypervisorConnectionName <String>]
39        [-IdleDuration <TimeSpan>]
40        [-IdleSince <DateTime>]
41        [-ImageOutOfDate <Boolean>]
42        [-InMaintenanceMode <Boolean>]
43        [-IPAddress <String>]
44        [-IsAnonymousUser <Boolean>]
45        [-IsPhysical <Boolean>]
46        [-LaunchedViaHostName <String>]
47        [-LaunchedViaIP <String>]
48        [-LaunchedViaPublishedName <String>]
49        [-LaunchedViaWorkspace <Boolean>]
50        [-LogoffInProgress <Boolean>]
51        [-LogonInProgress <Boolean>]
52        [-MachineName <String>]
53        [-MachineSummaryState <DesktopSummaryState>]
54        [-MachineUid <Int32>]
55        [-Metadata <String>]
56        [-OSType <String>]
57        [-PersistUserChanges <PersistUserChanges>]
58        [-PowerState <PowerState>]
59        [-PreferredZoneName <String>]
60        [-PreferredZoneUid <Guid>]
61        [-Protocol <String>]
62        [-ProvisioningType <ProvisioningType>]
63        [-ReceiverIPAddress <String>]
64        [-ReceiverName <String>]
65        [-SecureIcaActive <Boolean>]
66        [-SessionId <Int32>]
67        [-SessionReconnection <SessionReconnection>]
68        [-SessionState <SessionState>]
69        [-SessionStateChangeTime <DateTime>]
70        [-SessionSupport <SessionSupport>]
71        [-SessionType <SessionType>]
72        [-StartTime <DateTime>]
73        [-TenantId <Guid>]
74        [-UntrustedUserName <String>]
75        [-UserFullName <String>]
76        [-UserName <String>]
77        [-UserSID <String>]
```

```
      [-UserUPN <String>]
      [-ZoneName <String>]
      [-ZoneUid <Guid>]
      [-ApplicationUid <Int32>]
      [-SharedDesktopUid <Int32>]
      -Property <String>
      [-ReturnTotalRecordCount]
      [-MaxRecordCount <Int32>]
      [-Skip <Int32>]
      [-SortBy <String>]
      [-Filter <String>]
      [-FilterScope <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Group-BrokerSession
      [-Uid] <Int64>
      -Property <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Filters sessions using the specified criteria, then groups and counts matching sessions with the same value for a particular property. The number of sessions in the group, and the property value for the group, is output. For example:

C:\PS> Group-BrokerSession -Property SessionState

Count Name

---

43 Active

17 NonBrokeredSession

3 Disconnected

Filtering supports the same options as the Get-BrokerSession cmdlet, and allows filtering on both machine and session properties.

Group-BrokerSession is similar to the standard PowerShell Group-Object, but is faster than piping the output of Get-BrokerSession into Group-Object when working with many machines.

Note that the MaxRecordCount, ReturnTotalRecordCount, Skip, and SortBy parameters apply to GroupInfo records output rather than the filtered sessions.

Examples

EXAMPLE 1

Group sessions on machines from the dg1 group by session state.

```
Group-BrokerSession -Property SessionState -DesktopGroupName dg1
```

EXAMPLE 2

List alphabetically the names of the clients connected to the site, but only show clients whose names starts with 'ThinClient'.

```
Group-BrokerSession -Property ClientName -ClientName 'ThinClient*' -
    SortBy Name
```

Parameters

-Uid

Gets session by its Uid.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Selects the property by which matching sessions are grouped.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-SessionKey

Gets session having the specified unique key.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AgentVersion

Gets sessions with a specific Virtual Desktop Agent version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AnonymousUserId

Gets sessions associated with the specified user ID.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationInUse

Gets sessions running specific applications (identified by their SDK Name property).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppState

Gets sessions by their app state.

Valid values are PreLogon, PreLaunched, Active, Desktop, Lingering and NoApps.

Type:	SessionAppState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppStateLastChangeTime

Get sessions by their app state change time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutonomouslyBrokered

Gets sessions according to whether they are autonomously brokered or not. Autonomously brokered sessions are HDX sessions established by direct connection without being brokered.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringDuration

Gets session with a specific time taken to broker. In general, Citrix recommends using -Filter and relative comparisons.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringTime

Get sessions brokered at a specific time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringUserName

Get sessions by brokering user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrokeringUserSID

Get sessions by brokering user SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Gets sessions on machines from a specific catalog name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CbpVersion

The version of CBP that the VDA is currently registered with. This will be null when the VDA is not registered.

Type:	CBPVersion
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientAddress

Get sessions by client IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientName

Get sessions by client name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientPlatform

Get sessions by client platform.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientProductId

Get sessions by client product ID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientVersion

Get sessions by client version.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectedViaHostName

Get sessions by host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectedViaIP

Get sessions by IP address of the incoming connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectionMode

Gets sessions by the way in which the most recent connection to the session was established.

Valid modes are Brokered, Unbrokered, LeasedConnection, VdaHighAvailabilityMode, ThirdPartyBroker, and ThirdPartyBrokerWithLicensing.

Type:	ConnectionMode
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerDNSName

Gets sessions that are hosted on machines which are registered with a specific controller.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupName

Gets sessions from a desktop group with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-DesktopGroupUid

Gets sessions from a desktop group with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopKind

Gets sessions on a desktop of a particular kind.

Valid values are Private and Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopSID

Get sessions by desktop SID.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopUid

Get sessions by desktop Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeviceId

Get sessions by client device id.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DNSName

Gets sessions by their machine's DNS name.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EntitlementPolicyRuleUid

Gets sessions where the user was granted the entitlement to launch the session from the specified entitlement policy rule.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EstablishmentDuration

Gets sessions which took a specific time to establish. In general, Citrix recommends using -Filter and relative comparisons.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EstablishmentTime

Gets sessions which became established at a particular time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HardwareId

Get sessions by client hardware id.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Hidden

Get sessions by whether they are hidden or not. Hidden sessions are treated as though they do not exist when brokering sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineName

Gets sessions by their machine's name as known to its hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingServerName

Gets sessions hosted by a machine with a specific name of the hosting hypervisor server.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionName

Gets sessions hosted by a machine with a specific name of the hosting hypervisor connection.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdleDuration

Gets sessions that have been idle for the specified period

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IdleSince

Time at which session went idle

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageOutOfDate

Gets sessions hosted by a machine with a specific ImageOutOfDate setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Gets sessions hosted by a machine with a specific InMaintenanceMode setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IPAddress

Gets sessions hosted by a machine with a specific IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsAnonymousUser

Gets sessions depending on whether they were established anonymously ($true) or not ($false). An anonymous session is established without user credentials and a temporary local user account is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-IsPhysical

Gets sessions hosted on machines where the flag indicating if the machine can be power managed by the Citrix Broker Service matches the requested value. Where the power state of the machine cannot be controlled, specify $true, otherwise $false.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaHostName

Get sessions by the host name of the StoreFront server from which a user launches a session.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaIP

Get sessions by the IP address of the StoreFront server from which a user launches a session.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaPublishedName

Gets sessions originally launched using a resource having a name matching the specified published name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LaunchedViaWorkspace

Gets sessions by whether they were launched via Citrix Workspace or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffInProgress

Gets sessions by whether they are in the process of being logged off or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogonInProgress

Gets sessions by whether they are still executing user logon processing or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Gets sessions by their machine name (in the form DOMAIN\machine).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineSummaryState

Gets sessions on a machine with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, Preparing, and InUse.

Type:	DesktopSummaryState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

Gets sessions on a machine with the specified UID.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-OSType

Gets sessions with a specific type of operating system.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PersistUserChanges

Gets sessions where the user changes are persisted in a particular manner. Values can be:

- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.

Type:	PersistUserChanges
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerState

Gets sessions on machines in the specified power state.

Valid values are Unmanaged, Unknown, Unavailable, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Type:	PowerState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreferredZoneName

Gets sessions originally launched with the specified preferred zone name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreferredZoneUid

Gets sessions originally launched with the specified preferred zone Uid.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Protocol

Get sessions by connection protocol. Valid values are HDX, RDP and Console.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

Gets sessions hosted on machines provisioned in a particular manner. Values can be:

- Manual - No automated provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).
- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReceiverIPAddress

Gets sessions with the specified client IP address supplied by Receiver (for example, StoreFront) when the session was launched, or reconnected.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ReceiverName

Gets sessions with the specified client name supplied by Receiver (for example, StoreFront) when the session was launched, or reconnected.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaActive

Get sessions by their use of SecureICA.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionId

Deprecated.

Gets sessions by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

Type:	Int32

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionReconnection

Get sessions by their session reconnection (roaming) behavior. Possible values are:

Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionState

Get sessions by their state.

Valid values are Other, PreparingNewSession, Connected, Active, Disconnected, Reconnecting, Non-BrokeredSession, and Unknown.

Type:	SessionState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionStateChangeTime

Get sessions by their last state change time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

Gets sessions hosted on machines which support the required pattern of sessions. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionType

Gets sessions by their type.

Valid values are Application and Desktop.

Type:	SessionType
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Gets sessions by their start time. In general, Citrix recommends using -Filter and relative comparisons.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Gets sessions associated with the specified tenant.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UntrustedUserName

Gets sessions by the untrusted user name reported directly from the machine.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFullName

Gets sessions by user's full name (usually 'first-name last-name').

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserName

Get sessions by user name (in the form DOMAIN\user).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserSID

Get sessions by user's Windows SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserUPN

Gets sessions by user's User Principal Name (in the form user@domain).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Gets sessions hosted by machines located in the zone with the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

Gets sessions hosted by machines located in the zone with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationUid

Gets sessions running the application with the specified Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SharedDesktopUid

Gets sessions by SharedDesktop Uid.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

- Count: The count of sessions in this group.
- Name: The value of the property the sessions were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

Notes

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

Import-BrokerDesktopPolicy

March 11, 2024

Sets the site wide Citrix Group Policy settings for the site.

Syntax

```
Import-BrokerDesktopPolicy
       [-Policy] <Byte[]>
       [-IsBlobOnly]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Import-BrokerDesktopPolicy sets the site wide Citrix Group Policy settings. A successful call to this cmdlet will result in the supplied data being uploaded to every machine in the site prior to its next session launch.

Examples

EXAMPLE 1

This command sets the Citrix Group Policy settings in the site. These policy settings are then applied to every machine prior to the next session launch.

```
Import-BrokerDesktopPolicy $policyData
```

Parameters

-Policy

The configuration data containing the Citrix Group Policy settings to apply to every machine in the site.

Type:	Byte[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-IsBlobOnly

This parameter is reserved for future use.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Byte[]

The configuration data as an opaque binary blob.

Outputs

None

By default, this cmdlet returns no output.

Notes

Import-BrokerDesktopPolicy performs a specialized operation. Direct usage of it in scripts is discouraged, and could result in data corruption. It is recommended that this operation be performed via the Citrix Studio.

Import-BrokerPolicyTemplates

March 11, 2024

Sets the site wide Citrix Group Policy templates for the site.

Syntax

```
Import-BrokerPolicyTemplates
      [-Templates] <Byte[]>
      [-Version] <Int32>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Import-BrokerPolicyTemplates sets the site wide Citrix Group Policy templates. A read of the policy templates data using the Export-BrokerPolicyTemplates command should have been executed prior to issuing this command. That command returns a version number that indicates the version of the data stored in the database. If the version number is specified and the number does not match the number stored in the database, it means another import has been executed. In this case, this import will overwrite the changes made by the other import.

Examples

EXAMPLE 1

This command sets the Citrix Group Policy templates in the site.

```
Import-BrokerPolicyTemplates $templatesData 100
```

EXAMPLE 2

This command sets the Citrix Group Policy templates in the site even if the data in the database is not at version 100.

```
1  Import-BrokerPolicyTemplates $templatesData 100 -Force
```

Parameters

-Templates

The configuration data containing the Citrix Group Policy templates.

Type:	Byte[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Version

The current version of the group policy templates data. This number should be obtained from a previous Export-BrokerPolicyTemplates. This number is used to ensure that the data stored in the database has not changed between the last time the data was read and this import. If -Force is not specified, the import will be rejected if the version does not match the version in the database. If -Force is specified, the data stored in the database will be overwritten with the templates provided. The version number always increases by 1 for each write, even when the data is overwritten.

Type:	Int32
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

The current version of the group policy templates data. This number should be obtained from a previous Export-BrokerPolicyTemplates. This number is used to ensure that the data stored in the database has not changed between the last time the data was read and this import. If this parameter is not specified, the templates stored in the database is replaced regardless if there has been another import since the last time the data was exported.

Type:	SwitchParameter
Position:	4
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Byte[]

The configuration data as an opaque binary blob.

System.Int

The current version of the group policy templates data.

Outputs

None

By default, this cmdlet returns no output.

Notes

Import-BrokerPolicyTemplates performs a specialized operation. Direct usage of it in scripts is discouraged, and could result in data corruption. It is recommended that this operation be performed via the Citrix Studio.

Move-BrokerAdminFolder

March 11, 2024

Moves a folder to another place in the hierarchy, optionally renaming it

Syntax

```
Move-BrokerAdminFolder
    [-InputObject] <AdminFolder[]>
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-BrokerAdminFolder
    [-Name] <String>
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Move-BrokerAdminFolder cmdlet moves a folder for organising objects for administration purposes (for example, Applications) to another position in the hierarchy.

The following special characters are not allowed in the new FolderName: \ / ; : # . * ? = < > | [ ] ( ) “‘

Examples

EXAMPLE 1

Moves the folder called XXX within the folder F1\ to a new home in F2\

```
Move-BrokerAdminFolder F1\XXX\ F2\
```

EXAMPLE 2

Moves the folder called XXX within the folder F1\ to a new home in F2\ renaming it to YYY in the process

```
Move-BrokerAdminFolder F1\XXX\ F2\ -NewName YYY
```

Parameters

-InputObject

The folder(s) to be moved

Type:	AdminFolder[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

A pattern matching the names of folders to be moved

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Destination

The destination folder the folder being moved should end up in

Type:	AdminFolder
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-NewName

The name the new folder should have in the destination folder

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Depends on parameter

Parameters can be piped by property name.

Outputs

None or Citrix.Broker.Admin.SDK.AdminFolder

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AdminFolder object.

Related Links

- Get-BrokerAdminFolder
- New-BrokerAdminFolder

Move-BrokerApplication

March 11, 2024

Move a published application from one admin folder to another

Syntax

```
Move-BrokerApplication
    [-InputObject] <Application[]>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-BrokerApplication
    [-Name] <String>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Move-BrokerApplication cmdlet moves a published application from one place to another in the tree of admin folders, optionally renaming it in the process (if you only want to change the name of the application for administrative purposes and not its location in the tree, use the Rename-BrokerApplication cmdlet).

The location and name of a published application in this sense is only of interest to the administrator, changes do not affect the end-user experience.

Examples

EXAMPLE 1

Moves the application in the root folder called “App1”to the folder “F1”.

```
Move-BrokerApplication -Name 'App1' -Destination 'F1\'
```

EXAMPLE 2

Moves the application in folder “F1”called “App1”to the folder “F2”, renaming it to “Application1”in the process.

```
Move-BrokerApplication 'F1\App1' 'F2\' -NewName 'Application1'
```

Parameters

-InputObject

The application(s) to be moved

Type:	Application[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The application(s) to be moved

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Destination

The destination location within the admin folder hierarchy

Type:	AdminFolder
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewName

The new name of the application in its new destination

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Application

You can pipe applications to Move-BrokerApplication.

Outputs

None or Citrix.Broker.Admin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Application object.

Move-BrokerApplicationGroup

March 11, 2024

Move an application group from one admin folder to another

Syntax

```
Move-BrokerApplicationGroup
    [-InputObject] <ApplicationGroup[]>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-BrokerApplicationGroup
    [-Name] <String>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Move-BrokerApplicationGroup cmdlet moves an application group from one place to another in the tree of admin folders, optionally renaming it in the process (if you only want to change the name of the application group for administrative purposes and not its location in the tree, use the Rename-BrokerApplicationGroup cmdlet).

The location and name of an application group in this sense is only of interest to the administrator, changes do not affect the end-user experience.

Examples

Parameters

-InputObject

The application group(s) to be moved

Type:	ApplicationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the application group to be moved

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Destination

The destination location within the admin folder hierarchy.

Type:	AdminFolder

Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewName

The new name of the application group in its new destination

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.ApplicationGroup

You can pipe application groups to Move-BrokerApplicationGroup.

Outputs

None or Citrix.Broker.Admin.SDK.ApplicationGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.ApplicationGroup object.

Move-BrokerCatalog

March 11, 2024

Move a catalog from one admin folder to another

Syntax

```
Move-BrokerCatalog
    [-InputObject] <Catalog[]>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-BrokerCatalog
    [-Name] <String>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Move-BrokerCatalog cmdlet moves a catalog from one place to another in the tree of admin folders, optionally renaming it in the process (if you only want to change the name of the catalog for administrative purposes and not its location in the tree, use the Rename-BrokerCatalog cmdlet).

The location and name of a catalog in this sense is only of interest to the administrator, changes do not affect the end-user experience.

Examples

Parameters

-InputObject

The catalog(s) to be moved

Type:	Catalog[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the catalog to be moved

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Destination

The destination location within the admin folder hierarchy.

Type:	AdminFolder
Position:	3
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-NewName

The new name of the catalog in its new destination

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

You can pipe catalogs to Move-BrokerCatalog.

Outputs

None or Citrix.Broker.Admin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Catalog object.

Move-BrokerDesktopGroup

March 11, 2024

Move a desktop group from one admin folder to another

Syntax

```
Move-BrokerDesktopGroup
    [-InputObject] <DesktopGroup[]>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-BrokerDesktopGroup
    [-Name] <String>
    [-PassThru]
    [-Destination] <AdminFolder>
    [-NewName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Move-BrokerDesktopGroup cmdlet moves a desktop group from one place to another in the tree of admin folders, optionally renaming it in the process (if you only want to change the name of the desktop group for administrative purposes and not its location in the tree, use the Rename-BrokerDesktopGroup cmdlet).

The location and name of a desktop group in this sense is only of interest to the administrator, changes do not affect the end-user experience.

Examples

Parameters

-InputObject

The desktop group(s) to be moved

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the desktop group to be moved

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Destination

The destination location within the admin folder hierarchy.

Type:	AdminFolder
Position:	3
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-NewName

The new name of the desktop group in its new destination

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

You can pipe desktop groups to Move-BrokerDesktopGroup.

Outputs

None or Citrix.Broker.Admin.SDK.DesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.DesktopGroup object.

Move-BrokerGpoPolicy

March 11, 2024

Move policies to another policy set. The source policies must be in the same policy set. They must all not exist in the target policy set. An error will be reported if there is a name conflict and the move will fail. When the move fails, no policy is moved.

Syntax

```
Move-BrokerGpoPolicy
    -TargetPolicySet <Guid>
    -PolicyGuids <Guid[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

If the target policy set is not specified, the policies are deleted and not moved to any other policy set.

Examples

EXAMPLE 1

Copy policies to the target policy set.

```
Copy-BrokerGpoPolicy -TargetPolicySet "abcd1234-..." -PolicyGuids @("
    abcdef12-...", "12345678-...")
```

Parameters

-TargetPolicySet

GUID of the target policy set

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicyGuids

GUIDs of the policies to be moved

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

New-BrokerAccessPolicyRule

March 11, 2024

Creates a new rule in the site's access policy.

Syntax

```
New-BrokerAccessPolicyRule
   [-AllowedConnections <AllowedConnection>]
   [-AllowedProtocols <String[]>]
   [-AllowedUsers <AllowedUser>]
   [-AllowRestart <Boolean>]
   [-AppProtectionKeyLoggingRequired <Boolean>]
```

```
    [-AppProtectionScreenCaptureRequired <Boolean>]
    [-Description <String>]
    -DesktopGroupUid <Int32>
    [-Enabled <Boolean>]
    [-ExcludedClientIPFilterEnabled <Boolean>]
    [-ExcludedClientIPs <IPAddressRange[]>]
    [-ExcludedClientNameFilterEnabled <Boolean>]
    [-ExcludedClientNames <String[]>]
    [-ExcludedSmartAccessFilterEnabled <Boolean>]
    [-ExcludedSmartAccessTags <String[]>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-ExcludedUsers <User[]>]
    [-HdxSslEnabled <Boolean>]
    [-IncludedClientIPFilterEnabled <Boolean>]
    [-IncludedClientIPs <IPAddressRange[]>]
    [-IncludedClientNameFilterEnabled <Boolean>]
    [-IncludedClientNames <String[]>]
    [-IncludedSmartAccessFilterEnabled <Boolean>]
    [-IncludedSmartAccessFilterType <String>]
    [-IncludedSmartAccessTags <String[]>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-Name] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
New-BrokerAccessPolicyRule
    [-AllowedConnections <AllowedConnection>]
    [-AllowedProtocols <String[]>]
    [-AllowedUsers <AllowedUser>]
    [-AllowRestart <Boolean>]
    [-AppProtectionKeyLoggingRequired <Boolean>]
    [-AppProtectionScreenCaptureRequired <Boolean>]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-ExcludedClientIPFilterEnabled <Boolean>]
    [-ExcludedClientIPs <IPAddressRange[]>]
    [-ExcludedClientNameFilterEnabled <Boolean>]
    [-ExcludedClientNames <String[]>]
    [-ExcludedSmartAccessFilterEnabled <Boolean>]
    [-ExcludedSmartAccessTags <String[]>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-ExcludedUsers <User[]>]
    [-HdxSslEnabled <Boolean>]
    [-IncludedClientIPFilterEnabled <Boolean>]
    [-IncludedClientIPs <IPAddressRange[]>]
    [-IncludedClientNameFilterEnabled <Boolean>]
    [-IncludedClientNames <String[]>]
    [-IncludedDesktopGroupFilterEnabled <Boolean>]
    -IncludedDesktopGroups <DesktopGroup[]>
    [-IncludedSmartAccessFilterEnabled <Boolean>]
    [-IncludedSmartAccessFilterType <String>]
```

```
    [-IncludedSmartAccessTags <String[]>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-Name] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerAccessPolicyRule cmdlet adds a new rule to the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Multiple rules in the access policy can apply to the same desktop group.

For a user to gain access to a desktop group via a rule their connection must match all its enabled include filters, and none of its enabled exclude filters. In addition, for a user to be able to launch a desktop or application resource session from the desktop group, they must have an entitlement to use the resource granted by the entitlement or assignment policies, or by direct machine assignment.

Examples

EXAMPLE 1

Creates an access policy rule allowing access to the Tech Support desktop group for all users of the SUPPORT\uk-staff group. Connections to desktop or application resources in the group can only be made using the HDX protocol.

For users to gain access to resources in the group also requires that, depending on the desktop kind of the group, appropriate assignment or entitlement policy rules, or explicit machine assignments exist.

```
$dg = Get-BrokerDesktopGroup 'Tech Support'
New-BrokerAccessPolicyRule 'UK Tech Support' -IncludedUserFilterEnabled
    $true -IncludedUsers support\uk-staff -DesktopGroupUid $dg.Uid -
   AllowedProtocols 'HDX'
```

Parameters

-Name

Specifies the administrative name of the new rule. Each rule within the site's access policy must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

Specifies the desktop group to which the new rule applies.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedDesktopGroups

This parameter is supported for backward compatibility only. If used only a single desktop group UID can be specified.

The IncludedDesktopGroups and IncludedDesktopGroupFilterEnabled parameters have been superseded by the DesktopGroupUid parameter.

Type:	DesktopGroup[]
Position:	Named

Default value:	(empty list)
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AllowedConnections

Specifies whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection. This property forms part of the included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, ViaAG and AnyViaAG.

For a detailed description of this property see "help about_Broker_AccessPolicy".

Type:	AllowedConnection
Position:	Named
Default value:	Filtered
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AllowedProtocols

Specifies the protocols (for example HDX, RDP) available to the user for sessions delivered from the new rule's desktop group. If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.

If the protocol list is empty, access to the desktop group is implicitly denied.

Type:	String[]
Position:	Named
Default value:	HDX
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-AllowedUsers

Specifies the behavior of the included users filter of the new rule. This can restrict access to a list of named users or groups, allow access to any authenticated user, any user (whether authenticated or not), or only non-authenticated users. For a detailed description of this property see "help about_Broker_AccessPolicy".

Valid values are Filtered, AnyAuthenticated, Any, AnonymousOnly and FilteredOrAnonymous.

Type:	AllowedUser
Position:	Named
Default value:	Filtered
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AllowRestart

Specifies if the user can restart sessions delivered from the new rule's desktop group. Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppProtectionKeyLoggingRequired

Specifies whether key logging app protection is required.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppProtectionScreenCaptureRequired

Specifies whether screen capture app protection is required.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies an optional description of the new rule. The text is purely informational for the administrator, it is never visible to the end user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new rule is initially enabled. A disabled rule is ignored when evaluating the site's access policy.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedClientIPFilterEnabled

Specifies whether the excluded client IP address filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedClientIPs

Specifies IP addresses of user devices explicitly denied access to the new rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

Type:	IPAddressRange[]
Position:	Named
Default value:	(empty list)
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedClientNameFilterEnabled

Specifies whether the excluded client names filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedClientNames

Specifies names of user devices explicitly denied access to the new rule's desktop group. This property forms part of the excluded client names filter.

Type:	String[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedSmartAccessFilterEnabled

Specifies whether the excluded SmartAccess tags filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedSmartAccessTags

Specifies SmartAccess tags which explicitly deny access to the new rule's desktop group if any occur in those provided with the user's connection. This property forms part of the excluded SmartAccess tags filter.

Type:	String[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Specifies whether the excluded users filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUsers

Specifies any users and groups who are explicitly denied access to the new rule's desktop group. This property forms part of the excluded users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HdxSslEnabled

Indicates whether TLS encryption is enabled for sessions delivered from the rule's desktop group.

Type:	Boolean
Position:	Named
Default value:	$false
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedClientIPFilterEnabled

Specifies whether the included client IP address filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-IncludedClientIPs

Specifies IP addresses of user devices allowed access to the new rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the included client IP address filter.

Type:	IPAddressRange[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedClientNameFilterEnabled

Specifies whether the included client name filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedClientNames

Specifies names of user devices allowed access to the new rule's desktop group. This property forms part of the included client names filter.

Type:	String[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedSmartAccessFilterEnabled

Specifies whether the included SmartAccess tags filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedSmartAccessFilterType

Specifies whether all tags present in IncludedSmartAccessTags must match tags provided by the user's connection to grant access (MatchAll), or whether any tag matching is sufficient (MatchAny).

Type:	String
Accepted values:	MatchAll, MatchAny
Position:	Named
Default value:	MatchAny
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedSmartAccessTags

Specifies SmartAccess tags which grant access to the new rule's desktop group if they occur in those provided with the user's connection. If multiple tags are specified, access also depends on the IncludedSmartAccessFilterType setting. This property forms part of the included SmartAccess tags filter.

Type:	String[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Specifies whether the included users filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUsers

Specifies users and groups who are granted access to the new rule's desktop group. This property forms part of the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedDesktopGroupFilterEnabled

This parameter is supported for backward compatibility only. If used the supplied value must be $true.

The IncludedDesktopGroups and IncludedDesktopGroupFilterEnabled parameters have been superseded by the DesktopGroupUid parameter.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AccessPolicyRule

New-BrokerAccessPolicyRule returns the newly created access policy rule.

New-BrokerAdminFolder

March 11, 2024

Creates a new admin folder.

Syntax

```
New-BrokerAdminFolder
   [-FolderName] <String>
   [-ParentFolder <AdminFolder>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerAdminFolder cmdlet creates a new folder for organising objects for administration purposes (for example, Applications).

New-BrokerAdminFolder creates the folder object and optionally places it within an existing admin folder if required.

The following special characters are not allowed in the FolderName: \ / ; : # . * ? = < > | [ ] ( ) “‘

Examples

EXAMPLE 1

Creates an admin folder called F1 under the root folder (i.e. F1\)

```
New-BrokerAdminFolder F1
```

EXAMPLE 2

Creates an admin folder called F2 under the folder F1\ (i.e. F1\F2\)

```
New-BrokerAdminFolder F2 -AdminFolder F1\
```

Parameters

-FolderName

The simple name of the new folder within its parent (if any)

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ParentFolder

The name or UID of the parent folder (if any)

Type:	AdminFolder
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Depends on parameter

Parameters can be piped by property name.

Outputs

Citrix.Broker.Admin.SDK.AdminFolder

The new admin folder.

New-BrokerAppAssignmentPolicyRule

March 11, 2024

Creates a new application rule in the site's assignment policy.

Syntax

```
New-BrokerAppAssignmentPolicyRule
   [-Description <String>]
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-Name] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerAppAssignmentPolicyRule cmdlet adds a new application rule to the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

The following constraints apply when creating an application assignment rule for a desktop group:

- The group's desktop kind must be Private
- The group's delivery type must be AppsOnly
- Only a single application rule can apply to a given group
- Application assignment rules cannot be applied to RemotePC groups.

When a user selects an application published from a private group, a currently unassigned machine is selected from the group and permanently assigned to the user. An application session is then launched to the machine. Subsequent launches are routed directly to the now assigned machine.

Once a machine has been assigned in this way, the original assignment rule plays no further part in access to the machine.

Examples

EXAMPLE 1

Creates an application rule in the assignment policy that grants all members of the SALES\uk-staff group an entitlement to a single machine from the Sales Support desktop group. The machine can be used for running applications published from the group.

```
$dg = Get-BrokerDesktopGroup 'Sales Support'
New-BrokerAppAssignmentPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid
    -IncludedUsers sales\uk-staff
```

Parameters

-Name

Specifies the administrative name of the new application rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

Specifies the unique ID of the desktop group to which the new application rule applies.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies an optional description of the new application rule. The text is purely informational for the administrator, it is never visible to the end user.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new application rule is initially enabled. A disabled rule is ignored when evaluating the site's assignment policy.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUsers

Specifies the excluded users filter of the new application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the new application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUsers

Specifies the included users filter of the new application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

New-BrokerAppAssignmentPolicyRule returns the newly created application rule in the assignment policy.

New-BrokerAppEntitlementPolicyRule

March 11, 2024

Creates a new application rule in the site's entitlement policy.

Syntax

```
New-BrokerAppEntitlementPolicyRule
   [-Description <String>]
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-LeasingBehavior <LeasingBehavior>]
   [-Name] <String>
```

```
    [-SessionReconnection <SessionReconnection>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerAppEntitlementPolicyRule cmdlet adds a new application rule to the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

The following constraints apply when creating an application entitlement rule for a desktop group:

- The group's desktop kind must be Shared
- The group's delivery type must be AppsOnly or DesktopsAndApps
- Only a single application rule can apply to a given group

When a user selects an application published from a shared group, a machine is selected from the group on which to run the application. No permanent association exists between the user and the selected machine; once the session ends the association also ends.

Even though only a single application entitlement and therefore session can be defined for a group, the user can still run multiple applications from the group because the applications run within the same session.

Examples

EXAMPLE 1

Creates an application rule in the entitlement policy that entitles all members of the SUPPORT\uk-staff group to a machine for running applications published from the Customer Support desktop group.

```
$dg = Get-BrokerDesktopGroup 'Customer Support'
New-BrokerAppEntitlementPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid
    -IncludedUsers support\uk-staff
```

Parameters

-Name

Specifies the administrative name of the new application rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

Specifies the unique ID of the desktop group to which the new application rule applies.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies an optional description of the new application rule. The text is purely informational for the administrator, it is never visible to the end user.

Type:	String
Position:	Named
Default value:	Null
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new application rule is initially enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUsers

Specifies the excluded users filter of the application rule, that is, the users and groups who are explicitly denied entitlements to published applications from the desktop group.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to an application session by the new rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUsers

Specifies the included users filter of the application rule, that is, the users and groups who are granted an entitlement to an application session by the new rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named

Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LeasingBehavior

Defines the desired connection leasing behavior applied to sessions launched using this entitlement. Possible values are:

Allowed and Disallowed.

The Allowed value indicates that connection leasing should behave normally. The Disallowed value prevents users

from launching or reconnecting to sessions using this entitlement while connection leasing is active (typically during a database outage).

Type:	LeasingBehavior
Position:	Named
Default value:	Allowed
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SessionReconnection

Defines reconnection (roaming) behavior for sessions launched using this rule. Possible values are:

Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	Always
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

New-BrokerAppEntitlementPolicyRule returns the newly created application rule in the entitlement policy.

```

```
    [-WorkingDirectory <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerApplication cmdlet creates a new published application in the site.

New-BrokerApplication creates the application object, and associates it with a desktop group or application group. Application objects have three names that identify them (in addition to their Uid): the Name, BrowserName and the PublishedName. The BrowserName is unique across the entire site, and is primarily used internally. The Name is also unique and is what is seen by the administrator; it contains any prefix for an enclosing admin folder (if any). The PublishedName is not unique and is what is seen by the users.

You can create HostedOnDesktop, InstalledOnClient or PublishedContent applications but the ApplicationType cannot be changed later.

The following special characters are not allowed in the Name, BrowserName or the PublishedName properties: \ / ; : # . * ? = < > | [ ] ( ) “

In addition the ‘ character is not allowed in the Name property.

See about_Broker_Applications for more information.

Examples

EXAMPLE 1

Creates and returns an object for a published application called “Notepad”that launches “notepad.exe”.

```
New-BrokerApplication -ApplicationType HostedOnDesktop -Name "Notepad"
    -CommandLineExecutable "notepad.exe" -DesktopGroup PrivateDG1
```

EXAMPLE 2

Creates and returns an object for a published application called “Citrix.com”that launches the URL https://www.citrix.com/.

```
New-BrokerApplication -ApplicationType PublishedContent -Name "Citrix.
    com" -CommandLineExecutable "https://www.citrix.com/" -DesktopGroup
    SharedDG1
```

EXAMPLE 3

This is a much more complete example. It creates an application object to publish Notepad and associates it first with the "SharedDG1"desktop group.

Next it adds an additional desktop group (one that can host applications), and publishes the application to that desktop group. It then gets the ImportedFTA object for the .txt file-type extension (this assumes file-type associations have already been imported), and then configures it so that ".txt"is associated with the published application.

Note: The appropriate access policy and app assignment/entitlement rules must also be configured to allow access to the application.

```
1 $dg = Get-BrokerDesktopGroup "SharedDG1"
2 $app = New-BrokerApplication -ApplicationType HostedOnDesktop -Name "
     Notepad" -CommandLineExecutable "notepad.exe" -DesktopGroup $dg
3 $group = Get-BrokerDesktopGroup -Name "Shared desktop group"
4 Add-BrokerApplication $app -DesktopGroup $group
5 $fta = Get-BrokerImportedFTA -ExtensionName ".txt"
6 New-BrokerConfiguredFTA -ImportedFTA $fta -ApplicationUid $app.Uid
```

Parameters

-Name

Specifies the name of the application (must be unique within folder).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CommandLineExecutable

Specifies the name of the executable file to launch. The full path need not be provided if it's already in the path. Environment variables can also be used.

Type:	String

Position:	Named
Default value:	(required)
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ApplicationGroup

Specifies which application group this application should be associated with. Associations between applications and desktop groups or application groups can be added or removed using the Add-BrokerApplication and Remove-BrokerApplication cmdlets.

Type:	ApplicationGroup
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DesktopGroup

Specifies which desktop group this application should be associated with. Associations between applications and desktop groups or application groups can be added or removed using the Add-BrokerApplication and Remove-BrokerApplication cmdlets.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AdminFolder

The folder in which the new application should reside (if any).

Type:	AdminFolder
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ApplicationType

Specifies the type of the application: HostedOnDesktop, InstalledOnClient or PublishedContent.

Type:	ApplicationType
Position:	Named
Default value:	(required)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-BrowserName

Specifies the internal name for this application. It must be unique in the site.

Type:	String
Position:	Named
Default value:	(same as Name)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ClientFolder

Specifies the folder that the application belongs to as the user sees it. This is the application folder that is seen in the Citrix Online Plug-in, in Web Services, and also in the end-user's Start menu. Sub-directories can be specified with '' character. The following special characters are not allowed: / * ? < > | ":. Note that this property cannot be set for applications of type InstalledOnClient.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CommandLineArguments

Specifies the command-line arguments to use when launching the executable. Environment variables can be used. This setting is ignored for applications of type PublishedContent.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CpuPriorityLevel

Specifies the CPU priority for the launched process. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High. Note that this property cannot be set for applications of type InstalledOnClient.

Type:	CpuPriorityLevel
Position:	Named

Default value:	Normal
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies the description of the application. This is only seen by Citrix administrators and is not visible to users.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DoNotEnumerate

Specifies if the application is returned to the user by enumeration.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Specifies whether or not this application can be launched.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HomeZoneOnly

Specifies whether if the preferred zone for launching the application is its home zone but no machine is available from that zone then the launch fails.

This can only be set if the application has a home zone preference specified.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HomeZoneUid

Specifies any home zone preference used when launching this application.

Type:	Guid
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IconFromClient

Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IconUid

Specifies which icon to use for this application. This icon is visible both to the administrator (in the consoles) and to the user. If no icon is specified, then a generic built-in application icon is used.

Type:	Int32
Position:	Named
Default value:	2
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IgnoreUserHomeZone

Specifies that when launching the application and the user has a home zone specified then the user's home zone preference should be ignored.

This can only be set if the application does not itself have a home zone preference specified.

Type:	Boolean
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LocalLaunchDisabled

When launching a published application from within a published desktop, do not launch the application in that desktop session.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxPerMachineInstances

Specifies the maximum allowed concurrently running instances of the application that an individual machine can have. A value of zero allows unlimited usage subject to any site-wide limit.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxPerUserInstances

Specifies the maximum allowed concurrently running instances of the application that an individual user can have. A value of zero allows unlimited usage subject to any site-wide limit.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxTotalInstances

Specifies the maximum allowed total of concurrently running instances of the application in the site. A value of zero allows unlimited usage.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PackagedApplicationId

The Id of the Packaged Application in the AppLibrary

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PackagedApplicationType

The packaging technology used to create this application

Type:	String
Accepted values:	AppAttach, AppVDualAdmin, AppVSingleAdmin, FlexApp, Msix, NotApplicable
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PublishedName

The name seen by end users who have access to this application.

Type:	String
Position:	Named
Default value:	The same value as that supplied for the name of the application.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-SecureCmdLineArgumentsEnabled

Specifies whether the command-line arguments are secured or not. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ShortcutAddedToDesktop

Specifies whether or not a shortcut to the application should be placed on the user device. This is valid only for the Citrix Online Plug-in.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ShortcutAddedToStartMenu

Specifies whether a shortcut to the application should be placed in the user's start menu on their user device.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-StartMenuFolder

Specifies the name of the start menu folder that holds the application shortcut (if any). This is valid only for the Citrix Online Plug-in. Subdirectories can be specified with ' character. The following special characters are not allowed: / * ? < > | ":.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-UserFilterEnabled

Specifies whether the application's user filter is enabled or disabled. Where the user filter is enabled, the application is visible only to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

An optional GUID for this application.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Visible

Specifies whether or not this application is visible to users. Note that it's possible for an application to be disabled and still visible.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WaitForPrinterCreation

Specifies whether or not the session waits for the printers to be created before allowing the user to interact with the session. Note that this property cannot be set for applications of type InstalledOnClient.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WorkingDirectory

Specifies which working directory the executable is launched from. Environment variables can be used. This setting is ignored for applications of type PublishedContent.

Type:	String
Position:	Named
Default value:	Null
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Priority

Specifies the priority of the mapping between the application and desktop group. A value of zero has the highest priority, with increasing values indicating lower priorities.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Depends on parameter

Parameters can be piped by property name.

Outputs

Citrix.Broker.Admin.SDK.Application

New-BrokerApplication returns an Application object.

Notes

Usually only the Name is specified with the New-BrokerApplication cmdlet, and the system chooses a BrowserName and PublishedName for you. By default the BrowserName is the same as the Name, if it is unique in the site. If not, then "-x"is appended to the name, where "x"is a number. For instance, if there is already an application with a BrowserName of "Notepad"and a new application is created with a Name of "Notepad", then the new application gets a BrowserName of "Notepad-1". If another "Notepad"is published, it has a BrowserName of "Notepad-2".

That said, the BrowserName can optionally be specified as well.

New-BrokerApplicationGroup

March 11, 2024

Create a new application group to which applications can be added.

Syntax

```
New-BrokerApplicationGroup
   [-AdminFolder <AdminFolder>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-Name] <String>
   [-RestrictToTag <String>]
   [-Scope <String[]>]
   [-SessionSharingEnabled <Boolean>]
   [-SingleAppPerSession <Boolean>]
   [-TenantId <Guid>]
   [-UserFilterEnabled <Boolean>]
   [-UUID <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerApplicationGroup cmdlet creates a new application group. Applications that are added to the application group can then be managed centrally by setting properties on the application group rather than on each application individually.

Application groups may also be used to isolate applications that should not share sessions with other applications. To do this, create an application group with SessionSharingEnabled equal to $false, and then add to it those applications that you wish to isolate. The isolated applications continue to share sessions with each other, but not with any other published applications.

To create a new application and add it to an application group, use New-BrokerApplication -ApplicationGroup. To add an existing application to an application group, use Add-BrokerApplication -ApplicationGroup.

After adding applications to an application group, you must then publish the application group to a desktop group before its applications can be launched. Use the Add-BrokerApplicationGroup cmdlet to do this.

To manipulate the user filter associated with an application group, use Add-BrokerUser -ApplicationGroup and Remove-BrokerUser -ApplicationGroup.

To manipulate the set of tags associated with an application group, use Add-BrokerTag -ApplicationGroup and Remove-BrokerTag -ApplicationGroup.

See about_Broker_Applications for more information.

Examples

EXAMPLE 1

Creates a new application group called 'Helpdesk Apps'.

```
New-BrokerApplicationGroup "Helpdesk Apps"
```

EXAMPLE 2

Creates a new application group called 'Accounts Apps', and then restrict access so that only members of the MYDOMAIN\Accounts user group can launch applications in 'Accounts Apps'.

```
New-BrokerApplicationGroup "Accounts Apps" -UserFilterEnabled $true
Add-BrokerUser "MYDOMAIN\Accounts" -ApplicationGroup "Accounts Apps"
```

Parameters

-Name

A name for the application group. Not visible to end users.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AdminFolder

The folder in which the new application group should reside (if any).

Type:	AdminFolder
Position:	Named
Default value:	None (root folder)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A description for the application group. Not visible to end users.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Whether the application group's applications can be launched by end users.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RestrictToTag

Optional tag that may be used further to restrict which machines may be used for launching the application group's applications. A machine may be used by an application group if either the application group has no tag restriction or the application group does have a tag restriction and the machine is tagged with the same tag.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Scope

Specifies the name of the delegated administration scope to which the application group should belong.

Type:	String[]
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SessionSharingEnabled

Whether the application group's applications can share sessions with applications that are not a member of this application group. Please note this setting and SingleAppPerSession cannot be true at the same time.

Type:	Boolean
Position:	Named

Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SingleAppPerSession

Specifies whether each application launched from this application group starts in its own new session or can share an existing suitable session if present. Please note this setting and SessionSharingEnabled cannot be true at the same time.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TenantId

Specifies identity of tenant associated with application group. Must always be specified in multi-tenant sites, must not be specified otherwise.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UserFilterEnabled

Whether the application group's user filter is enabled or disabled. Where the user filter is enabled, the application is visible only to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

The UUID of the application group. If a UUID is not provided, then one will be generated automatically.

Type:	Guid
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ApplicationGroup

The newly created application group.

New-BrokerAssignmentPolicyRule

March 11, 2024

Creates a new desktop rule in the site's assignment policy.

Syntax

```
New-BrokerAssignmentPolicyRule
   [-ColorDepth <ColorDepth>]
   [-Description <String>]
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IconUid <Int32>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-MaxDesktops <Int32>]
   [-Name] <String>
   [-PublishedName <String>]
   [-SecureIcaRequired <Boolean>]
   [-UUID <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerAssignmentPolicyRule cmdlet adds a new desktop rule to the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

The following constraints apply when creating a desktop assignment rule for a desktop group:

- The group's desktop kind must be Private
- The group's delivery type must be DesktopsOnly
- Only one desktop assignment rule can be created for RemotePC groups.

When a user selects a machine assignment entitlement from a private group, a currently unassigned machine is selected from the group and permanently assigned to the user to create an assigned desktop. A desktop session is then launched to the machine. Subsequent launches are routed directly to the now assigned machine.

Once a machine has been assigned in this way, the original assignment rule plays no further part in access to the new desktop.

Multiple desktop rules in the assignment policy can apply to the same desktop group. Where a user is granted entitlements by more than one rule for the same group, they can have as many machine assignments from the group as the total of their entitlements.

Examples

EXAMPLE 1

Creates a desktop rule in the assignment policy that grants all members of the SALES\uk-staff group an entitlement to a single machine from the Sales Support desktop group. The entitlement name seen by users is Sales Desktop.

```
1 $dg = Get-BrokerDesktopGroup 'Sales Support'
2 New-BrokerAssignmentPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -
     IncludedUsers sales\uk-staff -PublishedName 'Sales Desktop'
```

Parameters

-Name

Specifies the administrative name of the new desktop rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

Specifies the unique ID of the desktop group to which the new desktop rule applies.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ColorDepth

Specifies the color depth of any desktop sessions to machines assigned by the new rule.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	ColorDepth
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies an optional description of the new desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new desktop rule is initially enabled. A disabled rule is ignored when evaluating the site's assignment policy.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUsers

Specifies the excluded users filter of the new desktop rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IconUid

Specifies the unique ID of the icon used to display the machine assignment entitlement to the user, and of the assigned desktop itself following the assignment.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Int32
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the new desktop rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUsers

Specifies the included users filter of the new desktop rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxDesktops

The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.

Type:	Int32
Position:	Named
Default value:	1

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PublishedName

The name of the new machine assignment entitlement as seen by the user, and of the assigned desktop following its usage.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-SecureIcaRequired

Specifies whether the new desktop rule requires the SecureICA protocol to be used for desktop sessions to machines assigned using the entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Boolean
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

An optional GUID for this rule.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

New-BrokerAssignmentPolicyRule returns the newly created desktop rule in the assignment policy rule.

New-BrokerAutoTagRule

March 11, 2024

Creates a new AutoTagRule.

Syntax

```
New-BrokerAutoTagRule
   [-Description <String>]
   [-Name] <String>
   -ObjectType <String>
   -RuleText <String>
   -TagUid <Int32>
   [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Creates an AutoTagRule which defines a rule to select objects to assign (or remove) a Tag to (or from).

Examples

EXAMPLE 1

Creates a new rule for the “MyExample”tag.

```
$tag = New-BrokerTag -Name MyExample
New-BrokerAutoTagRule -Name RandomAllocatedCatalogs -TagUid $tag.Uid -
    ObjectType Catalog -RuleText "-AllocationType Random"
```

Parameters

-Name

The rule name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectType

The object type on which the rule is applied.

Type:	String
Position:	Named
