Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RuleText

Rule in the text format.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-TagUid

The Tag Uid this rule applies to.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

The Description of rule.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.AutoTagRule

Outputs the AutoTagRule object.

New-BrokerCatalog

March 11, 2024

Adds a new catalog to the site.

Syntax

```
New-BrokerCatalog
   [-AdminFolder <AdminFolder>]
   [-AllocationType] <AllocationType>
   [-Description <String>]
   [-IsRemotePC <Boolean>]
   [-MachinesArePhysical <Boolean>]
   [-MdmEnrollment <String>]
   [-MinimumFunctionalLevel <FunctionalLevel>]
   [-Name] <String>
   [-PersistUserChanges] <PersistUserChanges>
   [-ProvisioningSchemeId <Guid>]
   [-ProvisioningType] <ProvisioningType>
   [-PvsAddress <String>]
```

```
    [-PvsDomain <String>]
    [-RemotePCHypervisorConnectionUid <Int32>]
    [-Scope <String[]>]
    [-SessionSupport] <SessionSupport>
    [-TenantId <Guid>]
    [-TimeZone <String>]
    [-UUID <Guid>]
    [-ZoneUid <Guid>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
New-BrokerCatalog
    [-PvsForVM <String[]>]
    [-AdminFolder <AdminFolder>]
    [-AllocationType] <AllocationType>
    [-CatalogKind] <CatalogKind>
    [-Description <String>]
    [-IsRemotePC <Boolean>]
    [-MachinesArePhysical <Boolean>]
    [-MdmEnrollment <String>]
    [-MinimumFunctionalLevel <FunctionalLevel>]
    [-Name] <String>
    [-PvsAddress <String>]
    [-PvsDomain <String>]
    [-RemotePCHypervisorConnectionUid <Int32>]
    [-Scope <String[]>]
    [-TenantId <Guid>]
    [-TimeZone <String>]
    [-UUID <Guid>]
    [-ZoneUid <Guid>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

New-BrokerCatalog adds a catalog through which machines can be provided to the site.

In order for a machine to register in a site, the machine must belong to a catalog with which it is compatible. The compatibility of a machine with a catalog is determined by two of the parameters of New-BrokerCatalog:

- MinimalFunctionalLevel: The minimal functional level supported in the

catalog. The functional level of the machine is determined by the capabilities of the Citrix VDA software on it.

- SessionSupport: The session support (single/multi) of the catalog. The

session support of the machine is determined by the variant of the Citrix VDA software installed (workstation/terminal services, respectively).

Examples

EXAMPLE 1

This command creates a catalog that can contain unmanaged physical or virtual machines that are permanently assigned to the user.

```
New-BrokerCatalog -AllocationType Static -CatalogKind Unmanaged -
    Description "Catalog1 Description" -Name "Catalog1 Name"
```

EXAMPLE 2

This command creates a catalog that can contain power-managed machines that are randomly assigned to the user.

```
New-BrokerCatalog -AllocationType Random -CatalogKind PowerManaged -
    Description "catalog 2 Description" -Name "Catalog2 Name"
```

EXAMPLE 3

This command creates a catalog that can contain managed machines that are provisioned using Provisioning Services.

```
New-BrokerCatalog -AllocationType Random -CatalogKind PVS -Description
    "PVS Catalog Desc" -Name "PVS Catalog Name" -PvsAddress "
    pvsServer@pvsDomain.com" -PvsDomain "pvsDomain.com" -PvsForVM $(
    $farmGuid:$schemeGuid)
```

Parameters

-Name

Specifies a name for the catalog. Each catalog within a site must have a unique name.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AllocationType

Specifies how machines in the catalog are assigned to users. Values can be:

- Static - Machines in a catalog of this type are permanently assigned to a user.
- Permanent - equivalent to 'Static'.
- Random - Machines in a catalog of this type are picked at random and temporarily assigned to a user.

Type:	AllocationType
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CatalogKind

Deprecated: The type of machines the catalog will contain. Values can be: ThinCloned, SingleImage, PowerManaged, Unmanaged, or Pvs.

- Thin-Cloned, Single-Image and Personal vDisk Catalogs

  Thin-cloned and single-image catalog kinds are for machines created and managed with Provisioning Services for VMs. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection.
  A thin-cloned catalog is used for original golden VM images that are cloned when they are assigned to a VM, and users' changes to the VM image are retained after the VM is restarted.
  A single-image catalog is used when multiple machines provisioned with Provisioning Services for VMs

all share a single golden VM image when they run
and, when restarted, they revert to the original VM image state.
A personal vDisk catalog is similar to a single-image catalog, but it also uses
personal vDisk technology.

- PowerManaged

  This catalog kind is for managed machines that are manually
  provisioned by administrators. All machines in this type of catalog
  are managed, and so must be associated with a hypervisor connection.

- Unmanaged

  This catalog kind is for unmanaged machines, so there is no
  associated hypervisor connection.

- PVS

  This catalog kind is for managed machines that are provisioned
  using Provisioning Services. All machines in this type of
  catalog are managed, and so must be associated with a hypervisor
  connection. Only shared desktops are suitable for this catalog kind.

Type:	CatalogKind
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningType

Specifies the ProvisioningType for the catalog. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,…).
- MCS - Machine provisioned by MCS (machine must be VM).

Type:	ProvisioningType
Position:	4

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SessionSupport

Specifies whether machines in the catalog are single or multi-session capable. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	5
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PersistUserChanges

Specifies how user changes are persisted on machines in the catalog. Possible values are:

- OnLocal: User changes are stored on the machine's local storage.
- Discard: User changes are discarded.

Type:	PersistUserChanges
Position:	6
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PvsForVM

Deprecated:

Identifies the provisioning scheme used by this catalog. To be specified in the format: ProvisioningSchemeGuid:ServiceGroupGuid. Applicable only to thin-cloned, single-image or personal vDisk catalogs.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AdminFolder

The folder in which the new catalog should reside (if any).

Type:	AdminFolder
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A description for the catalog.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-IsRemotePC

Specifies whether this is to be a Remote PC catalog.

IsRemotePC can only be enabled when:

- SessionSupport is SingleSession
- MachinesArePhysical is true.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MachinesArePhysical

Specifies whether machines in the catalog can be power-managed by the Citrix Broker Service. Where the Citrix Broker Service cannot control the power state of themachine specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the legacy CatalogKind parameter only with a Pvs catalog kind.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MdmEnrollment

MdmEnrollment for this catalog. Values can be:

- None - No enrollment.
- Intune - Microsoft Intune.

Type:	String
Accepted values:	Intune, IntuneWithCitrixTags, None
Position:	Named
Default value:	If no value is provided, the catalog does not enroll with Mdm.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MinimumFunctionalLevel

The minimum FunctionalLevel required for machines to register in the site.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25, L7_30, L7_34

Type:	FunctionalLevel
Position:	Named
Default value:	The default value for new Catalogs comes from the DefaultMinimumFunctionalLevel property of the Site object (see Get-BrokerSite).
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PvsAddress

Specifies the URL of the Provisioning Services server. Only applicable to Provisioning Services or Provisioning Services-personal vDisk catalogs.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PvsDomain

Specifies the Active Directory domain of the Provisioning Services server. Only applicable to Provisioning Services or Provisioning Services-personal vDisk catalogs.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RemotePCHypervisorConnectionUid

Specifies the hypervisor connection to use for powering on remote PCs in this catalog (only allowed when IsRemotePC is true).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Scope

Specifies the name of the delegated administration scope to which the catalog belongs.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TenantId

Specifies identity of tenant associated with catalog. Must always be specified in multitenant sites, must not be specified otherwise.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TimeZone

The time zone in which this catalog's machines reside.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-UUID

An optional GUID for this catalog.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ZoneUid

Zone Uid associated with this catalog.

Type:	Guid
Position:	Named
Default value:	If no Uid is provided the catalog is associated with Primary Zone.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeId

Specifies the identity of the MCS provisioning scheme the new catalog is associated with (can only be specified for new catalogs with a ProvisioningType of MCS).

Type:	Guid
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Catalog

New-BrokerCatalog returns the created catalog.

New-BrokerCatalogRebootSchedule

March 11, 2024

Creates a new reboot schedule for a catalog.

Syntax

```
New-BrokerCatalogRebootSchedule
   -CatalogUid <Int32>
   [-Description <String>]
   [-Enabled <Boolean>]
   [-MaxOvertimeStartMins <Int32>]
   [-Name] <String>
   -RebootDuration <Int32>
   [-StartDate <String>]
   [-StartTime <TimeSpan>]
   [-WarningDuration <Int32>]
   [-WarningMessage <String>]
   [-WarningRepeatInterval <Int32>]
   [-WarningTitle <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerCatalogRebootSchedule
   -CatalogName <String>
   [-Description <String>]
```

```
    [-Enabled <Boolean>]
    [-MaxOvertimeStartMins <Int32>]
    [-Name] <String>
    -RebootDuration <Int32>
    [-StartDate <String>]
    [-StartTime <TimeSpan>]
    [-WarningDuration <Int32>]
    [-WarningMessage <String>]
    [-WarningRepeatInterval <Int32>]
    [-WarningTitle <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerCatalogRebootSchedule cmdlet is used to define a reboot schedule for a catalog.

Examples

EXAMPLE 1

Schedules the machines in the catalog named ‘BankTellers’to be rebooted Feb 3, 2021 between 2 AM and 4 AM.

```
New-BrokerCatalogRebootSchedule -Name BankTellers -CatalogName
    BankTellers  -StartDate "2022-02-03" -StartTime "02:00" -Enabled
    $true -RebootDuration 120
```

EXAMPLE 2

Schedules the machines in the catalog having Uid 17 to be rebooted between 1 AM and 5 AM at Feb 3, 2021. Ten minutes prior to rebooting, each machine will display a message box with the title “WARNING: Reboot pending”and message “Save your work”in every user session.

```
New-BrokerCatalogRebootSchedule -Name 'Update reboot' -CatalogUid 17 -
    StartDate "2022-02-03" -StartTime "01:00" -Enabled $true -
    RebootDuration 240 -WarningTitle "WARNING: Reboot pending" -
    WarningMessage "Save your work" -WarningDuration 10
```

Parameters

-Name

The name of the new reboot schedule.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CatalogName

The name of the catalog that this reboot schedule is applied to.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CatalogUid

The Uid of the catalog that this reboot schedule is applied to.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-RebootDuration

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

An optional description for the reboot schedule.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Boolean that indicates if the new reboot schedule is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxOvertimeStartMins

Maximum delay in minutes after which the scheduled reboot will not take place.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-StartDate

The date on which the schedule is expected to run, date is in ISO 8601 Format (YYYY-MM-DD).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-StartTime

Time of day at which the scheduled reboot cycle starts (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningDuration

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed. In some cases the time required to process a reboot schedule may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-WarningRepeatInterval

Time to wait after the previous reboot warning before displaying the warning message in all user sessions on that machine again. If the warning repeat interval is zero then the warning message is not displayed after the initial warning.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.CatalogRebootSchedule

New-BrokerConfigurationSlot

March 11, 2024

Creates a new configuration slot.

Syntax

```
New-BrokerConfigurationSlot
   [-Description <String>]
   [-Name] <String>
   -SettingsGroup <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new configuration slot. The SettingsGroup of the slot determines the particular collection of related settings that may be specified in a machine configuration associated with this slot.

For example, the configuration slot may be restricted to configuring Citrix User Profile Manager settings by specifying the SettingsGroup parameter as "G=UPM".

Examples

EXAMPLE 1

Create a new slot named "UPM"to configure settings specific to "User Profile Management"

```
New-BrokerConfigurationSlot -Name "UPM" -SettingsGroup "G=UPM"
```

Parameters

-Name

Name of the new configuration slot. This must be alphanumeric and not contain white space.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-SettingsGroup

The settings group determines the particular collection of related settings that may be controlled by this slot.

This must match the format of a Citrix Group Policy configuration group (e.g. "G=UPM").

Only settings that have this exact group may be specified in a machine configuration associated with this configuration slot.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Description of configuration slot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ConfigurationSlot

New-BrokerConfigurationSlot returns an object representing the newly created configuration slot

New-BrokerConfiguredFTA

March 11, 2024

Creates a file type association with a published application.

Syntax

```
New-BrokerConfiguredFTA
   -ApplicationUid <Int32>
   -ImportedFTA <ImportedFTA>
   [-UUID <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerConfiguredFTA
   -ApplicationUid <Int32>
   -ExtensionName <String>
   [-ContentType <String>]
   -HandlerName <String>
   [-HandlerDescription <String>]
   [-HandlerOpenArguments <String>]
   [-UUID <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates an association between a file type and a published application for the purposes of the content redirection.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user

clicks on a document it launches the appropriate published application. This is known as "content redirection".

Configured file type associations are different from imported file type associations. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection. Imported file type associations are lists of known file type associations for a given desktop group. See Update-BrokerImportedFTA for more information about imported file type associations.

This cmdlet has two parameter sets, which correspond to the cmdlet's two use cases.

The first use case leverages imported file type associations to configure file types for published applications. Information about the file type association is read from the imported object. See the Update-BrokerImportedFTA cmdlet for more information about importing file type associations from a worker machine.

The second use case is more complex and allows you to create your own file type association without having to import it first. This also lets you create custom file type associations that may not already exist on the worker machines. This use case is more error-prone, however, because the individual attributes of the file type association must be correctly specified by you.

Examples

EXAMPLE 1

Gets the Uid for the application, gets the ImportedFTA

object for the file extension, and finally associates ".txt"with the

published "Notepad"application.

Note that the Get-BrokerImportedFTA cmdlet may return more than one

ImportedFTA objects for a specific extension name. See the help for

that cmdlet for more details.

```
$app = Get-BrokerApplication "Notepad"
$fta = Get-BrokerImportedFTA -ExtensionName ".txt"
New-BrokerConfiguredFTA -ImportedFTA $fta -ApplicationUid $app.Uid
```

EXAMPLE 2

This example is identical to the first, but shows the

the second use case of the cmdlet, specifying each attribute manually.

```
$app = Get-BrokerApplication "Notepad"
New-BrokerConfiguredFTA -ApplicationUid $app.Uid -ExtensionName ".txt"
    -HandlerName "txtfile" -ContentType "text\plain" -HandlerDescription
     "Text Document" -HandlerOpenArguments "%1"
```

Parameters

-ApplicationUid

Specifies the application with which the file type should be associated.

Type:	Int32
Position:	Named
Default value:	(required)
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ImportedFTA

Specifies the ImportedFTA object to use for creating the ConfiguredFTA object. All values needed to create a ConfiguredFTA object are read from the ImportedFTA object.

Type:	ImportedFTA
Position:	Named
Default value:	(required)
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExtensionName

Specifies the extension name for the file type association.

For example, “.txt”or “.doc”.

Type:	String
Position:	Named
Default value:	(required)
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HandlerName

Specifies the name of the handler for the file type association (as seen in the Registry). For example, “TXTFILE”or “Word.Document.8”.

Type:	String
Position:	Named
Default value:	(required)
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-UUID

An optional GUID for this ConfiguredFTA.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ContentType

Specifies the content type of the file type (as listed in
the Registry). For example, content type would be “text/plain”or
“application/msword”.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HandlerDescription

Specifies the description of the handler for the file type

association.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HandlerOpenArguments

Specifies the arguments for the open command that the handler should use. For example, "%1".

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.ConfiguredFTA

This cmdlet returns a single ConfiguredFTA object.

New-BrokerDelayedHostingPowerAction

March 11, 2024

Causes a power action to be queued after a delay.

Syntax

```
New-BrokerDelayedHostingPowerAction
   -Action <PowerManagementAction>
   -Delay <TimeSpan>
   [-MachineName] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Causes a power action to be queued after the specified period of time.

Only ShutDown or Suspend actions can be requested to be delayed in this manner.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement' .

Examples

EXAMPLE 1

Causes the machine called XD_VDA1 to be shut down after a delay of two minutes.

```
New-BrokerDelayedHostingPowerAction -Action Shutdown -MachineName '
    XD_VDA1' -Delay '00:02:00'
```

Parameters

-MachineName

Specifies the machine that the action is to be performed on.

The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Action

Specifies the power state change action that is to be performed on the specified machine after the specified delay.

Valid values are Shutdown and Suspend.

Type:	PowerManagementAction
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Delay

Specifies a timespan delay before the action is queued.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.DelayedHostingPowerAction

New-BrokerDelayedHostingPowerAction returns the created delayed power action.

New-BrokerDesktopGroup

March 11, 2024

Create a new desktop group for managing the brokering of groups of desktops.

Syntax

```
New-BrokerDesktopGroup
   [-AdminFolder <AdminFolder>]
   [-AllowReconnectInMaintenanceMode <Boolean>]
   [-AppDisks <Guid[]>]
   [-AppProtectionKeyLoggingRequired <Boolean>]
   [-AppProtectionScreenCaptureRequired <Boolean>]
   [-AutomaticPowerOnForAssigned <Boolean>]
```

```
    [-AutomaticPowerOnForAssignedDuringPeak <Boolean>]
    [-AutomaticRestartForUntaggedMachines <Boolean>]
    [-AutoscaleLogOffReminderEnabled <Boolean>]
    [-AutoscaleLogOffReminderIntervalSecondsOffPeak <Int32>]
    [-AutoscaleLogOffReminderIntervalSecondsPeak <Int32>]
    [-AutoscaleLogOffReminderMessage <String>]
    [-AutoscaleLogOffReminderTitle <String>]
    [-AutoscaleLogOffWarningMessage <String>]
    [-AutoscaleLogOffWarningTitle <String>]
    [-AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak <Int32>]
    [-AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak <Int32>]
    [-AutoscalingEnabled <Boolean>]
    [-ColorDepth <ColorDepth>]
    [-DeliveryType <DeliveryType>]
    [-Description <String>]
    -DesktopKind <DesktopKind>
    [-DisconnectOffPeakIdleSessionAfterSeconds <Int32>]
    [-DisconnectPeakIdleSessionAfterSeconds <Int32>]
    [-Enabled <Boolean>]
    [-IconUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-IsRemotePC <Boolean>]
    [-LicenseModel <LicenseModel>]
    [-LogoffOffPeakDisconnectedSessionAfterSeconds <Int32>]
    [-LogoffPeakDisconnectedSessionAfterSeconds <Int32>]
    [-MachineCost <Decimal>]
    [-MachineLogOnType <MachineLogOnType>]
    [-MinimumFunctionalLevel <FunctionalLevel>]
    [-Name] <String>
    [-OffPeakBufferSizePercent <Int32>]
    [-OffPeakDisconnectAction <SessionChangeHostingAction>]
    [-OffPeakDisconnectTimeout <Int32>]
    [-OffPeakExtendedDisconnectAction <SessionChangeHostingAction>]
    [-OffPeakExtendedDisconnectTimeout <Int32>]
    [-OffPeakLogOffAction <SessionChangeHostingAction>]
    [-OffPeakLogOffTimeout <Int32>]
    [-PeakAutoscaleAssignedPowerOnIdleAction <String>]
    [-PeakAutoscaleAssignedPowerOnIdleTimeout <Int32>]
    [-PeakBufferSizePercent <Int32>]
    [-PeakDisconnectAction <SessionChangeHostingAction>]
    [-PeakDisconnectTimeout <Int32>]
    [-PeakExtendedDisconnectAction <SessionChangeHostingAction>]
    [-PeakExtendedDisconnectTimeout <Int32>]
    [-PeakLogOffAction <SessionChangeHostingAction>]
    [-PeakLogOffTimeout <Int32>]
    [-PolicySetGuid <Guid>]
    [-PowerOffDelay <Int32>]
    [-ProductCode <String>]
    [-ProtocolPriority <String[]>]
    [-PublishedName <String>]
    [-RequiredSleepCapability <String>]
    [-ResourceLeasingEnabled <Boolean>]
    [-RestrictAutoscaleMinIdleUntaggedPercentDuringOffPeak <Int32>]
```

```
    [-RestrictAutoscaleMinIdleUntaggedPercentDuringPeak <Int32>]
    [-RestrictAutoscaleTagUid <Int32>]
    [-ReuseMachinesWithoutShutdownInOutage <Boolean>]
    [-Scope <String[]>]
    [-SecureIcaRequired <Boolean>]
    [-SessionSupport <SessionSupport>]
    [-SettlementPeriodBeforeAutoShutdown <TimeSpan>]
    [-SettlementPeriodBeforeUse <TimeSpan>]
    [-ShutdownDesktopsAfterUse <Boolean>]
    [-TenantId <Guid>]
    [-TimeZone <String>]
    [-TurnOnAddedMachine <Boolean>]
    [-UseVerticalScaling <Boolean>]
    [-UUID <Guid>]
    [-ZonePreferences <ZonePreference[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerDesktopGroup cmdlet creates a new broker desktop group that can then be used to manage the brokering settings of all desktops within that desktop group. Once the desktop group has been created, you can create desktops in it by adding the appropriate broker machines to it using the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets.

Desktop groups hold settings that apply to all desktops they contain.

For any automatic power management settings of a desktop group to take effect, the group's TimeZone property must be specified. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Examples

EXAMPLE 1

Create a desktop group to manage the brokering of private desktops, which will appear to users with the name "MyDesktop".

```
New-BrokerDesktopGroup "Assigned Desktops" -PublishedName "MyDesktop" -
    DesktopKind Private
```

Parameters

-Name

The name of the new broker desktop group.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopKind

The kind of desktops this group will hold. Valid values are Private and Shared.

Type:	DesktopKind
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AdminFolder

The folder in which the new desktop group should reside (if any).

Type:	AdminFolder
Position:	Named
Default value:	None (root folder)
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-AllowReconnectInMaintenanceMode

Whether the maintenance mode allows session reconnect to various Session support types.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppDisks

Specifies the application disks to be used by machines in the desktop group.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppProtectionKeyLoggingRequired

Specifies whether key logging app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AppProtectionScreenCaptureRequired

Specifies whether screen capture app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutomaticPowerOnForAssigned

Specifies whether assigned desktops in the desktop group should be automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutomaticPowerOnForAssignedDuringPeak

Specifies whether assigned desktops in the desktop group should be automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutomaticRestartForUntaggedMachines

Indicates whether untagged single-session machines belonging to a desktop group configured for restrict Autoscale and shutdown after use should restart after untainting.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoscaleLogOffReminderEnabled

Boolean value indicating whether the warning messages should be sent on an interval to nudge a logoff should be sent on an interval when autoscale is enabled.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoscaleLogOffReminderIntervalSecondsOffPeak

Represents the interval in seconds for which messages are sent to the user during off peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoscaleLogOffReminderIntervalSecondsPeak

Represents the interval in seconds for which messages are sent to the user during peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoscaleLogOffReminderMessage

Specifies the notification message to display to users in active sessions belonging to machines needed by Autoscale for shutdown

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AutoscaleLogOffReminderTitle

Specifies the notification message dialog title displayed when Autoscale issues a logoff reminder request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AutoscaleLogOffWarningMessage

Specifies the warning message to display to users in active sessions prior to Autoscale issuing a logoff request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AutoscaleLogOffWarningTitle

Specifies the warning message dialog title displayed prior to Autoscale issuing a logoff request.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak

Specifies the minimum seconds that need to elapse before Autoscale logs off the active sessions on the draining machines belonging to the delivery group during off-peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak

Specifies the minimum seconds that need to elapse before Autoscale logs off the active sessions on the draining machines belonging to the delivery group during peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AutoscalingEnabled

Specifies whether machines in this desktop group can be Autoscaled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ColorDepth

Specifies the color depth that the ICA session should use for desktops in this group. Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	TwentyFourBit
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DeliveryType

Specifies whether desktops, applications, or both, can be delivered from machines contained within the new desktop group. Desktop groups with a DesktopKind of Private cannot be used to deliver both desktops and applications. Defaults to DesktopsOnly if not specified.

Valid values are DesktopsOnly, AppsOnly, and DesktopsAndApps.

Type:	DeliveryType
Position:	Named
Default value:	DesktopsOnly

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A description for this desktop group useful for administrators of the site.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DisconnectOffPeakIdleSessionAfterSeconds

Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during off-peak time.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DisconnectPeakIdleSessionAfterSeconds

Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during peak time.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Whether the desktop group should be in the enabled state; disabled desktop groups do not appear to users.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IconUid

The UID of the broker icon to be displayed to users for their desktop(s) in this desktop group.

Type:	Int32
Position:	Named
Default value:	The Uid of the default desktop icon in this site - use the Get-BrokerSite cmdlet to find this value.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-InMaintenanceMode

Whether the desktop should be created in maintenance mode; a desktop group in maintenance mode will not allow users to connect or reconnect to their desktops.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IsRemotePC

Specifies whether this is to be a Remote PC desktop group.

IsRemotePC can only be enabled when:

- SessionSupport is SingleSession
- DeliveryType is DesktopsOnly
- DesktopKind is Private

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LicenseModel

The license model for this desktop group. If none is specified, then the site-wide license model is used.

Type:	LicenseModel

Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LogoffOffPeakDisconnectedSessionAfterSeconds

Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during off-peak time.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LogoffPeakDisconnectedSessionAfterSeconds

Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during peak time.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MachineCost

The per-hour instance cost of machines in this desktop group.

Type:	Decimal
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MachineLogOnType

Specifies the login type for the desktop group. Values can be:

- ActiveDirectory - Perform Active Directory login on the machine.
- LocalMappedAccount - Perform local mapped account login on the machine.

Type:	MachineLogOnType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MinimumFunctionalLevel

The minimum FunctionalLevel required for machines to work successfully in the desktop group.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25

Type:	FunctionalLevel
Position:	Named
Default value:	The FunctionalLevel of the current release (L7_6); by default no machines with less than the most current FunctionalLevel will be functional.
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-OffPeakBufferSizePercent

The percentage of single-session machines that are kept available in an idle state, or for multi-session machines, the percentage of the total load capacity to be kept available outside peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OffPeakDisconnectAction

The action to be performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown

Type:	SessionChangeHostingAction
Position:	Named
Default value:	Nothing
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OffPeakDisconnectTimeout

The number of minutes before the configured action should be performed after a user session disconnects outside peak hours.

Type:	Int32

Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OffPeakExtendedDisconnectAction

The action to be performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	Nothing
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OffPeakExtendedDisconnectTimeout

The number of minutes before the second configured action should be performed after a user session disconnects outside peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OffPeakLogOffAction

The action to be performed after a configurable period of a user session ending outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	Nothing
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OffPeakLogOffTimeout

The number of minutes before the configured action should be performed after a user session ends outside peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakAutoscaleAssignedPowerOnIdleAction

The action to be performed on an assigned machine started by Autoscale if that machine then remains unused for a defined period of time.

Type:	String
Accepted values:	Nothing, Shutdown, Suspend
Position:	Named
Default value:	Nothing

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakAutoscaleAssignedPowerOnIdleTimeout

The number of minutes before the configured action is performed on an assigned machine previously started by autoscale that subsequently remains unused.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakBufferSizePercent

The percentage of single-session machines that are kept available in an idle state, or for multi-session machines, the percentage of the total load capacity to be kept available in peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakDisconnectAction

The action to be performed after a configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	Nothing
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakDisconnectTimeout

The number of minutes before the configured action should be performed after a user session disconnects in peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakExtendedDisconnectAction

The action to be performed after a second configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	Nothing
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakExtendedDisconnectTimeout

The number of minutes before the second configured action should be performed after a user session disconnects in peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakLogOffAction

The action to be performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	Nothing
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakLogOffTimeout

The number of minutes before the configured action should be performed after a user session ends in peak hours.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PolicySetGuid

The policy set assigned to this delivery group.

Type:	Guid
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PowerOffDelay

The number of minutes following a power-on operation that Auto Scale will wait before attempting to power off that same machine. Possible values in the range 0 - 60.

Type:	Int32
Position:	Named
Default value:	30
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProductCode

The licensing product code for this desktop group. If none is specified, then the site-wide product code is used.

Type:	String

Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProtocolPriority

A list of protocol names in the order in which they should be attempted for use during connection.

Type:	String[]
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PublishedName

The name that will be displayed to users for their desktop(s) in this desktop group.

Type:	String
Position:	Named
Default value:	The same value as that supplied for the name of the desktop group.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RequiredSleepCapability

The sleep capability of this desktop group. Possible values are None, or Suspend.

Type:	String
Accepted values:	None, Suspend
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourceLeasingEnabled

Indicates if this desktop group is enabled for resource leasing.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RestrictAutoscaleMinIdleUntaggedPercentDuringOffPeak

This indicates the percentage that the number of untagged single-session machines in an idle state, or for multi-session machines, the untagged available load capacity must fall below before Autoscale powers on and manages 'tagged' machines, as per policy, in off-peak. If the number of untagged machines in an idle state, or the untagged available load capacity goes above this threshold value, Autoscale will attempt to shut down 'tagged' machines. Possible values are in the range -1 - 100, where -1 (default) disables this behavior. This is only relevant for desktop groups configured for Restrict Autoscaling.

Type:	Int32
Position:	Named
Default value:	-1

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RestrictAutoscaleMinIdleUntaggedPercentDuringPeak

This indicates the percentage that the number of untagged single-session machines in an idle state, or for multi-session machines, the untagged available load capacity must fall below before Autoscale powers on and manages 'tagged' machines, as per policy, in peak-time. If the number of untagged machines in an idle state, or the untagged available load capacity goes above this threshold value, Autoscale will attempt to shut down 'tagged' machines. Possible values are in the range -1 - 100, where -1 (default) disables this behavior. This is only relevant for delivery groups configured for Restrict Autoscaling.

Type:	Int32
Position:	Named
Default value:	-1
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RestrictAutoscaleTagUid

If set to a Tag UID, only machines that have this tag will be auto scaled.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ReuseMachinesWithoutShutdownInOutage

Specifies whether power cycle operations are required during outage for pooled machines.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Scope

Specifies the name of the delegated administration scope to which the desktop group should belong.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SecureIcaRequired

Whether HDX connections to desktops in the new desktop group require the use of a secure protocol.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-SessionSupport

Specifies whether machines in the desktop group are single or multi-session capable. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SettlementPeriodBeforeAutoShutdown

Time after a session ends during which automatic shutdown requests (for example, shutdown after use, idle pool management) are deferred. Any outstanding shutdown request takes effect after the settlement period expires. This is typically used to configure time to allow logoff scripts to complete.

Type:	TimeSpan
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SettlementPeriodBeforeUse

Idle period before a machine can be selected to host a new session after registration or the end of a previous session. This is typically used to allow a machine to become idle following processing

associated with start-up or logoff actions. A machine may still be selected during the idle period if no other machine is available for immediate use.

Type:	TimeSpan
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ShutdownDesktopsAfterUse

Whether desktops in this desktop group should be automatically shut down when each user session completes (only relevant to power-managed desktops).

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TenantId

Specifies identity of tenant associated with desktop group. Must always be specified in multitenant sites, must not be specified otherwise.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TimeZone

The time zone in which this desktop group's machines reside.

The time zone must be specified for any of the group's automatic power management settings to take effect. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-TurnOnAddedMachine

This flag specifies whether the Broker Service should attempt to power on machines when they are added to the desktop group.

Type:	Boolean
Position:	Named
Default value:	$false for single session machines and $true for multi-session machines.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UseVerticalScaling

Determines whether to use vertical scaling when considering RDS machines in the desktop group for launches. Vertical scaling would saturate machines in the current pool rather than send sessions to the least loaded machines. This would be a trade in performance vs. cost, where vertical scaling would be less costly.

With the default value ($null), the site-wide value will be inherted. A value of $false indicates that horizontal scaling should be used.

Type:	Boolean
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

An optional GUID for this desktop group.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ZonePreferences

Ordered list of zone preferences to be applied when launching resources from this desktop group. Valid zone preference values are UserLocation, UserHome, UserHomeOnly and ApplicationHome.

The list can have zero or more entries subject to the following restrictions: Zone preferences can only be applied to groups having a DesktopKind of Shared; the same zone preference value cannot occur in the list more than once; the UserHome and UserHomeOnly values are mutually exclusive and cannot both appear in the list.

Type:	ZonePreference[]
Position:	Named
Default value:	For shared groups the default preference list is ApplicationHome, UserHome, then UserLocation.
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.DesktopGroup

The newly created desktop group.

Notes

Once a new desktop group is created, you can create desktops in it by adding the appropriate broker machines to it using the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets.

New-BrokerDesktopGroupWebhook

March 11, 2024

Create a webhook for the sepcified desktop group

Syntax

```
New-BrokerDesktopGroupWebhook
   -Address <String>
   -DesktopGroupUid <Int32>
   -OnEvent <WebhookTrigger>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
7     [<CommonParameters>]
```

Description

This cmdlet is used to create a webhook for the sepcified desktop group, that is invoked upon the specified event of the desktop group.

Examples

EXAMPLE 1

Creates a new webhook for the desktop group with Uid 1, that is to be invoked when a machine registers to the broker.

When it is invoked, a HTTP POST request is sent out to the address above with a JSON payload {“SamName”: “value”} where “value”is the SAM name of registering machine.

```
1  New-BrokerDesktopGroupWebhook -DesktopGroupUid 1 -OnEvent
       MachineRegistration -Address 'http://citrix.com/example'
```

Parameters

-Address

The URL of the webhook

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

The Uid of the desktop group to configure a webhook

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OnEvent

The event upon that the webhook is invoked, currently the only supported event is MachineRegistration.

For MachineRegistration, when the webhook is invoked it is HTTP POST with a JSON payload of the format: {“SamName”: “value”} where the “value”is the SamName of the machine that is registering to the broker.

Type:	WebhookTrigger
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroupWebhook

The set of webhooks to be added to the desktop group can be piped into this cmdlet

Outputs

None

By default, this cmdlet returns no output.

- Get-BrokerDesktopGroup

New-BrokerEntitlementPolicyRule

March 11, 2024

Creates a new desktop rule in the site's entitlement policy.

Syntax

```
New-BrokerEntitlementPolicyRule
    [-ColorDepth <ColorDepth>]
    [-Description <String>]
    -DesktopGroupUid <Int32>
    [-Enabled <Boolean>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-ExcludedUsers <User[]>]
    [-IconUid <Int32>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-LeasingBehavior <LeasingBehavior>]
    [-MaxPerEntitlementInstances <Int32>]
    [-Name] <String>
    [-PublishedName <String>]
    [-RestrictToTag <String>]
    [-SecureIcaRequired <Boolean>]
    [-SessionReconnection <SessionReconnection>]
    [-UUID <Guid>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerEntitlementPolicyRule cmdlet adds a new desktop rule to the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

The following constraints apply when creating a desktop entitlement rule for a desktop group:

- The group's desktop kind must be Shared
- The group's delivery type must be DesktopsOnly or DesktopsAndApps

When a user selects a desktop entitlement published from a shared group, a machine is selected from the group on which to run the desktop session. No permanent association exists between the user and the selected machine; once the session ends the association also ends.

Multiple desktop rules in the entitlement policy can apply to the same desktop group. Where a user is granted an entitlement by more than one rule for the same group, they can use as many desktop sessions at the same time as they have entitlements.

Examples

EXAMPLE 1

Creates an desktop rule in the entitlement policy that entitles all members of the SUPPORT\uk-staff group to a desktop session from the Customer Support desktop group. The desktop entitlement name seen by users is Support Desktop.

```
$dg = Get-BrokerDesktopGroup 'Customer Support'
New-BrokerEntitlementPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -
    IncludedUsers support\uk-staff -PublishedName 'Support Desktop'
```

Parameters

-Name

Specifies the administrative name of the new desktop rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

Specifies the unique ID of the desktop group to which the new desktop rule applies.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ColorDepth

Specifies the color depth of any desktop sessions launched by a user from this entitlement.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	ColorDepth
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies an optional description of the new desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new desktop rule is initially enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

Type:	Boolean

Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExcludedUsers

Specifies the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from the new rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IconUid

Specifies the unique ID of the icon used to display the desktop session entitlement to the user.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Int32
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the new rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IncludedUsers

Specifies the included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the new rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named
Default value:	(empty list)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LeasingBehavior

Defines the desired connection leasing behavior applied to sessions launched using this entitlement. Possible values are:

Allowed and Disallowed.

The Allowed value indicates that connection leasing should behave normally. The Disallowed value prevents users

from launching or reconnecting to sessions using this entitlement while connection leasing is active (typically during a database outage).

Type:	LeasingBehavior
Position:	Named
Default value:	Allowed
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxPerEntitlementInstances

Maximum allowed concurrently running instances of the desktop associated with this entitlement in the site . A value of zero allows unlimited usage.

Type:	Int32
Position:	Named
Default value:	0

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PublishedName

The name of the new desktop session entitlement as seen by the user.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RestrictToTag

Optional tag that may be used further to restrict which machines may be made accessible to a user by an entitlement policy rule. A machine may be made accessible by an entitlement policy rule only if either the rule has no tag restriction or the rule does have a tag restriction and the machine is tagged with the same tag.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-SecureIcaRequired

Specifies whether the new desktop rule requires the SecureICA protocol for desktop sessions launched using the entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Boolean
Position:	Named
Default value:	Null (dynamically inherited from the desktop group)
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SessionReconnection

Defines reconnection (roaming) behavior for sessions launched using this rule. Possible values are:

Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	Always
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

An optional GUID for this rule.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

New-BrokerEntitlementPolicyRule returns the newly created desktop rule in the entitlement policy.

New-BrokerGpoFilter

March 11, 2024

Creates a new GPO filter.

Syntax

```
New-BrokerGpoFilter
   [-FilterData <String>]
   -FilterType <String>
   -IsAllowed <Boolean>
   -IsEnabled <Boolean>
   -PolicyGuid <Guid>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a GPO filter for a policy to specify how the policy should be applied.

Examples

EXAMPLE 1

Creates a new client name filter for a policy.

```
New-BrokerGpoFilter -PolicyGuid ([Guid]"12345678-...") -FilterType
    ClientName -FilterData 'Client1' -IsAllowed $true -IsEnabled $true
```

Parameters

-FilterType

The filter type.

Type:	String
Accepted values:	AccessControl, BranchRepeater, ClientIP, ClientName, DesktopGroup, DesktopKind, DesktopTag, OU, User
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IsAllowed

Specifies to allow the policy when the filter condition is true.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IsEnabled

Specifies if the filter is enabled or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PolicyGuid

The GUID of the policy for which the filter is defined

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-FilterData

The filter data. Ignored if the filter is a BranchRepeater filter.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoFilter

Outputs the GPO filter object.

Related Links

- about_Broker_GroupPolicy
- Get-BrokerGpoFilter
- Set-BrokerGpoFilter
- Remove-BrokerGpoFilter

New-BrokerGpoPolicy

March 11, 2024

Create a new GPO policy.

Syntax

```
New-BrokerGpoPolicy
   [-Description <String>]
   [-IsEnabled <Boolean>]
   [-Name] <String>
   -PolicySetGuid <Guid>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerGpoPolicy cmdlet creates a new GPO policy.

Examples

EXAMPLE 1

Create a policy named Policy0 in the default site policy set.

```
New-BrokerGpoPolicy -Name "Policy0"
```

Parameters

-Name

Specifies the new policy name. The name must not exist in the specified policy set.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PolicySetGuid

Specifies the policy set the new policy will be in. If the GUID is not specified, the new policy is created in the default site policy set.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies the description of the policy.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-IsEnabled

Specifies whether policy is enabled.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoPolicy

The newly created GPO policy.

Notes

The priority of the new policy is assigned with the lowest priority.

Related Links

- about_Broker_GroupPolicy
- Get-BrokerGpoPolicy
- Set-BrokerGpoPolicy
- Remove-BrokerGpoPolicy

New-BrokerGpoPolicySet

March 11, 2024

Creates a new GPO policy set.

Syntax

```
New-BrokerGpoPolicySet
    [-Description <String>]
    [-Name] <String>
    -PolicySetType <String>
    [-Scope <String[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Create a new GPO policy set.

Examples

EXAMPLE 1

Creates a new policy set for a configuration slot without a description. The caller should keep the PolicySetGuid property returned in the object for later use.

```
New-BrokerGpoPolicySet -PolicySetType SlotPolicies
```

Parameters

-Name

The name of the policy set. It must be unique among all policy sets.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PolicySetType

The type of the policy set. Valid values are: SitePolicies, SlotPolicies, and SiteTemplate. SitePolicies specifies a policy set that stores the default policies for the site. SlotPolicies specifies a policy set that stores the policies for a configuration slot. SiteTemplate specifies a policy set that stores the site's policy templates.

Type:	String
Accepted values:	CustomTemplates, DeliveryGroupPolicies, SitePolicies, SiteTemplates
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

A short description describing the use of this policy set.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Scope

Specifies the name of the delegated administration scope to which the policy set belongs.

Type:	String[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoPolicySet

New-BrokerGpoPolicySet returns a GPO policy set object.

Related Links

- about_Broker_GroupPolicy

New-BrokerGpoSetting

March 11, 2024

Creates a new GPO setting.

Syntax

```
New-BrokerGpoSetting
   -PolicyGuid <Guid>
   [-SettingName] <String>
   [-SettingValue <String>]
   [-UseDefault <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a GPO setting for a policy.

Examples

EXAMPLE 1

Creates a new 'Audio quality'setting.

```
New-BrokerGpoSetting -PolicyGuid ([Guid]"12345678-...") -SettingName
    AudioQuality -UseDefault $true
```

Parameters

-SettingName

The setting name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PolicyGuid

The GUID of the policy for which the filter is created.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SettingValue

The setting value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-UseDefault

Indicate if the default value of setting is used. Ignored if setting is Boolean.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoSetting

Outputs the GPO setting object.

New-BrokerHostingPowerAction

March 11, 2024

Creates a new action in the power action queue.

Syntax

```
New-BrokerHostingPowerAction
   -Action <PowerManagementAction>
   [-ActualPriority <Int32>]
   [-MachineName] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
7     [<CommonParameters>]
```

Description

The New-BrokerHostingPowerAction cmdlet adds a new power action record into the queue of power actions to be performed. The power actions in the queue are processed on a priority basis and sent to the relevant hypervisor to change the power state of a virtual machine.

A power action record defines the action to be performed, the machine on which the action is to be performed, and an initial priority value for the action. Multiple actions may be created that relate to the same machine.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement' .

Examples

EXAMPLE 1

Causes the machine called 'XD_VDA1'to be shut down.

```
1  New-BrokerHostingPowerAction -Action Shutdown -MachineName 'XD_VDA1'
```

Parameters

-MachineName

Specifies the machine that the action is to be performed on.

The machine can be identified by DNS name or short name or SID or 'machine\domain'form name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Action

Specifies the power state change action that is to be performed on the specified machine.

Valid values are: TurnOn, TurnOff, ShutDown, Reset, Restart, Suspend and Resume.

Type:	PowerManagementAction
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ActualPriority

Specifies an initial priority value for the action in the queue.

This priority is the current action priority; the 'base'priority for actions created via this cmdlet is always 30. Numerically lower priority values indicate more important actions that are processed in preference to actions with numerically higher priority settings.

Type:	Int32
Position:	Named
Default value:	30
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

MachineName (System.String)

A list of machine names can be supplied as input.

Outputs

Citrix.Broker.Admin.SDK.HostingPowerAction

New-BrokerHostingPowerAction returns the newly created power action record.

New-BrokerHypervisorConnection

March 11, 2024

Creates a new hypervisor connection.

Syntax

```
New-BrokerHypervisorConnection
   [-HypHypervisorConnectionUid] <Guid>
   [-PreferredController <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerHypervisorConnection cmdlet creates a new hypervisor connection.

Examples

EXAMPLE 1

This command creates a new hypervisor connection with a preferred controller.

```
New-BrokerHypervisorConnection -PreferredController "domainName\
   controllerName" -HypHypervisorConnectionUid "d16f4e56-b85e-4ba6-b745
   -0e978ae4f192"
```

EXAMPLE 2

This command creates a new hypervisor connection, and leaves it to the system to select a preferred controller.

```
New-BrokerHypervisorConnection -HypHypervisorConnectionUid "d16f4e56-
   b85e-4ba6-b745-0e978ae4f192"
```

Parameters

-HypHypervisorConnectionUid

The Guid that identifies the hypervisor connection, as defined in DUM.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PreferredController

The preferred controller machine for the hypervisor connection. Can be specified as (first match is used):

- Full SAM name.
- Full DNS name.
- SID value.
- NetBIOS name (SAM without domain).
- Partial DNS name (DNS name without some or all domain information).

Where not specified, the system selects preferred controller machine based on loading.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.HypervisorConnection

New-BrokerHypervisorConnection returns an opaque object containing information about the hypervisor connection.

Related Links

- Get-BrokerHypervisorConnection
- Remove-BrokerHypervisorConnection
- Set-BrokerHypervisorConnection

New-BrokerIcon

March 11, 2024

Creates a new icon.

Syntax

```
New-BrokerIcon
   [-EncodedIconData] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Accepts Base64 encoded .ICO format icon data, stores it in the database and returns an Icon object containing the Uid assigned to it.

New-BrokerIcon can be used with the Get-BrokerIcon cmdlet to obtain the Base64 icon. See Examples for a demonstration.

Examples

EXAMPLE 1

Extracts the first icon resource from notepad.exe, and sets this as the icon for a desktop group.

```
$ctxIcon = Get-BrokerIcon -FileName C:\Windows\System32\notepad.exe -
   index 0
$brokerIcon = New-BrokerIcon -EncodedIconData $ctxIcon.EncodedIconData
$desktopGroup = Get-BrokerDesktopGroup -Name 'MyDesktopGroup'
Set-BrokerDesktopGroup $desktopGroup -IconUid $brokerIcon.Uid
```

Parameters

-EncodedIconData

Specifies the Base64 encoded .ICO format icon data.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Icon

Returns an Icon object.

New-BrokerImportDb

March 11, 2024

This cmdlet is for internal use only

Syntax

```
New-BrokerImportDb
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet is for internal use only

Examples

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet accepts no input

Outputs

String

New-BrokerMachine

March 11, 2024

Adds a machine that can be used to run desktops and applications.

Syntax

```
New-BrokerMachine
   [-AssignedClientName <String>]
   [-AssignedIPAddress <String>]
   -CatalogUid <Int32>
   [-HostedMachineId <String>]
   [-HypervisorConnectionUid <Int32>]
   [-InMaintenanceMode <Boolean>]
   [-IsReserved <Boolean>]
```

```
    [-MachineName] <String>
    [-UUID <Guid>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

By adding a machine to a catalog, New-BrokerMachine adds a machine to the site, and is the first step in making the machine available to run users'desktops and applications. The machine may be physical or virtual.

For physical machines, you must specify the machine's SID and the catalog to which it will belong. For virtual machines which are not provisioned by MCS, you must also provide the hypervisor connection responsible for running the machine and the hosted machine ID by which the hypervisor recognizes the machine.

The machine must support the expected capabilities of the catalog: the catalog specifies a SessionType and a MinimalFunctionalLevel. The session support of the machine is determined by the type of Citrix VDA software installed (server or workstation) and the functional level depends on the version of the Citrix VDA software installed. The New-BrokerMachine command will complete successfully if these are not correct but the machine will be unable to register.

For more information about machines, see about_Broker_Machines.

Examples

EXAMPLE 1

This adds the physical machine with the specified SAM name to this site and places it in the specified catalog.

```
New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine'
```

EXAMPLE 2

This adds the physical machine with the specified SID to this site and places it in the specified catalog.

```
New-BrokerMachine -CatalogUid 2 -MachineName 'S
    -1-5-12-1234567890-1234567890-1234567890-1234'
```

EXAMPLE 3

This adds the virtual machine, running on the specified hypervisor, to this site and places it in the catalog.

```
New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine' -
    HostedMachineId 'F8143B4F-7371-4efa-868A-54787EF9F64E' -
    HypervisorConnectionUid 5
```

EXAMPLE 4

This adds the specified physical machine to the site and uses Add-BrokerMachine to add it to a desktop group.

```
$m = New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine'
Add-BrokerMachine -InputObject $m -DesktopGroup 3
```

Parameters

-MachineName

Specify the name of the machine to create (in the form 'domain\machine'). A SID can also be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CatalogUid

The catalog to which this machine will belong.

Type:	Int32
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-AssignedClientName

The client name to which this machine will be assigned. Machines can be assigned to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AssignedIPAddress

The client IP address to which this machine will be assigned. Machines can be assigned to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HostedMachineId

The unique ID by which the hypervisor recognizes the machine. Omit this for physical machines or MCS-provisioned VMs.

Type:	String
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HypervisorConnectionUid

The hypervisor connection that runs the machine. Omit this for physical machines or MCS-provisioned VMs.

Type:	Int32
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-InMaintenanceMode

Specifies whether the machine is initially in maintenance mode. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IsReserved

Specifies whether the machine should be reserved for special use, for example, for AppDisk preparation. A reserved machine cannot be added to a desktop group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

An optional GUID for this machine.

Type:	Guid
Position:	Named
Default value:	A new GUID is generated if none is supplied.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Machine

New-BrokerMachine returns the created machine.

- about_Broker_Machines
- Add-BrokerMachine

New-BrokerMachineCommand

March 11, 2024

Creates a new command to deliver to a desktop.

Syntax

```
New-BrokerMachineCommand
   -Category <String>
   -CommandName <String>
   [-CommandData <Byte[]>]
   [-DesktopGroups <DesktopGroup[]>]
   [-SendTrigger <MachineCommandTrigger>]
   -User <String>
   [-SendDeadline <TimeSpan>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerMachineCommand
   -Category <String>
   -CommandName <String>
   [-CommandData <Byte[]>]
   [-SendTrigger <MachineCommandTrigger>]
   -MachineUid <Int32>
   [-SendDeadline <TimeSpan>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerMachineCommand
   -Category <String>
   -CommandName <String>
   [-CommandData <Byte[]>]
   [-SendTrigger <MachineCommandTrigger>]
   -SessionUid <Int64>
   [-SendDeadline <TimeSpan>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerMachineCommand
   -Category <String>
   -CommandName <String>
   [-CommandData <Byte[]>]
   [-Synchronous]
   -MachineUid <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Create a new command queued for delivery to a desktop. Commands are sent to a specific handler installed on the desktop using the Category parameter. Each handler has its own list of commands

identified by the CommandName parameter. Optional command data can be provided using the CommandData parameter in a format specified by the handler.

Commands are targeted at a specific user, session or machine. Commands targeted at a user can be further be restricted to one or more desktop groups.

The SendTrigger is used to restrict the command to a specific event related to the target. For example, when the target machine registers or when the target user reconnects to a session. The command will be sent to the machine when the SendTrigger occurs for the target.

If the Synchronous switch is provided, the target must be a machine and no SendTrigger can be specified. The command is sent immediately to the machine if it is currently registered and fails if the machine is not registered.

Note that the combined length of the Category and CommandName is limited to 64 characters. The Category and CommandName must both be entirely alphanumeric and not include any white space.

Examples

EXAMPLE 1

Instruct the User Profile Manager service to execute the "ResetUpmProfile"command using the encoded $byteArray command data when user domain1\user1 logs on to any machine in desktop group 1

```
New-BrokerMachineCommand -Category UserProfileManager -CommandName "
    ResetUpmProfile" -DesktopGroups 1 -CommandData $byteArray -
    SendTrigger logon -user domain1\user1
```

EXAMPLE 2

Instruct the monitor service to immediately execute the "EnableLogging"command on the machine having Uid 13.

```
New-BrokerMachineCommand -Synchronous -Category "MonitorService" -
    CommandName "EnableLogging" -MachineUid 13
```

Parameters

-Category

The service on the desktop to send the command to.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CommandName

The name of the command to send (as defined by the service).

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-User

User whose desktop or session should receive the command.

Type:	String
Position:	Named
Default value:	Any user.
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-MachineUid

Specific machine that should receive the command.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SessionUid

Currently logged on user session that should receive the command.

Type:	Int64
Position:	Named
Default value:	Any session.
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Synchronous

Send the command immediately and block while waiting for the reply.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CommandData

Optional additional data to include with the command.

Type:	Byte[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroups

Further restrict the command targeted at a user to machines in these desktop groups.

Type:	DesktopGroup[]
Position:	Named
Default value:	No restriction by desktop group.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SendTrigger

Queue command for delivery until this particular event occurs. Valid values are NextContact, Broker, LogOn, Logoff, Disconnect and Reconnect.

Type:	MachineCommandTrigger
Position:	Named
Default value:	Default value is 'NextContact'so the command is sent during the next communication with the desktop.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SendDeadline

Automatically cancel the command if it not delivered before the specified time span passes.

Type:	TimeSpan
Position:	Named
Default value:	Command expires after 24 hours.
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

No parameter is accepted from the input pipeline.

Outputs

Citrix.Broker.Admin.SDK.MachineCommand

New command that was added to the command queue.

Citrix.Broker.Admin.SDK.MachineSynchronousCommandResponse

When the Synchronous option is used, the command is immediately sent to the specified machine and processed. The SDK object returned describes the command and the result of this command processing.

Notes

Commands are subject to delegated administration restrictions based on the desktop group, category and command name.

- Get-BrokerMachineCommand
- Remove-BrokerMachineCommand

New-BrokerMachineConfiguration

March 11, 2024

Creates a new machine configuration associated with an existing configuration slot.

Syntax

```
New-BrokerMachineConfiguration
   -ConfigurationSlotUid <Int32>
   [-Description <String>]
   -LeafName <String>
   -Policy <Byte[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new machine configuration containing settings that match the SettingsGroup of the associated configuration slot. This machine configuration can then be applied to a desktop group to have the settings applied to machines in that group.

The SettingsGroup of the configuration slot restricts the permitted settings. Use the SDK snap-in that matches the SettingsGroup to create the encoded settings data.

Examples

EXAMPLE 1

Creates a new configuration named "%SlotName%\Finance Department"where %SlotName% is the name of the configuration slot having the Uid $csUid. The encoded settings in the $policy variable must match the SettingsGroup of the configuration slot having the Uid $csUid.

```
New-BrokerMachineConfiguration -LeafName "Finance Department" -
    Description "Finance Dept. User Profile Management policy" -Policy
    $policy -ConfigurationSlotUid $csUid
```

Parameters

-ConfigurationSlotUid

Unique identifier of the configuration slot to associate with this machine configuration.

Type:	Int32
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LeafName

Name of the new machine configuration. This must be unique amongst the machine configurations associated with the same configuration slot.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Policy

A binary array of encoded settings (policy) data created with the SDK snap-in that matches the SettingsGroup of the configuration slot.

Type:	Byte[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Description of the new machine configuration.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.MachineConfiguration

New-BrokerMachineConfiguration returns the newly created configuration

Notes

Delegated Administration can be used to restrict the configuration slots that an administrator can use and hence which components of the system that can be configured.

New-BrokerPowerTimeScheme

March 11, 2024

Creates a new power time scheme for a desktop group.

Syntax

```
New-BrokerPowerTimeScheme
   -DaysOfWeek <TimeSchemeDays>
   -DesktopGroupUid <Int32>
   [-DisplayName <String>]
```

```
    [-Name] <String>
    [-PeakHalfHours <Boolean[]>]
    [-PeakHours <Boolean[]>]
    [-PoolSize <Int32[]>]
    [-PoolSizeHalfHours <Int32[]>]
    [-PoolUsingPercentage <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerPowerTimeScheme cmdlet adds a new power time scheme to be associated with a desktop group. The power time scheme must relate to days of the week that are not already covered by an existing power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

See 'help about_Broker_PowerManagement'for a detailed description of the power policy mechanism and pool size management.

Examples

EXAMPLE 1

Creates a new scheme attached to the desktop group whose UID value is 3. This new scheme covers the weekend and Monday and Tuesday, and defines 'peak'hours as 8am to 6:30pm, with all other times being 'off-peak'. No pool size values are supplied, so all size values for all the hours default to -1.

```
New-BrokerPowerTimeScheme -Name 'First Half Week' -DaysOfWeek Weekend,
    Monday,Tuesday -DesktopGroupUid 3 -PeakHalfHours (0..47 | %{
  if ($_ -lt 16 -or $_ -gt 37) {
  $false  }
  else {
  $true  }
   }
  )
```

Parameters

-Name

Specifies the administrative name of the new power time scheme. Each scheme must have a name which is unique within the site.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DaysOfWeek

Specifies the pattern of days of the week that the power time scheme covers.

Valid values are (singly or a list of) Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday, Weekdays and Weekend.

Type:	TimeSchemeDays
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DesktopGroupUid

Specifies the desktop group that the power time scheme applies to.

Type:	Int32
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DisplayName

Specifies the name of the new power time scheme as displayed in the DesktopStudio console. Each scheme associated with a desktop group must have a display name which is unique within its desktop group, although the same display name can be used on power schemes for different desktop groups.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PeakHalfHours

A set of 48 boolean flag values, one for each half hour of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. If the flag is $true it means that the associated half hour of the day is considered a peak time; if $false it means that it is considered off-peak.

Type:	Boolean[]
Position:	Named
Default value:	48 $false values, meaning all half hours are off-peak
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PeakHours

A set of 24 boolean flag values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag is $true it means that the associated hour of the day is considered a peak time; if $false it means that it is considered off-peak.

Type:	Boolean[]
Position:	Named
Default value:	24 $false values, meaning all hours are off-peak
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PoolSize

For single-session desktop groups, a set of 24 integer values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. For multi-session desktop groups, a set of 48 integer values, one for each half hour of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of -1 has special meaning: pool size management does not apply during such hours.

Type:	Int32[]
Position:	Named
Default value:	24 (or 48 for multi-session desktop groups) values of '-1', meaning no pool size management is to be performed
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PoolSizeHalfHours

A set of 48 integer values, one for each half hour of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of -1 has special meaning: pool size management does not apply during such half hours.

Type:	Int32[]
Position:	Named
Default value:	48 values of '-1', meaning no pool size management is to be performed
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PoolUsingPercentage

A boolean flag to indicate whether the integer values in the pool size array are to be treated as absolute values (if this value is $false) or as percentages of the number of machines in the desktop group (if this value is $true).

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.PowerTimeScheme

New-BrokerPowerTimeScheme returns the newly created power time scheme.

New-BrokerRebootSchedule

March 11, 2024

Creates a new reboot schedule for a desktop group.

Syntax

```
New-BrokerRebootSchedule
   [-Day <RebootScheduleDays>]
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   -RebootDuration <Int32>
   [-StartTime <TimeSpan>]
   [-WarningDuration <Int32>]
   [-WarningMessage <String>]
   [-WarningRepeatInterval <Int32>]
   [-WarningTitle <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerRebootSchedule
   [-Day <RebootScheduleDays>]
   [-DesktopGroupName] <String>
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   -RebootDuration <Int32>
   [-StartTime <TimeSpan>]
   [-WarningDuration <Int32>]
   [-WarningMessage <String>]
   [-WarningRepeatInterval <Int32>]
   [-WarningTitle <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerRebootSchedule cmdlet is used to define a reboot schedule for a desktop group.

Examples

EXAMPLE 1

Schedules the machines in the desktop group named ‘BankTellers’to be rebooted every night between 2 AM and 4 AM.

```
New-BrokerRebootSchedule -DesktopGroupName BankTellers -Frequency Daily
    -StartTime "02:00" -Enabled $true -RebootDuration 120
```

EXAMPLE 2

Schedules the machines in the desktop group having Uid 17 to be rebooted every Saturday night between 1 AM and 5 AM. Ten minutes prior to rebooting, each machine will display a message box with the title “WARNING: Reboot pending”and message “Save your work”in every user session.

```
New-BrokerRebootSchedule -DesktopGroupUid 17 -Frequency Weekly -Day
    Saturday -StartTime "01:00" -Enabled $true -RebootDuration 240 -
    WarningTitle "WARNING: Reboot pending" -WarningMessage "Save your
    work" -WarningDuration 10
```

EXAMPLE 3

Schedules the machines in the desktop group named ‘BankTellers’to be rebooted every night between 3 AM and 5 AM. Fifteen, ten and five minutes prior to rebooting each machine, the message “Rebooting in %m% minutes.”will be displayed in each user session with the pattern ‘%m%’replaced with the number of minutes until the reboot.

```
New-BrokerRebootSchedule -DesktopGroupName BankTellers -Frequency Daily
    -StartTime "03:00" -Enabled $true -RebootDuration 120 -
    WarningMessage "Rebooting in %m% minutes." -WarningDuration 15 -
    WarningRepeatInterval 5
```

Parameters

-DesktopGroupName

The name of the desktop group that this reboot schedule is applied to.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RebootDuration

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DesktopGroupUid

The Uid of the desktop group that this reboot schedule is applied to.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Day

For weekly schedules, the day of the week on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the new reboot schedule is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Frequency

Frequency with which this schedule runs (either Weekly or Daily).

Type:	RebootScheduleFrequency
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-StartTime

Time of day at which the scheduled reboot cycle starts (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningDuration

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed. In some cases the time required to process a reboot schedule may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-WarningRepeatInterval

Time to wait after the previous reboot warning before displaying the warning message in all user sessions on that machine again. If the warning repeat interval is zero then the warning message is not displayed after the initial warning.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RebootSchedule

New-BrokerRebootScheduleV2

March 11, 2024

Creates a new reboot schedule for a desktop group.

Syntax

```
New-BrokerRebootScheduleV2
   [-Day <RebootScheduleDays>]
   [-DayInMonth <RebootScheduleDays>]
   [-Description <String>]
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   [-FrequencyFactor <Int32>]
   [-IgnoreMaintenanceMode <Boolean>]
   [-MaxOvertimeStartMins <Int32>]
   [-Name] <String>
   -RebootDuration <Int32>
   [-RestrictToTag <String>]
   [-StartDate <String>]
   [-StartTime <TimeSpan>]
   [-UseNaturalReboot <Boolean>]
   [-WarningDuration <Int32>]
   [-WarningMessage <String>]
   [-WarningRepeatInterval <Int32>]
   [-WarningTitle <String>]
   [-WeekInMonth <RebootScheduleWeeks>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerRebootScheduleV2
   [-Day <RebootScheduleDays>]
   [-DayInMonth <RebootScheduleDays>]
   [-Description <String>]
   -DesktopGroupName <String>
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   [-FrequencyFactor <Int32>]
   [-IgnoreMaintenanceMode <Boolean>]
   [-MaxOvertimeStartMins <Int32>]
   [-Name] <String>
   -RebootDuration <Int32>
   [-RestrictToTag <String>]
   [-StartDate <String>]
   [-StartTime <TimeSpan>]
   [-UseNaturalReboot <Boolean>]
```

```
    [-WarningDuration <Int32>]
    [-WarningMessage <String>]
    [-WarningRepeatInterval <Int32>]
    [-WarningTitle <String>]
    [-WeekInMonth <RebootScheduleWeeks>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerRebootScheduleV2 cmdlet is used to define a reboot schedule for a desktop group.

Examples

EXAMPLE 1

Schedules the machines in the desktop group named ‘BankTellers’to be rebooted every night between 2 AM and 4 AM.

```
New-BrokerRebootScheduleV2 -Name BankTellers-DailyReboot -
    DesktopGroupName BankTellers -Frequency Daily -StartTime "02:00" -
    Enabled $true -RebootDuration 120
```

EXAMPLE 2

Schedules the machines in the desktop group having Uid 17 to be rebooted every Saturday early morning between 1 AM and 5 AM. Ten minutes prior to rebooting, each machine will display a message box with the title “WARNING: Reboot pending”and message “Save your work”in every user session.

```
New-BrokerRebootScheduleV2 -Name 'Saturday reboots' -DesktopGroupUid 17
     -Frequency Weekly -Day Saturday -StartTime "01:00" -Enabled $true -
    RebootDuration 240 -WarningTitle "WARNING: Reboot pending" -
    WarningMessage "Save your work" -WarningDuration 10
```

EXAMPLE 3

Schedules the machines in the desktop group having Uid 17 to be rebooted Saturday and Sunday early morning between 1 AM and 5 AM for every four weeks starting from Feb 6, 2021. Ten minutes prior to rebooting, each machine will display a message box with the title “WARNING: Reboot pending”and message “Save your work”in every user session.

```
New-BrokerRebootScheduleV2 -Name 'Saturday reboots' -DesktopGroupUid 17
    -Frequency Weekly -FrequencyFactor 4 -Day "Saturday,Sunday" -
    StartDate "2021-02-03" -StartTime "01:00" -Enabled $true -
    RebootDuration 240 -WarningTitle "WARNING: Reboot pending" -
    WarningMessage "Save your work" -WarningDuration 10
```

EXAMPLE 4

Schedules the machines in the desktop group having Uid 17 to be rebooted the last Saturday of the month early morning between 1 AM and 5 AM for every month. Ten minutes prior to rebooting, each machine will display a message box with the title "WARNING: Reboot pending"and message "Save your work"in every user session.

```
New-BrokerRebootScheduleV2 -Name 'Monthly reboots' -DesktopGroupUid 17
    -Frequency Monthly -DayInMonth Saturday -WeekInMonth Last -StartTime
    "01:00" -Enabled $true -RebootDuration 240 -WarningTitle "WARNING:
    Reboot pending" -WarningMessage "Save your work" -WarningDuration 10
```

EXAMPLE 5

Schedules the machines in the desktop group having Uid 17 to be rebooted the first Sunday of the month early morning between 1 AM and 5 AM for every two months, starting from Feb 7, 2021 which is the first Sunday of Feburary, 2021. Ten minutes prior to rebooting, each machine will display a message box with the title "WARNING: Reboot pending"and message "Save your work"in every user session.

```
New-BrokerRebootScheduleV2 -Name 'Monthly reboots' -DesktopGroupUid 17
    -Frequency Monthly -FrequencyFactor 2 -StartDate "2021-02-03" -
    DayInMonth Sunday -WeekInMonth First -StartTime "01:00" -Enabled
    $true -RebootDuration 240 -WarningTitle "WARNING: Reboot pending" -
    WarningMessage "Save your work" -WarningDuration 10
```

EXAMPLE 6

Schedules the machines in the desktop group named 'BankTellers'to be rebooted every night between 3 AM and 5 AM. Fifteen, ten and five minutes prior to rebooting each machine, the message "Rebooting in %m% minutes."will be displayed in each user session with the pattern '%m%'replaced with the number of minutes until the reboot.

```
New-BrokerRebootScheduleV2 -Name BankTellers-DailyReboot -
    DesktopGroupName BankTellers -Frequency Daily -StartTime "03:00" -
    Enabled $true -RebootDuration 120 -WarningMessage "Rebooting in %m%
    minutes." -WarningDuration 15 -WarningRepeatInterval 5
```

EXAMPLE 7

Schedules only machines with the tag ‘Daily Reboot’in the desktop group named ‘BankTellers’to be rebooted every night between 3 AM and 5 AM. Fifteen, ten and five minutes prior to rebooting each machine, the message “Rebooting in %m% minutes.”will be displayed in each user session with the pattern ‘%m%’replaced with the number of minutes until the reboot.

```
New-BrokerRebootScheduleV2 -Name BankTellers-DailyReboot -
    DesktopGroupName BankTellers -Frequency Daily -StartTime "03:00" -
    Enabled $true -RebootDuration 120 -WarningMessage "Rebooting in %m%
    minutes." -WarningDuration 15 -WarningRepeatInterval 5 -
    RestrictToTag 'Daily Reboot'
```

Parameters

-Name

The name of the new reboot schedule.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-RebootDuration

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group that this reboot schedule is applied to.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

The Uid of the desktop group that this reboot schedule is applied to.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Day

For weekly schedules, the days of the week on which the scheduled reboot-cycle starts (one or more of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DayInMonth

For monthly schedules, the day in the month on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

An optional description for the reboot schedule.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Boolean that indicates if the new reboot schedule is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Frequency

Frequency with which this schedule runs (either Weekly or Daily or Monthly).

Type:	RebootScheduleFrequency
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-FrequencyFactor

The frequency factor for the reboot schedule. It indicates how often the schedule should run with respect to the frequency. For example, if the FrequencyFactor is set to 2, it means every two days from the StartDate when the Frequency is Daily, every two weeks from StartDate when the Frequency is Weekly, and similarly for monthly. It defaults to 1 if not provided. StartDate property needs to be provided if the frequency factor is greater than 1.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IgnoreMaintenanceMode

Boolean value to reboot machines in maintenance mode

Type:	Boolean
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxOvertimeStartMins

Maximum delay in minutes after which the scheduled reboot will not take place.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RestrictToTag

If set the reboot schedule only applies to machines in the desktop group with the specified tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-StartDate

The date on which the first schedule is expected to run, date is in ISO 8601 Format (YYYY-MM-DD). The actual start date to match the frequency pattern need not be provided. For example, if today is Monday and the schedule is set to run every Sunday for every four weeks, there is no need to identify the date on which Sunday falls after four weeks. Today's date ((Get-Date).Date.ToString('yyyy-MM-dd')) can be provided and the service would adjust the start date to reflect the actual date i.e, the Sunday four weeks from today. Get-BrokerRebootScheduleV2 cmdlet will reflect the actual start date.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-StartTime

Time of day at which the scheduled reboot cycle starts (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UseNaturalReboot

Boolean value indicating whether the machines should reboot whenever they happen to have no sessions, rather than at equally spaced times within the cycle duration.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningDuration

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed. In some cases the time required to process a reboot schedule may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-WarningRepeatInterval

Time to wait after the previous reboot warning before displaying the warning message in all user sessions on that machine again. If the warning repeat interval is zero then the warning message is not displayed after the initial warning.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-WeekInMonth

For monthly schedules, the week in the month on which the scheduled reboot-cycle starts (one of First, Second, Third, Fourth, Last).

Type:	RebootScheduleWeeks
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RebootScheduleV2

New-BrokerRemotePCAccount

March 11, 2024

Create a new RemotePCAccount.

Syntax

```
New-BrokerRemotePCAccount
   [-AllowSubfolderMatches <Boolean>]
   -CatalogUid <Int32>
   [-MachinesExcluded <String[]>]
   [-MachinesIncluded <String[]>]
   -OU <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Create a new RemotePCAccount. A RemotePCAccount defines machine filters to support Remote PC automation adding unconfigured machines to catalogs.

Examples

EXAMPLE 1

Create a RemotePCAccount that adds unconfigured machines with computer objects in MyOU, into catalog 42.

```
New-BrokerRemotePCAccount -OU 'ou=MyOU,dc=MyDomain,dc=com' -CatalogUid
    42
```

EXAMPLE 2

Create a RemotePCAccount matching unconfigured machines from DOMAIN1, except those with host-names containing JOHNDOE, and add them to catalog 42.

```
New-BrokerRemotePCAccount -OU 'any' -CatalogUid 42 -MachinesIncluded @(
    'DOMAIN1\*') -MachinesExcluded @('DOMAIN1\*JOHNDOE*')
```

EXAMPLE 3

Create a RemotePCAccount that matches any unconfigured machine, causing automation to add matching machines to catalog 42.

```
New-BrokerRemotePCAccount -OU 'any' -CatalogUid 42
```

Parameters

-CatalogUid

Specifies the catalog which Remote PC automation adds an unconfigured machine to if it matches this RemotePCAccount.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-OU

Specifies the DN of an AD container, or has the special value ‘any’.

When an AD container is specified a machine may only match with the RemotePCAccount when the AD computer object is located relative to the OU.

When ‘any’is specified the location of the AD computer object is ignored for purposes of matching this RemotePCAccount. The machine must still meet the MachinesIncluded and MachinesExcluded filters for a match to occur.

In the event that a machine matches with multiple RemotePCAccounts then the RemotePCAccount OU with the longest canonical name takes precedence. The special 'any'OU is treated as lowest priority.

Note that the OU value of every RemotePCAccount must be unique, and this includes only one 'any' entry being permitted.

Type:	String
Position:	Named
Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AllowSubfolderMatches

When true a machine matches this RemotePCAccount if the AD computer object exists within the container specified by the OU property, or within a child container of the OU.

When false the AD computer object only matches if it exists directly in the AD container specified by the OU property.

This property is not meaningful when OU has the special value 'any'.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MachinesExcluded

MachinesExcluded specifies a set of strings that can include asterisk wildcards. If a machine name matches any entries in MachinesExcluded then it cannot match with this RemotePCAccount regardless of whether there is a MachinesIncluded match.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Type:	String[]
Position:	Named
Default value:	@()
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MachinesIncluded

MachinesIncluded specifies a set of strings that can include asterisk wildcards. A machine may only match with this RemotePCAccount if it matches a MachinesIncluded entry and does not match any MachinesExcluded entries.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Type:	String[]
Position:	Named
Default value:	@('*')
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.RemotePCAccount

The newly created RemotePCAccount.

New-BrokerSessionLinger

March 11, 2024

Creates a new session linger setting for a desktop group.

Syntax

```
New-BrokerSessionLinger
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerSessionLinger
   [-DesktopGroupName] <String>
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerSessionLinger cmdlet is used to define a session linger setting for a desktop group.

Note that each desktop group can only have a single session linger setting. Session lingering only applies to application sessions.

Examples

EXAMPLE 1

Creates a new session linger setting with a disconnect timer of 30 minutes and terminate timer of 1 hour.

```
New-BrokerSessionLinger -DesktopGroupName test -Enabled $true -
    MaxTimeBeforeDisconnect 0:30 -MaxTimeBeforeTerminate 1:00
```

Parameters

-DesktopGroupName

The name of the desktop group that this linger setting is applied to.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

The Uid of the desktop group that this linger setting is applied to.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the new session linger is enabled.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxAverageLoadThreshold

Specifies the average load threshold across the desktop group. When the threshold hits, lingering sessions across the group be terminated to reduce load. Sessions that have been lingering the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxLoadPerMachineThreshold

Specifies the maximum load threshold per machine in the desktop group. When the threshold hits, lingering sessions on each loaded machine will be terminated to reduce load. Sessions that have been lingering the longest will be chosen first.

Type:	Int32
Position:	Named

Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxTimeBeforeDisconnect

Specifies the time by which a lingering session will be disconnected. The disconnect timer is optional, but when specified the terminate timer needs to be also set. The disconnect time cannot be greater than the terminate time. When the disconnect and terminate times are the same, the terminate timer takes precedence. The disconnect timer needs to be paired with a session termination condition like the terminate timer or one of load threshold settings.

Type:	TimeSpan
Position:	Named
Default value:	15 minutes
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxTimeBeforeTerminate

Specifies the time by which a lingering session will be terminated. The terminate timer is not optional when timers are configured. When the disconnect and terminate times are the same, the terminate timer takes precedence.

Type:	TimeSpan
Position:	Named
Default value:	8 hours
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UserFilterEnabled

Specifies whether the session linger's user filter is enabled or disabled. Where the user filter is enabled, lingering is enabled only to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Depends on parameter

Parameters can be piped by property name.

Outputs

Citrix.Broker.Admin.SDK.SessionLinger

New-BrokerSessionLinger returns a session linger object.

New-BrokerSessionPreLaunch

March 11, 2024

Creates a new session pre-launch setting for a desktop group.

Syntax

```
New-BrokerSessionPreLaunch
   -DesktopGroupUid <Int32>
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
```

```
    [-UserFilterEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
New-BrokerSessionPreLaunch
    [-DesktopGroupName] <String>
    [-Enabled <Boolean>]
    [-MaxAverageLoadThreshold <Int32>]
    [-MaxLoadPerMachineThreshold <Int32>]
    [-MaxTimeBeforeDisconnect <TimeSpan>]
    [-MaxTimeBeforeTerminate <TimeSpan>]
    [-UserFilterEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-BrokerSessionPreLaunch cmdlet is used to define a session pre-launch setting for a desktop group.

Note that each desktop group can only have a single session pre-launch setting. Session pre-launch only applies to application sessions.

Examples

EXAMPLE 1

Creates a new session pre-launch setting with a disconnect timer of 30 minutes and terminate timer of 1 hour.

```
New-BrokerSessionPreLaunch -DesktopGroupName test -Enabled $true -
    MaxTimeBeforeDisconnect 0:30 -MaxTimeBeforeTerminate 1:00
```

Parameters

-DesktopGroupName

The name of the desktop group that this pre-launch setting is applied to.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DesktopGroupUid

The Uid of the desktop group that this pre-launch setting is applied to.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the new session pre-launch is enabled.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxAverageLoadThreshold

Specifies the average load threshold across the desktop group. When the threshold hits, pre-launched sessions across the group be terminated to reduce load. Sessions that have been pre-launched the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxLoadPerMachineThreshold

Specifies the maximum load threshold per machine in the desktop group. When the threshold hits, pre-launched sessions on each loaded machine will be terminated to reduce load. Sessions that have been pre-launched the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxTimeBeforeDisconnect

Specifies the time by which a pre-launched session will be disconnected. The disconnect timer is optional, but when specified the terminate timer needs to be also set. The disconnect time cannot be greater than the terminate time. When the disconnect and terminate times are the same, the terminate timer takes precedence. The disconnect timer needs to be paired with a session termination condition like the terminate timer or one of load threshold settings.

Type:	TimeSpan
Position:	Named
Default value:	15 minutes
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MaxTimeBeforeTerminate

Specifies the time by which a pre-launched session will be terminated. The terminate timer is not optional when timers are configured. When the disconnect and terminate times are the same, the terminate timer takes precedence.

Type:	TimeSpan
Position:	Named
Default value:	8 hours
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UserFilterEnabled

Specifies whether the session pre-launch's user filter is enabled or disabled. Where the user filter is enabled, pre-launch is enabled only to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Depends on parameter

Parameters can be piped by property name.

Outputs

Citrix.Broker.Admin.SDK.SessionPreLaunch

New-BrokerSessionPreLaunch returns a session pre-launch object.

New-BrokerStorefrontAddress

March 11, 2024

Creates a new StoreFront address configuration, specifying a single address.

Syntax

```
New-BrokerStorefrontAddress
   -Name <String>
   -Url <String>
   -Enabled <Boolean>
   -Description <String>
   [<CommonParameters>]
```

Description

Use this command when you want to create a new StoreFront configuration byte array from scratch, rather than modifying an existing one. You must define the URL for the StoreFront, and some additional details.

This command does not, by itself, have any persistent effects within XenDesktop. To make the change persistent, the new configuration byte array must first be transformed into a machine configuration within the Citrix Broker Service. To do this, use the New-BrokerMachineConfiguration command. You can then use the Add-BrokerMachineConfiguration and Set-BrokerMachineConfiguration commands to fully associate the new configuration with a delivery group.

Examples

EXAMPLE 1

This example shows a new configuration byte array being created to specify a single StoreFront address. The configuration byte array is then provided as input to the Get-BrokerStorefrontAddress command, which interprets and outputs the same fields.

```
$configuration = New-BrokerStorefrontAddress -Url "https://mysite.com/
    Citrix/StoreWeb" -Description "This StoreFront delivers my corporate
     applications" -Name "StoreFront1" -Enabled $true

Get-BrokerStorefrontAddress -ByteArray $configuration

Name               Url                                        Enabled
    Description
----               ---                                        -------
    -----------
StoreFront1        https://mysite.com/Citrix/StoreWeb           True
    This StoreFront delivers my corporate applications.
```

Parameters

-Name

Specifies the name of the new StoreFront.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Url

Specifies the URL to the StoreFront, such as “https://mysite.com/Citrix/StoreWeb”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Specifies if the new StoreFront address should be enabled for user access.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Specifies a human-readable description of the new StoreFront.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

The new configuration set, with all of the given modifications applied.

New-BrokerTag

March 11, 2024

Creates a new tag.

Syntax

```
New-BrokerTag
   [-Description <String>]
   [-Name] <String>
   [-Scope <String[]>]
   [-UUID <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a tag that can be associated with other objects using Add-BrokerTag.

Examples

EXAMPLE 1

Creates a new tag with name 'Tag1'.

```
New-BrokerTag -Name 'Tag1'
```

EXAMPLE 2

Creates a new tag with name ‘Tag2’and associates it with machine DOMAIN\Machine.

```
New-BrokerTag 'Tag2' | Add-BrokerTag -Machine DOMAIN\Machine
```

Parameters

-Name

Specifies a name for the new tag.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

A description for the tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Scope

Specifies the name of the delegated administration scope to which the tag should belong.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UUID

Specifies a UUID for the new tag. When not specified, a UUID is automatically assigned.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.Tag

Outputs the generated tag.

Related Links

- Add-BrokerTag
- Get-BrokerTag
- Remove-BrokerTag

- Set-BrokerTag

New-BrokerUniversalClaim

March 11, 2024

A claim can be an arbitrary string up to 450 characters in length. Each Claim is mapped to a Virtual SID. Virtual SIDs are generated by either taking a SHA256 hash of the claim, and storing the hash bytes in a SID format, or in the case of a SID string being used as a Claim, the SID is copied to the VirtualSid.

Syntax

```
New-BrokerUniversalClaim
   -Claim <String>
   [-DirectoryContext] <String>
   [-UniversalClaimsTenantContext <String>]
   [-VirtualSid] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new UniversalClaim object.

Examples

EXAMPLE 1

Creates a new UniversalClaim mapping

```
New-BrokerUniversalClaim -Claim AD:... -VirtualSid S-1-...1234 -
   DirectoryContext {
 .. }
```

Parameters

-VirtualSid

The VirtualSid for this UniversalClaim mapping.

Type: String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Claim

The Claim for this UniversalClaim mapping.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DirectoryContext

The DirectoryContext associated with this UniversalClaim mapping.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-UniversalClaimsTenantContext

The UnivesalClaimsTenantContext for this UniversalClaim mapping.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.UniversalClaim

Get-BrokerUniversalClaim returns an object for each matching broker UniversalClaim mapping.

Related Links

New-BrokerUser

March 11, 2024

Creates a new broker user object

Syntax

```
New-BrokerUser
   [-SID] <SecurityIdentifier>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerUser
   [-Name] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerUser cmdlet creates a new broker object to represent a user identity (or the identity of a group of users). The object is created local to the PowerShell environment in which the cmdlet is run; no new user object is created in the broker configuration, unless the object is added to another broker object, such as a machine or a desktop. For details, see Add-BrokerUser.

The identity of the user or group must be specified using either the Name or SID parameter

Examples

EXAMPLE 1

Create a broker user object for the specified user.

```
$user = New-BrokerUser DOMAIN\UserName
```

EXAMPLE 2

Create a broker user object for the specified user.

```
$user = New-BrokerUser -SID S
    -1-5-23-1763203430-193137401-908696819-3450
```

Parameters

-SID

The SID of the user or group

Type:	SecurityIdentifier
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

The name of the user or group

Type:	String
Position:	2
Default value:	Null
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.User

The broker user object

Notes

Typically, broker user objects are created implicitly using the

Add-BrokerUser cmdlet with a user name or SID.

New-BrokerUserZonePreference

March 11, 2024

Creates a zone preference for a user/group account in this site

Syntax

```
New-BrokerUserZonePreference
   -HomeZoneUid <Guid>
   [-Name] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-BrokerUserZonePreference
   -HomeZoneUid <Guid>
   [-SID] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The New-BrokerUserZonePreference cmdlet specifies a preferred home zone for resources launched using the specified user/group account.

Subject to the configuration of the desktop groups in use, and the availability of machines in the preferred zone, desktops and applications are launched using machines in that zone where possible.

Examples

EXAMPLE 1

Sets the preferred zone for resources launched by members of the EMEA\sales group account.

```
$zp = New-BrokerUserZonePreference EMEA\sales -HomeZoneUid 2E885C02-6
   B65-47AA-8B03-E855BE2FF7D7
```

Parameters

-Name

Name of the user/group account with which the new home zone preference is to be associated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-SID

SID of the user/group account with which the new home zone preference is to be associated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HomeZoneUid

The home zone preference to be associated with the user/group account.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.UserZonePreference

New-BrokerUserZonePreference returns the newly created zone preference object.

New-BrokerXmlServiceKey

March 11, 2024

Generate a new 256 bit, base64 encoded, XML Service Key

Syntax

```
New-BrokerXmlServiceKey
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

To be used with the Set-BrokerSite Cmdlet to set the two XmlServiceKey properties.

Examples

EXAMPLE 1

Sets XmlServiceKey1 in the Site settings

```
$xmlServiceKey1 = New-BrokerXmlServiceKey
Set-BrokerSite -XmlServiceKey1 $xmlServiceKey1
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

Remove-BrokerAccessPolicyRule

March 11, 2024

Deletes a rule from the site's access policy.

Syntax

```
Remove-BrokerAccessPolicyRule
      [-InputObject] <AccessPolicyRule[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerAccessPolicyRule
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerAccessPolicyRule cmdlet deletes a rule from the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Deleting a rule does not affect existing user sessions, but it may result in users being unable to launch new sessions, or reconnect to disconnected sessions if access to the desktop group delivering those sessions was granted by the deleted rule.

Examples

EXAMPLE 1

Deletes the access policy rule called Temp Staff. Existing sessions are not affected, but if access was granted by the deleted rule users may be unable to reconnect to sessions if they are subsequently disconnected.

```
Remove-BrokerAccessPolicyRule 'Temp Staff'
```

EXAMPLE 2

Deletes all access policy rules explicitly granting user SALES\johndoe access to any desktop group in the site. Any existing desktop sessions for the user are not affected. The user may still be able to access site resources by access policy rules that grant access through group membership or non-user-based connection filters.

```
Get-BrokerAccessPolicyRule -IncludedUsers sales\johndoe | Remove-
    BrokerAccessPolicyRule
```

Parameters

-InputObject

The access policy rule to be deleted.

Type:	AccessPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the access policy rule to be deleted.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AccessPolicyRule

The access policy rule to be deleted.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAccessPolicyRuleMetadata

March 11, 2024

Deletes AccessPolicyRule Metadata from the AccessPolicyRule objects

Syntax

```
Remove-BrokerAccessPolicyRuleMetadata
      [-InputObject] <AccessPolicyRule[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerAccessPolicyRuleMetadata cmdlet deletes Metadata from the AccessPolicyRule objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the AccessPolicyRule whose instance is pointed by $obj-Uid

```
Remove-BrokerAccessPolicyRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the AccessPolicyRule in the site

```
Get-BrokerAccessPolicyRule | Remove-BrokerAccessPolicyRuleMetadata -
    Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the AccessPolicyRule object's instance whose Metadata is to be deleted.

Type:	AccessPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule

You can pipe the AccessPolicyRule to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Remove-BrokerAdminFolder

March 11, 2024

Removes an admin folder.

Syntax

```
Remove-BrokerAdminFolder
      [-InputObject] <AdminFolder[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerAdminFolder
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerAdminFolder cmdlet removes an existing admin folder.

Remove-BrokerAdminFolder will not remove a folder if it contains any other objects (e.g. sub-folders or applications).

Examples

EXAMPLE 1

Removes the folder called F2 within the folder F1\

```
Remove-BrokerAdminFolder F1\F2\
```

Parameters

-InputObject

Identifies the folder to remove

Type:	AdminFolder[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name pattern of folder(s) to remove

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AdminFolder

The admin folder objects can be specified as input.

Outputs

None

This cmdlet does not return any output.

Remove-BrokerAdminFolderMetadata

March 11, 2024

Deletes AdminFolder Metadata from the AdminFolder objects

Syntax

```
Remove-BrokerAdminFolderMetadata
       [-InputObject] <AdminFolder[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerAdminFolderMetadata cmdlet deletes Metadata from the AdminFolder objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the AdminFolder whose instance is pointed by $obj-Uid

```
Remove-BrokerAdminFolderMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the AdminFolder in the site

```
Get-BrokerAdminFolder | Remove-BrokerAdminFolderMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the AdminFolder object’s instance whose Metadata is to be deleted.

Type:	AdminFolder[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAdminFolder

You can pipe the AdminFolder to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAppAssignmentPolicyRule

March 11, 2024

Deletes an application rule from the site's assignment policy.

Syntax

```
Remove-BrokerAppAssignmentPolicyRule
      [-InputObject] <AppAssignmentPolicyRule[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerAppAssignmentPolicyRule
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerAppAssignmentPolicyRule cmdlet deletes an application rule from the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Deleting an application rule does not remove machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Examples

EXAMPLE 1

Deletes the application rule called Temp Staff from the assignment policy. Access to machines already assigned by this rule is not affected in any way.

```
1 Remove-BrokerAppAssignmentPolicyRule 'Temp Staff'
```

EXAMPLE 2

Deletes the application rule for the Sales Support desktop group from the site's assignment policy. This prevents any further machine assignments being made from this group, but it does not affect existing assignments made by the rule.

```
1 $dg = Get-BrokerDesktopGroup 'Sales Support'
2 Get-BrokerAppAssignmentPolicyRule -DesktopGroupUid $dg.Uid | Remove-
     BrokerAppAssignmentPolicyRule
```

Parameters

-InputObject

The application rule to be deleted from the assignment policy.

Type:	AppAssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the application rule to be deleted from the assignment policy.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

The application rule to be deleted from the assignment policy.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAppEntitlementPolicyRule

March 11, 2024

Deletes an application rule from the site's entitlement policy.

Syntax

```
Remove-BrokerAppEntitlementPolicyRule
       [-InputObject] <AppEntitlementPolicyRule[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerAppEntitlementPolicyRule
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerAppEntitlementPolicyRule cmdlet deletes an application rule from the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Deleting a rule does not affect existing sessions launched using the rule, but users cannot reconnect to those sessions if they are subsequently disconnected.

Examples

EXAMPLE 1

Deletes the application rule called Temp Workers from the entitlement policy rule. Existing application sessions launched using that rule are not affected, but users cannot reconnect to those sessions if they are subsequently disconnected.

```
1 Remove-BrokerAppEntitlementPolicyRule 'Temp Workers'
```

EXAMPLE 2

Deletes the application rule from the entitlement policy rule applied to the Customer Support desktop group. This effectively removes all access to the applications published from this group. Existing application sessions are not affected, but users cannot reconnect to those sessions if they are subsequently disconnected.

```
1 $dg = Get-BrokerDesktopGroup 'Customer Support'
2 Get-BrokerAppEntitlementPolicyRule -DesktopGroupUid $dg.Uid | Remove-
     BrokerAppEntitlementPolicyRule
```

Parameters

-InputObject

The application rule to be deleted from the entitlement policy.

Type:	AppEntitlementPolicyRule[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the application rule to be deleted from the entitlement policy.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

The application rule to be deleted from the entitlement policy.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Remove-BrokerApplication

March 11, 2024

Deletes one or more applications, or an association of an application.

Syntax

```
Remove-BrokerApplication
      [-InputObject] <Application[]>
      [-Force]
      [-ApplicationGroup <ApplicationGroup>]
      [-DesktopGroup <DesktopGroup>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerApplication
      [-Force]
      [-Name] <String>
      [-ApplicationGroup <ApplicationGroup>]
      [-DesktopGroup <DesktopGroup>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerApplication cmdlet deletes one or more applications, or you can use it to delete just the association of an application to a desktop group or application group.

Its usage dictates the behavior of the cmdlet. If only the application is specified as a parameter, then the cmdlet deletes the application. It also deletes any associations this application has with other objects, such as with access policy rules or desktop groups. More specifically, when an application is deleted the following happens:

- The association to any desktop groups is removed.
- The association to any application groups is removed.
- The association to any tags is removed.
- Any configured file-type association objects for this application are deleted.
- The association to any user accounts is removed.
- The association to any access session conditions is removed.
- The access policy rule object for this application, if one existed, is deleted.
- Finally, the application object itself is deleted.

Note that if the application is in use by a user then the application cannot be deleted.

If more than just the application is supplied as a parameter to the cmdlet (for instance, if a Desktop-Group object is also specified) then the application is not deleted. Instead, only the association from the application to that desktop group is removed.

Examples

EXAMPLE 1

This command deletes the application that has a BrowserName of "Notepad".

```
Remove-BrokerApplication "Notepad"
```

EXAMPLE 2

This command removes the association of the desktop group that has a name of "Private Desktop-Group"from the application that has a BrowserName of "Notepad". It does not otherwise modify the application.

```
$app = Get-BrokerApplication -BrowserName "Notepad"
$group = Get-BrokerDesktopGroup -Name "Private DesktopGroup"
Remove-BrokerApplication -InputObject $app -DesktopGroup $group
```

Parameters

-InputObject

Specifies the applications to delete. The Uid can also be substituted for the application objects.

Type:	Application[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application to remove.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Force

Remove application even if it's in use. Removing an application that is currently in use, can potentially leave an application session containing no applications. If all the applications that are currently active in a disconnected application session are removed, the user will be unable to reconnect to the session. Forcing removal of an in-use application does not impact the actual session itself.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationGroup

Specifies the application group that this application should no longer be associated with. The Uid or Name can also be substituted for the application group object.

Type:	ApplicationGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

Specifies the desktop group that this application should no longer be associated with. The Uid or Name can also be substituted for the desktop group object.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Application

The application objects can be specified as input.

Outputs

None

This cmdlet does not return any output.

Remove-BrokerApplicationGroup

March 11, 2024

Remove application groups from the system, or break the association between an application group and a desktop group.

Syntax

```
Remove-BrokerApplicationGroup
       [-InputObject] <ApplicationGroup[]>
       [-Force]
       [-DesktopGroup <DesktopGroup>]
       [-LoggingId <Guid>]
```

```
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-BrokerApplicationGroup
        [-Force]
        [-Name] <String>
        [-DesktopGroup <DesktopGroup>]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet has 2 functions:

- Break associations between application groups and desktop groups.
- Remove application groups from the system.

Associating an application group with a desktop group allows the applications that are members of that application group to be launched on machines that are members of the associated desktop group. Breaking that association means that those applications may no longer be launched on those machines.

To remove an application group from the system, you must first remove all of its applications. Use the Remove-BrokerApplication cmdlet to remove an application (either to remove it from an application group, or to remove it from the system entirely).

Examples

EXAMPLE 1

Remove the association between the 'Office'application group and the 'Windows10VDAs'desktop group. The 'Office'applications will no longer be launchable on the machines in the 'Windows10VDAs' desktop group.

```
Remove-BrokerApplicationGroup Office -DesktopGroup Windows10VDAs
```

EXAMPLE 2

Remove the 'Office'application group from the system altogether. You must remove all applications from the application group first.

```
Remove-BrokerApplicationGroup Office
```

Parameters

-InputObject

Specifies the application groups to remove.

Type:	ApplicationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Removes application groups whose name matches the given pattern.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Force

When this flag is specified, an application group may be removed from the system even if its Session-SharingEnabled property is false and one of its applications is still running in some session.

Such an application group cannot by default be removed, because doing so would allow for other applications to be launched into existing sessions. Either wait until the sessions associated with the application group have exited, or use the -Force flag.

Type:	SwitchParameter
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroup

When this parameter is specified, the application groups are removed from the given desktop group. The desktop group may be specified either by its Uid or by its name.

When this parmeter is not specified, the application groups are removed from the system entirely.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.ApplicationGroup

You can pipe application groups to Remove-BrokerApplicationGroup.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerApplicationGroupMetadata

March 11, 2024

Deletes ApplicationGroup Metadata from the ApplicationGroup objects

Syntax

```
Remove-BrokerApplicationGroupMetadata
      [-InputObject] <ApplicationGroup[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerApplicationGroupMetadata cmdlet deletes Metadata from the ApplicationGroup objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the ApplicationGroup whose instance is pointed by $obj-Uid

```
Remove-BrokerApplicationGroupMetadata -InputObject $obj-Uid -Name "
   MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the ApplicationGroup in the site

```
Get-BrokerApplicationGroup | Remove-BrokerApplicationGroupMetadata -
   Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the ApplicationGroup object's instance whose Metadata is to be deleted.

Type:	ApplicationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerApplicationGroup

You can pipe the ApplicationGroup to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerApplicationInstanceMetadata

March 11, 2024

Deletes ApplicationInstance Metadata from the ApplicationInstance objects

Syntax

```
Remove-BrokerApplicationInstanceMetadata
      [-InputObject] <ApplicationInstance[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerApplicationInstanceMetadata cmdlet deletes Metadata from the ApplicationInstance objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the ApplicationInstance whose instance is pointed by $obj-Uid

```
Remove-BrokerApplicationInstanceMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the ApplicationInstance in the site

```
Get-BrokerApplicationInstance | Remove-
    BrokerApplicationInstanceMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the ApplicationInstance object's instance whose Metadata is to be deleted.

Type:	ApplicationInstance[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerApplicationInstance

You can pipe the ApplicationInstance to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerApplicationMetadata

March 11, 2024

Deletes Application Metadata from the Application objects

Syntax

```
Remove-BrokerApplicationMetadata
       [-InputObject] <Application[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerApplicationMetadata cmdlet deletes Metadata from the Application objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Application whose instance is pointed by $obj-Uid

```
Remove-BrokerApplicationMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Application in the site

```
Get-BrokerApplication | Remove-BrokerApplicationMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the Application object’s instance whose Metadata is to be deleted.

Type:	Application[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerApplication

You can pipe the Application to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAssignmentPolicyRule

March 11, 2024

Deletes a desktop rule from the site's assignment policy.

Syntax

```
Remove-BrokerAssignmentPolicyRule
      [-InputObject] <AssignmentPolicyRule[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerAssignmentPolicyRule
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerAssignmentPolicyRule cmdlet deletes a desktop rule from the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Deleting a desktop rule does not remove machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Examples

EXAMPLE 1

Deletes the desktop rule called Temp Staff from the assignment policy. Access to machines already assigned by this rule is not affected in any way.

```
Remove-BrokerAssignmentPolicyRule 'Temp Staff'
```

EXAMPLE 2

Deletes all desktop rules for the Sales Support desktop group from the site's assignment policy. This prevents any further machine assignments being made from this group, but it does not affect existing assignments made by these rules.

```
$dg = Get-BrokerDesktopGroup 'Sales Support'
Get-BrokerAssignmentPolicyRule -DesktopGroupUid $dg.Uid | Remove-
    BrokerAssignmentPolicyRule
```

Parameters

-InputObject

The desktop rule to be deleted from the assignment policy.

Type:	AssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the desktop rule to be deleted from the assignment policy.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

The desktop rule to be deleted from the assignment policy.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAssignmentPolicyRuleMetadata

March 11, 2024

Deletes AssignmentPolicyRule Metadata from the AssignmentPolicyRule objects

Syntax

```
Remove-BrokerAssignmentPolicyRuleMetadata
      [-InputObject] <AssignmentPolicyRule[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerAssignmentPolicyRuleMetadata cmdlet deletes Metadata from the Assignment-PolicyRule objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the AssignmentPolicyRule whose instance is pointed by $obj-Uid

```
Remove-BrokerAssignmentPolicyRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the AssignmentPolicyRule in the site

```
Get-BrokerAssignmentPolicyRule | Remove-
    BrokerAssignmentPolicyRuleMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the AssignmentPolicyRule object’s instance whose Metadata is to be deleted.

Type:	AssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule

You can pipe the AssignmentPolicyRule to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAutoTagRule

March 11, 2024

Removes an AutoTagRule.

Syntax

```
Remove-BrokerAutoTagRule
       [-InputObject] <AutoTagRule[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerAutoTagRule
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes an AutoTagRule.

Examples

EXAMPLE 1

Removes RandomAllocatedCatalogs AutoTagRule.

```
Remove-BrokerAutoTagRule -Name RandomAllocatedCatalogs
```

Parameters

-InputObject

Specifies the AutoTagRule to remove.

Type:	AutoTagRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the AutoTagRule to remove.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AutoTagRule

AutoTagRules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerAutoTagRuleMetadata

March 11, 2024

Deletes AutoTagRule Metadata from the AutoTagRule objects

Syntax

```
Remove-BrokerAutoTagRuleMetadata
       [-InputObject] <AutoTagRule[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerAutoTagRuleMetadata cmdlet deletes Metadata from the AutoTagRule objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the AutoTagRule whose instance is pointed by $obj-Uid

```
Remove-BrokerAutoTagRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the AutoTagRule in the site

```
Get-BrokerAutoTagRule | Remove-BrokerAutoTagRuleMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the AutoTagRule object’s instance whose Metadata is to be deleted.

Type:	AutoTagRule[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAutoTagRule

You can pipe the AutoTagRule to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerCatalog

March 11, 2024

Removes catalogs from the site.

Syntax

```
Remove-BrokerCatalog
       [-InputObject] <Catalog[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerCatalog
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Remove catalogs from the site.

In order to remove a catalog from a site, the catalog must not contain machines. To remove a machine from a catalog use the Remove-BrokerMachine cmdlet. Note: in order to remove a machine from a catalog, it must not belong to a desktop group.

Examples

EXAMPLE 1

These commands delete the catalog with the name "MyCatalog".

```
Remove-BrokerCatalog -Name "MyCatalog"
Remove-BrokerCatalog -InputObject (Get-BrokerCatalog -Name "MyCatalog")
```

EXAMPLE 2

This command deletes all catalogs with names beginning with "test".

```
Remove-BrokerCatalog -Name 'test*'
```

EXAMPLE 3

Remove all the Remote PC catalogs that are associated with desktop group 42. Note that this only breaks the Remote PC relationships and does not delete the desktop groups.

```
Get-BrokerCatalog -RemotePCDesktopGroupUid 42 | Remove-BrokerCatalog -
    RemotePCDesktopGroup 42
```

Parameters

-InputObject

Specifies the catalog objects to delete.

Type:	Catalog[]
Position:	2
Default value:	Null

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the catalog to delete.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

You can pipe the catalogs to be deleted to Remove-BrokerCatalog.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerCatalogMetadata

March 11, 2024

Deletes Catalog Metadata from the Catalog objects

Syntax

```
Remove-BrokerCatalogMetadata
       [-InputObject] <Catalog[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerCatalogMetadata cmdlet deletes Metadata from the Catalog objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the Catalog whose instance is pointed by $obj-Uid

```
Remove-BrokerCatalogMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the Catalog in the site

```
Get-BrokerCatalog | Remove-BrokerCatalogMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the Catalog object's instance whose Metadata is to be deleted.

Type:	Catalog[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerCatalog

You can pipe the Catalog to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerCatalogRebootSchedule

March 11, 2024

Removes the reboot schedule.

Syntax

```
Remove-BrokerCatalogRebootSchedule
       [-InputObject] <CatalogRebootSchedule[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerCatalogRebootSchedule
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerCatalogRebootSchedule cmdlet is used to delete an existing catalog reboot schedule.

Examples

EXAMPLE 1

Deletes every catalog reboot schedule.

```
Get-BrokerCatalogRebootSchedule | Remove-BrokerCatalogRebootSchedule
```

EXAMPLE 2

Deletes the catalog reboot schedule having Uid 12.

```
Remove-BrokerCatalogRebootSchedule 12
```

EXAMPLE 3

Deletes the catalog reboot schedule named Accounting.

```
Remove-BrokerCatalogRebootSchedule -Name Accounting
```

Parameters

-InputObject

The catalog reboot schedule to be removed.

Type:	CatalogRebootSchedule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the catalog reboot schedule to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.CatalogRebootSchedule

Reboot schedules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerConfigurationSlot

March 11, 2024

Removes a configuration slot.

Syntax

```
Remove-BrokerConfigurationSlot
       [-InputObject] <ConfigurationSlot[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerConfigurationSlot
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes a configuration slot from the site.

All machine configurations associated with this slot are also removed.

Examples

EXAMPLE 1

Remove the configuration slot named “User Profile Manager”.

```
1  Remove-BrokerConfigurationSlot -Name "User Profile Manager"
```

Parameters

-InputObject

Configuration slot to remove.

Type:	ConfigurationSlot[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Name of configuration slot to remove.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Configuration slot to remove

Configuration slots may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerConfigurationSlotMetadata

March 11, 2024

Deletes ConfigurationSlot Metadata from the ConfigurationSlot objects

Syntax

```
Remove-BrokerConfigurationSlotMetadata
      [-InputObject] <ConfigurationSlot[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerConfigurationSlotMetadata cmdlet deletes Metadata from the ConfigurationSlot objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

```
Remove-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the ConfigurationSlot in the site

```
Get-BrokerConfigurationSlot | Remove-BrokerConfigurationSlotMetadata -
    Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the ConfigurationSlot object’s instance whose Metadata is to be deleted.

Type:	ConfigurationSlot[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerConfigurationSlot

You can pipe the ConfigurationSlot to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerConfiguredFTA

March 11, 2024

Deletes one or more configured file type associations.

Syntax

```
Remove-BrokerConfiguredFTA
       [-InputObject] <ConfiguredFTA[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Deletes one or more file type associations configured for a published application. At least one configured file type association object must be specified.

Examples

EXAMPLE 1

Deletes all configured file type associations with an extension name of ".txt".

```
$ftas = Get-BrokerConfiguredFTA -ExtensionName ".txt"
Remove-BrokerConfiguredFTA $ftas
```

Parameters

-InputObject

Specifies the ConfiguredFTA objects to delete.

Type:	ConfiguredFTA[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.ConfiguredFTA[]

One or more ConfiguredFTA objects can be supplied as input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerControllerMetadata

March 11, 2024

Deletes Controller Metadata from the Controller objects

Syntax

```
Remove-BrokerControllerMetadata
      [-InputObject] <Controller[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerControllerMetadata cmdlet deletes Metadata from the Controller objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Controller whose instance is pointed by $obj-Uid

```
Remove-BrokerControllerMetadata -InputObject $obj-Uid -Name "
   MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Controller in the site

```
Get-BrokerController | Remove-BrokerControllerMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the Controller object’s instance whose Metadata is to be deleted.

Type:	Controller[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerController

You can pipe the Controller to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerDelayedHostingPowerAction

March 11, 2024

Cancels one or more delayed power actions.

Syntax

```
Remove-BrokerDelayedHostingPowerAction
      [-InputObject] <DelayedHostingPowerAction[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerDelayedHostingPowerAction
      [-MachineName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes one or more delayed power actions that have not yet been queued for execution.

Examples

EXAMPLE 1

Cancels any pending delayed power actions for the machine called XD_VDA1.

```
Remove-BrokerHostingPowerAction -MachineName 'XD_VDA1'
```

Parameters

-InputObject

The power action to be cancelled.

Type:	DelayedHostingPowerAction[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

Cancels only actions for machines whose name (of the form domain\machine) matches the specified string.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DelayedHostingPowerAction

The power action to be cancelled.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerDesktopGroup

March 11, 2024

Remove desktop groups from the system or remove them from a Remote PC catalog.

Syntax

```
Remove-BrokerDesktopGroup
      [-InputObject] <DesktopGroup[]>
      [-Force]
      [-RemotePCCatalog <Catalog>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerDesktopGroup
      [-Force]
      [-Name] <String>
      [-RemotePCCatalog <Catalog>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet has 2 functions:

- Remove desktop groups from the system.
- Break Remote PC associations between desktop groups and a catalog.

The Remote PC relationships are used by Remote PC automation to determine which desktop groups a machine in a particular Remote PC catalog can be published to. The assignment policy rules belonging to those desktop groups also determines the set of users that are allowed to be assigned to machines from the catalog.

Examples

EXAMPLE 1

Remove all desktop groups with names starting with “EMEA”.

```
Remove-BrokerDesktopGroup EMEA*
```

EXAMPLE 2

Remove all desktops that are currently disabled even if there are active sessions.

```
Get-BrokerDesktopGroup -Enabled $false | Remove-BrokerDesktopGroup -
    Force
```

EXAMPLE 3

Remove all the Remote PC desktop groups that are associated with catalog 42. Note that this only breaks the Remote PC relationships and does not delete the desktop groups.

```
Get-BrokerDesktopGroup -RemotePCCatalogUid 42 | Remove-
    BrokerDesktopGroup -RemotePCCatalog 42
```

Parameters

-InputObject

Specifies the desktop groups to remove.

Type:	DesktopGroup[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the desktop group to remove.

Type:	String
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Force

Remove desktop groups even if there are active sessions.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemotePCCatalog

When this parameter is specified, Remote PC desktop groups are removed from the specified Remote PC catalog.

Type:	Catalog
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

You can pipe desktop groups to Remove-BrokerDesktopGroup.

Outputs

None

By default, this cmdlet returns no output.

Notes

If a desktop group contains desktops when it is removed, these desktops are also removed (but the underlying broker machine remains).

A desktop group that still has active sessions cannot be removed unless the -Force switch is used.

Remove-BrokerDesktopGroupMetadata

March 11, 2024

Deletes DesktopGroup Metadata from the DesktopGroup objects

Syntax

```
Remove-BrokerDesktopGroupMetadata
       [-InputObject] <DesktopGroup[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerDesktopGroupMetadata cmdlet deletes Metadata from the DesktopGroup objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the DesktopGroup whose instance is pointed by $obj-Uid

```
Remove-BrokerDesktopGroupMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the DesktopGroup in the site

```
1 Get-BrokerDesktopGroup | Remove-BrokerDesktopGroupMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the DesktopGroup object's instance whose Metadata is to be deleted.

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerDesktopGroup

You can pipe the DesktopGroup to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerDesktopGroupWebhook

March 11, 2024

Remove the webhook from a desktop group

Syntax

```
Remove-BrokerDesktopGroupWebhook
      [-InputObject] <DesktopGroupWebhook[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is used to remove the configured webhook from a desktop group

Examples

EXAMPLE 1

Removes the webhook configured for the desktop group with Uid 1

```
Get-BrokerDesktopGroupWebhook -DesktopGroupUid 1 | Remove-
   BrokerDesktopGroupWebhook
```

Parameters

-InputObject

Sepcified the webhook to remove

Type:	DesktopGroupWebhook[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroupWebhook

You can pipe webhooks to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerEntitlementPolicyRule

March 11, 2024

Deletes a desktop rule from the site's entitlement policy.

Syntax

```
Remove-BrokerEntitlementPolicyRule
      [-InputObject] <EntitlementPolicyRule[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerEntitlementPolicyRule
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerEntitlementPolicyRule cmdlet deletes a desktop rule from the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Deleting a rule does not affect existing sessions launched using the rule, but users cannot reconnect to those sessions if they are subsequently disconnected.

Examples

EXAMPLE 1

Deletes the desktop rule called Temp Workers from the entitlement policy. Existing desktop sessions launched using the rule are not affected, but users cannot reconnect to sessions if they are subsequently disconnected.

```
Remove-BrokerEntitlementPolicyRule 'Temp Workers'
```

EXAMPLE 2

Deletes all desktop rules from the entitlement policy applying to the Customer Support desktop group. This effectively removes all access to the desktops published from this group. Existing desktop sessions are not affected, but users cannot reconnect to sessions if they are subsequently disconnected.

```
$dg = Get-BrokerDesktopGroup 'Customer Support'
Get-BrokerEntitlementPolicyRule -DesktopGroupUid $dg.Uid | Remove-
    BrokerEntitlementPolicyRule
```

Parameters

-InputObject

The desktop rule to be deleted from the entitlement policy.

Type:	EntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the desktop rule to be deleted from the entitlement policy.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

The desktop rule to be deleted from the entitlement policy.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerEntitlementPolicyRuleMetadata

March 11, 2024

Deletes EntitlementPolicyRule Metadata from the EntitlementPolicyRule objects

Syntax

```
Remove-BrokerEntitlementPolicyRuleMetadata
      [-InputObject] <EntitlementPolicyRule[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerEntitlementPolicyRuleMetadata cmdlet deletes Metadata from the Entitlement-PolicyRule objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the EntitlementPolicyRule whose instance is pointed by $obj-Uid

```
Remove-BrokerEntitlementPolicyRuleMetadata -InputObject $obj-Uid -Name
    "MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the EntitlementPolicyRule in the site

```
Get-BrokerEntitlementPolicyRule | Remove-
    BrokerEntitlementPolicyRuleMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the EntitlementPolicyRule object's instance whose Metadata is to be deleted.

Type:	EntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule

You can pipe the EntitlementPolicyRule to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerGpoFilter

March 11, 2024

Removes a GPO filter.

Syntax

```
Remove-BrokerGpoFilter
       [-InputObject] <GpoFilter[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Remove a GPO filter.

Examples

EXAMPLE 1

Remove the filter with the specified ID.

```
Remove-BrokerGpoFilter ([Guid]"12345678-...")
```

Parameters

-InputObject

Specifies the GPO filter object to remove.

Type:	GpoFilter[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoFilter

GPO filters may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerGpoPolicy

March 11, 2024

Remove a GPO policy.

Syntax

```
Remove-BrokerGpoPolicy
       [-InputObject] <GpoPolicy[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerGpoPolicy
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Remove a GPO policy.

Examples

EXAMPLE 1

Remove all policies that have the word 'test'in their names.

```
Get-BrokerGpoPolicy -Name '*test*' | Remove-BrokerGpoPolicy
```

Parameters

-InputObject

Specifies the GPO policy object to remove.

Type:	GpoPolicy[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the GPO policy object to remove.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoPolicy

You can pipe GPO policies to Remove-BrokerGpoPolicy.

Outputs

None

By default, this cmdlet returns no output.

Notes

Removing a policy changes the priorities of other existing policies.

Remove-BrokerGpoPolicySet

March 11, 2024

Remove a GPO policy set.

Syntax

```
Remove-BrokerGpoPolicySet
      [-InputObject] <GpoPolicySet[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerGpoPolicySet
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove a GPO policy set. The policies, filters, and settings that are in the policy set are removed, as well as the policy set object itself.

Examples

EXAMPLE 1

Remove the specified policy set in the database.

```
Remove-BrokerGpoPolicySet ([Guid]"12345678-...")
```

Parameters

-InputObject

Specifies the policy set to remove.

Type:	GpoPolicySet[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the policy set to remove.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Broker.Admin.SDK.GpoPolicySet

Remove-BrokerGpoPolicySet removes a GPO policy set object.

Remove-BrokerGpoSetting

March 11, 2024

Remove a GPO setting.

Syntax

```
Remove-BrokerGpoSetting
      [-InputObject] <GpoSetting[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerGpoSetting
      [-SettingName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove a GPO setting.

Examples

EXAMPLE 1

Remove the setting with the specified GUID.

```
Remove-BrokerGpoSetting ([Guid]"12345678-...")
```

Parameters

-InputObject

Specifies the GPO setting object to remove.

Type:	GpoSetting[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SettingName

Specifies the name of the GPO setting object to remove.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoSetting

GPO settings may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerHostingPowerAction

March 11, 2024

Cancel one or more pending power actions.

Syntax

```
Remove-BrokerHostingPowerAction
      [-InputObject] <HostingPowerAction[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerHostingPowerAction
      [-MachineName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Causes one or more of the pending power actions in the queue to be marked as canceled. The affected power actions are not sent to the hypervisor for processing, and take no further part in the queuing activity.

Power actions cannot be canceled once they have started to be processed by the hypervisor.

Examples

EXAMPLE 1

Cancels any pending power actions for the machine called 'XD_VDA1'.

```
Remove-BrokerHostingPowerAction -MachineName 'XD_VDA1'
```

EXAMPLE 2

Cancels any pending power actions requested in the last five minutes.

```
Get-BrokerHostingPowerAction -Filter {
  State -eq "Pending" -and RequestTime -gt "-00:05"  }
  | Remove-BrokerHostingPowerAction
```

Parameters

-InputObject

The power action to be canceled.

Type:	HostingPowerAction[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

Cancels only actions for machines whose name (of the form domain\machine) matches the specified string.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.HostingPowerAction

The power action to be canceled.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerHostingPowerActionMetadata

March 11, 2024

Deletes HostingPowerAction Metadata from the HostingPowerAction objects

Syntax

```
Remove-BrokerHostingPowerActionMetadata
      [-InputObject] <HostingPowerAction[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerHostingPowerActionMetadata cmdlet deletes Metadata from the HostingPowerAction objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the HostingPowerAction whose instance is pointed by $obj-Uid

```
Remove-BrokerHostingPowerActionMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the HostingPowerAction in the site

```
Get-BrokerHostingPowerAction | Remove-BrokerHostingPowerActionMetadata
    -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the HostingPowerAction object’s instance whose Metadata is to be deleted.

Type:	HostingPowerAction[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerHostingPowerAction

You can pipe the HostingPowerAction to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerHypervisorAlertMetadata

March 11, 2024

Deletes HypervisorAlert Metadata from the HypervisorAlert objects

Syntax

```
Remove-BrokerHypervisorAlertMetadata
      [-InputObject] <HypervisorAlert[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerHypervisorAlertMetadata cmdlet deletes Metadata from the HypervisorAlert objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the HypervisorAlert whose instance is pointed by $obj-Uid

```
Remove-BrokerHypervisorAlertMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the HypervisorAlert in the site

```
Get-BrokerHypervisorAlert | Remove-BrokerHypervisorAlertMetadata -Name
    "MyMetadataName"
```

Parameters

-InputObject

Specifies the HypervisorAlert object's instance whose Metadata is to be deleted.

Type:	HypervisorAlert[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerHypervisorAlert

You can pipe the HypervisorAlert to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerHypervisorConnection

March 11, 2024

Removes a hypervisor connection from the system.

Syntax

```
Remove-BrokerHypervisorConnection
      [-InputObject] <HypervisorConnection[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerHypervisorConnection
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove-BrokerHypervisorConnection removes a hypervisor connection from the system. A hypervisor connection cannot be removed if it's being used by a machine.

Examples

EXAMPLE 1

This command removes a hypervisor connection by name.

```
Remove-BrokerHypervisorConnection -Name "Xen Server Connection"
```

EXAMPLE 2

Gets a hypervisor connection by preferred controller and removes it.

```
$hvConn = Get-BrokerHypervisorConnection -PreferredController "
    controllerName" -Name "Xen Server Connection"
Remove-BrokerHypervisorConnection -InputObject $hvConn
```

Parameters

-InputObject

Specifies the hypervisor connection object to remove.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the hypervisor connection object to remove.

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.HypervisorConnection

You can pipe the hypervisor connection to be removed to Remove-BrokerHypervisorConnection.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerHypervisorConnectionMetadata

March 11, 2024

Deletes HypervisorConnection Metadata from the HypervisorConnection objects

Syntax

```
Remove-BrokerHypervisorConnectionMetadata
      [-InputObject] <HypervisorConnection[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerHypervisorConnectionMetadata cmdlet deletes Metadata from the Hypervisor-Connection objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the HypervisorConnection whose instance is pointed by $obj-Uid

```
Remove-BrokerHypervisorConnectionMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the HypervisorConnection in the site

```
Get-BrokerHypervisorConnection | Remove-
    BrokerHypervisorConnectionMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the HypervisorConnection object’s instance whose Metadata is to be deleted.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerHypervisorConnection

You can pipe the HypervisorConnection to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerIcon

March 11, 2024

Remove an icon.

Syntax

```
Remove-BrokerIcon
       [-InputObject] <Icon[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes an icon from the database.

Examples

EXAMPLE 1

Removes the icon with Uid 3.

```
Remove-BrokerIcon 3
```

Parameters

-InputObject

Specifies the icon to remove.

Type:	Icon[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Icon

The icon to be removed can be piped into the cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

Note that if the icon is currently in use, for example, as a desktop icon, it cannot be removed until the association is cleared.

Remove-BrokerIconMetadata

March 11, 2024

Deletes Icon Metadata from the Icon objects

Syntax

```
Remove-BrokerIconMetadata
      [-InputObject] <Icon[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerIconMetadata cmdlet deletes Metadata from the Icon objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Icon whose instance is pointed by $obj-Uid

```
Remove-BrokerIconMetadata -InputObject $obj-Uid -Name "MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Icon in the site

```
Get-BrokerIcon | Remove-BrokerIconMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the Icon object’s instance whose Metadata is to be deleted.

Type:	Icon[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerIcon

You can pipe the Icon to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerImportDb

March 11, 2024

This cmdlet is for internal use only

Syntax

```
Remove-BrokerImportDb
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet is for internal use only

Examples

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet accepts no input

Outputs

None

By default, this cmdlet returns no output.

Related Links

Remove-BrokerImportedFTA

March 11, 2024

Deletes one or more imported file type associations.

Syntax

```
Remove-BrokerImportedFTA
      -DesktopGroupUids <Int32[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Deletes all of the imported file type associations belonging to one or more desktop groups. At least one desktop group must be specified.

Imported file type associations are grouped together based on the desktop group of the machine from which they were imported. All file types for a desktop group are deleted. There is no mechanism for deleting a subset imported file type associations for a specific desktop group.

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Examples

EXAMPLE 1

Deletes all imported file type associations

belonging to the “Sales VMs”desktop group.

```
$dg = Get-BrokerDesktopGroup -Name "Sales VMs"
Remove-BrokerImportedFTA -DesktopGroupUids $dg.Uid
```

Parameters

-DesktopGroupUids

Deletes the imported file type associations belonging

to specified desktop groups.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Int32[]

An array of Uids for the desktop groups can be supplied as input. The desktop groups must be of the Private or Shared desktop kind.

Outputs

None

By default, this cmdlet returns no output.

Notes

If an imported file type association is used to create a new configured file type association and the imported file type association is subsequently deleted, the configured file type association is not affected.

Remove-BrokerLease

March 11, 2024

Remove the specified lease in the Database.

Syntax

```
Remove-BrokerLease
      [-InputObject] <Lease[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerLease
      [-Key] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Marks the specified lease for deletion. Note that the lease is eventually fully deleted when enough time has been allowed for the deletion to propagate to all controller machines in the site, but is immediately removed from lease search results.

Examples

EXAMPLE 1

Marks the specified lease for deletion.

```
$lease = Get-BrokerLease -Uid 1
Remove-BrokerLease $lease
```

Parameters

-InputObject

Specifies the lease to remove.

Type:	Lease[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Key

Specifies the lease key of the lease to remove. A pattern can be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Lease

The lease to be removed can be piped into the cmdlet.

Outputs

None

This cmdlet does not return any output.

Notes

The lease is marked for deletion after this cmdlet is run. Note that the lease is eventually fully deleted when enough time has been allowed for the deletion to propagate to all controller machines in the site, but is immediately removed from lease search results.

Remove-BrokerLeaseMetadata

March 11, 2024

Deletes Lease Metadata from the Lease objects

Syntax

```
Remove-BrokerLeaseMetadata
      [-InputObject] <Lease[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerLeaseMetadata cmdlet deletes Metadata from the Lease objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Lease whose instance is pointed by $obj-Uid

```
Remove-BrokerLeaseMetadata -InputObject $obj-Uid -Name "MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Lease in the site

```
Get-BrokerLease | Remove-BrokerLeaseMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the Lease object’s instance whose Metadata is to be deleted.

Type:	Lease[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerLease

You can pipe the Lease to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet accepts no input

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerMachine

March 11, 2024

Removes one or more machines from its desktop group or catalog.

Syntax

```
Remove-BrokerMachine
      [-InputObject] <Machine[]>
      [-Force]
      [-DesktopGroup <DesktopGroup>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerMachine
      [-Force]
      [-MachineName] <String>
      [-DesktopGroup <DesktopGroup>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerMachine cmdlet removes one or more machines from their desktop group or catalog. There are three forms:

- Use the -InputObject parameter to remove a single machine instance or

array of instances from their desktop group or catalog.

- Use the -MachineName parameter to remove the single named machine from

its group or catalog.

- Use pipelining to pipe machine instances to the command.

To remove machines from their desktop group use the -DesktopGroup parameter; the specified group must be the one that contains the machines. If more than one machine is being removed from its group they must all be members of the same group.

If the -DesktopGroup parameter is not used then the machines are removed from their catalog. Removing a machine from its catalog deletes the record of the machine from the Citrix Broker Service.

Machines cannot be removed from their catalog while they are members of a desktop group.

Examples

EXAMPLE 1

These all remove a single machine from a desktop group, identifying the group by instance, UID, or name.

```
Remove-BrokerMachine -InputObject $machine -DesktopGroup $desktopGroup
Remove-BrokerMachine -InputObject $machine -DesktopGroup 2
Remove-BrokerMachine $machine -DesktopGroup "MyDesktopGroup"
```

EXAMPLE 2

These remove the machine called “DOMAIN\MyMachine”from its desktop group.

```
Remove-BrokerMachine -MachineName "DOMAIN\MyMachine" -DesktopGroup 2
Remove-BrokerMachine DOMAIN\MyMachine -DesktopGroup "MyDesktopGroup"
Remove-BrokerMachine DOMAIN\MyMachine -DesktopGroup $desktopGroup
```

EXAMPLE 3

These all remove a machine from its catalog.

```
Remove-BrokerMachine -MachineName DOMAIN\MyMachine
Remove-BrokerMachine "DOMAIN\MyMachine"
Remove-BrokerMachine $machine
```

EXAMPLE 4

These find specific machines and remove them from their desktop group or catalog.

```
Get-BrokerMachine -Uid 3 | Remove-BrokerMachine -DesktopGroup $dg
Get-BrokerMachine -CatalogUid 4 | Remove-BrokerMachine
```

Parameters

-InputObject

An array of machines to be removed from their desktop group or catalog.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

The name of the single machine to remove (must match the MachineName property of the machine).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Force

Forces removal of machine from a desktop group even if it is still in use (that is, there are user sessions running on the machine). Forcing removal of a machine does not disconnect or logoff the user sessions.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroup

The desktop group from which the machines are to be removed, specified by name, UID, or instance.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Machine

You can pipe in the machines to be removed.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerMachineCommand

March 11, 2024

Cancel a pending command queued for delivery to a desktop.

Syntax

```
Remove-BrokerMachineCommand
      [-InputObject] <MachineCommand[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Sets the state of a pending command queued for delivery to a desktop to Canceled. The command is not removed from the system.

Examples

EXAMPLE 1

Cancel all pending commands.

```
Get-BrokerMachineCommand | Remove-BrokerMachineCommand
```

EXAMPLE 2

Cancel all pending commands that have the category "UPM".

```
1  Get-BrokerMachineCommand -Category "UPM" | Remove-BrokerMachineCommand
```

Parameters

-InputObject

Commands to cancel.

Type:	MachineCommand[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.MachineCommand

Commands to cancel.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerMachineCommandMetadata

March 11, 2024

Deletes MachineCommand Metadata from the MachineCommand objects

Syntax

```
Remove-BrokerMachineCommandMetadata
       [-InputObject] <MachineCommand[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerMachineCommandMetadata cmdlet deletes Metadata from the MachineCommand objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the MachineCommand whose instance is pointed by $obj-Uid

```
Remove-BrokerMachineCommandMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the MachineCommand in the site

```
Get-BrokerMachineCommand | Remove-BrokerMachineCommandMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the MachineCommand object’s instance whose Metadata is to be deleted.

Type:	MachineCommand[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerMachineCommand

You can pipe the MachineCommand to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Remove-BrokerMachineConfiguration

March 11, 2024

Deletes a machine configuration from the site or removes the association from a desktop group.

Syntax

```
Remove-BrokerMachineConfiguration
       [-InputObject] <MachineConfiguration[]>
       [-Application <Application>]
       [-DesktopGroup <DesktopGroup>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerMachineConfiguration
      [-Name] <String>
      [-Application <Application>]
      [-DesktopGroup <DesktopGroup>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet has three functions:

- Break associations between desktop groups and machine configurations.
- Break associations between applications and machine configurations.
- Remove machine configurations from the system.

If no desktop group or application is specified, then the Remove-MachineConfiguration cmdlet removes the machine configuration from the site.

If a desktop group is specified, then the Remove-MachineConfiguration cmdlet removes the association between the machine configuration and that desktop group. In this case, the machine configuration is not removed from the site.

If an application is specified, then the Remove-MachineConfiguration cmdlet removes the association between the machine configuration and that application. Again, in this case, the machine configuration is not removed from the site.

Examples

EXAMPLE 1

Removes the machine configuration named “UPM\Finance”.

```
Remove-BrokerMachineConfiguration -Name UPM\Finance
```

EXAMPLE 2

Removes the association of the machine configuration named “Receiver\HumanResources”from the “SharedWorkers”desktop group.

```
Remove-BrokerMachineConfiguration -Name Receiver\HumanResources -
    DesktopGroup SharedWorkers
```

Parameters

-InputObject

Machine configuration to remove.

Type:	MachineConfiguration[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Name of machine configuration for which the remove operation applies.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Application

The application from which this machine configuration is to be removed.

Type:	Application
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-DesktopGroup

The desktop group from which this machine configuration is to be removed.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.MachineConfiguration

Machine configuration to remove

Outputs

None

By default, this cmdlet returns no output.

Notes

A machine configuration can only be removed if it is not currently applied to a desktop group.

Remove-BrokerMachineConfigurationMetadata

March 11, 2024

Deletes MachineConfiguration Metadata from the MachineConfiguration objects

Syntax

```
Remove-BrokerMachineConfigurationMetadata
       [-InputObject] <MachineConfiguration[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerMachineConfigurationMetadata cmdlet deletes Metadata from the MachineConfiguration objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the MachineConfiguration whose instance is pointed by $obj-Uid

```
Remove-BrokerMachineConfigurationMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the MachineConfiguration in the site

```
Get-BrokerMachineConfiguration | Remove-
    BrokerMachineConfigurationMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the MachineConfiguration object's instance whose Metadata is to be deleted.

Type:	MachineConfiguration[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerMachineConfiguration

You can pipe the MachineConfiguration to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerMachineMetadata cmdlet deletes Metadata from the Machine objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Machine whose instance is pointed by $obj-Uid

```
Remove-BrokerMachineMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Machine in the site

```
Get-BrokerMachine | Remove-BrokerMachineMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the Machine object’s instance whose Metadata is to be deleted.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. Remove-BrokerPowerTimeScheme

March 11, 2024

Deletes an existing power time scheme.

Syntax

```
Remove-BrokerPowerTimeScheme
      [-InputObject] <PowerTimeScheme[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerPowerTimeScheme
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerPowerTimeScheme cmdlet deletes a power time scheme from the system, and leaves the days that the time scheme used to cover for the associated desktop group as defaulting to all hours off-peak and all hours with pool size of -1.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

Examples

EXAMPLE 1

Deletes the power time scheme named 'Development Weekdays'.

```
Remove-BrokerPowerTimeScheme -Name 'Development Weekdays'
```

EXAMPLE 2

Deletes all power time schemes for the desktop group named 'Finance desk1'.

```
Get-BrokerPowerTimeScheme -DesktopGroupUid (Get-BrokerDesktopGroup -
    name 'Finance desk1').Uid  | Remove-BrokerPowerTimeScheme
```

Parameters

-InputObject

The power time scheme to be deleted.

Type:	PowerTimeScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the power time scheme to be deleted.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.PowerTimeScheme

The power time scheme to be deleted.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerPowerTimeSchemeMetadata

March 11, 2024

Deletes PowerTimeScheme Metadata from the PowerTimeScheme objects

Syntax

```
Remove-BrokerPowerTimeSchemeMetadata
       [-InputObject] <PowerTimeScheme[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerPowerTimeSchemeMetadata cmdlet deletes Metadata from the PowerTimeScheme objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the PowerTimeScheme whose instance is pointed by $obj-Uid

```
Remove-BrokerPowerTimeSchemeMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the PowerTimeScheme in the site

```
Get-BrokerPowerTimeScheme | Remove-BrokerPowerTimeSchemeMetadata -Name
    "MyMetadataName"
```

Parameters

-InputObject

Specifies the PowerTimeScheme object’s instance whose Metadata is to be deleted.

Type:	PowerTimeScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme

You can pipe the PowerTimeScheme to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerRebootCycleMetadata

March 11, 2024

Deletes RebootCycle Metadata from the RebootCycle objects

Syntax

```
Remove-BrokerRebootCycleMetadata
       [-InputObject] <RebootCycle[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerRebootCycleMetadata cmdlet deletes Metadata from the RebootCycle objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the RebootCycle whose instance is pointed by $obj-Uid

```
Remove-BrokerRebootCycleMetadata -InputObject $obj-Uid -Name "
   MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the RebootCycle in the site

```
Get-BrokerRebootCycle | Remove-BrokerRebootCycleMetadata -Name "
    MyMetadataName"
```

Parameters

-InputObject

Specifies the RebootCycle object’s instance whose Metadata is to be deleted.

Type:	RebootCycle[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerRebootCycle

You can pipe the RebootCycle to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerRebootSchedule

March 11, 2024

Removes the reboot schedule.

Syntax

```
Remove-BrokerRebootSchedule
       [-InputObject] <RebootSchedule[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerRebootSchedule
       [-DesktopGroupName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerRebootSchedule cmdlet is used to delete an existing reboot schedule.

Examples

EXAMPLE 1

Deletes every reboot schedule.

```
Get-BrokerRebootSchedule | Remove-BrokerRebootSchedule
```

EXAMPLE 2

Deletes the reboot schedule for the desktop group having Uid 12.

```
Remove-BrokerRebootSchedule 12
```

EXAMPLE 3

Deletes the reboot schedule for the desktop group named Accounting.

```
1  Remove-BrokerRebootSchedule -DesktopGroupName Accounting
```

Parameters

-InputObject

The reboot schedule to be deleted.

Type:	RebootSchedule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group whose reboot schedule is to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RebootSchedule

Reboot schedules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerRebootScheduleV2

March 11, 2024

Removes the reboot schedule.

Syntax

```
Remove-BrokerRebootScheduleV2
      [-InputObject] <RebootScheduleV2[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerRebootScheduleV2
      [-Name] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerRebootScheduleV2 cmdlet is used to delete an existing reboot schedule.

Examples

EXAMPLE 1

Deletes every reboot schedule.

```
Get-BrokerRebootScheduleV2 | Remove-BrokerRebootScheduleV2
```

EXAMPLE 2

Deletes the reboot schedule having Uid 12.

```
Remove-BrokerRebootScheduleV2 12
```

EXAMPLE 3

Deletes the reboot schedule named Accounting.

```
Remove-BrokerRebootScheduleV2 -Name Accounting
```

Parameters

-InputObject

The reboot schedule to be removed.

Type:	RebootScheduleV2[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the reboot schedule to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RebootScheduleV2

Reboot schedules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerRebootScheduleV2Metadata

March 11, 2024

Deletes RebootScheduleV2 Metadata from the RebootScheduleV2 objects

Syntax

```
Remove-BrokerRebootScheduleV2Metadata
       [-InputObject] <RebootScheduleV2[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerRebootScheduleV2Metadata cmdlet deletes Metadata from the RebootScheduleV2 objects.

Examples

EXAMPLE 1

This command deletes the Metadata "MyMetadataName"key-value pair for the RebootScheduleV2 whose instance is pointed by $obj-Uid

```
Remove-BrokerRebootScheduleV2Metadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata "MyMetadataName"key-value pair for all the RebootScheduleV2 in the site

```
Get-BrokerRebootScheduleV2 | Remove-BrokerRebootScheduleV2Metadata -
    Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the RebootScheduleV2 object's instance whose Metadata is to be deleted.

Type:	RebootScheduleV2[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerRebootScheduleV2

You can pipe the RebootScheduleV2 to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerRemotePCAccount

March 11, 2024

Delete RemotePCAccounts from the system.

Syntax

```
Remove-BrokerRemotePCAccount
      [-InputObject] <RemotePCAccount[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Delete RemotePCAccounts from the site.

Examples

EXAMPLE 1

Delete RemotePCAccount 42.

```
Remove-BrokerRemotePCAccount 42
```

EXAMPLE 2

Delete the 'any'OU RemotePCAccount.

```
Get-BrokerRemotePCAccount -OU 'any' | Remove-BrokerRemotePCAccount
```

EXAMPLE 3

Delete all RemotePCAccounts.

```
Get-BrokerRemotePCAccount | Remove-BrokerRemotePCAccount
```

Parameters

-InputObject

Specifies the RemotePCAccounts to delete.

Type:	RemotePCAccount[]
Position:	2

Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RemotePCAccount

You can pipe the RemotePCAccounts to be deleted into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerScope

March 11, 2024

Remove the specified catalog/desktop group from the given scope(s).

Syntax

```
Remove-BrokerScope
      [-InputObject] <Scope[]>
      [-ApplicationGroup <ApplicationGroup>]
      [-Catalog <Catalog>]
      [-DesktopGroup <DesktopGroup>]
      [-PolicySet <GpoPolicySet>]
      [-Tag <Tag>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerScope cmdlet is used to remove a scopeable object object from the given scope(s). A scopeable object is one of:

- a catalog
- a desktop group
- an application group

To remove a scopeable object from a scope you need permission to change the scopes of the scopeable object.

If the scopeable object is not in a specified scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Removes the “Win7 Desktops”desktop group from both the Sales and Marketing scopes.

```
Remove-BrokerScope Sales,Marketing -DesktopGroup "Win7 Desktops"
```

EXAMPLE 2

Removes the “Win7 Desktops”desktop group from both the Sales and Marketing scopes.

```
Sales,Marketing | Remove-BrokerScope -DesktopGroup 'Win7 Desktops'
```

Parameters

-InputObject

Specifies the scopes to remove the object from.

Type:	Scope[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ApplicationGroup

Specifies the application group object to be removed.

Type:	ApplicationGroup

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Catalog

Specifies the catalog object to be removed.

Type:	Catalog
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

Specifies the desktop group object to be removed.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PolicySet

Specifies the policy set object to be removed.

Type:	GpoPolicySet
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Tag

Specifies the tag object to be removed.

Type:	Tag
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Scope

You can pipe scopes to Remove-BrokerScope.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerSessionLinger

March 11, 2024

Removes a session linger setting.

Syntax

```
Remove-BrokerSessionLinger
       [-InputObject] <SessionLinger[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerSessionLinger
      [-DesktopGroupName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerSessionLinger cmdlet is used to delete an existing session linger setting.

Examples

EXAMPLE 1

Deletes every session linger setting for all desktop groups.

```
Get-BrokerSessionLinger | Remove-BrokerSessionLinger
```

Parameters

-InputObject

The session linger setting to be deleted.

Type:	SessionLinger[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group whose session linger setting is to be removed.

Type:	String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.SessionLinger

Session linger settings may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerSessionMetadata

March 11, 2024

Deletes Session Metadata from the Session objects

Syntax

```
Remove-BrokerSessionMetadata
      [-InputObject] <Session[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerSessionMetadata cmdlet deletes Metadata from the Session objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Session whose instance is pointed by $obj-Uid

```
Remove-BrokerSessionMetadata -InputObject $obj-Uid -Name "
    MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Session in the site

```
Get-BrokerSession | Remove-BrokerSessionMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the Session object’s instance whose Metadata is to be deleted.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerSession

You can pipe the Session to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerSessionPreLaunch

March 11, 2024

Removes a session pre-launch setting.

Syntax

```
Remove-BrokerSessionPreLaunch
      [-InputObject] <SessionPreLaunch[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-BrokerSessionPreLaunch
      [-DesktopGroupName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerSessionPreLaunch cmdlet is used to delete an existing session pre-launch setting.

Examples

EXAMPLE 1

Deletes every session pre-launch setting for all desktop groups.

```
Get-BrokerSessionPreLaunch | Remove-BrokerSessionPreLaunch
```

Parameters

-InputObject

The session pre-launch setting to be deleted.

Type:	SessionPreLaunch[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group whose session pre-launch setting is to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.SessionPreLaunch

Session pre-launch settings may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerSiteMetadata

March 11, 2024

Deletes Site Metadata from the Site objects

Syntax

```
Remove-BrokerSiteMetadata
      [[-InputObject] <Site[]>]
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-BrokerSiteMetadata cmdlet deletes Metadata from the Site objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Site

```
Remove-BrokerSiteMetadata -Name "MyMetadataName"
```

Parameters

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-InputObject

Specifies the Site object's instance whose Metadata is to be deleted.

Type:	Site[]
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

Remove-BrokerTag

March 11, 2024

Removes tag to object associations or deletes tags from the site altogether.

Syntax

```
Remove-BrokerTag
       [-InputObject] <Tag[]>
       [-Force]
       [-Application <Application>]
       [-ApplicationGroup <ApplicationGroup>]
       [-Catalog <Catalog>]
       [-Desktop <Desktop>]
       [-DesktopGroup <DesktopGroup>]
       [-Machine <Machine>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerTag
       [-Tags] <Tag[]>
       [-AllApplications]
       [-AllApplicationGroups]
       [-AllDesktops]
       [-AllDesktopGroups]
       [-AllCatalogs]
       [-AllMachines]
       [-AllObjects]
       [-Force]
       [-Application <Application>]
       [-ApplicationGroup <ApplicationGroup>]
       [-Catalog <Catalog>]
       [-Desktop <Desktop>]
       [-DesktopGroup <DesktopGroup>]
       [-Machine <Machine>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerTag
       [-Force]
       [-Name] <String>
       [-Application <Application>]
       [-ApplicationGroup <ApplicationGroup>]
       [-Catalog <Catalog>]
       [-Desktop <Desktop>]
       [-DesktopGroup <DesktopGroup>]
       [-Machine <Machine>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes the association between tags and objects within the site, or deletes tags from the site altogether.

To remove an association, supply one of the Application, Machine, Desktop or DesktopGroup parameters.

To delete a tag entirely, together with any associations between the tag and other objects in the site, specify the tag without any associated object parameter.

Examples

EXAMPLE 1

Removes the association between a tag and a desktop. The tag itself continues to exist in the site.

```
Remove-BrokerTag $tag -Machine $machine
```

EXAMPLE 2

Deletes the tag from the site also removing any associations that may exist between the tag and other objects.

```
Remove-BrokerTag $tag
```

Parameters

-Tags

Specifies one or more tag objects.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies one or more tag objects.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies a tag by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AllApplications

Remove the specified tags from all applications.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllApplicationGroups

Remove the specified tags from all application groups.

Type:	SwitchParameter
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllDesktops

Remove the specified tags from all desktops.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllDesktopGroups

Remove the specified tags from all desktop groups.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllCatalogs

Remove the specified tags from all catalogs.

Type:	SwitchParameter
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllMachines

Remove the specified tags from all machines.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllObjects

Remove the specified tags from all objects.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Remove tags even if they are used by group policy.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Application

Removes the association between the given tag and application.

Type:	Application
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ApplicationGroup

Removes the association between the given tag and application group.

Type:	ApplicationGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Catalog

Removes the association between the given tag and the catalog group.

Type:	Catalog
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Desktop

Removes the association between the given tag and desktop.

Type:	Desktop
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroup

Removes the association between the given tag and desktop group.

Type:	DesktopGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Machine

Removes the association between the given tag and machine.

Type:	Machine
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Tag

Tags may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerTagMetadata

March 11, 2024

Deletes Tag Metadata from the Tag objects

Syntax

```
Remove-BrokerTagMetadata
       [-InputObject] <Tag[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerTagMetadata cmdlet deletes Metadata from the Tag objects.

Examples

EXAMPLE 1

This command deletes the Metadata “MyMetadataName”key-value pair for the Tag whose instance is pointed by $obj-Uid

```
Remove-BrokerTagMetadata -InputObject $obj-Uid -Name "MyMetadataName"
```

EXAMPLE 2

This command deletes the Metadata “MyMetadataName”key-value pair for all the Tag in the site

```
Get-BrokerTag | Remove-BrokerTagMetadata -Name "MyMetadataName"
```

Parameters

-InputObject

Specifies the Tag object’s instance whose Metadata is to be deleted.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata to be deleted

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerTag

You can pipe the Tag to delete the metadata.

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerUniversalClaim

March 11, 2024

Remove a Broker UniversalClaim mapping

Syntax

```
Remove-BrokerUniversalClaim
       [-InputObject] <UniversalClaim[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerUniversalClaim cmdlet removes a UniversalClaim mapping that was previously added. Mappings are added automatically, and should not normally need to be removed.

Examples

EXAMPLE 1

Removes a UniversalClaim mapping

```
Remove-BrokerUniversalClaim -InputObject $ClaimToRemove
```

Parameters

-InputObject

Specifies the objects to be removed

Type:	UniversalClaim[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.UniversalClaim

You can pipe UniversalClaims to be removed by Remove-BrokerUniversalClaim

Outputs

None

By default, this cmdlet returns no output.

Remove-BrokerUser

March 11, 2024

Remove broker user objects from another broker object

Syntax

```
Remove-BrokerUser
       [-InputObject] <User[]>
       [-ApplicationGroup <ApplicationGroup>]
       [-Application <Application>]
       [-SessionLinger <SessionLinger>]
       [-SessionPreLaunch <SessionPreLaunch>]
       [-Machine <Machine>]
       [-PrivateDesktop <PrivateDesktop>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerUser
       [-Name] <String>
       [-ApplicationGroup <ApplicationGroup>]
       [-Application <Application>]
       [-SessionLinger <SessionLinger>]
       [-SessionPreLaunch <SessionPreLaunch>]
       [-Machine <Machine>]
       [-PrivateDesktop <PrivateDesktop>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
```

```
11          [<CommonParameters>]
```

Description

The Remove-BrokerUser cmdlet removes broker user objects from another specified object, such as a broker private desktop, to which the user had previously been added.

Examples

EXAMPLE 1

Remove the assignment of the specified private desktop to the specified user.

```
1  Remove-BrokerUser "DOMAIN\UserName" -PrivateDesktop "DOMAIN\MachineName
       "
```

Parameters

-InputObject

Specifies the user objects to remove.

Type:	User[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the user objects to remove, based on their Name property.

Type:	String
Position:	2
Default value:	Null

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ApplicationGroup

The application group from which to remove the user

Type:	ApplicationGroup
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Application

The application from which to remove the user

Type:	Application
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SessionLinger

The desktop group session linger setting from which to remove the user.

Type:	SessionLinger
Position:	Named

Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SessionPreLaunch

The desktop group session pre-launch setting from which to remove the user.

Type:	SessionPreLaunch
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Machine

The machine from which to remove the user

Type:	Machine
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PrivateDesktop

The desktop from which to remove the user

Type:	PrivateDesktop
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.USer

You can pipe the users to be removed to Remove-BrokerUser.

Outputs

None

By default, this cmdlet returns no output.

Notes

Specify one of the -Machine or -PrivateDesktop parameters only.

Remove-BrokerUserZonePreference

March 11, 2024

Removes any zone preference associated with a user/group account in this site

Syntax

```
Remove-BrokerUserZonePreference
       [-InputObject] <UserZonePreference[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-BrokerUserZonePreference
       [-Name] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-BrokerUserZonePreference cmdlet removes any preferred home zone associated with a user/group account.

Removing a home preference means that the account no longer has an influence on any choice of zone used for resource launches.

Examples

EXAMPLE 1

Removes any home zone preference associated with the APAC\sales account for this site.

```
Remove-BrokerUserZonePreference APAC\sales
```

Parameters

-InputObject

The account zone preference to be removed.

Type:	UserZonePreference[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the user/group account whose home zone preference is to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.UserZonePreference

The account zone preference to be removed.

Outputs

None

By default, this cmdlet returns no output.

Rename-BrokerAccessPolicyRule

March 11, 2024

Renames a rule in the site's access policy.

Syntax

```
Rename-BrokerAccessPolicyRule
      [-InputObject] <AccessPolicyRule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerAccessPolicyRule
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Rename-BrokerAccessPolicyRule cmdlet renames a rule in the site's access policy. The Name property of the rule is changed.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Examples

EXAMPLE 1

Renames the access policy rule called Sales to TeleSales. The new name of the rule must be unique in the access policy.

```
1  Rename-BrokerAccessPolicyRule 'Sales' -NewName 'TeleSales'
```

Parameters

-InputObject

The access policy rule to be renamed.

Type:	AccessPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The existing name of the access policy rule to be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The new name for the access policy rule being renamed. The new name must not match that of any other existing rules in the policy.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AccessPolicyRule

The access policy rule to be renamed.

Outputs

None or Citrix.Broker.Admin.SDK.AccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AccessPolicyRule object.

Rename-BrokerAdminFolder

March 11, 2024

Renames a folder

Syntax

```
Rename-BrokerAdminFolder
       [-InputObject] <AdminFolder[]>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-BrokerAdminFolder
       [-Name] <String>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-BrokerAdminFolder cmdlet renames a folder for organising objects for administration purposes (for example, Applications).

The following special characters are not allowed in the new FolderName: \ / ; : # . * ? = < > | [ ] ( ) “‘

Examples

EXAMPLE 1

Renames the folder called XXX within the folder F1\ to YYY

```
Rename-BrokerAdminFolder F1\XXX\ YYY
```

Parameters

-InputObject

The folder(s) to be renamed

Type:	AdminFolder[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

A pattern matching the names of folders to be renamed

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The name the new folder(s) should have.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Depends on parameter

Parameters can be piped by property name.

Outputs

None or Citrix.Broker.Admin.SDK.AdminFolder

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AdminFolder object.

- Get-BrokerAdminFolder
- New-BrokerAdminFolder

Rename-BrokerAppAssignmentPolicyRule

March 11, 2024

Renames an application rule in the site's assignment policy.

Syntax

```
Rename-BrokerAppAssignmentPolicyRule
      [-InputObject] <AppAssignmentPolicyRule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerAppAssignmentPolicyRule
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Rename-BrokerAppAssignmentPolicyRule cmdlet renames an application rule in the site's assignment policy. The Name property of the rule is changed.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Examples

EXAMPLE 1

Renames the application rule in the assignment policy called Offshore to Remote Workers. The new name of the rule must be unique in the assignment policy.

```
Rename-BrokerAppAssignmentPolicyRule 'Offshore' -NewName 'Remote
   Workers'
```

Parameters

-InputObject

The application rule in the assignment policy to be renamed.

Type:	AppAssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The existing name of the application rule in the assignment policy to be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The new name of the application rule in the assignment policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

The application rule in the assignment policy being renamed.

Outputs

None or Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule object.

Rename-BrokerAppEntitlementPolicyRule

March 11, 2024

Renames an application rule in the site's entitlement policy.

Syntax

```
Rename-BrokerAppEntitlementPolicyRule
      [-InputObject] <AppEntitlementPolicyRule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerAppEntitlementPolicyRule
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Rename-BrokerAppEntitlementPolicyRule cmdlet renames an application rule in the site's entitlement policy. The Name property of the rule is changed.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Examples

EXAMPLE 1

Renames the application rule in the entitlement policy called Prod Dev to Product Development. The new name of the rule must be unique in the entitlement policy.

```
1  Rename-BrokerAppEntitlementPolicyRule 'Prod Dev' -NewName 'Product
       Development'
```

Parameters

-InputObject

The application rule in the entitlement policy to be renamed.

Type:	AppEntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The existing name of the application rule in the entitlement policy to be renamed.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The new name of the application rule in the entitlement policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

The application rule in the entitlement policy being renamed.

Outputs

None or Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule object.

Related Links

Rename-BrokerApplication

March 11, 2024

Renames an application.

Syntax

```
Rename-BrokerApplication
       [-InputObject] <Application[]>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-BrokerApplication
       [-Name] <String>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-BrokerApplication cmdlet changes the administrative name of an application. An application cannot have the same name as another application.

Renaming an application does not alter its published name. To change the name with which this application appears to end-users, set a new value for the PublishedName property using the Set-BrokerApplication cmdlet.

Renaming an application does not alter its BrowserName. If the BrowserName property also needs to be changed, use the Set-BrokerApplication cmdlet to modify it.

Examples

EXAMPLE 1

Renames the application with name "Old Name"to "New Name".

```
Rename-BrokerApplication -Name "Old Name" -NewName "New Name"
```

EXAMPLE 2

Renames application with the Uid 1 to "New Name", showing the result.

```
Get-BrokerApplication -Uid 1 | Rename-BrokerApplication -NewName "New
    Name" -PassThru
```

Parameters

-InputObject

Specifies the application to rename.

Type:	Application[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application to rename.

Type:	String
Position:	2

Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name for the application.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Application

You can pipe applications to Rename-BrokerApplication.

Outputs

None or Citrix.Broker.Admin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Application object.

Rename-BrokerApplicationGroup

March 11, 2024

Renames an application group.

Syntax

```
Rename-BrokerApplicationGroup
       [-InputObject] <ApplicationGroup[]>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-BrokerApplicationGroup
       [-Name] <String>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-BrokerApplicationGroup cmdlet changes the name of an application group. An application group cannot have the same name as another application group.

Application group names are not visible to end users.

Examples

EXAMPLE 1

Renames the application group with name “Ofice”to “Office”.

```
Rename-BrokerApplicationGroup -Name "Ofice" -NewName "Office"
```

EXAMPLE 2

Renames application group with the Uid 1 to “New Name”, showing the result.

```
Get-BrokerApplicationGroup -Uid 1 | Rename-BrokerApplicationGroup -
    NewName "New Name" -PassThru
```

Parameters

-InputObject

Specifies the application group to rename.

Type:	ApplicationGroup[]
Position:	2
Default value:	Nul
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application group to rename.

Type:	String
Position:	2
Default value:	Null
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the application group.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.ApplicationGroup

You can pipe application groups to Rename-BrokerApplicationGroup.

Outputs

None or Citrix.Broker.Admin.SDK.ApplicationGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.ApplicationGroup object.

Rename-BrokerAssignmentPolicyRule

March 11, 2024

Renames a desktop rule in the site's assignment policy.

Syntax

```
Rename-BrokerAssignmentPolicyRule
      [-InputObject] <AssignmentPolicyRule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerAssignmentPolicyRule
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Rename-BrokerAssignmentPolicyRule cmdlet renames a desktop rule in the site's assignment policy. The Name property of the rule is changed.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Examples

EXAMPLE 1

Renames the desktop rule in the assignment policy called Offshore to Remote Workers. The new name of the rule must be unique in the assignment policy.

```
Rename-BrokerAssignmentPolicyRule 'Offshore' -NewName 'Remote Workers'
```

Parameters

-InputObject

The desktop rule in the assignment policy to be renamed.

Type:	AssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The existing name of the desktop rule in the assignment policy to be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The new name of the desktop rule in the assignment policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

The desktop rule in the assignment policy being renamed.

Outputs

None, or Citrix.Broker.Admin.SDK.AssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AssignmentPolicyRule object.

Rename-BrokerAutoTagRule

March 11, 2024

Renames the AutoTagRule.

Syntax

```
Rename-BrokerAutoTagRule
      [-InputObject] <AutoTagRule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerAutoTagRule
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Renames the AutoTagRule.

Examples

EXAMPLE 1

Renames RandomAllocatedCatalogs to StaticAllocatedCatalogs.

```
Rename-BrokerAutoTagRule -Name RandomAllocatedCatalogs -NewName
    StaticAllocatedCatalogs
```

Parameters

-InputObject

Specifies the AutoTagRule object to rename.

Type:	AutoTagRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the AutoTagRule be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name for the AutoTagRule.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AutoTagRule

AutoTagRule may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Rename-BrokerCatalog

March 11, 2024

Renames a catalog.

Syntax

```
Rename-BrokerCatalog
       [-InputObject] <Catalog[]>
       [-PassThru]
       [-NewName] <String>
```

```
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Rename-BrokerCatalog
        [-Name] <String>
        [-PassThru]
        [-NewName] <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

The Rename-BrokerCatalog cmdlet changes the name of a catalog. A catalog cannot have the same name as another catalog.

The following special characters are not allowed in a catalog name: \ / ; : # . * ? = < > | [ ] ( ) “‘

Examples

EXAMPLE 1

Renames the catalog with the name “Old Name”to “New Name”.

```
Rename-BrokerCatalog -Name "Old Name" -NewName "New Name"
```

EXAMPLE 2

Renames the catalog with the name “Old Name”to “New Name”.

```
c:\$catalog = Get-BrokerCatalog -Name "Old Name"
Rename-BrokerCatalog -InputObject $catalog -NewName "New Name"
```

Parameters

-InputObject

Specifies the catalog to rename.

Type:	Catalog[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the catalog to rename.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the catalog.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

You can pipe catalogs to Rename-BrokerCatalog.

Outputs

None or Citrix.Broker.Admin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Catalog object.

Rename-BrokerCatalogRebootSchedule

March 11, 2024

Renames a catalog reboot schedule.

Syntax

```
Rename-BrokerCatalogRebootSchedule
      [-InputObject] <CatalogRebootSchedule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerCatalogRebootSchedule
      [-Name] <String>
      [-PassThru]
```

```
4         [-NewName] <String>
5         [-LoggingId <Guid>]
6         [<CitrixCommonParameters>]
7         [<CommonParameters>]
```

Description

The Rename-BrokerCatalogRebootSchedule cmdlet changes the name of a catalog reboot schedule. A reboot schedule cannot have the same name as another reboot schedule.

Examples

EXAMPLE 1

Renames the catalog reboot schedule with name “Old Name”to “New Name”.

```
1  Rename-BrokerCatalogRebootSchedule -Name "Old Name" -NewName "New Name"
```

EXAMPLE 2

Renames catalog reboot schedule with the Uid 1 to “New Name”, showing the result.

```
1  Get-BrokerCatalogRebootSchedule -Uid 1 | Rename-
       BrokerCatalogRebootSchedule -NewName "New Name" -PassThru
```

Parameters

-InputObject

Specifies the reboot schedule to rename.

Type:	CatalogRebootSchedule[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the reboot schedule to rename.

Type:	String
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name for the reboot schedule.

Type:	String
Position:	3
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.CatalogRebootSchedule

You can pipe reboot schedules into Rename-BrokerCatalogRebootSchedule.

Outputs

None or Citrix.Broker.Admin.SDK.CatalogRebootSchedule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.CatalogRebootSchedule object.

Rename-BrokerDesktopGroup

March 11, 2024

Renames a desktop group.

Syntax

```
Rename-BrokerDesktopGroup
       [-InputObject] <DesktopGroup[]>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-BrokerDesktopGroup
       [-Name] <String>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-BrokerDesktopGroup cmdlet changes the name of a desktop group. A desktop group cannot have the same name as another desktop group.

Examples

EXAMPLE 1

Renames desktop group with the name “Old Name”to “New Name”.

```
Rename-BrokerDesktopGroup -Name "Old Name" -NewName "New Name"
```

EXAMPLE 2

Renames desktop group with the Uid 1 to “New Name”, showing the result.

```
Get-BrokerDesktopGroup -Uid 1 | Rename-BrokerDesktopGroup -NewName "New
    Name" -PassThru
```

Parameters

-InputObject

Specifies the desktop group to rename.

Type:	DesktopGroup[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the desktop group to rename.

Type:	String
Position:	2
Default value:	Null
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name that the desktop group will have.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

You can pipe desktop groups to Rename-BrokerDesktopGroup.

Outputs

None or Citrix.Broker.Admin.SDK.DesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.DesktopGroup object.

Notes

Renaming a desktop group does not alter its published name. If you need to change the name with which this desktop group appears to end-users, set a new value for the PublishedName property using the Set-BrokerDesktopGroup cmdlet.

Rename-BrokerEntitlementPolicyRule

March 11, 2024

Renames a desktop rule in the site's entitlement policy.

Syntax

```
Rename-BrokerEntitlementPolicyRule
      [-InputObject] <EntitlementPolicyRule[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerEntitlementPolicyRule
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Rename-BrokerEntitlementPolicyRule cmdlet renames a desktop rule in the site's entitlement policy. The Name property of the rule is changed.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Examples

EXAMPLE 1

Renames the desktop rule in the entitlement policy called Prod Dev to Product Development. The new name of the rule must be unique in the entitlement policy.

```
Rename-BrokerEntitlementPolicyRule 'Prod Dev' -NewName 'Product
    Development'
```

Parameters

-InputObject

The desktop rule in the entitlement policy to be renamed.

Type:	EntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The existing name of the desktop rule in the entitlement policy to be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The new name of the desktop rule in the entitlement policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

The desktop rule in the entitlement policy being renamed.

Outputs

None or Citrix.Broker.Admin.SDK.EntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.EntitlementPolicyRule object.

Rename-BrokerGpoPolicy

March 11, 2024

Rename policies of the same name.

Syntax

```
Rename-BrokerGpoPolicy
      [-InputObject] <GpoPolicy[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerGpoPolicy
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Renames GPO policies with the supplied name. Policy names are unique in a policy set. Policies of the same name can exist in different policy sets. This cmdlet renames all policies in different policy sets.

Examples

EXAMPLE 1

Renames all the policies with the name ‘Test’to ‘Policy1’.

```
Rename-BrokerGpoPolicy -Name 'Test' -NewName 'Policy1'
```

Parameters

-InputObject

Specifies the GPO policy objects to rename.

Type:	GpoPolicy[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Identifies the policies to be renamed by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies new name for the policies.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoPolicy

The policy to rename can be piped into this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.GpoPolicy

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.GpoPolicy object.

Notes

Note that when renaming a policy, its Guid remains the same and any associations are maintained.

Rename-BrokerGpoPolicySet

March 11, 2024

Rename a GPO policy set.

Syntax

```
Rename-BrokerGpoPolicySet
      [-InputObject] <GpoPolicySet[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerGpoPolicySet
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Renames a GPO policy set to a new name.

Examples

EXAMPLE 1

Renames the policy set with the name ‘Test’to ‘Set1’.

```
Rename-BrokerGpoPolicySet -Name 'Test' -NewName 'Set1'
```

Parameters

-InputObject

Specifies the GPO policy set object to rename.

Type:	GpoPolicySet[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

Identifies the policy set to be renamed by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies new name for the policy set.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoPolicySet

The policy set to rename can be piped into this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.GpoPolicySet

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.GpoPolicySet object.

Notes

Note that when renaming a policy set, its Guid remains the same and any associations are maintained.

Rename-BrokerImportDb

March 11, 2024

This cmdlet is for internal use only

Syntax

```
Rename-BrokerImportDb
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is for internal use only

Examples

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet accepts no input

Outputs

String

Rename-BrokerMachineConfiguration

March 11, 2024

Renames a machine configuration.

Syntax

```
Rename-BrokerMachineConfiguration
      [-InputObject] <MachineConfiguration[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerMachineConfiguration
       [-Name] <String>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-MachineConfiguration cmdlet changes the name of a machine configuration. A machine configuration cannot have the same name as another machine configuration associated with the same slot.

Examples

EXAMPLE 1

Renames the machine configuration named “UPM\All Departments”to “UPM\Finance Department”

.

```
Rename-BrokerMachineConfiguration -Name "UPM\All Departments" -NewName
    "UPM\Finance Department"
```

EXAMPLE 2

Renames the machine configuration named “UPM\All Departments”to “UPM\Finance Department”

.

```
Rename-BrokerMachineConfiguration -Name "UPM\All Departments" -NewName
    "Finance Department"
```

Parameters

-InputObject

Machine configuration to rename.

Type:	MachineConfiguration[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Current name of machine configuration.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

New name for machine configuration. This may have the form "ConfigurationSlotName\MachineConfigurationNam
or "MachineConfigurationName". If the "ConfigurationSlotName"is provided it must match the name
of the configuration slot that the machine configuration is associated with.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.MachineConfiguration

Machine configuration to rename.

Outputs

None or Citrix.Broker.Admin.SDK.MachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.MachineConfiguration object.

Notes

The configuration slot can not be changed. Thus the left term of the Name and NewName must match.

Rename-BrokerPowerTimeScheme

March 11, 2024

Changes the name of an existing power time scheme.

Syntax

```
Rename-BrokerPowerTimeScheme
      [-InputObject] <PowerTimeScheme[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerPowerTimeScheme
      [-Name] <String>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Rename-BrokerPowerTimeScheme cmdlet renames a particular power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

Examples

EXAMPLE 1

Renames the power time scheme named 'Development Weekdays'to 'Dev Week'.

```
Rename-BrokerPowerTimeScheme -Name 'Development Weekdays' -NewName 'Dev
    Week'
```

Parameters

-InputObject

The power time scheme to be renamed.

Type:	PowerTimeScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The current name of the power time scheme to be renamed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

The new name to be applied to the power time scheme.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.PowerTimeScheme

The power time scheme to be renamed.

Outputs

None or Citrix.Broker.Admin.SDK.PowerTimeScheme

This cmdlet does not generate any output, unless

you use the PassThru parameter, in which case it generates a

Citrix.Broker.Admin.SDK.PowerTimeScheme object.

Rename-BrokerRebootScheduleV2

March 11, 2024

Renames a reboot schedule.

Syntax

```
Rename-BrokerRebootScheduleV2
      [-InputObject] <RebootScheduleV2[]>
      [-PassThru]
      [-NewName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-BrokerRebootScheduleV2
       [-Name] <String>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-BrokerRebootScheduleV2 cmdlet changes the name of a reboot schedule. A reboot schedule cannot have the same name as another reboot schedule.

Examples

EXAMPLE 1

Renames the reboot schedule with name “Old Name”to “New Name”.

```
Rename-BrokerRebootScheduleV2 -Name "Old Name" -NewName "New Name"
```

EXAMPLE 2

Renames reboot schedule with the Uid 1 to “New Name”, showing the result.

```
Get-BrokerRebootScheduleV2 -Uid 1 | Rename-BrokerRebootScheduleV2 -
    NewName "New Name" -PassThru
```

Parameters

-InputObject

Specifies the reboot schedule to rename.

Type:	RebootScheduleV2[]
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

Specifies the name of the reboot schedule to rename.

Type:	String
Position:	2
Default value:	Null
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name for the reboot schedule.

Type:	String
Position:	3
Default value:	Null
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RebootScheduleV2

You can pipe reboot schedules into Rename-BrokerRebootScheduleV2.

Outputs

None or Citrix.Broker.Admin.SDK.RebootScheduleV2

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.RebootScheduleV2 object.

Rename-BrokerTag

March 11, 2024

Rename one or more tags.

Syntax

```
Rename-BrokerTag
       [-InputObject] <Tag[]>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-BrokerTag
       [-Name] <String>
       [-PassThru]
       [-NewName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Renames one or more tags with the supplied name.

Examples

EXAMPLE 1

Renames tags with the name 'OldName'to 'ReplacementName'.

```
Rename-BrokerTag -Name 'OldName' -NewName 'ReplacementName'
```

Parameters

-InputObject

Specifies one or more tag objects to rename.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Identifies tags to be renamed by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies new name for the tags.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Tag

The tag to rename can be piped into this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.Tag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Tag object.

Notes

Note that when renaming a tag, its UUID remains the same and any associations are maintained.

Reset-BrokerEnabledFeatureList

March 11, 2024

Refreshes the Broker service's list of enabled features.

Syntax

```
Reset-BrokerEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Broker Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Broker SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Broker service instance's list of enabled features.

```
Reset-BrokerEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-BrokerHypervisorConnection

March 11, 2024

Reset the hypervisor connection

Syntax

```
Reset-BrokerHypervisorConnection
      [[-HypervisorConnectionUid] <Int32>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Reset-BrokerHypervisorConnection
     [-InputObject] <HypervisorConnection>
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Requests the hypervisor connection to be reset. The connection is dropped, details including credentials refreshed and the connection re-established. The reset request is asynchronous and may take a moment to occur

Examples

EXAMPLE 1

This command resets the specified Hypervisor connection by internal Uid

```
Reset-BrokerHypervisorConnection -HypervisorConnectionUid 2
```

EXAMPLE 2

This command resets the piped in hypervisor connection

```
Get-HypervisorConnection | Reset-BrokerHypervisorConnection
```

Parameters

-InputObject

Specifies the hypervisor connection object to remove.

Type:	HypervisorConnection
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Specifies the hypervisor connection Uid

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.HypervisorConnection

You can pipe the hypervisor connection to be reset to Reset-BrokerHypervisorConnection.

Outputs

None

By default, this cmdlet returns no output.

Reset-BrokerLhcDbInstance

March 11, 2024

This cmdlet is for internal use only

Syntax

```
Reset-BrokerLhcDbInstance
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

This cmdlet is for internal use only

Examples

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet accepts no input

Outputs

String

Related Links

Reset-BrokerLicensingConnection

March 11, 2024

Resets the broker's license server connection.

Syntax

```
Reset-BrokerLicensingConnection
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Reset-BrokerLicensingConnection cmdlet resets the broker's connection to the license server.

Licensing changes resulting from new license files or alterations to the site-level licensing properties don't become effective immediately. There will typically be a delay as the changes are propagated across the site based on the scheduling of refresh logic built into the controllers and the license server.

Resetting the connection causes the list of available licenses for the connection to be updated. After adding licenses or changing the site-level licensing properties you can run Reset-BrokerLicensingConnection to ensure that the broker can access the new licenses immediately.

Each broker service instance holds its own connection to the license server. In order for the licensing changes to be applied immediately throughout the XenDesktop site this command needs to be run on every controller in the site.

Examples

EXAMPLE 1

Reset the broker's license server connection.

```
Reset-BrokerLicensingConnection
```

Parameters

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-BrokerServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Broker Service.

Syntax

```
Reset-BrokerServiceGroupMembership
      [-ConfigServiceInstance] <PSObject[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Broker Service access permissions and configuration service locations. The Reset-BrokerServiceGroupMembership command must be run on at least one instance of the service type (Broker) after installation and registration with the configuration service. Without this operation, the Broker services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional

services are added to the deployment, provided that the configuration service is not stopped. The Reset-BrokerServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    BrokerServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-BrokerServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	PSObject[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-BrokerServiceGroupMembership command.

Outputs

Citrix.Broker.Sdk.ServiceInstance

Reset-BrokerServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Broker Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Send-BrokerSessionMessage

March 11, 2024

Sends a message to a session.

Syntax

```
Send-BrokerSessionMessage
    [-InputObject] <Session[]>
    [-MessageStyle] <SendMessageStyle>
    [-Title] <String>
    [-Text] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Generates a message box in the target session(s).

Examples

EXAMPLE 1

Sends a message to all the sessions for any user in MYDOMAIN.

```
$sessions = Get-BrokerSession -UserName MYDOMAIN\*
Send-BrokerSessionMessage $sessions -MessageStyle Information -Title
   TestTitle -Text TestMessage
```

EXAMPLE 2

Sends a message to the session on the desktop with Uid 1.

```
$desktop = Get-BrokerDesktop -Uid 1
Send-BrokerSessionMessage $desktop.SessionUid -MessageStyle Information
    -Title TestTitle -Text TestMessage
```

EXAMPLE 3

Trap and display error information.

```
trap  [Citrix.Broker.Admin.SDK.SdkOperationException]
{

  write $("Exception name = " + $_.Exception.GetType().FullName)
  write $("SdkOperationException.Status = " + $_.Exception.Status)
  write $("SdkOperationException.ErrorData=")
  $_.Exception.ErrorData

  write $("SdkOperationException.InnerException = " + $_.Exception.
     InnerException)
  $_.Exception.InnerException
  continue
 }

Send-BrokerSessionMessage -InputObject 10,11,12 -MessageStyle
   Information -Title "message title" -Text "message text"
```

Parameters

-InputObject

The target session(s) to send the message to.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MessageStyle

The style of message box to use (valid values are Critical, Question, Exclamation, or Information).

Type:	SendMessageStyle
Position:	3

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Title

Text to display in the messagebox title bar.

Type:	String
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Text

The message to display.

Type:	String
Position:	5
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

The session to which to send the message can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Sessions can be passed as the InputObject parameter as either session objects or their numeric Uids.

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between controller and machine, if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Send-BrokerSessionMessage could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the send message operation is invoked on the machines running valid sessions.

The system can fail to invoke the operation if the machine is not in an appropriate state or if there are problems in communicating with the machine. When an operation is invoked the system detects if the operation was initiated successfully or not by the session. As this operation is non-blocking the system doesn't detect or report whether the operation ultimately succeeded or failed after its successful initialization in the session.

Operation failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandli
In the event of errors the SdkErrorRecord error status code is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount: The number of operations attempted.
- OperationsFailedCount - The number of failed operations.
- OperationsSucceededCount - The number of successfully executed operations.
- UnresolvedSessionFailuresCount - The number of operations that failed due to invalid sessions being supplied.
- OperationInvocationFailuresCount - The number of operations that failed because they could not be invoked in the session.
- DesktopExecutionFailuresCount - The number of operations that failed because they could not be successfully executed in the session.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

"Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded:<OperationsSucceededCount>"

Set-BrokerAccessPolicyRule

March 11, 2024

Modifies an existing rule in the site's access policy.

Syntax

```
Set-BrokerAccessPolicyRule
    [-InputObject] <AccessPolicyRule[]>
    [-PassThru]
    [-AddExcludedClientIPs <IPAddressRange[]>]
    [-AddExcludedClientNames <String[]>]
    [-AddExcludedSmartAccessTags <String[]>]
    [-AddExcludedUsers <User[]>]
    [-AddIncludedClientIPs <IPAddressRange[]>]
    [-AddIncludedClientNames <String[]>]
    [-AddIncludedSmartAccessTags <String[]>]
    [-AddIncludedUsers <User[]>]
    [-AllowedConnections <AllowedConnection>]
    [-AllowedProtocols <String[]>]
    [-AllowedUsers <AllowedUser>]
    [-AllowRestart <Boolean>]
    [-AppProtectionKeyLoggingRequired <Boolean>]
    [-AppProtectionScreenCaptureRequired <Boolean>]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-ExcludedClientIPFilterEnabled <Boolean>]
    [-ExcludedClientIPs <IPAddressRange[]>]
    [-ExcludedClientNameFilterEnabled <Boolean>]
    [-ExcludedClientNames <String[]>]
    [-ExcludedSmartAccessFilterEnabled <Boolean>]
    [-ExcludedSmartAccessTags <String[]>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-ExcludedUsers <User[]>]
    [-HdxSslEnabled <Boolean>]
    [-IncludedClientIPFilterEnabled <Boolean>]
    [-IncludedClientIPs <IPAddressRange[]>]
    [-IncludedClientNameFilterEnabled <Boolean>]
    [-IncludedClientNames <String[]>]
    [-IncludedSmartAccessFilterEnabled <Boolean>]
    [-IncludedSmartAccessFilterType <String>]
    [-IncludedSmartAccessTags <String[]>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-RemoveExcludedClientIPs <IPAddressRange[]>]
    [-RemoveExcludedClientNames <String[]>]
    [-RemoveExcludedSmartAccessTags <String[]>]
    [-RemoveExcludedUsers <User[]>]
    [-RemoveIncludedClientIPs <IPAddressRange[]>]
    [-RemoveIncludedClientNames <String[]>]
    [-RemoveIncludedSmartAccessTags <String[]>]
    [-RemoveIncludedUsers <User[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRule
    [-Name] <String>
    [-PassThru]
    [-AddExcludedClientIPs <IPAddressRange[]>]
    [-AddExcludedClientNames <String[]>]
    [-AddExcludedSmartAccessTags <String[]>]
    [-AddExcludedUsers <User[]>]
    [-AddIncludedClientIPs <IPAddressRange[]>]
    [-AddIncludedClientNames <String[]>]
    [-AddIncludedSmartAccessTags <String[]>]
    [-AddIncludedUsers <User[]>]
    [-AllowedConnections <AllowedConnection>]
    [-AllowedProtocols <String[]>]
    [-AllowedUsers <AllowedUser>]
    [-AllowRestart <Boolean>]
    [-AppProtectionKeyLoggingRequired <Boolean>]
    [-AppProtectionScreenCaptureRequired <Boolean>]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-ExcludedClientIPFilterEnabled <Boolean>]
    [-ExcludedClientIPs <IPAddressRange[]>]
    [-ExcludedClientNameFilterEnabled <Boolean>]
    [-ExcludedClientNames <String[]>]
    [-ExcludedSmartAccessFilterEnabled <Boolean>]
    [-ExcludedSmartAccessTags <String[]>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-ExcludedUsers <User[]>]
    [-HdxSslEnabled <Boolean>]
    [-IncludedClientIPFilterEnabled <Boolean>]
    [-IncludedClientIPs <IPAddressRange[]>]
    [-IncludedClientNameFilterEnabled <Boolean>]
    [-IncludedClientNames <String[]>]
    [-IncludedSmartAccessFilterEnabled <Boolean>]
    [-IncludedSmartAccessFilterType <String>]
    [-IncludedSmartAccessTags <String[]>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-RemoveExcludedClientIPs <IPAddressRange[]>]
    [-RemoveExcludedClientNames <String[]>]
    [-RemoveExcludedSmartAccessTags <String[]>]
    [-RemoveExcludedUsers <User[]>]
    [-RemoveIncludedClientIPs <IPAddressRange[]>]
    [-RemoveIncludedClientNames <String[]>]
    [-RemoveIncludedSmartAccessTags <String[]>]
    [-RemoveIncludedUsers <User[]>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerAccessPolicyRule cmdlet modifies an existing rule in the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Changing a rule does not affect existing user sessions, but it may result in users being unable to launch new sessions, or reconnect to disconnected sessions if the change removes access to the desktop group delivering those sessions.

Examples

EXAMPLE 1

Adds user group OFFICE\contractors to the Temp Staff access policy rule. The resources that the group can access are dependent on the existing properties of the rule in addition to the site's assignment and entitlement policies.

```
Set-BrokerAccessPolicyRule 'Temp Staff' -AddIncludedUsers office\
    contractors
```

EXAMPLE 2

Modifies the Temp Staff access policy rule to remove access to any user device with an IP address matching 10.15.0.0/16, and requires that all connections by the rule must come through Access Gateway (assuming that the included SmartAccess tags filter is enabled).

```
Set-BrokerAccessPolicyRule 'Temp Staff' -ExcludedClientIPFilterEnabled
    $true -AddExcludedClientIPs '10.15.0.0/16' -AllowedConnections ViaAG
```

Parameters

-InputObject

The access policy rule to be modified.

Type:	AccessPolicyRule[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the access policy rule to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddExcludedClientIPs

Adds the specified user device IP addresses to the excluded client IP address filter of the rule.

See the ExcludedClientIPs parameter for more information.

Type:	IPAddressRange[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddExcludedClientNames

Adds the specified user device names to the excluded client names filter of the rule.

See the ExcludedClientNames parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddExcludedSmartAccessTags

Adds the specified SmartAccess tags to the excluded SmartAccess tags filter of the rule.

See the ExcludedSmartAccessTags parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddExcludedUsers

Adds the specified users and groups to the excluded users filter of the rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedClientIPs

Adds the specified user device IP addresses to the included client IP address filter of the rule.

See the IncludedClientIPs parameter for more information.

Type:	IPAddressRange[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedClientNames

Adds the specified user device names to the included client names filter of the rule.

See the IncludedClientNames parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedSmartAccessTags

Adds the specified SmartAccess tags to the included SmartAccess tags filter of the rule.

See the IncludedSmartAccessTags parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedUsers

Adds the specified users and groups to the included users filter of the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowedConnections

Changes whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection. This property forms part of the included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, ViaAG and AnyViaAG.

For a detailed description of this property see "help about_Broker_AccessPolicy".

Type:	AllowedConnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowedProtocols

Changes the protocols (for example HDX, RDP) available to the user for sessions delivered from the rule's desktop group. If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.

If the protocol list is empty, access to the desktop group is implicitly denied.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowedUsers

Changes the behavior of the included users filter of the rule. This can restrict access to a list of named users or groups, allow access to any authenticated user, any user (whether authenticated or not), or only non-authenticated users. For a detailed description of this property see "help about_Broker_AccessPolicy".

Valid values are Filtered, AnyAuthenticated, Any, AnonymousOnly and FilteredOrAnonymous.

Type:	AllowedUser

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowRestart

Changes whether the user can restart sessions delivered from the rule's desktop group. Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionKeyLoggingRequired

Specifies whether key logging app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionScreenCaptureRequired

Specifies whether screen capture app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Changes the description of the rule. The text is purely informational for the administrator, it is never visible to the end user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Changes whether the rule is enabled or disabled. A disabled rule is ignored when evaluating the site's access policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ExcludedClientIPFilterEnabled

Changes whether the excluded client IP address filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedClientIPs

Changes the IP addresses of user devices explicitly denied access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

Type:	IPAddressRange[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedClientNameFilterEnabled

Changes whether the excluded client names filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedClientNames

Changes which names of user devices are explicitly denied access to the rule's desktop group. This property forms part of the excluded client names filter.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedSmartAccessFilterEnabled

Changes whether the excluded SmartAccess tags filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedSmartAccessTags

Changes which SmartAccess tags explicitly deny access to the rule's desktop group if any occur in those provided with the user's connection. This property forms part of the excluded SmartAccess tags filter.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Changes whether the excluded users filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUsers

Changes which users and groups are explicitly denied access to the rule's desktop group. This property forms part of the excluded users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-HdxSslEnabled

Indicates whether TLS encryption is enabled for sessions delivered from the rule's desktop group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedClientIPFilterEnabled

Changes whether the included client IP address filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedClientIPs

Changes which IP addresses of user devices allowed access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the included client IP address filter.

Type:	IPAddressRange[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedClientNameFilterEnabled

Changes whether the included client name filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedClientNames

Changes which names of user devices are allowed access to the rule's desktop group. This property forms part of the included client names filter.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedSmartAccessFilterEnabled

Changes whether the included SmartAccess tags filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedSmartAccessFilterType

Changes whether all tags present in IncludedSmartAccessTags must match tags provided by the user's connection to grant access (MatchAll), or whether any tag matching is sufficient (MatchAny).

Type:	String
Accepted values:	MatchAll, MatchAny
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedSmartAccessTags

Changes which SmartAccess tags grant access to the rule's desktop group if they occur in those provided with the user's connection. If multiple tags are specified, access also depends on the IncludedSmartAccessFilterType setting. This property forms part of the included SmartAccess tags filter.

Type:	String[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Changes whether the included users filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUsers

Changes which users and groups are granted access to the rule's desktop group. This property forms part of the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedClientIPs

Removes the specified user device IP addresses from the excluded client IP address filter of the rule.

See the ExcludedClientIPs parameter for more information.

Type:	IPAddressRange[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedClientNames

Removes the specified user device names from the excluded client names filter of the rule.

See the ExcludedClientNames parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedSmartAccessTags

Removes the specified SmartAccess tags from the excluded SmartAccess tags filter of the rule.

See the ExcludedSmartAccessTags parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedUsers

Removes the specified users and groups from the excluded users filter of the rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedClientIPs

Removes the specified user device IP addresses from the included client IP address filter of the rule.

See the IncludedClientIPs parameter for more information.

Type:	IPAddressRange[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedClientNames

Removes the specified client names from the included client names filter of the rule.

See the IncludedClientNames parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedSmartAccessTags

Removes the specified SmartAccess tags from the included SmartAccess tags filter of the rule.

See the IncludedSmartAccessTags parameter for more information.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedUsers

Removes the specified users and groups from the included users filter of the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AccessPolicyRule

The access policy rule to be modified.

Outputs

None, or Citrix.Broker.Admin.SDK.AccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AccessPolicyRule object.

Set-BrokerAccessPolicyRuleMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for AccessPolicyRule

Syntax

```
Set-BrokerAccessPolicyRuleMetadata
   [-AccessPolicyRuleId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRuleMetadata
   [-AccessPolicyRuleId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRuleMetadata
   [-AccessPolicyRuleId] <Int32>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRuleMetadata
   [-InputObject] <AccessPolicyRule[]>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRuleMetadata
   [-InputObject] <AccessPolicyRule[]>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRuleMetadata
   [-AccessPolicyRuleName] <String>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAccessPolicyRuleMetadata
   [-AccessPolicyRuleName] <String>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerAccessPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for AccessPolicyRule. The AccessPolicyRule can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the AccessPolicyRule whose instance is pointed by $obj-Uid

```
Set-BrokerAccessPolicyRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the AccessPolicyRule in the site

```
Get-BrokerAccessPolicyRule | Set-BrokerAccessPolicyRuleMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys "name1"and "name2"with the values "value1" and "value2"respectively for the AccessPolicyRule in the site whose name is 'objname'

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerAccessPolicyRuleMetadata 'objname'
```

Parameters

-AccessPolicyRuleId

Specifies the AccessPolicyRule object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the AccessPolicyRule objects whose Metadata is to be created/updated.

Type:	AccessPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-AccessPolicyRuleName

Specifies the AccessPolicyRule object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule

You can pipe the AccessPolicyRule to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule object.

Set-BrokerAdminFolderMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for AdminFolder

Syntax

```
Set-BrokerAdminFolderMetadata
   [-AdminFolderId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAdminFolderMetadata
    [-AdminFolderId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAdminFolderMetadata
    [-AdminFolderId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAdminFolderMetadata
    [-InputObject] <AdminFolder[]>
    [-PassThru]
    -Name <String>

    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAdminFolderMetadata
    [-AdminFolderName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAdminFolderMetadata
    [-AdminFolderName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerAdminFolderMetadata cmdlet creates/updates metadata key-value pairs for AdminFolder. The AdminFolder can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the AdminFolder whose instance is pointed by $obj-Uid

```
Set-BrokerAdminFolderMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the AdminFolder in the site

```
Get-BrokerAdminFolder | Set-BrokerAdminFolderMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys "name1"and "name2"with the values "value1" and "value2"respectively for the AdminFolder in the site whose name is 'objname'

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerAdminFolderMetadata 'objname'
```

Parameters

-AdminFolderId

Specifies the AdminFolder object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the AdminFolder objects whose Metadata is to be created/updated.

Type:	AdminFolder[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-AdminFolderName

Specifies the AdminFolder object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAdminFolder

You can pipe the AdminFolder to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerAdminFolder

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerAdminFolder object.

Set-BrokerAppAssignmentPolicyRule

March 11, 2024

Modifies an existing application rule in the site's assignment policy.

Syntax

```
Set-BrokerAppAssignmentPolicyRule
   [-InputObject] <AppAssignmentPolicyRule[]>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-RemoveExcludedUsers <User[]>]
   [-RemoveIncludedUsers <User[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAppAssignmentPolicyRule
   [-Name] <String>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-RemoveExcludedUsers <User[]>]
   [-RemoveIncludedUsers <User[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerAppAssignmentPolicyRule cmdlet modifies an existing application rule in the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Changing an application rule does not alter machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Examples

EXAMPLE 1

Adds the user group OFFICE\interns to the Temp Staff application rule in the assignment policy. This grants all members of that user group an entitlement to a machine in the rule's desktop group. The machines can run applications published from the group. The application session properties obtained using the rule are determined by the rule's other properties.

```
Set-BrokerAppAssignmentPolicyRule 'Temp Staff' -AddIncludedUsers office
    \interns
```

EXAMPLE 2

Disables the Temp Staff application rule in the assignment policy. This prevents further machine assignments being made using this rule until it is re-enabled. However, access to machines already assigned using the rule is not impacted.

```
Set-BrokerAppAssignmentPolicyRule 'Temp Staff' -Enabled $false
```

Parameters

-InputObject

The application rule in the assignment policy to be modified.

Type:	AppAssignmentPolicyRule[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application rule in the assignment policy to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddExcludedUsers

Adds the specified users to the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedUsers

Adds the specified users to the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Changes the description of the application rule. The text is purely informational for the administrator, it is never visible to the end user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Enables or disables the application rule. A disabled rule is ignored when evaluating the site's assignment policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUsers

Changes the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUsers

Changes the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule, or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedUsers

Removes the specified users from the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedUsers

Removes the specified users from the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

The application rule within the assignment policy to be modified.

Outputs

None or Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule object.

Set-BrokerAppEntitlementPolicyRule

March 11, 2024

Modifies an existing application rule in the site's entitlement policy.

Syntax

```
Set-BrokerAppEntitlementPolicyRule
   [-InputObject] <AppEntitlementPolicyRule[]>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-LeasingBehavior <LeasingBehavior>]
   [-RemoveExcludedUsers <User[]>]
   [-RemoveIncludedUsers <User[]>]
   [-SessionReconnection <SessionReconnection>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAppEntitlementPolicyRule
   [-Name] <String>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
```

```
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-LeasingBehavior <LeasingBehavior>]
    [-RemoveExcludedUsers <User[]>]
    [-RemoveIncludedUsers <User[]>]
    [-SessionReconnection <SessionReconnection>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerAppEntitlementPolicyRule cmdlet modifies an existing application rule in the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Changing a rule does not affect existing sessions launched using the rule, but if the change removes an entitlement to a machine that was previously granted, users may be unable to reconnect to a disconnected session on that machine.

Examples

EXAMPLE 1

Adds the user group OFFICE\contractors to those entitled to run applications from the rule's associated desktop group. This grants all members of that group an entitlement to an application session from that group.

```
Set-BrokerAppEntitlementPolicyRule 'Temp Workers' -AddIncludedUsers
    office\contractors
```

EXAMPLE 2

Disables the Temp Workers application rule in the entitlement policy. This prevents further application sessions being launched using this rule until it is re-enabled. However, access to existing application sessions is not affected.

```
Set-BrokerAppEntitlementPolicyRule 'Temp Workers' -Enabled $false
```

Parameters

-InputObject

The application rule in the entitlement policy to be modified.

Type:	AppEntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the application rule in the entitlement policy to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AddExcludedUsers

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedUsers

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Changes the description of the application rule. The text is purely informational for the administrator, it is never visible to the end user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Enables or disables the application rule. A disabled rule is ignored when evaluating the site's entitlement policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUsers

Changes the excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

This can be used to exclude users or groups or users who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to an application session by the application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUsers

Changes the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LeasingBehavior

Defines the desired connection leasing behavior applied to sessions launched using this entitlement. Possible values are:

Allowed and Disallowed.

The Allowed value indicates that connection leasing should behave normally. The Disallowed value prevents users

from launching or reconnecting to sessions using this entitlement while connection leasing is active (typically during a database outage).

Type:	LeasingBehavior
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedUsers

Removes the specified users from the excluded users filter of the application rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedUsers

Removes the specified users from the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionReconnection

Defines reconnection (roaming) behavior for sessions launched using this rule. Possible values are:

Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

The application rule in the entitlement policy rule to be modified.

Outputs

None or Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule object.

Set-BrokerApplication

March 11, 2024

Changes the settings of an application to the value specified in the command.

Syntax

```
Set-BrokerApplication
   [-InputObject] <Application[]>
   [-PassThru]
   [-BrowserName <String>]
   [-ClientFolder <String>]
   [-CommandLineArguments <String>]
   [-CommandLineExecutable <String>]
   [-CpuPriorityLevel <CpuPriorityLevel>]
   [-Description <String>]
   [-DoNotEnumerate <Boolean>]
   [-Enabled <Boolean>]
   [-HomeZoneOnly <Boolean>]
   [-HomeZoneUid <Guid>]
   [-IconFromClient <Boolean>]
   [-IconUid <Int32>]
   [-IgnoreUserHomeZone <Boolean>]
   [-LocalLaunchDisabled <Boolean>]
   [-MaxPerMachineInstances <Int32>]
   [-MaxPerUserInstances <Int32>]
   [-MaxTotalInstances <Int32>]
   [-PublishedName <String>]
   [-SecureCmdLineArgumentsEnabled <Boolean>]
   [-ShortcutAddedToDesktop <Boolean>]
   [-ShortcutAddedToStartMenu <Boolean>]
   [-StartMenuFolder <String>]
   [-UserFilterEnabled <Boolean>]
   [-Visible <Boolean>]
   [-WaitForPrinterCreation <Boolean>]
```

```
    [-WorkingDirectory <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplication
    [-Name] <String>
    [-PassThru]
    [-BrowserName <String>]
    [-ClientFolder <String>]
    [-CommandLineArguments <String>]
    [-CommandLineExecutable <String>]
    [-CpuPriorityLevel <CpuPriorityLevel>]

    [-WaitForPrinterCreation <Boolean>]
    [-WorkingDirectory <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerApplication cmdlet changes the value of one or more properties of an application, such as its CpuPriorityLevel or its CommandLineArguments, to the value specified in the command.

This cmdlet lets you change only the settings of the Application object, and not the relationships to other objects. For instance, it does not let you change which users can access this application, or change which desktop groups this application is published to. To do this, you need to remove the existing association, and then add a new association. The following example shows how to change the desktop group that an application is associated with from $group1 to $group2:

Remove-BrokerApplication -DesktopGroup $group1

Add-BrokerApplication -DesktopGroup $group2

You can change properties of HostedOnDesktop, InstalledOnClient and PublishedContent applications but it is not possible to change the ApplicationType. Also, the Name cannot be changed using this cmdlet; to do this, use the Rename-BrokerApplication cmdlet.

Examples

EXAMPLE 1

Modifies the application that has a Name of "Notepad"so that its description reads Windows Notepad.

```
Set-BrokerApplication -Name "Notepad" -Description 'Windows Notepad'
```

EXAMPLE 2

First gets the application with a BrowserName of "Calculator", then modifies that application (by supplying the application object in the first position) so that it is disabled for users.

```
$app = Get-BrokerApplication -BrowserName "Calculator"
Set-BrokerApplication -InputObject $app -Enabled $false
```

Parameters

-InputObject

Specifies the application to modify. The Uid of the application can also be substituted for the object.

Type:	Application[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the application to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BrowserName

Specifies the BrowserName of the application.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ClientFolder

Specifies the folder that the application belongs to as the user sees it. This is the application folder displayed in the Citrix Online Plug-in, in Web Services, and also in the user's start menu. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | ":. Note that this property cannot be set for applications of type InstalledOnClient.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CommandLineArguments

Specifies the command-line arguments to use when launching the executable. This setting is ignored for applications of type PublishedContent.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CommandLineExecutable

Specifies the name of the executable file to launch.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-CpuPriorityLevel

Specifies the CPU priority for the launched executable. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High. Note that this property cannot be set for applications of type InstalledOnClient.

Type:	CpuPriorityLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Specifies the description of the application.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotEnumerate

Specifies whether or not this application is returned to the user during enumeration.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Specifies whether or not this application can be launched.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HomeZoneOnly

Specifies whether if the preferred zone for launching the application is its home zone but no machine is available from that zone then the launch fails.

This can only be set if the application has a home zone preference specified.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HomeZoneUid

Specifies any home zone preference used when launching this application.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconFromClient

Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Specifies which icon to use for this application. This application is visible both to the administrator (in the consoles) and also to the user. If no icon is specified, then a generic built-in application icon is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreUserHomeZone

Specifies that when launching the application and the user has a home zone specified then the user's home zone preference should be ignored.

This can only be set if the application does not itself have a home zone preference specified.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalLaunchDisabled

When launching a published application from within a published desktop, do not launch the application in that desktop session.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPerMachineInstances

Specifies the maximum allowed concurrently running instances of the application that an individual machine can have. A value of zero allows unlimited usage subject to any site-wide limit.

Reducing the limit below the currently running number of instances does not cause any of those to be stopped.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPerUserInstances

Specifies the maximum allowed concurrently running instances of the application that an individual user can have. A value of zero allows unlimited usage subject to any site-wide limit.

Reducing the limit below the currently running number of instances does not cause any of those to be stopped.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTotalInstances

Specifies the maximum allowed total of concurrently running instances of the application in the site. A value of zero allows unlimited usage.

Reducing the limit below the currently running number of instances does not cause any of those to be stopped.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Specifies the name seen by end users who have access to this application.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureCmdLineArgumentsEnabled

Specifies whether the command-line arguments should be secured. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ShortcutAddedToDesktop

Specifies whether or not a shortcut to the application should be placed on the user device.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ShortcutAddedToStartMenu

Specifies whether a shortcut to the application should be placed in the user's start menu on their user device.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartMenuFolder

Specifies the name of the start menu folder that holds the application shortcut (if any). This is valid only for the Citrix Online Plug-in. Subdirectories can be specified with ‘' character. The following special characters are not allowed: / * ? < > | “:.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Specifies whether the application's user filter is enabled or disabled. Where the user filter is enabled, the application is only visible to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Visible

Specifies whether or not this application is visible to users. Note that it's possible for an application to be disabled and still visible.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WaitForPrinterCreation

Specifies whether or not the session waits for the printers to be created before allowing the end-user to interact with the session. Note that this property cannot be set for applications of type InstalledOnClient.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WorkingDirectory

Specifies from which working directory the executable is launched from. This setting is ignored for applications of type PublishedContent.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Application, or depends on parameter

You can pipe the application to be added to Set-BrokerApplication. You can also pipe some of the other parameters by name.

Outputs

None or Citrix.Broker.Admin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Application object.

Set-BrokerApplicationGroup

March 11, 2024

Changes properties of application groups.

Syntax

```
Set-BrokerApplicationGroup
    [-InputObject] <ApplicationGroup[]>
    [-PassThru]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-RestrictToTag <String>]
    [-SessionSharingEnabled <Boolean>]
    [-SingleAppPerSession <Boolean>]
    [-UserFilterEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationGroup
    [-Name] <String>
    [-PassThru]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-RestrictToTag <String>]
    [-SessionSharingEnabled <Boolean>]
    [-SingleAppPerSession <Boolean>]
    [-UserFilterEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerApplicationGroup cmdlet changes the properties of one or more application groups. The changed properties and the new values of those properties are specified as parameters to Set-BrokerApplicationGroup.

This cmdlet cannot change the relationships of application group objects with other objects. For instance, it cannot change which users can access applications in this application group, or change which desktop groups this application group is published to. To do this, you need to remove the existing association, and then add a new association.

The following example shows how to change the desktop group that application group $application-Group is associated with from $desktopGroup1 to $desktopGroup2:

Remove-BrokerApplicationGroup $applicationGroup -DesktopGroup $desktopGroup1

Add-RemoveApplicationGroup $applicationGroup -DesktopGroup $desktopGroup2

Application groups may not be renamed using this cmdlet. To rename an application group, use Rename-BrokerApplicationGroup.

Examples

EXAMPLE 1

Prevent new instances of applications in the 'Helpdesk Apps'application group from being launched.

```
Set-BrokerApplicationGroup 'Helpdesk Apps' -Enabled $false
```

EXAMPLE 2

Disable the user filter on every application group in the system. (Other access control mechanisms, such as access policy and user filters on individual applications, still apply.)

```
Get-BrokerApplicationGroup | Set-BrokerApplicationGroup -
    UserFilterEnabled $false
```

Parameters

-InputObject

Specifies the application group whose properties should be altered. Its Uid can also be substituted for the object reference.

Type:	ApplicationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Alters the properties of application groups whose name matches the supplied pattern.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

The new description for the application group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Whether the application group's applications should be launchable by end users.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTag

Specifies the new values of the application group's tag restriction.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSharingEnabled

Specifies the new value of the application group's SessionSharingEnabled flag. Please note this setting and SingleAppPerSession cannot be true at the same time.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SingleAppPerSession

Specifies whether each application launched from this application group starts in its own new session or can share an existing suitable session if present. Please note this setting and SessionSharingEnabled cannot be true at the same time.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Specifies the new value of the application group's UserFilterEnabled flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.ApplicationGroup

You can pipe application groups to Set-BrokerApplication.

Outputs

None or Citrix.Broker.Admin.SDK.ApplicationGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.ApplicationGroup object.

Set-BrokerApplicationGroupMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for ApplicationGroup

Syntax

```
Set-BrokerApplicationGroupMetadata
   [-ApplicationGroupId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerApplicationGroupMetadata
   [-ApplicationGroupId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerApplicationGroupMetadata
   [-ApplicationGroupId] <Int32>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerApplicationGroupMetadata
   [-InputObject] <ApplicationGroup[]>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerApplicationGroupMetadata
   [-InputObject] <ApplicationGroup[]>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerApplicationGroupMetadata
    [-ApplicationGroupName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationGroupMetadata
    [-ApplicationGroupName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerApplicationGroupMetadata cmdlet creates/updates metadata key-value pairs for ApplicationGroup. The ApplicationGroup can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the ApplicationGroup whose instance is pointed by $obj-Uid

```
Set-BrokerApplicationGroupMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the ApplicationGroup in the site

```
Get-BrokerApplicationGroup | Set-BrokerApplicationGroupMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the ApplicationGroup in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerApplicationGroupMetadata 'objname'
```

Parameters

-ApplicationGroupId

Specifies the ApplicationGroup object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the ApplicationGroup objects whose Metadata is to be created/updated.

Type:	ApplicationGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ApplicationGroupName

Specifies the ApplicationGroup object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerApplicationGroup

You can pipe the ApplicationGroup to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerApplicationGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerApplicationGroup object.

Set-BrokerApplicationInstanceMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for ApplicationInstance

Syntax

```
Set-BrokerApplicationInstanceMetadata
   [-ApplicationInstanceId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerApplicationInstanceMetadata
   [-ApplicationInstanceId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerApplicationInstanceMetadata
   [-ApplicationInstanceId] <Int64>
```

```
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationInstanceMetadata
    [-InputObject] <ApplicationInstance[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationInstanceMetadata
    [-InputObject] <ApplicationInstance[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerApplicationInstanceMetadata cmdlet creates/updates metadata key-value pairs for ApplicationInstance. The ApplicationInstance can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the ApplicationInstance whose instance is pointed by $obj-Uid

```
Set-BrokerApplicationInstanceMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the ApplicationInstance in the site

```
Get-BrokerApplicationInstance | Set-BrokerApplicationInstanceMetadata -
    Name "MyMetadataName" -Value "1234"
```

Parameters

-ApplicationInstanceId

Specifies the ApplicationInstance object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the ApplicationInstance objects whose Metadata is to be created/updated.

Type:	ApplicationInstance[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerApplicationInstance

You can pipe the ApplicationInstance to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerApplicationInstance

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerApplicationInstance object.

Set-BrokerApplicationMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Application

Syntax

```
Set-BrokerApplicationMetadata
    [-ApplicationId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationMetadata
    [-ApplicationId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationMetadata
    [-ApplicationId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationMetadata
    [-InputObject] <Application[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationMetadata
    [-InputObject] <Application[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerApplicationMetadata
    [-ApplicationName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerApplicationMetadata
    [-ApplicationName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerApplicationMetadata cmdlet creates/updates metadata key-value pairs for Application. The Application can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Application whose instance is pointed by $obj-Uid

```
Set-BrokerApplicationMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Application in the site

```
Get-BrokerApplication | Set-BrokerApplicationMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the Application in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerApplicationMetadata 'objname'
```

Parameters

-ApplicationId

Specifies the Application object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Application objects whose Metadata is to be created/updated.

Type:	Application[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ApplicationName

Specifies the Application object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerApplication

You can pipe the Application to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerApplication

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerApplication object.

Set-BrokerAssignmentPolicyRule

March 11, 2024

Modifies an existing desktop rule in the site's assignment policy.

Syntax

```
Set-BrokerAssignmentPolicyRule
   [-InputObject] <AssignmentPolicyRule[]>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-ColorDepth <ColorDepth>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IconUid <Int32>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-MaxDesktops <Int32>]
   [-PublishedName <String>]
   [-RemoveExcludedUsers <User[]>]
   [-RemoveIncludedUsers <User[]>]
   [-SecureIcaRequired <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRule
   [-Name] <String>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-ColorDepth <ColorDepth>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IconUid <Int32>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-MaxDesktops <Int32>]
   [-PublishedName <String>]
   [-RemoveExcludedUsers <User[]>]
```

```
    [-RemoveIncludedUsers <User[]>]
    [-SecureIcaRequired <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerAssignmentPolicyRule cmdlet modifies an existing desktop rule in the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Changing a desktop rule does not alter machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Examples

EXAMPLE 1

Adds the user group OFFICE\interns to the Temp Staff desktop rule in the assignment policy. This grants all members of that user group entitlements to machines in the rule's desktop group. The number of machine entitlements per user and the session properties of the desktops obtained using the rule are determined by the rule's other properties.

```
Set-BrokerAssignmentPolicyRule 'Temp Staff' -AddIncludedUsers office\
    interns
```

EXAMPLE 2

Disables the Temp Staff desktop rule in the assignment policy. This prevents further machine assignments being made using this rule until it is re-enabled. However, access to machines already assigned using the rule is not impacted.

```
Set-BrokerAssignmentPolicyRule 'Temp Staff' -Enabled $false
```

Parameters

-InputObject

The desktop rule in the assignment policy to be modified.

Type:	AssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the desktop rule in the assignment policy to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AddExcludedUsers

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedUsers

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Changes the color depth of any desktop sessions to machines assigned by the rule.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Changes the description of the desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Enables or disables the desktop rule. A disabled rule is ignored when evaluating the site's assignment policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUsers

Changes the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Changes the unique ID of the icon used to display the machine assignment entitlement to the user, and of the assigned desktop itself following the assignment.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUsers

Changes the included users filter of the rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule, or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDesktops

The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Changes the published name of the machine assignment entitlement as seen by the user. Changing the published name does not affect the names of desktops that have already been assigned by the rule.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-RemoveExcludedUsers

Removes the specified users from the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedUsers

Removes the specified users from the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Changes whether the desktop rule requires the SecureICA protocol for desktop sessions to machines assigned using the entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

The desktop rule within the assignment policy to be modified.

Outputs

None or Citrix.Broker.Admin.SDK.AssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AssignmentPolicyRule object.

Set-BrokerAssignmentPolicyRuleMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for AssignmentPolicyRule

Syntax

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-AssignmentPolicyRuleId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-AssignmentPolicyRuleId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-AssignmentPolicyRuleId] <Int32>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-InputObject] <AssignmentPolicyRule[]>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-InputObject] <AssignmentPolicyRule[]>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-AssignmentPolicyRuleName] <String>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerAssignmentPolicyRuleMetadata
   [-AssignmentPolicyRuleName] <String>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerAssignmentPolicyRuleMetadata cmdlet creates/updates metadata key-value

pairs for AssignmentPolicyRule. The AssignmentPolicyRule can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the AssignmentPolicyRule whose instance is pointed by $obj-Uid

```
Set-BrokerAssignmentPolicyRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the AssignmentPolicyRule in the site

```
Get-BrokerAssignmentPolicyRule | Set-BrokerAssignmentPolicyRuleMetadata
     -Name "MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the AssignmentPolicyRule in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerAssignmentPolicyRuleMetadata 'objname'
```

Parameters

-AssignmentPolicyRuleId

Specifies the AssignmentPolicyRule object whose Metadata is to be created/updated by ID.

Type: Int32

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the AssignmentPolicyRule objects whose Metadata is to be created/updated.

Type:	AssignmentPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-AssignmentPolicyRuleName

Specifies the AssignmentPolicyRule object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule

You can pipe the AssignmentPolicyRule to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule object.

Set-BrokerAutoTagRule

March 11, 2024

Changes an existing AutoTagRule.

Syntax

```
Set-BrokerAutoTagRule
    [-InputObject] <AutoTagRule[]>
    [-PassThru]
    [-Description <String>]
    [-ObjectType <String>]
    [-RuleText <String>]
    [-TagUid <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRule
    [-Name] <String>
    [-PassThru]
    [-Description <String>]
    [-ObjectType <String>]
    [-RuleText <String>]
    [-TagUid <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Changes the specified properties of an existing AutoTagRule.

Examples

EXAMPLE 1

Sets RandomAllocatedCatalogs'tag to MyExample2.

```
$tag = New-BrokerTag -Name MyExample2
Set-BrokerAutoTagRule -Name RandomAllocatedCatalogs -TagUid $tag.Uid
```

Parameters

-InputObject

Specifies the AutoTagRule object to change.

Type:	AutoTagRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the AutoTagRule to change.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Description

New Description that will be set.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ObjectType

New ObjectType that will be set.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RuleText

New RuleText that will be set.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-TagUid

New TagUid that will be set.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.AutoTagRule

AutoTagRule may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerAutoTagRuleMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for AutoTagRule

Syntax

```
Set-BrokerAutoTagRuleMetadata
   [-AutoTagRuleId] <Int32>
   [-PassThru]
   -Name <String>
```

```
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRuleMetadata
    [-AutoTagRuleId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRuleMetadata
    [-AutoTagRuleId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRuleMetadata
    [-InputObject] <AutoTagRule[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRuleMetadata
    [-InputObject] <AutoTagRule[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRuleMetadata
    [-AutoTagRuleName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerAutoTagRuleMetadata
    [-AutoTagRuleName] <String>
    [-PassThru]
    -Map <PSObject>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerAutoTagRuleMetadata cmdlet creates/updates metadata key-value

pairs for AutoTagRule. The AutoTagRule can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the AutoTagRule whose instance is pointed by $obj-Uid

```
Set-BrokerAutoTagRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the AutoTagRule in the site

```
Get-BrokerAutoTagRule | Set-BrokerAutoTagRuleMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the AutoTagRule in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerAutoTagRuleMetadata 'objname'
```

Parameters

-AutoTagRuleId

Specifies the AutoTagRule object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the AutoTagRule objects whose Metadata is to be created/updated.

Type:	AutoTagRule[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-AutoTagRuleName

Specifies the AutoTagRule object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a

series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerAutoTagRule

You can pipe the AutoTagRule to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerAutoTagRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerAutoTagRule object.

Set-BrokerCatalog

March 11, 2024

Sets the properties of a catalog.

Syntax

```
Set-BrokerCatalog
   [-InputObject] <Catalog[]>
   [-PassThru]
   [-Description <String>]
   [-IsRemotePC <Boolean>]
   [-MinimumFunctionalLevel <FunctionalLevel>]
   [-ProvisioningSchemeId <Guid>]
   [-PvsAddress <String>]
   [-PvsDomain <String>]
   [-RemotePCHypervisorConnectionUid <Int32>]
   [-TimeZone <String>]
   [-ZoneUid <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerCatalog
   [-Name] <String>
   [-PassThru]
   [-Description <String>]
   [-IsRemotePC <Boolean>]
   [-MinimumFunctionalLevel <FunctionalLevel>]
   [-ProvisioningSchemeId <Guid>]
   [-PvsAddress <String>]
   [-PvsDomain <String>]
   [-RemotePCHypervisorConnectionUid <Int32>]
   [-TimeZone <String>]
   [-ZoneUid <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerCatalog cmdlet sets properties of a catalog or set of catalogs. The catalog can be specified by name, in which case only one catalog can be specified, or one or more catalog instances can

be passed to the command either by piping or by using the -InputObject parameter.

Examples

EXAMPLE 1

This example specifies a catalog by name and sets its description.

```
Set-BrokerCatalog -Name "MyCatalog" -Description "New Description"
```

EXAMPLE 2

This example sets the description for all catalogs with AllocationType 'Static'.

```
$permCatalogs = Get-BrokerCatalog -AllocationType Static
Set-BrokerCatalog -InputObject $permCatalogs -Description "Permanently
    assigned machines"
```

Parameters

-InputObject

Specifies the catalog objects to modify.

Type:	Catalog[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Identifies the catalog to modify.

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Supplies the new value of the Description property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsRemotePC

Supplies a new value for IsRemotePC.

IsRemotePC can only be enabled when:

- SessionSupport is SingleSession
- MachinesArePhysical is true.

IsRemotePC can only be set from true to false when no RemotePCAccount references this catalog, and when no Remote PC relationship exists between this catalog and a desktop group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MinimumFunctionalLevel

The new minimum FunctionalLevel required for machines to work successfully in the catalog. If this is higher than the FunctionalLevel of any machines already in the catalog, they will immediately cease to function.

Valid values are L5, L7, L7_6, L7_7, L7_8, L7_9, L7_20, L7_25, L7_30, L7_34

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeId

Specifies the identity of the MCS provisioning scheme the catalog is associated with (can only be specified for new catalogs with a ProvisioningType of MCS; once set can never be changed).

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvsAddress

Supplies the new value of the PvsAddress property. Can only be set if CatalogKind is Pvs.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PvsDomain

Supplies the new value of the PvsDomain property. Can only be set if CatalogKind is Pvs.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemotePCHypervisorConnectionUid

Supplies the new hypervisor connection to use for powering on remote PCs in this catalog (only allowed when IsRemotePC is true); this will affect all machines already in the catalog as well as those created later.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TimeZone

The time zone in which this catalog's machines reside.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

Supplies the Zone Uid associated with this catalog.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

You can pipe the catalogs to be modified to Set-BrokerCatalog.

Outputs

None or Citrix.Broker.Admin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Catalog object.

Notes

A catalog's Name property cannot be changed by Set-BrokerCatalog. To rename a catalog use Rename-BrokerCatalog.

Set-BrokerCatalogMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Catalog

Syntax

```
Set-BrokerCatalogMetadata
   [-CatalogId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerCatalogMetadata
   [-CatalogId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerCatalogMetadata
   [-CatalogId] <Int32>
   [-PassThru]
```

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerCatalogMetadata
    [-InputObject] <Catalog[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerCatalogMetadata
    [-InputObject] <Catalog[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerCatalogMetadata
    [-CatalogName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerCatalogMetadata
    [-CatalogName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerCatalogMetadata cmdlet creates/updates metadata key-value pairs for Catalog. The Catalog can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Catalog whose instance is pointed by $obj-Uid

```
Set-BrokerCatalogMetadata -InputObject $obj-Uid -Name "MyMetadataName"
    -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Catalog in the site

```
Get-BrokerCatalog | Set-BrokerCatalogMetadata -Name "MyMetadataName" -
    Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the Catalog in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerCatalogMetadata 'objname'
```

Parameters

-CatalogId

Specifies the Catalog object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Catalog objects whose Metadata is to be created/updated.

Type:	Catalog[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CatalogName

Specifies the Catalog object whose Metadata is to be created/updated by name.

Type:	String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerCatalog

You can pipe the Catalog to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerCatalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerCatalog object.

Set-BrokerCatalogRebootSchedule

March 11, 2024

Updates the values of one or more catalog reboot schedules.

Syntax

```
Set-BrokerCatalogRebootSchedule
    [-InputObject] <CatalogRebootSchedule[]>
    [-PassThru]
    [-Description <String>]
    [-Enabled <Boolean>]
```

```
    [-MaxOvertimeStartMins <Int32>]
    [-RebootDuration <Int32>]
    [-StartDate <String>]
    [-StartTime <TimeSpan>]
    [-WarningDuration <Int32>]
    [-WarningMessage <String>]
    [-WarningRepeatInterval <Int32>]
    [-WarningTitle <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerCatalogRebootSchedule
    [-Name] <String>
    [-PassThru]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-MaxOvertimeStartMins <Int32>]
    [-RebootDuration <Int32>]
    [-StartDate <String>]
    [-StartTime <TimeSpan>]
    [-WarningDuration <Int32>]
    [-WarningMessage <String>]
    [-WarningRepeatInterval <Int32>]
    [-WarningTitle <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerCatalogRebootSchedule cmdlet is used to alter the settings of an existing catalog reboot schedule.

Examples

EXAMPLE 1

Sets the catalog reboot schedule named Accounting to display a message with the title “WARNING: Reboot pending”and body “Save your work”ten minutes prior to rebooting each machine. The message is displayed in every user session on that machine.

```
Set-BrokerCatalogRebootSchedule -Name Accounting -WarningMessage "Save
    your work" -WarningDuration 10 -WarningTitle "WARNING: Reboot
    pending"
```

EXAMPLE 2

Sets all disabled reboot schedules to be enabled.

```
Get-BrokerCatalogRebootSchedule -Enabled $false | Set-
    BrokerCatalogRebootSchedule -Enabled $true
```

EXAMPLE 3

Sets the catalog reboot schedule for the reboot schedule having Uid 17 to display the message "Rebooting in %m% minutes."Fifteen, ten and five minutes prior to rebooting each machine, the message "Rebooting in %m% minutes."will be displayed in each user session with the pattern '%m%'replaced with the number of minutes until the reboot.

```
Set-BrokerCatalogRebootSchedule 17 -WarningMessage "Rebooting in %m%
    minutes." -WarningDuration 15 -WarningRepeatInterval 5
```

Parameters

-InputObject

The catalog reboot schedule to be modified.

Type:	CatalogRebootSchedule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the reboot schedule

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

An optional description for the reboot schedule.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the reboot schedule is to be enabled or disabled.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxOvertimeStartMins

Maximum delay in minutes after which the scheduled reboot will not take place

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartDate

The date on which the schedule is expected to run, date is in ISO 8601 Format (YYYY-MM-DD).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Time of day at which the scheduled reboot cycle starts (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningDuration

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed. In some cases the time required to process a reboot schedule may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Time to wait after the previous reboot warning before displaying the warning message in all user sessions on that machine again. If the warning repeat interval is zero then the warning message is not displayed after the initial warning.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.CatalogRebootSchedule

Catalog reboot schedules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerConfiguration

March 11, 2024

This cmdlet is for internal use only

Syntax

```
Set-BrokerConfiguration
   [-Configuration <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet is for internal use only

Examples

Parameters

-Configuration

This parameter is for internal use only

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet does not accept input

Outputs

None

By default, this cmdlet returns no output.

    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerConfigurationSlotMetadata cmdlet creates/updates metadata key-value pairs for ConfigurationSlot. The ConfigurationSlot can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

```
Set-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the ConfigurationSlot in the site

```
Get-BrokerConfigurationSlot | Set-BrokerConfigurationSlotMetadata -Name
     "MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys "name1"and "name2"with the values "value1" and "value2"respectively for the ConfigurationSlot in the site whose name is 'objname'

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerConfigurationSlotMetadata 'objname'
```

Parameters

-ConfigurationSlotId

Specifies the ConfigurationSlot object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the ConfigurationSlot objects whose Metadata is to be created/updated.

Type:	ConfigurationSlot[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ConfigurationSlotName

Specifies the ConfigurationSlot object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerConfigurationSlot

You can pipe the ConfigurationSlot to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerConfigurationSlot

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerConfigurationSlot object.

Set-BrokerControllerMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Controller

Syntax

```
Set-BrokerControllerMetadata
    [-ControllerId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerControllerMetadata
    [-ControllerId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerControllerMetadata
    [-ControllerId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerControllerMetadata
    [-InputObject] <Controller[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerControllerMetadata
    [-InputObject] <Controller[]>
    [-PassThru]
```

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerControllerMetadata
    [-ControllerName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerControllerMetadata
    [-ControllerName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerControllerMetadata cmdlet creates/updates metadata key-value

pairs for Controller. The Controller can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Controller whose instance is pointed by $obj-Uid

```
Set-BrokerControllerMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Controller in the site

```
Get-BrokerController | Set-BrokerControllerMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the Controller in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerControllerMetadata 'objname'
```

Parameters

-ControllerId

Specifies the Controller object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Controller objects whose Metadata is to be created/updated.

Type:	Controller[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ControllerName

Specifies the Controller object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerController

You can pipe the Controller to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerController

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerController object.

Set-BrokerDBConnection

March 11, 2024

Configures a database connection for the Broker Service.

Syntax

```
Set-BrokerDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Broker Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Broker SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-BrokerDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-BrokerDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Broker Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	3
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-BrokerDBConnection cmdlet returns an object describing the status of the Broker Service together with extra diagnostics information. Possible values are:

- OK:

The Broker Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Broker Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Broker Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Broker Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Broker Service currently in use is newer than, and incompatible with, the version of the Broker Service schema on the database. Upgrade the Broker Service to a more recent version.

- DBOlderVersionThanService:

The version of the Broker Service schema on the database is newer than, and incompatible with, the version of the Broker Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Broker Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Broker Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Broker Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-BrokerDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Broker Service.

Syntax

```
Set-BrokerDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerDBCredentials
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Broker Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Broker Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Broker SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-BrokerDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-BrokerDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-BrokerDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-BrokerDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerDesktopGroup

March 11, 2024

Adjusts the settings of a broker desktop group.

Syntax

```
Set-BrokerDesktopGroup
   [-InputObject] <DesktopGroup[]>
   [-PassThru]
   [-AllowReconnectInMaintenanceMode <Boolean>]
   [-AppDisks <Guid[]>]
   [-AppProtectionKeyLoggingRequired <Boolean>]
   [-AppProtectionScreenCaptureRequired <Boolean>]
   [-AutomaticPowerOnForAssigned <Boolean>]
   [-AutomaticPowerOnForAssignedDuringPeak <Boolean>]
   [-AutomaticRestartForUntaggedMachines <Boolean>]
   [-AutoscaleLogOffReminderEnabled <Boolean>]
   [-AutoscaleLogOffReminderIntervalSecondsOffPeak <Int32>]
   [-AutoscaleLogOffReminderIntervalSecondsPeak <Int32>]
   [-AutoscaleLogOffReminderMessage <String>]
   [-AutoscaleLogOffReminderTitle <String>]
   [-AutoscaleLogOffWarningMessage <String>]
```

```
    [-AutoscaleLogOffWarningTitle <String>]
    [-AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak <Int32>]
    [-AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak <Int32>]
    [-AutoscalingEnabled <Boolean>]
    [-ColorDepth <ColorDepth>]
    [-DeliveryType <DeliveryType>]
    [-Description <String>]
    [-DisconnectOffPeakIdleSessionAfterSeconds <Int32>]
    [-DisconnectPeakIdleSessionAfterSeconds <Int32>]
    [-Enabled <Boolean>]
    [-IconUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-IsRemotePC <Boolean>]
    [-LicenseModel <LicenseModel>]
    [-LogoffOffPeakDisconnectedSessionAfterSeconds <Int32>]
    [-LogoffPeakDisconnectedSessionAfterSeconds <Int32>]
    [-MachineCost <Decimal>]
    [-MachineLogOnType <MachineLogOnType>]
    [-MinimumFunctionalLevel <FunctionalLevel>]
    [-OffPeakBufferSizePercent <Int32>]
    [-OffPeakDisconnectAction <SessionChangeHostingAction>]
    [-OffPeakDisconnectTimeout <Int32>]
    [-OffPeakExtendedDisconnectAction <SessionChangeHostingAction>]
    [-OffPeakExtendedDisconnectTimeout <Int32>]

    [-PeakAutoscaleAssignedPowerOnIdleTimeout <Int32>]
    [-PeakBufferSizePercent <Int32>]
    [-PeakDisconnectAction <SessionChangeHostingAction>]
    [-PeakDisconnectTimeout <Int32>]
    [-PeakExtendedDisconnectAction <SessionChangeHostingAction>]
```

```
49      [-PeakExtendedDisconnectTimeout <Int32>]
50      [-PeakLogOffAction <SessionChangeHostingAction>]
51      [-PeakLogOffTimeout <Int32>]
52      [-PolicySetGuid <Guid>]
53      [-PowerOffDelay <Int32>]
54      [-ProductCode <String>]
55      [-ProtocolPriority <String[]>]
56      [-PublishedName <String>]
57      [-RequiredSleepCapability <String>]
58      [-ResourceLeasingEnabled <Boolean>]
59      [-RestrictAutoscaleMinIdleUntaggedPercentDuringOffPeak <Int32>]
60      [-RestrictAutoscaleMinIdleUntaggedPercentDuringPeak <Int32>]
61      [-RestrictAutoscaleTagUid <Int32>]
62      [-ReuseMachinesWithoutShutdownInOutage <Boolean>]
63      [-SecureIcaRequired <Boolean>]
64      [-SettlementPeriodBeforeAutoShutdown <TimeSpan>]
65      [-SettlementPeriodBeforeUse <TimeSpan>]
66      [-ShutdownDesktopsAfterUse <Boolean>]
67      [-TimeZone <String>]
68      [-TurnOnAddedMachine <Boolean>]
69      [-UseVerticalScaling <Boolean>]
70      [-ZonePreferences <ZonePreference[]>]
71      [-LoggingId <Guid>]
72      [<CitrixCommonParameters>]
73      [<CommonParameters>]
```

Description

The Set-BrokerDesktopGroup cmdlet is used to disable or enable an existing broker desktop group or to alter its settings.

Examples

EXAMPLE 1

Sets all desktop groups with names starting “EMEA”into maintenance mode, returning the set of desktop groups.

```
1  Set-BrokerDesktopGroup EMEA* -InMaintenanceMode $true -PassThru
```

EXAMPLE 2

Disable all desktop groups that are in maintenance mode.

```
1  Get-BrokerDesktopGroup -InMaintenanceMode $true | Set-
       BrokerDesktopGroup -Enabled $false
```

Parameters

-InputObject

Specifies the desktop groups to adjust.

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the desktop groups to adjust, based on their Name property.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AllowReconnectInMaintenanceMode

Whether the maintenance mode allows session reconnect to various Session support types.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppDisks

Specifies the application disks to be used by machines in the desktop group.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionKeyLoggingRequired

Specifies whether key logging app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AppProtectionScreenCaptureRequired

Specifies whether screen capture app protection is required.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomaticPowerOnForAssigned

Specifies whether assigned desktops in the desktop group should be automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomaticPowerOnForAssignedDuringPeak

Specifies whether assigned desktops in the desktop group should be automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutomaticRestartForUntaggedMachines

Indicates whether untagged single-session machines belonging to a desktop group configured for restrict Autoscale and shutdown after use should restart after untainting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderEnabled

Gets the value indicating whether the warning messages should be sent on an interval to nudge a logoff should be sent on an interval when autoscale is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderIntervalSecondsOffPeak

Gets the interval in seconds which represents the time interval at which messages are sent to the user during off peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderIntervalSecondsPeak

Gets the interval in seconds which represents the time interval at which messages are sent to the user during peak time when autoscale is enabled. This message will nudge users to log off instead of forcibly logging them off

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderMessage

Specifies the notification message to display to users in active sessions belonging to machines needed by Autoscale for shutdown

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffReminderTitle

Specifies the notification message dialog title displayed when Autoscale issues a logoff reminder request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffWarningMessage

Specifies the warning message to display to users in active sessions prior to Autoscale issuing a logoff request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleLogOffWarningTitle

Specifies the warning message dialog title displayed prior to Autoscale issuing a logoff request.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleMaxSecondsBeforeForcedLogOffDuringOffPeak

Specifies the minimum seconds that need to elapse before Autoscale logs off the active sessions on the draining machines belonging to the delivery group during off-peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscaleMaxSecondsBeforeForcedLogOffDuringPeak

Specifies the minimum seconds that need to elapse before Autoscale logs off the active sessions on the draining machines belonging to the delivery group peak time. This property will override the power-off delay behavior if it is configured to a value greater than zero.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AutoscalingEnabled

Specifies whether machines in this desktop group can be Autoscaled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Specifies the color depth that the ICA session should use for desktops in this group. Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeliveryType

Specifies whether desktops, applications, or both, can be delivered from machines contained within the desktop group. Desktop groups with a DesktopKind of Private cannot be used to deliver both desktops and applications.

When changing the delivery type to desktops only, there must be no remaining desktop-hosted applications associated with the group, or application-specific assignment/entitlement policy rules for the group.

When changing the delivery type to applications only, there must be no remaining client-hosted applications associated with the group, or desktop-specific assignment/entitlement policy rules for the group.

Valid values are DesktopsOnly, AppsOnly, and DesktopsAndApps.

Type:	DeliveryType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

A description for this desktop group useful for administrators of the site.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisconnectOffPeakIdleSessionAfterSeconds

Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during off-peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisconnectPeakIdleSessionAfterSeconds

Specifies the time in seconds after which an idle session belonging to the delivery group is disconnected during peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Whether the desktop group should be in the enabled state; disabled desktop groups do not appear to users.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

The UID of the broker icon to be displayed to users for their desktop(s) in this desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-InMaintenanceMode

Whether the desktop should be put into maintenance mode; a desktop group in maintenance mode will not allow users to connect or reconnect to their desktops.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsRemotePC

Supplies a new value for IsRemotePC.

IsRemotePC can only be enabled when:

- SessionSupport is SingleSession
- DeliveryType is DesktopsOnly
- DesktopKind is Private

IsRemotePC can be switched from true to false only if no RemotePC relationship exists between a catalog and this desktop group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseModel

The license model for this desktop group. If none is specified, then the site-wide license model is used.

Type:	LicenseModel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffOffPeakDisconnectedSessionAfterSeconds

Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during off-peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffPeakDisconnectedSessionAfterSeconds

Specifies the time in seconds after which a disconnected session belonging to the delivery group is terminated during peak time.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MachineCost

The per-hour instance cost of machines in this desktop group.

Type:	Decimal
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineLogOnType

Specifies the login type for the desktop group. Values can be:

- ActiveDirectory - Perform Active Directory login on the machine.
- LocalMappedAccount - Perform local mapped account login on the machine.

Type:	MachineLogOnType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MinimumFunctionalLevel

The new minimum FunctionalLevel required for machines to work successfully in the desktop group. If this is higher than the FunctionalLevel of any machines already in the desktop group, they will immediately cease to function.

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakBufferSizePercent

The percentage of single-session machines that are kept available in an idle state, or for multi-session machines, the percentage of the total load capacity to be kept available outside peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakDisconnectAction

The action to be performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakDisconnectTimeout

The number of minutes before the configured action should be performed after a user session disconnects outside peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakExtendedDisconnectAction

The action to be performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakExtendedDisconnectTimeout

The number of minutes before the second configured action should be performed after a user session disconnects outside peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakLogOffAction

The action to be performed after a configurable period of a user session ending outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OffPeakLogOffTimeout

The number of minutes before the configured action should be performed after a user session ends outside peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakAutoscaleAssignedPowerOnIdleAction

The action to be performed on an assigned machine started by Autoscale if that machine then remains unused for a defined period of time.

Type:	String
Accepted values:	Nothing, Shutdown, Suspend
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakAutoscaleAssignedPowerOnIdleTimeout

The number of minutes before the configured action is performed on an assigned machine previously started by autoscale that subsequently remains unused.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakBufferSizePercent

The percentage of single-session machines that are kept available in an idle state, or for multi-session machines, the percentage of the total load capacity to be kept available in peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakDisconnectAction

The action to be performed after a configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakDisconnectTimeout

The number of minutes before the configured action should be performed after a user session disconnects in peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakExtendedDisconnectAction

The action to be performed after a second configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-PeakExtendedDisconnectTimeout

The number of minutes before the second configured action should be performed after a user session disconnects in peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakLogOffAction

The action to be performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Type:	SessionChangeHostingAction
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakLogOffTimeout

The number of minutes before the configured action should be performed after a user session ends in peak hours.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicySetGuid

The policy set assigned to this delivery group.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PowerOffDelay

The number of minutes following a power-on operation that Auto Scale will wait before attempting to power off that same machine. Possible values are in the range 0 - 60.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductCode

The licensing product code for this desktop group. If none is specified, then the site-wide product code is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProtocolPriority

A list of protocol names in the order in which they should be attempted for use during connection.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

The name that will be displayed to users for their desktop(s) in this desktop group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RequiredSleepCapability

The sleep capability of this desktop group. Possible values are None, or Suspend.

Type:	String
Accepted values:	None, Suspend
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLeasingEnabled

Indicates if this desktop group is enabled for resource leasing.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictAutoscaleMinIdleUntaggedPercentDuringOffPeak

This indicates the percentage that the number of untagged single-session machines in an idle state, or for multi-session machines, the untagged available load capacity must fall below before Autoscale powers on and manages ‘tagged’machines, as per policy, in off-peak. If the number of untagged machines in an idle state, or the untagged available load capacity goes above this threshold value, Autoscale will attempt to shut down ‘tagged’machines. Possible values are in the range -1 - 100, where -1 (default) disables this behavior. This is only relevant for desktop groups configured for Restrict Autoscaling.

Type:	Int32

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictAutoscaleMinIdleUntaggedPercentDuringPeak

This indicates the percentage that the number of untagged single-session machines in an idle state, or for multi-session machines, the untagged available load capacity must fall below before Autoscale powers on and manages 'tagged' machines, as per policy, in peak time. If the number of untagged machines in an idle state, or the untagged available load capacity goes above this threshold value, Autoscale will attempt to shut down 'tagged' machines. Possible values are in the range -1 - 100, where -1 (default) disables this behavior. This is only relevant for desktop groups configured for Restrict Autoscaling.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictAutoscaleTagUid

If set to a Tag UID, only machines that have this tag will be auto scaled.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ReuseMachinesWithoutShutdownInOutage

Specifies whether power cycle operations are required during outage for pooled machines.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Whether HDX connections to desktops in the new desktop group require the use of a secure protocol.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettlementPeriodBeforeAutoShutdown

Time after a session ends during which automatic shutdown requests (for example, shutdown after use, idle pool management) are deferred. Any outstanding shutdown request takes effect after the settlement period expires. This is typically used to configure time to allow logoff scripts to complete.

Type:	TimeSpan

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettlementPeriodBeforeUse

Idle period before a machine can be selected to host a new session after registration or the end of a previous session. This is typically used to allow a machine to become idle following processing associated with start-up or logoff actions. A machine may still be selected during the idle period if no other machine is available for immediate use.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ShutdownDesktopsAfterUse

Whether desktops in this desktop group should be automatically shut down when each user session completes (only relevant to power-managed desktops).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TimeZone

The time zone in which this desktop group's machines reside.

The time zone must be specified for any of the group's automatic power management settings to take effect. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TurnOnAddedMachine

This flag specifies whether the Broker Service should attempt to power on machines when they are added to the desktop group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseVerticalScaling

Determines whether to use vertical scaling when considering RDS machines in the desktop group for launches. Vertical scaling would saturate machines in the current pool rather than send sessions to the least loaded machines. This would be a trade in performance vs. cost, where vertical scaling would be less costly.

With the default value ($null), the site-wide value will be inherted. A value of $false indicates that horizontal scaling should be used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZonePreferences

Ordered list of zone preferences to be applied when launching resources from this desktop group. Valid zone preference values are UserLocation, UserHome, UserHomeOnly and ApplicationHome.

The list can have zero or more entries subject to the following restrictions: Zone preferences can only be applied to groups having a DesktopKind of Shared; the same zone preference value cannot occur in the list more than once; the UserHome and UserHomeOnly values are mutually exclusive and cannot both appear in the list.

Type:	ZonePreference[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

You can pipe the desktop groups to be adjusted to Set-BrokerDesktopGroup.

Outputs

None or Citrix.Broker.Admin.SDK.DesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.DesktopGroup object.

Set-BrokerDesktopGroupMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for DesktopGroup

Syntax

```
Set-BrokerDesktopGroupMetadata
   [-DesktopGroupId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerDesktopGroupMetadata
   [-DesktopGroupId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerDesktopGroupMetadata
   [-DesktopGroupId] <Int32>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerDesktopGroupMetadata
   [-InputObject] <DesktopGroup[]>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerDesktopGroupMetadata
   [-InputObject] <DesktopGroup[]>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerDesktopGroupMetadata
    [-DesktopGroupName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerDesktopGroupMetadata
    [-DesktopGroupName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerDesktopGroupMetadata cmdlet creates/updates metadata key-value pairs for DesktopGroup. The DesktopGroup can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the DesktopGroup whose instance is pointed by $obj-Uid

```
Set-BrokerDesktopGroupMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the DesktopGroup in the site

```
Get-BrokerDesktopGroup | Set-BrokerDesktopGroupMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the DesktopGroup in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerDesktopGroupMetadata 'objname'
```

Parameters

-DesktopGroupId

Specifies the DesktopGroup object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the DesktopGroup objects whose Metadata is to be created/updated.

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

Specifies the DesktopGroup object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerDesktopGroup

You can pipe the DesktopGroup to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerDesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerDesktopGroup object.

Set-BrokerDesktopGroupWebhook

March 11, 2024

Adjusts the settings of a webhook for a desktop group

Syntax

```
Set-BrokerDesktopGroupWebhook
   [-InputObject] <DesktopGroupWebhook[]>
   [-PassThru]
   [-Address <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet is used to alter the settings of a webhook for a desktop group

Examples

EXAMPLE 1

Changes the URL of the webhook for the desktop group with Uid 1

```
Get-BrokerDesktopGroupWebhook -DesktopGroupUid 1 | Set-
    BrokerDesktopGroupWebhook -Address "http://citrix.com/example2"
```

Parameters

-InputObject

The webhook object to alter the settings.

Type:	DesktopGroupWebhook[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Address

Specified the new URL for the webhook.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroupWebhook

You can pipe webhooks to this cmdlet

Outputs

None or Citrix.Broker.Admin.SDK.DesktopGroupWebhook

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.DesktopGroupWebhook object.

Set-BrokerEntitlementPolicyRule

March 11, 2024

Modifies an existing desktop rule in the site's entitlement policy.

Syntax

```
Set-BrokerEntitlementPolicyRule
   [-InputObject] <EntitlementPolicyRule[]>
   [-PassThru]
   [-AddExcludedUsers <User[]>]
   [-AddIncludedUsers <User[]>]
   [-ColorDepth <ColorDepth>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-ExcludedUserFilterEnabled <Boolean>]
   [-ExcludedUsers <User[]>]
   [-IconUid <Int32>]
   [-IncludedUserFilterEnabled <Boolean>]
   [-IncludedUsers <User[]>]
   [-LeasingBehavior <LeasingBehavior>]
   [-MaxPerEntitlementInstances <Int32>]
   [-PublishedName <String>]
   [-RemoveExcludedUsers <User[]>]
   [-RemoveIncludedUsers <User[]>]
   [-RestrictToTag <String>]
   [-SecureIcaRequired <Boolean>]
   [-SessionReconnection <SessionReconnection>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRule
    [-Name] <String>
    [-PassThru]
    [-AddExcludedUsers <User[]>]
    [-AddIncludedUsers <User[]>]
    [-ColorDepth <ColorDepth>]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-ExcludedUserFilterEnabled <Boolean>]
    [-ExcludedUsers <User[]>]
    [-IconUid <Int32>]
    [-IncludedUserFilterEnabled <Boolean>]
    [-IncludedUsers <User[]>]
    [-LeasingBehavior <LeasingBehavior>]
    [-MaxPerEntitlementInstances <Int32>]
    [-PublishedName <String>]
    [-RemoveExcludedUsers <User[]>]
    [-RemoveIncludedUsers <User[]>]
    [-RestrictToTag <String>]
    [-SecureIcaRequired <Boolean>]
    [-SessionReconnection <SessionReconnection>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerEntitlementPolicyRule cmdlet modifies an existing desktop rule in the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Changing a rule does not affect existing sessions launched using the rule, but if the change removes an entitlement to a machine that was previously granted, users may be unable to reconnect to a disconnected session on that machine.

Examples

EXAMPLE 1

Adds the user group OFFICE\contractors to the Temp Workers desktop rule of the entitlement policy. This grants all members of that group an entitlement to a desktop session in the rule's associated desktop group. The session properties of the desktops obtained using the rule are determined by the rule's other properties.

```
Set-BrokerEntitlementPolicyRule 'Temp Workers' -AddIncludedUsers office
    \contractors
```

EXAMPLE 2

Disables the Temp Workers desktop rule in the entitlement policy. This prevents further desktop sessions being launched using this rule until it is re-enabled. However, access to existing desktop sessions is not affected.

```
Set-BrokerEntitlementPolicyRule 'Temp Workers' -Enabled $false
```

Parameters

-InputObject

The desktop rule in the entitlement policy to be modified.

Type:	EntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the desktop rule in the entitlement policy to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddExcludedUsers

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AddIncludedUsers

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Changes the color depth of any desktop sessions launched by a user from this entitlement. Existing sessions are not affected.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Changes the description of the desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Enables or disables the desktop rule. A disabled rule is ignored when evaluating the site's entitlement policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUserFilterEnabled

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedUsers

Changes the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Type:	User[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Changes the icon (identified by its unique ID) for the published desktop entitlement as seen by the user.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUserFilterEnabled

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludedUsers

Changes the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LeasingBehavior

Defines the desired connection leasing behavior applied to sessions launched using this entitlement. Possible values are:

Allowed and Disallowed.

The Allowed value indicates that connection leasing should behave normally. The Disallowed value prevents users

from launching or reconnecting to sessions using this entitlement while connection leasing is active (typically during a database outage).

Type:	LeasingBehavior
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxPerEntitlementInstances

Maximum allowed concurrently running instances of the desktop associated with this entitlement in the site . A value of zero allows unlimited usage.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Changes the name of the published desktop entitlement as seen by the user.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveExcludedUsers

Removes the specified users from the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

See the ExcludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemoveIncludedUsers

Removes the specified users from the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

See the IncludedUsers parameter for more information.

Type:	User[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTag

Optional tag that may be used further to restrict which machines may be made accessible to a user by an entitlement policy rule. A machine may be made accessible by an entitlement policy rule only if either the rule has no tag restriction or the rule does have a tag restriction and the machine is tagged with the same tag.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Changes whether the desktop rule requires the SecureICA protocol for desktop sessions launched using the entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionReconnection

Defines reconnection (roaming) behavior for sessions launched using this rule. Possible values are:

Always, DisconnectedOnly, and SameEndpointOnly.

Type:	SessionReconnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

The desktop rule in the entitlement policy to be modified.

Outputs

None or Citrix.Broker.Admin.SDK.EntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.EntitlementPolicyRule object.

Set-BrokerEntitlementPolicyRuleMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for EntitlementPolicyRule

Syntax

```
Set-BrokerEntitlementPolicyRuleMetadata
   [-EntitlementPolicyRuleId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRuleMetadata
   [-EntitlementPolicyRuleId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRuleMetadata
   [-EntitlementPolicyRuleId] <Int32>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRuleMetadata
   [-InputObject] <EntitlementPolicyRule[]>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRuleMetadata
    [-InputObject] <EntitlementPolicyRule[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRuleMetadata
    [-EntitlementPolicyRuleName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerEntitlementPolicyRuleMetadata
    [-EntitlementPolicyRuleName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerEntitlementPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for EntitlementPolicyRule. The EntitlementPolicyRule can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the EntitlementPolicyRule whose instance is pointed by $obj-Uid

```
Set-BrokerEntitlementPolicyRuleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the EntitlementPolicyRule in the site

```
Get-BrokerEntitlementPolicyRule | Set-
    BrokerEntitlementPolicyRuleMetadata -Name "MyMetadataName" -Value "
    1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the EntitlementPolicyRule in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerEntitlementPolicyRuleMetadata 'objname'
```

Parameters

-EntitlementPolicyRuleId

Specifies the EntitlementPolicyRule object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the EntitlementPolicyRule objects whose Metadata is to be created/updated.

Type:	EntitlementPolicyRule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-EntitlementPolicyRuleName

Specifies the EntitlementPolicyRule object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule

You can pipe the EntitlementPolicyRule to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule object.

Set-BrokerGpoFilter

March 11, 2024

Changes the data of an existing GPO filter.

Syntax

```
Set-BrokerGpoFilter
    [-InputObject] <GpoFilter[]>
    [-PassThru]
    [-FilterData <String>]
    [-IsAllowed <Boolean>]
    [-IsEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Changes the data of an existing GPO filter. No other properties of the filter can be modified.

Examples

EXAMPLE 1

Changes the data of a filter to 'Client2'.

```
Set-BrokerGpoFilter ([Guid]"12345678-...") -FilterData 'Client2'
```

Parameters

-InputObject

Specifies the GPO filter object to set.

Type:	GpoFilter[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterData

The filter data. Ignored if the filter is a BranchRepeater filter.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsAllowed

Specifies if policy is allowed if the filter condition is true.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsEnabled

Specifies if the filter is enabled or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoFilter

GPO filters may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerGpoPolicy

March 11, 2024

Changes the properties of a GPO policy.

Syntax

```
Set-BrokerGpoPolicy
    [-InputObject] <GpoPolicy[]>
    [-PassThru]
    [-Description <String>]
    [-IsEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerGpoPolicy
    [-Name] <String>
    [-PassThru]
    [-Description <String>]
    [-IsEnabled <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerGpoPolicy cmdlet is used to disable or enable an existing GPO policy or to alter its properties.

Examples

EXAMPLE 1

Enable all policies with names containing the word 'test'.

```
Get-BrokerGpoPolicy -Name '*test*' | Set-BrokerGpoPolicy -IsEnabled
    $true
```

Parameters

-InputObject

Specifies the GPO policy object to set.

Type:	GpoPolicy[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies a new name for the policy.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Specifies a new description for the policy.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsEnabled

Enable or disable the policy.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoPolicy

You can pipe GPO policies to be adjusted to Set-BrokerGpoPolicy.

Outputs

None or Citrix.Broker.Admin.SDK.GpoPolicy

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.GpoPolicy object.

Set-BrokerGpoPolicyPriorities

March 11, 2024

Changes the priorities of policies in a GPO policy set.

Syntax

```
Set-BrokerGpoPolicyPriorities
    [-PolicySetGuid <Guid>]
    [-PolicyGuids] <Guid[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerGpoPolicyPriorities cmdlet is used to change the priorities of the policies in a policy set. The input must be an array of GUIDs and it must be the complete set of all policy GUIDs in the policy set and there must be no duplications of GUIDs in the input.

Examples

EXAMPLE 1

Set the new policy priority order.

```
Set-BrokerGpoPolicyPriorities -PolicyGuids @("abcdef12-...", "
    12345678-...")
```

Parameters

-PolicyGuids

The list GUIDS of all the policies in the policy set. The order of the GUIDs indicate the new priority oder.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PolicySetGuid

The GUID of the policy set that contains the policies. If this is not specified, this means the default site policy set.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

This cmdlet does not generate any output.

Set-BrokerGpoPolicySet

March 11, 2024

Changes the data of an existing GPO policy set.

Syntax

```
Set-BrokerGpoPolicySet
   [-InputObject] <GpoPolicySet[]>
   [-PassThru]
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerGpoPolicySet
   [-Name] <String>
   [-PassThru]
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Changes the last convert mark or the description of an existing GPO policy set.

Examples

EXAMPLE 1

Changes the description of the policy set to ‘my policy set’.

```
Set-BrokerGpoPolicySet ([Guid]"12345678-...") -Description 'my policy
   set'
```

Parameters

-InputObject

Specifies the GPO policy set object to set.

Type:	GpoPolicySet[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the policy set. It must be unique among all policy sets.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

A short description of the policy set.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoPolicySet

GPO policy sets may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerGpoSetting

March 11, 2024

Changes the state and/or value of an existing GPO setting.

Syntax

```
Set-BrokerGpoSetting
    [-InputObject] <GpoSetting[]>
    [-PassThru]
    [-SettingValue <String>]
    [-UseDefault <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerGpoSetting
    [-SettingName] <String>
    [-PassThru]
    [-SettingValue <String>]
    [-UseDefault <Boolean>]
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Changes the state and/or value of an existing GPO setting.

Examples

EXAMPLE 1

Changes the state of the setting to 2 (disabled).

```
Set-BrokerGpoSetting ([Guid]"12345678-...") -UseDefault $true
```

Parameters

-InputObject

Specifies the GPO setting object to set.

Type:	GpoSetting[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SettingName

Specifies the GPO setting object to set.

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettingValue

The setting value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseDefault

Indicate if default value of setting is used. Ignored if setting is Boolean.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.GpoSetting

GPO settings may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerHostingPowerAction

March 11, 2024

Changes the priority of one or more pending power actions.

Syntax

```
Set-BrokerHostingPowerAction
    [-InputObject] <HostingPowerAction[]>
    [-PassThru]
    [-ActualPriority <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerAction
    [-MachineName] <String>
    [-PassThru]
    [-ActualPriority <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
```

```
7     [<CommonParameters>]
```

Description

The Set-BrokerHostingPowerAction cmdlet modifies an existing power action in the site's power action queue. The only property of power actions you can change, is the current priority of the action.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement' .

Examples

EXAMPLE 1

Sets the current priority of actions for the machine called 'XD_VDA1'to 25. Numerically lower priority values indicate more important actions that will be processed in preference to actions with numerically higher priority settings.

```
1  Set-BrokerHostingPowerAction -MachineName 'XD_VDA1' -ActualPriority 25
```

Parameters

-InputObject

The power action whose priority is to be changed.

Type:	HostingPowerAction[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

Changes the priority of actions that are for machines whose name (of the form domain\machine) matches the specified string.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ActualPriority

Specifies a new priority value for the action in the queue.

This priority is the current action priority; the 'base'or original priority for actions cannot be altered. Numerically lower priority values indicate more important actions that are processed in preference to actions with numerically higher priority settings.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.HostingPowerAction

The power action whose priority is to be changed.

Outputs

None or Citrix.Broker.Admin.SDK.HostingPowerAction

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.HostingPowerAction object.

Set-BrokerHostingPowerActionMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for HostingPowerAction

Syntax

```
Set-BrokerHostingPowerActionMetadata
    [-HostingPowerActionId] <Int64>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerActionMetadata
    [-HostingPowerActionId] <Int64>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerActionMetadata
    [-HostingPowerActionId] <Int64>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerActionMetadata
    [-InputObject] <HostingPowerAction[]>
    [-PassThru]
    -Name <String>
```

```
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerActionMetadata
    [-InputObject] <HostingPowerAction[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerActionMetadata
    [-HostingPowerActionName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHostingPowerActionMetadata
    [-HostingPowerActionName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerHostingPowerActionMetadata cmdlet creates/updates metadata key-value pairs for HostingPowerAction. The HostingPowerAction can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the HostingPowerAction whose instance is pointed by $obj-Uid

```
Set-BrokerHostingPowerActionMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the HostingPowerAction in the site

```
Get-BrokerHostingPowerAction | Set-BrokerHostingPowerActionMetadata -
    Name "MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the HostingPowerAction in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerHostingPowerActionMetadata 'objname'
```

Parameters

-HostingPowerActionId

Specifies the HostingPowerAction object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the HostingPowerAction objects whose Metadata is to be created/updated.

Type:	HostingPowerAction[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HostingPowerActionName

Specifies the HostingPowerAction object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerHostingPowerAction

You can pipe the HostingPowerAction to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerHostingPowerAction

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerHostingPowerAction object.

Set-BrokerHypervisorAlertMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for HypervisorAlert

Syntax

```
Set-BrokerHypervisorAlertMetadata
   [-HypervisorAlertId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerHypervisorAlertMetadata
   [-HypervisorAlertId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerHypervisorAlertMetadata
   [-HypervisorAlertId] <Int64>
```

```
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorAlertMetadata
    [-InputObject] <HypervisorAlert[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorAlertMetadata
    [-InputObject] <HypervisorAlert[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerHypervisorAlertMetadata cmdlet creates/updates metadata key-value pairs for HypervisorAlert. The HypervisorAlert can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the HypervisorAlert whose instance is pointed by $obj-Uid

```
Set-BrokerHypervisorAlertMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the HypervisorAlert in the site

```
Get-BrokerHypervisorAlert | Set-BrokerHypervisorAlertMetadata -Name "
    MyMetadataName" -Value "1234"
```

Parameters

-HypervisorAlertId

Specifies the HypervisorAlert object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the HypervisorAlert objects whose Metadata is to be created/updated.

Type:	HypervisorAlert[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerHypervisorAlert

You can pipe the HypervisorAlert to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerHypervisorAlert

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerHypervisorAlert object.

Set-BrokerHypervisorConnection

March 11, 2024

Sets the properties of a hypervisor connection.

Syntax

```
Set-BrokerHypervisorConnection
   [-InputObject] <HypervisorConnection[]>
   [-PassThru]
   [-PreferredController <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerHypervisorConnection
   [-Name] <String>
   [-PassThru]
   [-PreferredController <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerHypervisorConnection cmdlet sets the properties on a hypervisor connection.

Examples

EXAMPLE 1

Updates the preferred controller for a hypervisor connection.

```
$hvConn = Get-BrokerHypervisorConnection -PreferredController "
   oldController" -Name "Xen Server Connection"
Set-BrokerHypervisorConnection -InputObject $hvConn -
   PreferredController "newController"
```

Parameters

-InputObject

Specifies the hypervisor connection object to adjust.

Type:	HypervisorConnection[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the hypervisor connection object to adjust.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreferredController

Supplies the new value of the PreferredController property.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.HypervisorConnection

You can pipe the hypervisor connection to be modified to Set-BrokerHypervisorConnection.

Outputs

None or Citrix.Broker.Admin.SDK.HypervisorConnection

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.HypervisorConnection object.

Set-BrokerHypervisorConnectionMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for HypervisorConnection

Syntax

```
Set-BrokerHypervisorConnectionMetadata
   [-HypervisorConnectionId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerHypervisorConnectionMetadata
   [-HypervisorConnectionId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorConnectionMetadata
    [-HypervisorConnectionId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorConnectionMetadata
    [-InputObject] <HypervisorConnection[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorConnectionMetadata
    [-InputObject] <HypervisorConnection[]>
    [-PassThru]

    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorConnectionMetadata
    [-HypervisorConnectionName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerHypervisorConnectionMetadata
    [-HypervisorConnectionName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerHypervisorConnectionMetadata cmdlet creates/updates metadata key-value

pairs for HypervisorConnection. The HypervisorConnection can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the HypervisorConnection whose instance is pointed by $obj-Uid

```
Set-BrokerHypervisorConnectionMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the HypervisorConnection in the site

```
Get-BrokerHypervisorConnection | Set-BrokerHypervisorConnectionMetadata
     -Name "MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys "name1"and "name2"with the values "value1" and "value2"respectively for the HypervisorConnection in the site whose name is 'objname'

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerHypervisorConnectionMetadata 'objname'
```

Parameters

-HypervisorConnectionId

Specifies the HypervisorConnection object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the HypervisorConnection objects whose Metadata is to be created/updated.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Specifies the HypervisorConnection object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerHypervisorConnection

You can pipe the HypervisorConnection to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerHypervisorConnection

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerHypervisorConnection object.

Set-BrokerIconMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Icon

Syntax

```
Set-BrokerIconMetadata
    [-IconId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerIconMetadata
    [-IconId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerIconMetadata
    [-IconId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerIconMetadata
    [-InputObject] <Icon[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerIconMetadata
    [-InputObject] <Icon[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerIconMetadata cmdlet creates/updates metadata key-value pairs for Icon. The Icon can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Icon whose instance is pointed by $obj-Uid

```
Set-BrokerIconMetadata -InputObject $obj-Uid -Name "MyMetadataName" -
    Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Icon in the site

```
Get-BrokerIcon | Set-BrokerIconMetadata -Name "MyMetadataName" -Value "
    1234"
```

Parameters

-IconId

Specifies the Icon object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Icon objects whose Metadata is to be created/updated.

Type:	Icon[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerIcon

You can pipe the Icon to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerIcon

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerIcon object.

Set-BrokerLeaseMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Lease

Syntax

```
Set-BrokerLeaseMetadata
   [-LeaseId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerLeaseMetadata
   [-LeaseId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerLeaseMetadata
   [-LeaseId] <Int64>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerLeaseMetadata
   [-InputObject] <Lease[]>
```

```
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerLeaseMetadata
    [-InputObject] <Lease[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerLeaseMetadata
    [-LeaseName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerLeaseMetadata
    [-LeaseName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerLeaseMetadata cmdlet creates/updates metadata key-value

pairs for Lease. The Lease can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Lease whose instance is pointed by $obj-Uid

```
Set-BrokerLeaseMetadata -InputObject $obj-Uid -Name "MyMetadataName" -
    Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Lease in the site

```
Get-BrokerLease | Set-BrokerLeaseMetadata -Name "MyMetadataName" -Value
    "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the Lease in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerLeaseMetadata 'objname'
```

Parameters

-LeaseId

Specifies the Lease object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Lease objects whose Metadata is to be created/updated.

Type:	Lease[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LeaseName

Specifies the Lease object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerLease

You can pipe the Lease to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerLease

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerLease object.

Set-BrokerMachine

March 11, 2024

Sets properties on a machine.

Syntax

```
Set-BrokerMachine
   [-InputObject] <Machine[]>
   [-PassThru]
   [-AssignedClientName <String>]
   [-AssignedIPAddress <String>]
   [-ColorDepth <ColorDepth>]
   [-Description <String>]
   [-HostedMachineId <String>]
   [-HypervisorConnectionUid <Int32>]
   [-IconUid <Int32>]
   [-InMaintenanceMode <Boolean>]
   [-IsReserved <Boolean>]
   [-PublishedName <String>]
   [-SecureIcaRequired <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerMachine
   [-MachineName] <String>
```

```
    [-PassThru]
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
    [-ColorDepth <ColorDepth>]
    [-Description <String>]
    [-HostedMachineId <String>]
    [-HypervisorConnectionUid <Int32>]
    [-IconUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-IsReserved <Boolean>]
    [-PublishedName <String>]
    [-SecureIcaRequired <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerMachine cmdlet sets properties on a machine or set of machines. You can specify a single machine by name or multiple machine instances can be passed to the command by piping or using the -InputObject parameter.

Examples

EXAMPLE 1

This example specifies a machine by name and sets its hypervisor connection.

```
Set-BrokerMachine -MachineName 'MyDomain\MyMachine' -
    HypervisorConnectionUid 3
```

EXAMPLE 2

This example finds all machines in domain MyDomain and sets their hypervisor connections.

```
$machines = Get-BrokerMachine -MachineName 'MyDomain\*'
Set-BrokerMachine -InputObject $machines -HypervisorConnectionUid 3
```

EXAMPLE 3

This example also finds all machines in domain MyDomain and sets their hypervisor connections.

```
Get-BrokerMachine -MachineName 'MyDomain\*' | Set-BrokerMachine -
    HypervisorConnectionUid 3
```

Parameters

-InputObject

The machine instances whose properties you want to set.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

The machine whose properties you want to set.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-AssignedClientName

Changes the client name assignment of the machine. Set this to $null to remove the assignment. You can assign machines to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedIPAddress

Changes the client IP address assignment of the machine. Set this to $null to remove the assignment. You can assign machines to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

The color depth setting configured on the machine, possible values are:

$null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Description of the machine.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HostedMachineId

The unique ID by which the hypervisor recognizes the machine.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionUid

The hypervisor connection that runs the machine. This may only be set for VMs which are not provisioned by MCS.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

The UID of the machine's icon that is displayed in StoreFront.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Sets whether the machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-IsReserved

Specifies whether the machine should be reserved for special use, for example, for AppDisk preparation. A machine cannot be reserved if it is already a member of a desktop group.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

The name of the machine that is displayed in StoreFront, if the machine has been published. It can be set only for private desktops.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Flag indicating whether SecureICA is required or not when starting a session on the machine.

Type:	Boolean

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Machine

You can pipe in the machines whose properties you want to set.

Outputs

None or Citrix.Broker.Admin.SDK.Machine

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Machine object.

Set-BrokerMachineCatalog

March 11, 2024

Moves one or more machines into a different catalog.

Syntax

```
Set-BrokerMachineCatalog
   [-InputObject] <Machine[]>
   [-CatalogUid] <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerMachineCatalog cmdlet is used to move machines into a different catalog. The following properties of the destination catalog must exactly match those of the machine's current catalog otherwise the command fails:

- AllocationType
- ProvisioningType
- PersistUserChanges
- SessionSupport
- IsRemotePC
- MinimumFunctionalLevel
- PhysicalMachines

Changing a machine's catalog does not change the machine's desktop group membership. There is no effect on user sessions present on a machine if its catalog is changed.

Examples

EXAMPLE 1

This example finds all machines in domain Marketing and moves them into a catalog called MarketingMachines.

```
$catalog = Get-BrokerCatalog MarketingMachines
$machines = Get-BrokerMachine -MachineName 'Marketing\*'
Set-BrokerMachineCatalog $machines -CatalogUid $cat.Uid
```

Parameters

-InputObject

The machine instances that are being moved into a different catalog.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CatalogUid

The unique identifier of the catalog into which the machines are being moved.

Type:	Int32
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Machine

You can pipe in the machines that are to be moved into a new catalog.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerMachineCommandMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for MachineCommand

Syntax

```
Set-BrokerMachineCommandMetadata
   [-MachineCommandId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerMachineCommandMetadata
   [-MachineCommandId] <Int64>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineCommandMetadata
    [-MachineCommandId] <Int64>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineCommandMetadata
    [-InputObject] <MachineCommand[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineCommandMetadata
    [-InputObject] <MachineCommand[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerMachineCommandMetadata cmdlet creates/updates metadata key-value pairs for MachineCommand. The MachineCommand can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the MachineCommand whose instance is pointed by $obj-Uid

```
Set-BrokerMachineCommandMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the MachineCommand in the site

```
1 Get-BrokerMachineCommand | Set-BrokerMachineCommandMetadata -Name "
    MyMetadataName" -Value "1234"
```

Parameters

-MachineCommandId

Specifies the MachineCommand object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-InputObject

Specifies the MachineCommand objects whose Metadata is to be created/updated.

Type:	MachineCommand[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerMachineCommand

You can pipe the MachineCommand to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerMachineCommand

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerMachineCommand object.

Set-BrokerMachineConfiguration

March 11, 2024

Sets the properties of a machine configuration.

Syntax

```
Set-BrokerMachineConfiguration
   [-InputObject] <MachineConfiguration[]>
   [-PassThru]
   [-Description <String>]
   [-Policy <Byte[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerMachineConfiguration
   [-Name] <String>
   [-PassThru]
   [-Description <String>]
   [-Policy <Byte[]>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Sets the properties of a machine configuration. The encoded settings data must only contain settings that match the SettingsGroup of the associated configuration slot. Use the SDK snap-in that matches the SettingsGroup of the associated configuration slot to generate new encoded settings data or modify existing settings values.

Examples

EXAMPLE 1

Use the encoded settings binary data in $newPolicy to update the machine configuration.

```
Set-BrokerMachineConfiguration -Name "UPM\Finance Department" -Policy
   $newPolicy
```

EXAMPLE 2

Assign the description “User Profile Management”to every machine configuration associated with the UPM slot.

```
1  Get-BrokerMachineConfiguration -Name "UPM\*" | Set-
       BrokerMachineConfiguration -Description "User Profile Management"
```

Parameters

-InputObject

Machine configuration to modify.

Type:	MachineConfiguration[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Name of machine configuration to modify.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

New description for the machine configuration.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Policy

New binary array of encoded settings data.

Type:	Byte[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.MachineConfiguration

Machine configuration to modify.

Outputs

None or Citrix.Broker.Admin.SDK.MachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.MachineConfiguration object.

Set-BrokerMachineConfigurationMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for MachineConfiguration

Syntax

```
Set-BrokerMachineConfigurationMetadata
    [-MachineConfigurationId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineConfigurationMetadata
    [-MachineConfigurationId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineConfigurationMetadata
    [-MachineConfigurationId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineConfigurationMetadata
```

```
    [-InputObject] <MachineConfiguration[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineConfigurationMetadata
    [-InputObject] <MachineConfiguration[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineConfigurationMetadata
    [-MachineConfigurationName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineConfigurationMetadata
    [-MachineConfigurationName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerMachineConfigurationMetadata cmdlet creates/updates metadata key-value pairs for MachineConfiguration. The MachineConfiguration can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the MachineConfiguration whose instance is pointed by $obj-Uid

```
```

```
Set-BrokerMachineConfigurationMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the MachineConfiguration in the site

```
Get-BrokerMachineConfiguration | Set-BrokerMachineConfigurationMetadata
     -Name "MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the MachineConfiguration in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerMachineConfigurationMetadata 'objname'
```

Parameters

-MachineConfigurationId

Specifies the MachineConfiguration object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the MachineConfiguration objects whose Metadata is to be created/updated.

Type:	MachineConfiguration[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineConfigurationName

Specifies the MachineConfiguration object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerMachineConfiguration

You can pipe the MachineConfiguration to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerMachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerMachineConfiguration object.

Set-BrokerMachineMaintenanceMode

March 11, 2024

Sets whether the specified machine(s) are in maintenance mode.

Syntax

```
1 Set-BrokerMachineMaintenanceMode
2    [-InputObject] <Machine[]>
3    [-MaintenanceMode] <Boolean>
4    [-LoggingId <Guid>]
5    [<CitrixCommonParameters>]
6    [<CommonParameters>]
```

Description

The cmdlet can be used to set whether a machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

There are times when it is necessary to disable desktops. You can do this by setting the InMaintenanceMode property of a desktop to $true. This puts it into maintenance mode. The broker excludes single-session desktops in maintenance mode from brokering decisions and does not start new sessions on them. Existing sessions are unaffected. For multi-session desktops in maintenance mode, reconnections to existing sessions are allowed, but no new sessions are created on the machine.

Desktops in maintenance mode are also excluded from automatic power management, although explicit power actions are still performed.

This cmdlet is equivalent to using the Set-BrokerMachine cmdlet to set the value of only the InMaintenanceMode property.

Examples

EXAMPLE 1

This example finds all machines in domain MyDomain and removes them from maintenance mode by setting their InMaintenanceMode property to false.

```
$machines = Get-BrokerMachine -MachineName 'MyDomain\*'
Set-BrokerMachineMaintenanceMode -InputObject $machines $false
```

Parameters

-InputObject

The machine instances whose InMaintenanceMode property you want to set.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MaintenanceMode

Sets whether the machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

Type:	Boolean
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Machine

You can pipe in the machines whose properties you want to set.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerMachineMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Machine

Syntax

```
Set-BrokerMachineMetadata
   [-MachineId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerMachineMetadata
   [-MachineId] <Int32>
   [-PassThru]
   -Name <String>
```

```
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineMetadata
    [-MachineId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineMetadata
    [-InputObject] <Machine[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineMetadata
    [-InputObject] <Machine[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineMetadata
    [-MachineName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerMachineMetadata
    [-MachineName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerMachineMetadata cmdlet creates/updates metadata key-value

pairs for Machine. The Machine can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the Machine whose instance is pointed by $obj-Uid

```
Set-BrokerMachineMetadata -InputObject $obj-Uid -Name "MyMetadataName"
    -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the Machine in the site

```
Get-BrokerMachine | Set-BrokerMachineMetadata -Name "MyMetadataName" -
    Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys "name1"and "name2"with the values "value1" and "value2"respectively for the Machine in the site whose name is 'objname'

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerMachineMetadata 'objname'
```

Parameters

-MachineId

Specifies the Machine object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Machine objects whose Metadata is to be created/updated.

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

Specifies the Machine object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerMachine

You can pipe the Machine to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerMachine

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerMachine object.

Set-BrokerPowerTimeScheme

March 11, 2024

Modifies an existing power time scheme.

Syntax

```
Set-BrokerPowerTimeScheme
    [-InputObject] <PowerTimeScheme[]>
    [-PassThru]
    [-DaysOfWeek <TimeSchemeDays>]
    [-DisplayName <String>]
    [-PeakHalfHours <Boolean[]>]
    [-PeakHours <Boolean[]>]
    [-PoolSize <Int32[]>]
    [-PoolSizeHalfHours <Int32[]>]
    [-PoolUsingPercentage <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerPowerTimeScheme
    [-Name] <String>
    [-PassThru]
    [-DaysOfWeek <TimeSchemeDays>]
    [-DisplayName <String>]
    [-PeakHalfHours <Boolean[]>]
    [-PeakHours <Boolean[]>]
    [-PoolSize <Int32[]>]
    [-PoolSizeHalfHours <Int32[]>]
    [-PoolUsingPercentage <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerPowerTimeScheme cmdlet modifies an existing time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times.In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see ‘help about_Broker_PowerManagement’.

Examples

EXAMPLE 1

Sets the pool size for the power time scheme named ‘Development Weekdays’to be 20 for the time between 8am to 6:30pm, and 5 for other times.

```
Set-BrokerPowerTimeScheme -Name 'Development Weekdays' -
    PoolSizeHalfHours ( 0..47 | %{
  if ($_ -lt 16 -or $_ -gt 37) {
  5  }
  else {
  20  }
   }
  )
```

Parameters

-InputObject

The power time scheme to be changed.

Type:	PowerTimeScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Identifies the power time scheme to be changed by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DaysOfWeek

Changes the pattern of days of the week that the time scheme applies to. The pattern of days is specified as a single value or a list of values, where each value refers to either a single day or defined group of days.

Valid values are: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Weekend and Weekdays.

Type:	TimeSchemeDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisplayName

Changes the name that is used by the DesktopStudio console when showing the time scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakHalfHours

A set of 48 boolean flag values, one for each hour half of the day. The first value in the array relates to midnight to 00:29, the next one to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. If the flag is $true it means that the associated half hour of the day is considered a peak time; if $false it means that it is considered off-peak.

If fewer than 48 values are supplied, the final missing values are assumed to be 'false', and if more than 48 values are supplied, only the first 48 are used.

Type:	Boolean[]
Position:	Named
Default value:	48 $false values, meaning all half hours are off-peak
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PeakHours

Changes the pattern of hours considered 'peak'vs 'off-peak'for the days covered by the time scheme. A 24-entry array of boolean truth values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:59, the first relates to 1am to 1:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag value is $true it means the associated hour of the day is considered a peak time; if $false it means that it is considered off-peak.

If fewer than 24 values are supplied, the final missing values are assumed to be 'false', and if more than 24 values are supplied, only the first 24 are used.

Type:	Boolean[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PoolSize

Changes the requested pool size of running machines at the various hours of the day (for single-session desktop groups, or half hours for multi-session) for the days covered by the time scheme.

For single-session desktop groups, a 24-entry array of integer values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:59, the first relates to 1 AM to 1:59 and so on, with the last array element relating to 11 PM to 11:59. If fewer than 24 values are supplied, the final missing values are assumed to be -1, and if more than 24 values are supplied, only the first 24 are used.

For multi-session desktop groups, a 48-entry array of integer values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:29, the first relates to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. If fewer than 48 values are supplied, the final missing values are assumed to be -1, and if more than 48 values are supplied, only the first 48 are used.

The pool size array entry values are either absolute numbers of machines that should be running or are a percentage of the machines in the desktop group that should be running during the associated hour of the day. A value of -1 in the array signifies that no management of the number of running machines should be attempted during the associated hour of the day.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PoolSizeHalfHours

Changes the requested pool size of running machines at the various half-hours of the day for the days covered by the time scheme.

A 48-entry array of integer values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:29, the first relates to 0:30 AM to 0:59 and so on, with the last array element relating to 11:30 PM to 11:59. If fewer than 48 values are supplied, the final missing values are assumed to be -1, and if more than 48 values are supplied, only the first 48 are used.

The pool size array entry values are either absolute numbers of machines that should be running or are a percentage of the machines in the desktop group that should be running during the associated half hour of the day. A value of -1 in the array signifies that no management of the number of running machines should be attempted during the associated half hour of the day.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PoolUsingPercentage

Changes whether pool size values from the 'PoolSize'or 'PoolSizeHalfHours'array are evaluated as absolute numbers of running machines or as a percentage of machines in the desktop group that are to be maintained as running.

A value of $true indicates that the pool size array values are percentages of total machines in the desktop group and a value of $false indicates that the pool size array values are absolute numbers of machines to maintain as running.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.PowerTimeScheme

The power time scheme to be changed.

Outputs

None or Citrix.Broker.Admin.SDK.PowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.PowerTimeScheme object.

Set-BrokerPowerTimeSchemeMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for PowerTimeScheme

Syntax

```
Set-BrokerPowerTimeSchemeMetadata
   [-PowerTimeSchemeId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerPowerTimeSchemeMetadata
   [-PowerTimeSchemeId] <Int32>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerPowerTimeSchemeMetadata
   [-PowerTimeSchemeId] <Int32>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerPowerTimeSchemeMetadata
   [-InputObject] <PowerTimeScheme[]>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerPowerTimeSchemeMetadata
   [-InputObject] <PowerTimeScheme[]>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerPowerTimeSchemeMetadata
   [-PowerTimeSchemeName] <String>
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerPowerTimeSchemeMetadata
   [-PowerTimeSchemeName] <String>
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerPowerTimeSchemeMetadata cmdlet creates/updates metadata key-value pairs for PowerTimeScheme. The PowerTimeScheme can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the PowerTimeScheme whose instance is pointed by $obj-Uid

```
Set-BrokerPowerTimeSchemeMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the PowerTimeScheme in the site

```
Get-BrokerPowerTimeScheme | Set-BrokerPowerTimeSchemeMetadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the PowerTimeScheme in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerPowerTimeSchemeMetadata 'objname'
```

Parameters

-PowerTimeSchemeId

Specifies the PowerTimeScheme object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the PowerTimeScheme objects whose Metadata is to be created/updated.

Type:	PowerTimeScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PowerTimeSchemeName

Specifies the PowerTimeScheme object whose Metadata is to be created/updated by name.

Type:	String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme

You can pipe the PowerTimeScheme to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme object.

Set-BrokerPrivateDesktop

March 11, 2024

Change the settings of a private desktop.

Syntax

```
Set-BrokerPrivateDesktop
    [-InputObject] <PrivateDesktop[]>
    [-PassThru]
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
```

```
    [-ColorDepth <ColorDepth>]
    [-Description <String>]
    [-IconUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-PublishedName <String>]
    [-SecureIcaRequired <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerPrivateDesktop
    [-MachineName] <String>
    [-PassThru]
    [-AssignedClientName <String>]
    [-AssignedIPAddress <String>]
    [-ColorDepth <ColorDepth>]
    [-Description <String>]
    [-IconUid <Int32>]
    [-InMaintenanceMode <Boolean>]
    [-PublishedName <String>]
    [-SecureIcaRequired <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Private desktops are automatically created when a machine is added to a desktop group with a DesktopKind of 'Private', and these inherit default properties. Use Set-BrokerPrivateDesktop to change the configuration settings of an existing private desktop.

To specify private desktops, you can choose whether to update by machine name, or by passing a PrivateDesktop or an array of PrivateDesktop objects. You can also use the Uid or an array of Uids instead.

You cannot modify many properties of a private desktop as these contain status information; for example DNSName, RegistrationState, and OSVersion.

Use Add- and Remove- cmdlets to update relationships between private desktops and other objects. For example, you can add a tag to a private desktop with:

Add-BrokerTag $tag -Desktop $desktop.Uid

Similarly, assign users to private desktops with:

Add-BrokerUser $user -PrivateDesktop $desktop

Many of the fields that can be set with this cmdlet can also be set with Set-BrokerMachine, such as MaintenanceMode. Using Set-BrokerMachine is preferred in these cases.

For more information about desktops, see about_Broker_Desktops; for more information about machines, see about_Broker_Machines.

Examples

EXAMPLE 1

Change the color depth of Machine1 to be 16-bit.

```
Set-BrokerPrivateDesktop DOMAIN\Machine1 -ColorDepth SixteenBit
```

EXAMPLE 2

Bring all private desktops currently in maintenance mode back into normal service.

```
Get-BrokerPrivateDesktop -InMaintenanceMode $true | Set-
    BrokerPrivateDesktop -InMaintenanceMode $false
```

Parameters

-InputObject

Specifies the desktop or array of desktops to modify. You can also use an integer Uid of the desktop instead.

Type:	PrivateDesktop[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

Specifies the desktop to modify using its machine name (in the form 'domain\machine').

Type:	String

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedClientName

Changes the client name assignment of the desktop. Set this to $null to remove the assignment. Desktops can be assigned to multiple users, a single IP address, or a single client name, but only to one of these categories at one time.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AssignedIPAddress

Changes the IP address assignment of the desktop. Set this to $null to remove the assignment. Desktops can be assigned to multiple users, a single IP address, or a single client name, but only to one of these categories at one time.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ColorDepth

Changes the color depth connections to this desktop should use.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit. A value of $null results in the desktop group value being used instead.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Changes the description of the desktop.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IconUid

Changes the icon displayed for this desktop. When this setting is $null, the icon displayed is determined by the desktop group.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Changes the maintenance mode setting of a desktop. When a desktop is in maintenance mode, it is not included as a candidate when brokering new sessions, and it does not participate in automatic power management (idle pool); however, it still responds to explicit power operations.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PublishedName

Changes the name displayed to the user for this desktop. When this setting is $null, the name displayed is determined by the PublishedName of the desktop group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Changes whether or not SecureICA is required for connections to this desktop. When this setting is $null, the SecureIcaRequired setting from the desktop group is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.PrivateDesktop

You can pipe PrivateDesktop objects into this cmdlet instead of on the command line with the -InputObject parameter.

Outputs

None or Citrix.Broker.Admin.SDK.PrivateDesktop

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.PrivateDesktop object.

Set-BrokerRebootCycleMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for RebootCycle

Syntax

```
Set-BrokerRebootCycleMetadata
    [-RebootCycleId] <Int64>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootCycleMetadata
    [-RebootCycleId] <Int64>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootCycleMetadata
    [-RebootCycleId] <Int64>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootCycleMetadata
    [-InputObject] <RebootCycle[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootCycleMetadata
    [-InputObject] <RebootCycle[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerRebootCycleMetadata cmdlet creates/updates metadata key-value pairs for RebootCycle. The RebootCycle can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the RebootCycle whose instance is pointed by $obj-Uid

```
Set-BrokerRebootCycleMetadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the RebootCycle in the site

```
Get-BrokerRebootCycle | Set-BrokerRebootCycleMetadata -Name "
    MyMetadataName" -Value "1234"
```

Parameters

-RebootCycleId

Specifies the RebootCycle object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the RebootCycle objects whose Metadata is to be created/updated.

Type:	RebootCycle[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerRebootCycle

You can pipe the RebootCycle to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerRebootCycle

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerRebootCycle object.

Set-BrokerRebootSchedule

March 11, 2024

Updates the values of one or more desktop group reboot schedules.

Syntax

```
Set-BrokerRebootSchedule
   [-InputObject] <RebootSchedule[]>
   [-PassThru]
   [-Day <RebootScheduleDays>]
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   [-RebootDuration <Int32>]
   [-StartTime <TimeSpan>]
   [-WarningDuration <Int32>]
   [-WarningMessage <String>]
   [-WarningRepeatInterval <Int32>]
   [-WarningTitle <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerRebootSchedule
   [-DesktopGroupName] <String>
   [-PassThru]
   [-Day <RebootScheduleDays>]
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   [-RebootDuration <Int32>]
   [-StartTime <TimeSpan>]
   [-WarningDuration <Int32>]
   [-WarningMessage <String>]
   [-WarningRepeatInterval <Int32>]
   [-WarningTitle <String>]
   [-LoggingId <Guid>]
```

```
14      [<CitrixCommonParameters>]
15      [<CommonParameters>]
```

Description

The Set-BrokerRebootSchedule cmdlet is used to alter the settings of an existing desktop group reboot schedule.

Examples

EXAMPLE 1

Sets the reboot schedule for the desktop group named Accounting to display a message with the title "WARNING: Reboot pending"and body "Save your work"ten minutes prior to rebooting each machine. The message is displayed in every user session on that machine.

```
1  Set-BrokerRebootSchedule -DesktopGroupName Accounting -WarningMessage "
       Save your work" -WarningDuration 10 -WarningTitle "WARNING: Reboot
       pending"
```

EXAMPLE 2

Sets all weekly reboot schedules to run on Friday.

```
1  Get-BrokerRebootSchedule -Frequency Weekly | Set-BrokerRebootSchedule -
       Day Friday
```

EXAMPLE 3

Sets the reboot schedule for the desktop group having Uid 17 to display the message "Rebooting in %m% minutes."Fifteen, ten and five minutes prior to rebooting each machine, the message "Rebooting in %m% minutes."will be displayed in each user session with the pattern '%m%'replaced with the number of minutes until the reboot.

```
1  Set-BrokerRebootSchedule -DesktopGroupUid 17 -WarningMessage "Rebooting
       in %m% minutes." -WarningDuration 15 -WarningRepeatInterval 5
```

Parameters

-InputObject

The reboot schedule to be modified.

Type:	RebootSchedule[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group whose reboot schedule is to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Day

For weekly schedules, the day of the week on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the reboot schedule is to be enabled or disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Frequency

Frequency with which this schedule runs (either Weekly or Daily).

Type:	RebootScheduleFrequency
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Time of day at which the scheduled reboot cycle starts (HH:MM).

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningDuration

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed. In some cases the time required to process a reboot schedule may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Time to wait after the previous reboot warning before displaying the warning message in all user sessions on that machine again. If the warning repeat interval is zero then the warning message is not displayed after the initial warning.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RebootSchedule

Reboot schedules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerRebootScheduleV2

March 11, 2024

Updates the values of one or more desktop group reboot schedules.

Syntax

```
Set-BrokerRebootScheduleV2
   [-InputObject] <RebootScheduleV2[]>
   [-PassThru]
   [-Day <RebootScheduleDays>]
   [-DayInMonth <RebootScheduleDays>]
   [-Description <String>]
   [-Enabled <Boolean>]
   [-Frequency <RebootScheduleFrequency>]
   [-FrequencyFactor <Int32>]
   [-IgnoreMaintenanceMode <Boolean>]
   [-MaxOvertimeStartMins <Int32>]
   [-RebootDuration <Int32>]
   [-RestrictToTag <String>]
   [-StartDate <String>]
   [-StartTime <TimeSpan>]
   [-UseNaturalReboot <Boolean>]
```

```
    [-WarningDuration <Int32>]
    [-WarningMessage <String>]
    [-WarningRepeatInterval <Int32>]
    [-WarningTitle <String>]
    [-WeekInMonth <RebootScheduleWeeks>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2
    [-Name] <String>
    [-PassThru]
    [-Day <RebootScheduleDays>]
    [-DayInMonth <RebootScheduleDays>]
    [-Description <String>]
    [-Enabled <Boolean>]
    [-Frequency <RebootScheduleFrequency>]
    [-FrequencyFactor <Int32>]
    [-IgnoreMaintenanceMode <Boolean>]
    [-MaxOvertimeStartMins <Int32>]
    [-RebootDuration <Int32>]
    [-RestrictToTag <String>]
    [-StartDate <String>]
    [-StartTime <TimeSpan>]
    [-UseNaturalReboot <Boolean>]
    [-WarningDuration <Int32>]
    [-WarningMessage <String>]
    [-WarningRepeatInterval <Int32>]
    [-WarningTitle <String>]
    [-WeekInMonth <RebootScheduleWeeks>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerRebootScheduleV2 cmdlet is used to alter the settings of an existing desktop group reboot schedule.

Examples

EXAMPLE 1

Sets the reboot schedule for the reboot schedule named Accounting to display a message with the title "WARNING: Reboot pending"and body "Save your work"ten minutes prior to rebooting each machine. The message is displayed in every user session on that machine.

```
Set-BrokerRebootScheduleV2 -Name Accounting -WarningMessage "Save your
    work" -WarningDuration 10 -WarningTitle "WARNING: Reboot pending"
```

EXAMPLE 2

Sets all weekly reboot schedules to run on Friday.

```
Get-BrokerRebootScheduleV2 -Frequency Weekly | Set-
    BrokerRebootScheduleV2 -Day Friday
```

EXAMPLE 3

Sets the reboot schedule for the reboot schedule having Uid 17 to display the message "Rebooting in %m% minutes."Fifteen, ten and five minutes prior to rebooting each machine, the message "Rebooting in %m% minutes."will be displayed in each user session with the pattern '%m%'replaced with the number of minutes until the reboot.

```
Set-BrokerRebootScheduleV2 17 -WarningMessage "Rebooting in %m% minutes
    ." -WarningDuration 15 -WarningRepeatInterval 5
```

EXAMPLE 4

Restricts the reboot schedule having uid 12 to only reboot machines within the desktop group tagged with the 'Finance Dept'tag.

```
Set-BrokerRebootScheduleV2 12 -RestrictToTag 'Finance Dept'
```

Parameters

-InputObject

The reboot schedule to be modified.

Type:	RebootScheduleV2[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Name

The name of the reboot schedule

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Day

For weekly schedules, the days of the week on which the scheduled reboot-cycle starts (one or more of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DayInMonth

For monthly schedules, the day in the month on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Type:	RebootScheduleDays
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

An optional description for the reboot schedule.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the reboot schedule is to be enabled or disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Frequency

Frequency with which this schedule runs (either Weekly or Daily or Monthly).

Type:	RebootScheduleFrequency
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FrequencyFactor

The frequency factor for the reboot schedule. It indicates how often the schedule should run with respect to the frequency. For example, if the FrequencyFactor is set to 2, it means every two days from the StartDate when the Frequency is Daily, every two weeks from the StartDate when the Frequency is Weekly, and similarly for monthly. It defaults to 1 if not provided. The StartDate needs to be set if the frequency factor is greater than 1.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreMaintenanceMode

Boolean value to reboot machines in maintenance mode

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxOvertimeStartMins

Maximum delay in minutes after which the scheduled reboot will not take place

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RebootDuration

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTag

If specified, restricts the reboot schedule to only those machines in the desktop group with the specified tag. Specify $null to remove any tag restriction.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartDate

The date on which the first schedule is expected to run, date is in ISO 8601 Format (YYYY-MM-DD). The actual start date to match the frequency pattern need not be provided. For example, if today is Monday and the schedule is set to run every Sunday for every four weeks, there is no need to identify the date on which Sunday falls after four weeks. Today's date ((Get-Date).Date.ToString('yyyy-MM-dd')) can be provided and the service would adjust the start date to reflect the actual date i.e, the Sunday four weeks from today. Get-BrokerRebootScheduleV2 cmdlet will reflect the actual start date.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Time of day at which the scheduled reboot cycle starts (HH:MM).

Type:	TimeSpan
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseNaturalReboot

Boolean value indicating whether the machines should reboot whenever they happen to have no sessions, rather than at equally spaced times within the cycle duration.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningDuration

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed. In some cases the time required to process a reboot schedule may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Time to wait after the previous reboot warning before displaying the warning message in all user sessions on that machine again. If the warning repeat interval is zero then the warning message is not displayed after the initial warning.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WeekInMonth

For monthly schedules, the week in the month on which the scheduled reboot-cycle starts (one of First, Second, Third, Fourth, Last).

Type:	RebootScheduleWeeks
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RebootScheduleV2

Reboot schedules may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Set-BrokerRebootScheduleV2Metadata

March 11, 2024

Creates/Updates metadata key-value pairs for RebootScheduleV2

Syntax

```
Set-BrokerRebootScheduleV2Metadata
    [-RebootScheduleV2Id] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2Metadata
    [-RebootScheduleV2Id] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2Metadata
    [-RebootScheduleV2Id] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2Metadata
    [-InputObject] <RebootScheduleV2[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2Metadata
    [-InputObject] <RebootScheduleV2[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2Metadata
    [-RebootScheduleV2Name] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerRebootScheduleV2Metadata
    [-RebootScheduleV2Name] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerRebootScheduleV2Metadata cmdlet creates/updates metadata key-value pairs for RebootScheduleV2. The RebootScheduleV2 can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata "MyMetadataName"key-value pair for the RebootScheduleV2 whose instance is pointed by $obj-Uid

```
Set-BrokerRebootScheduleV2Metadata -InputObject $obj-Uid -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key "MyMetadataName"with the value "1234"for all the RebootScheduleV2 in the site

```
Get-BrokerRebootScheduleV2 | Set-BrokerRebootScheduleV2Metadata -Name "
    MyMetadataName" -Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys "name1"and "name2"with the values "value1" and "value2"respectively for the RebootScheduleV2 in the site whose name is 'objname'

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerRebootScheduleV2Metadata 'objname'
```

Parameters

-RebootScheduleV2Id

Specifies the RebootScheduleV2 object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the RebootScheduleV2 objects whose Metadata is to be created/updated.

Type:	RebootScheduleV2[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-RebootScheduleV2Name

Specifies the RebootScheduleV2 object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerRebootScheduleV2

You can pipe the RebootScheduleV2 to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerRebootScheduleV2

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerRebootScheduleV2 object.

Set-BrokerRemotePCAccount

March 11, 2024

Modify one or more RemotePCAccounts.

Syntax

```
Set-BrokerRemotePCAccount
   [-InputObject] <RemotePCAccount[]>
   [-PassThru]
   [-AllowSubfolderMatches <Boolean>]
   [-MachinesExcluded <String[]>]
   [-MachinesIncluded <String[]>]
   [-OU <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Modify one or more RemotePCAccounts.

Examples

EXAMPLE 1

Make all RemotePCAccounts filter out machines from DOMAIN42.

```
Get-BrokerRemotePCAccount | Set-BrokerRemotePCAccount -MachinesExcluded
    @('DOMAIN42\*')
```

Parameters

-InputObject

Specifies the RemotePCAccounts to modify.

Type:	RemotePCAccount[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AllowSubfolderMatches

When true a machine matches this RemotePCAccount if the AD computer is in the container specified by the OU property, or within a child container of the OU.

When false the AD computer object only matches if it is directly in the AD container specified by the OU property.

This property is not meaningful when OU has the special value 'any'.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-MachinesExcluded

MachinesExcluded specifies a set of strings that can include asterisk wildcards. If a machine name matches any entries in MachinesExcluded then it cannot match with this RemotePCAccount regardless of whether there is a MachinesIncluded match.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesIncluded

MachinesIncluded specifies a set of strings that can include asterisk wildcards. A machine may only match with this RemotePCAccount if it matches a MachinesIncluded entry and does not match any MachinesExcluded entries.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Type:	String[]

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OU

Specifies the DN of an AD container, or has the special value 'any'.

When an AD container is specified a machine may only match with the RemotePCAccount when the AD computer object is located relative to the OU.

When 'any'is specified the location of the AD computer object is ignored for purposes of matching this RemotePCAccount. The machine must still meet the MachinesIncluded and MachinesExcluded filters for a match to occur.

In the event that a machine matches with multiple RemotePCAccounts then the RemotePCAccount OU with the longest canonical name takes precedence. The special 'any'OU is treated as lowest priority.

Note that the OU value of every RemotePCAccount must be unique, and this includes only one 'any' entry being permitted.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RemotePCAccount

You can pipe the RemotePCAccounts to be modified into this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.RemotePCAccount

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.RemotePCAccount object.

Set-BrokerServiceConfigurationData

March 11, 2024

Set the Service configuration data objects.

Syntax

```
Set-BrokerServiceConfigurationData
    [-InputObject] <ServiceConfigurationData[]>
    [-PassThru]
    [-SettingValue <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

View the Service configuration data objects stored in the broker database. These objects if set correctly, if set overrride the values present in the windows registry

Examples

EXAMPLE 1

Running this will set the HeartbeatPeriodMs to 6 minutes

```
Set-BrokerServiceConfigurationData Core.HeartbeatPeriodMs  -
    SettingValue 360000
```

EXAMPLE 2

Running this will reset the value of MaxHeartbeatIntervalMs and it will be read from the windows registry instead of the Broker Database

```
Set-BrokerServiceConfigurationData MaxHeartbeatIntervalMs
```

Parameters

-InputObject

The service configuration data object

Type:	ServiceConfigurationData[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SettingValue

The value of the service setting that can be overridden and stored in the database. This must fall in the specified range as described in order to successfully set the service configuration object. Keeping the parameter as null will result in resetting of the key(It will be read from the windows registry in that case)

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

Input cannot be piped to this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.ServiceConfigurationData

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.ServiceConfigurationData object.

Related Links

- Get-BrokerServiceConfigurationData

Set-BrokerSession

March 11, 2024

Sets properties of a session.

Syntax

```
Set-BrokerSession
   [-InputObject] <Session[]>
   [-PassThru]
   [-Hidden <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSession
   [-SessionKey] <Guid>
   [-PassThru]
   [-Hidden <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerSession cmdlet sets properties on a session or set of sessions. You can specify a single session by Uid or SessionKey (Guid) or multiple session instances can be passed to the command by piping or using the -InputObject parameter.

Examples

EXAMPLE 1

Finds all sessions in the site for user John Smith that have been hidden, and makes them available for reconection again.

```
$sessions = Get-BrokerSession -User ACCOUNTS\JohnSmith -Hidden $true
$sessions | Set-BrokerSession -Hidden $false
```

Parameters

-InputObject

The session instances whose properties you want to set.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SessionKey

The session key (Guid) of the session whose properties you want to set.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Hidden

Changes whether the session is hidden or not. Hidden sessions are treated as though they do not exist when brokering sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

A session may be hidden automatically by the system when an attempt is made to reconnect to a session that is unreachable due to, for example, the failure of a VM's hypervisor. This allows a new session to be brokered provided that other machines in the same desktop group are still available. If the original session still exists after the hypervisor is restored then it must be unhidden to allow the user to reconnect to it.

Only sessions for shared desktops or applications can be hidden or unhidden. Private desktop or application sessions can never be hidden.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

You can pipe in the sessions whose properties you want to set.

Outputs

None or Citrix.Broker.Admin.SDK.Session

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Session object.

Related Links

- Get-BrokerSession

Set-BrokerSessionLinger

March 11, 2024

Updates the values of one or more desktop group session linger settings.

Syntax

```
Set-BrokerSessionLinger
   [-InputObject] <SessionLinger[]>
   [-PassThru]
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSessionLinger
   [-DesktopGroupName] <String>
   [-PassThru]
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerSessionLinger cmdlet is used to alter the settings of an existing desktop group session linger setting.

Examples

EXAMPLE 1

Sets the disconnect time for the session linger setting associated with desktop group named Accounting.

```
Set-BrokerSessionLinger -DesktopGroupName Accounting -
    MaxTimeBeforeDisconnect 0:10
```

Parameters

-InputObject

The session linger to be modified.

Type:	SessionLinger[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group whose session linger setting is to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the session linger setting is to be enabled or disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAverageLoadThreshold

Specifies the average load threshold across the desktop group. When the threshold hits, lingering sessions across the group be terminated to reduce load. Sessions that have been lingering the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-MaxLoadPerMachineThreshold

Specifies the maximum load threshold per machine in the desktop group. When the threshold hits, lingering sessions on each loaded machine will be terminated to reduce load. Sessions that have been lingering the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeDisconnect

Specifies the time by which a lingering session will be disconnected. The disconnect time cannot be greater than the terminate timer (if enabled). When the disconnect and terminate times are the same, the terminate time takes precedence.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeTerminate

Specifies the time by which a lingering session will be terminated. When the disconnect and terminate times are the same, the terminate time takes precedence.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Specifies whether the session linger's user filter is enabled or disabled. Where the user filter is enabled, lingering is enabled only to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.SessionLinger

Session linger settings may be specified through pipeline input.

Outputs

None or Citrix.Broker.Admin.SDK.SessionLinger

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.SessionLinger object.

Set-BrokerSessionMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Session

Syntax

```
Set-BrokerSessionMetadata
    [-SessionId] <Int64>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerSessionMetadata
    [-SessionId] <Int64>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerSessionMetadata
    [-SessionId] <Int64>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerSessionMetadata
    [-InputObject] <Session[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerSessionMetadata
    [-InputObject] <Session[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerSessionMetadata
    [-SessionName] <Guid>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerSessionMetadata
    [-SessionName] <Guid>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerSessionMetadata cmdlet creates/updates metadata key-value

pairs for Session. The Session can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Session whose instance is pointed by $obj-Uid

```
Set-BrokerSessionMetadata -InputObject $obj-Uid -Name "MyMetadataName"
    -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Session in the site

```
Get-BrokerSession | Set-BrokerSessionMetadata -Name "MyMetadataName" -
    Value "1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the Session in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerSessionMetadata 'objname'
```

Parameters

-SessionId

Specifies the Session object whose Metadata is to be created/updated by ID.

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int64
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Session objects whose Metadata is to be created/updated.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SessionName

Specifies the Session object whose Metadata is to be created/updated by name.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerSession

You can pipe the Session to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerSession

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerSession object.

Set-BrokerSessionPreLaunch

March 11, 2024

Updates the values of one or more desktop group session pre-launch settings.

Syntax

```
Set-BrokerSessionPreLaunch
   [-InputObject] <SessionPreLaunch[]>
   [-PassThru]
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSessionPreLaunch
   [-DesktopGroupName] <String>
   [-PassThru]
   [-Enabled <Boolean>]
   [-MaxAverageLoadThreshold <Int32>]
   [-MaxLoadPerMachineThreshold <Int32>]
   [-MaxTimeBeforeDisconnect <TimeSpan>]
   [-MaxTimeBeforeTerminate <TimeSpan>]
   [-UserFilterEnabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerSessionPreLaunch cmdlet is used to alter the settings of an existing desktop group session pre-launch setting.

Examples

EXAMPLE 1

Sets the disconnect time for the session pre-launch setting associated with desktop group named Accounting.

```
Set-BrokerSessionPreLaunch -DesktopGroupName Accounting -
    MaxTimeBeforeDisconnect 0:10
```

Parameters

-InputObject

The session pre-launch to be modified.

Type:	SessionPreLaunch[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DesktopGroupName

The name of the desktop group whose session pre-launch setting is to be modified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean that indicates if the session pre-launch setting is to be enabled or disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxAverageLoadThreshold

Specifies the average load threshold across the desktop group. When the threshold hits, pre-launched sessions across the group be terminated to reduce load. Sessions that have been pre-launched the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxLoadPerMachineThreshold

Specifies the maximum load threshold per machine in the desktop group. When the threshold hits, pre-launched sessions on each loaded machine will be terminated to reduce load. Sessions that have been pre-launched the longest will be chosen first.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeDisconnect

Specifies the time by which a pre-launched session will be disconnected. The disconnect time cannot be greater than the terminate timer (if enabled). When the disconnect and terminate times are the same, the terminate time takes precedence.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxTimeBeforeTerminate

Specifies the time by which a pre-launched session will be terminated. When the disconnect and terminate times are the same, the terminate time takes precedence.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserFilterEnabled

Specifies whether the session pre-launch's user filter is enabled or disabled. Where the user filter is enabled, pre-launch is enabled only to users who appear in the filter (either explicitly or by virtue of group membership).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.SessionPreLaunch

Session pre-launch settings may be specified through pipeline input.

Outputs

None or Citrix.Broker.Admin.SDK.SessionPreLaunch

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.SessionPreLaunch object.

Set-BrokerSharedDesktop

March 11, 2024

Change the settings of a shared desktop.

Syntax

```
Set-BrokerSharedDesktop
   [-InputObject] <SharedDesktop[]>
   [-PassThru]
   [-InMaintenanceMode <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSharedDesktop
   [-MachineName] <String>
   [-PassThru]
   [-InMaintenanceMode <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Shared desktops are automatically created when a machine is added to a desktop group with a DesktopKind of 'Shared', and these inherit default properties. Use Set-BrokerSharedDesktop to change the configuration settings of an existing shared desktop.

To specify shared desktops, you can choose whether to update by machine name or by passing a SharedDesktop or an array of SharedDesktop objects. You can also use the Uid or an array of Uids instead.

Most properties of a shared desktop cannot be modified as these contain status information; for example DNSName, RegistrationState, and OSVersion. You can change only the maintenance mode setting with this cmdlet.

Many of the properties that can be set with Set-BrokerSharedDesktop can be set by using %5BSet-BrokerMachine%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/Broker/Set-BrokerMachine.html) (e.g. InMaintenanceMode). Using the %5BSet-BrokerMachine%5D(/en-us/citrix-virtual-apps-desktops-sdk/2311/Broker/Set-BrokerMachine.html) cmdlet, where possible, is the preferred behaviour.

See about_Broker_Desktops for more information about desktops.

Examples

EXAMPLE 1

Put the Machine1 shared desktop into maintenance mode.

```
Set-BrokerSharedDesktop DOMAIN\Machine1 -InMaintenanceMode $true
```

EXAMPLE 2

Bring all shared desktops currently in maintenance mode back into normal service.

```
Get-BrokerSharedDesktop -InMaintenanceMode $true | Set-
    BrokerSharedDesktop -InMaintenanceMode $false
```

Parameters

-InputObject

Specifies the desktop or array of desktops to modify. You can also use an integer Uid of the desktop instead.

Type:	SharedDesktop[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MachineName

Specifies the desktop to modify using its machine name (in the form 'domain\machine').

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InMaintenanceMode

Changes the maintenance mode setting of a desktop. When a desktop is in maintenance mode, it is not included as a candidate when brokering new sessions, and it does not participate in automatic power management (idle pool); however, it still responds to explicit power operations.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.SharedDesktop

You can pipe SharedDesktop objects into this cmdlet instead of on the command line with the -InputObject parameter.

Outputs

None or Citrix.Broker.Admin.SDK.SharedDesktop

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.SharedDesktop object.

Set-BrokerSite

March 11, 2024

Changes the overall settings of the current XenDesktop broker site.

Syntax

```
Set-BrokerSite
   [-PassThru]
   [-AlwaysBypassAuthForCachedResources <Boolean>]
   [-ApplicationIconUid <Int32>]
   [-BaseOU <Guid>]
   [-BypassAuthForCachedResources <Boolean>]
   [-CloudSiteLicense <String>]
   [-CloudValidLicenses <String>]
   [-ColorDepth <ColorDepth>]
   [-ConnectionLeasingEnabled <Boolean>]
   [-CredentialForwardingToCloudAllowed <Boolean>]
   [-DefaultMinimumFunctionalLevel <FunctionalLevel>]
   [-DefaultReuseMachinesWithoutShutdownInOutage <Boolean>]
   [-DeleteResourceLeasesOnLogOff <Boolean>]
   [-DesktopGroupIconUid <Int32>]
   [-DnsResolutionEnabled <Boolean>]
   [-LocalHostCacheEnabled <Boolean>]
   [-PreferredAccountName <String>]
   [-RequireXmlServiceKeyForNFuse <Boolean>]
   [-RequireXmlServiceKeyForSta <Boolean>]
   [-ResourceLeaseValidityPeriodInDays <Int32>]
   [-ResourceLeasingEnabled <Boolean>]
   [-ReuseMachinesWithoutShutdownInOutageAllowed <Boolean>]
   [-SecureIcaRequired <Boolean>]
   [-TelemetryHeadlessLaunchEnabled <Boolean>]
   [-TelemetryLaunchMinTimeIntervalMins <Int32>]
   [-TelemetryLaunchShadowDelayMins <Int32>]
   [-TrustManagedAnonymousXmlServiceRequests <Boolean>]
   [-TrustRequestsSentToTheXmlServicePort <Boolean>]
   [-UseVerticalScalingForRdsLaunches <Boolean>]
   [-XmlServiceKey1 <String>]
   [-XmlServiceKey2 <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerSite cmdlet modifies properties of the current broker site.

The broker site is a top-level, logical representation of the XenDesktop site, from the perspective of the brokering services running within the site. It defines various site-wide default attributes used by the brokering services.

A XenDesktop installation has only a single broker site instance.

Examples

EXAMPLE 1

Specifies that any new desktop groups created, where a color depth value is not specified, default to using 16-bit color depth for user sessions to desktops or applications within that group.

```
1  Set-BrokerSite -ColorDepth SixteenBit
```

Parameters

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlwaysBypassAuthForCachedResources

Allows client to always display cached resources without authentication..

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-ApplicationIconUid

Changes the default icon used for new applications if no icon is specified explicitly when an application is created. Changing this default has no impact on the icons used by existing applications.

The specified icon must already have been added to the site using New-BrokerIcon.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BaseOU

Changes the objectGUID property identifying the base OU in Active Directory used for desktop registrations. For sites using only registry-based discovery (the default) this value is $null.

Any desktop attempting to register through a different OU from the one specified here is rejected. Note that desktops configured for registry-based discovery can register with the site, even if a BaseOU value is specified.

Information held in Active Directory is not modified by changing this value.

Typically, this property is changed only by using the Set-ADControllerDiscovery.ps1 script.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BypassAuthForCachedResources

Allows client to display cached resources without authentication..

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CloudSiteLicense

Used to override the Product, Edition and LicensingModel set during provisioning at CCS level.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CloudValidLicenses

List of license SKUs purchased by the customer needs to be set a provisioning time every time Ptah re-provisions the customer because of SKU changes for the customer. This will be used for validation purposes.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-ColorDepth

Changes the default color depth for new desktop groups, if no color depth is specified explicitly when a group is created. Changing this default has no impact on the color depths used already by existing groups.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Type:	ColorDepth
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConnectionLeasingEnabled

Connection leasing is no longer supported and cannot be enabled. This property exists for backwards compatibility only.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CredentialForwardingToCloudAllowed

Determines whether to allow the Connector to forward user credentials to cloud for verification when they cannot be authenticated locally.

With the default value ($false), requests from Storefront containing user credentials that cannot be authenticated locally will be failed.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DefaultMinimumFunctionalLevel

Changes the default minimum functional level used for new catalogs and desktop groups when no explicit value is provided.

Type:	FunctionalLevel
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DefaultReuseMachinesWithoutShutdownInOutage

The default ReuseMachinesWithoutShutdownInOutage used for new desktop groups when no explicit value is provided.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeleteResourceLeasesOnLogOff

Enables lease syncing on client.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroupIconUid

Changes the default desktop icon used for new desktop groups if no icon is specified explicitly when a group is created. Changing this default has no impact on the icons used already by existing groups.

The specified icon must already have been added to the site using New-BrokerIcon.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DnsResolutionEnabled

Changes whether ICA files returned by a broker service to a user device contain the numeric IP address or the DNS name of the desktop machine to which a session should be established.

With the default value ($false), ICA files will always contain a numeric IP address. To have DNS names appear in the ICA files, set the value to $true.

Even when DNS resolution is enabled ($true), IP addresses may still appear in ICA files. The reasons for this include, for example, that the broker service is unable to obtain a DNS name for the target machine, or that Storefront is configured to always use numeric IP addresses in this context.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalHostCacheEnabled

If the Local Host Cache feature is available, this property enables or disables it at run-time.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PreferredAccountName

Determines if SAM name or UPN should be displayed for default name of user/group account

Type:	String
Accepted values:	SamName, SamNameFallbackToUpn, Upn
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RequireXmlServiceKeyForNFuse

Determines whether an XML Service Key header is required for the NFuse, MCP, and Admin XML interfaces.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RequireXmlServiceKeyForSta

Determines whether an XML Service Key header is required for the STA interface.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLeaseValidityPeriodInDays

Validity period for a lease.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLeasingEnabled

Enables lease syncing on client.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReuseMachinesWithoutShutdownInOutageAllowed

Allows the ReuseMachinesWithoutShutdownInOutage setting on individual DesktopGroups to be enabled. Because these settings have potential security implications, only the site administrator can enable use of this feature. Disabling this setting will clear corresponding field on all delivery groups.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecureIcaRequired

Changes the default SecureICA usage requirements for new desktop groups if no SecureICA setting is specified explicitly when a group is created. Changing this default has no impact on the SecureICA usage requirements of existing groups.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-TelemetryHeadlessLaunchEnabled

Enables client to perform headless telemetry launches.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TelemetryLaunchMinTimeIntervalMins

Configures minimum time interval (in minutes) between headless telemetry launches.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TelemetryLaunchShadowDelayMins

Configures delay (in minutes) between ICA-HDX launch and headless telemetry launch.

Type:	Int32
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TrustManagedAnonymousXmlServiceRequests

Changes whether the XML Service (as used by Storefront) implicitly trusts managed anonymous launch requests.

With the default value ($false), any attempt to use the XML service for managed anonymous sessions is rejected.

If this setting is enabled, anyone with access to the XML service will be able to utilize the managed anonymous functionality to leave disconnected prelaunched anonymous sessions available for reconnection. You must ensure that controllers running the brokering services are securely firewalled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TrustRequestsSentToTheXmlServicePort

Changes whether the XML Service (as used by Storefront) implicitly trusts the originator of requests it receives, or whether it fully authenticates them.

With the default value ($false), full authentication checks are performed. However, you must enable this setting ($true) to allow support for “Pass-through”authentication, and/or connections routed through Access Gateway.

If this setting is enabled, you must ensure that controllers running the brokering services are securely firewalled.

Type:	Boolean
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseVerticalScalingForRdsLaunches

Determines whether to use vertical scaling when considering RDS machines for launches. Vertical scaling would saturate machines in the current pool rather than send sessions to the least loaded machines. This would be a trade in performance vs. cost, where vertical scaling would be less costly.

With the default value ($false), horizontal scaling will be used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServiceKey1

A 256 bit service key for the XML Services.

Use the New-BrokerXmlServiceKey cmdlet to generate keys.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServiceKey2

A 256 bit service key for the XML Services.

Use the New-BrokerXmlServiceKey cmdlet to generate keys.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None or Citrix.Broker.Admin.SDK.Site

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Site object.

Set-BrokerSiteMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Site

Syntax

```
Set-BrokerSiteMetadata
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSiteMetadata
   [[-InputObject] <Site[]>]
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSiteMetadata
   [[-InputObject] <Site[]>]
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSiteMetadata
   [-PassThru]
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerSiteMetadata
   [-PassThru]
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerSiteMetadata cmdlet creates/updates metadata key-value

pairs for Site. The Site can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Site

```
Set-BrokerSiteMetadata -Name "MyMetadataName" -Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”

```
Get-BrokerSite | Set-BrokerSiteMetadata -Name "MyMetadataName" -Value "
    1234"
```

Parameters

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Site objects whose Metadata is to be created/updated.

Type:	Site[]
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerSite

You can pipe the Site to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerSite

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerSite object.

Set-BrokerTag

March 11, 2024

Sets the properties of a tag.

Syntax

```
Set-BrokerTag
    [-InputObject] <Tag[]>
    [-PassThru]
    [-Description <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerTag
    [-Name] <String>
    [-PassThru]
    [-Description <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerTag cmdlet sets properties of a tag or set of tags. The tags on which to operate can be specified by name, in which case multiple tags may be specified through the use of wildcards, or by passing one or more Tag instances to the cmdlet by piping or by using the -InputObject parameter.

Examples

EXAMPLE 1

This example sets the description for the existing tag MyTag.

```
$mytag = Get-BrokerTag MyTag
Set-BrokerTag -InputObject $mytag -Description "This is my tag. I use
    it to label all my things."
```

Parameters

-InputObject

Specifies the tag objects to modify.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Identifies the tag to modify.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Description

Supplies the new value of the Description property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Tag

You can pipe the tags to be modified to Set-BrokerTag.

Outputs

None or Citrix.Broker.Admin.SDK.Tag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Tag object.

Notes

A tag's Name property cannot be changed by Set-BrokerTag. To rename a tag use Rename-BrokerTag.

Set-BrokerTagMetadata

March 11, 2024

Creates/Updates metadata key-value pairs for Tag

Syntax

```
Set-BrokerTagMetadata
    [-TagId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerTagMetadata
    [-TagId] <Int32>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerTagMetadata
    [-TagId] <Int32>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerTagMetadata
    [-InputObject] <Tag[]>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerTagMetadata
    [-InputObject] <Tag[]>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-BrokerTagMetadata
    [-TagName] <String>
    [-PassThru]
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-BrokerTagMetadata
    [-TagName] <String>
    [-PassThru]
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-BrokerTagMetadata cmdlet creates/updates metadata key-value

pairs for Tag. The Tag can be specified by InputObject or piping.

Examples

EXAMPLE 1

This command creates/updates the Metadata “MyMetadataName”key-value pair for the Tag whose instance is pointed by $obj-Uid

```
Set-BrokerTagMetadata -InputObject $obj-Uid -Name "MyMetadataName" -
    Value "1234"
```

EXAMPLE 2

This command creates/updates metadata key “MyMetadataName”with the value “1234”for all the Tag in the site

```
Get-BrokerTag | Set-BrokerTagMetadata -Name "MyMetadataName" -Value "
    1234"
```

EXAMPLE 3

This command creates/updates two metadata keys “name1”and “name2”with the values “value1” and “value2”respectively for the Tag in the site whose name is ‘objname’

```
@{
  'name1' = 'value1'; 'name2' = 'value2'  }
  | Set-BrokerTagMetadata 'objname'
```

Parameters

-TagId

Specifies the Tag object whose Metadata is to be created/updated by ID.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InputObject

Specifies the Tag objects whose Metadata is to be created/updated.

Type:	Tag[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TagName

Specifies the Tag object whose Metadata is to be created/updated by name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Name

Specifies the name of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Value

Specifies the value of the Metadata member to be created/updated

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Map

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.BrokerTag

You can pipe the Tag to hold the new or updated metadata.

Outputs

None or Citrix.Broker.Admin.SDK.BrokerTag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerTag object.

Set-BrokerUserZonePreference

March 11, 2024

Changes the zone preference associated with a user/group account in this site

Syntax

```
Set-BrokerUserZonePreference
   [-InputObject] <UserZonePreference[]>
   [-PassThru]
   [-HomeZoneUid <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-BrokerUserZonePreference
   [-Name] <String>
   [-PassThru]
   [-HomeZoneUid <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-BrokerUserZonePreference cmdlet allows the preferred home zone for resources launched using the specified user/group account to be changed.

Subject to the configuration of the desktop groups in use, and the availability of machines in the preferred zone, desktops and applications are launched using machines in that zone where possible.

Examples

EXAMPLE 1

Changes the preferred zone for resources launched by members of the APAC\marketing group account.

```
Set-BrokerUserZonePreference APAC\marketing -HomeZoneUid 2E885C02-6B65
   -47AA-8B03-E855BE2FF7D7
```

Parameters

-InputObject

The account zone preference to be modified.

Type:	UserZonePreference[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The name of the user/group account whose home zone preference is to be changed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-HomeZoneUid

The home zone preference to be associated with the user/group account for this site.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.UserZonePreference

The account zone preference to be modified.

Outputs

None or Citrix.Broker.Admin.SDK.UserZonePreference

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.UserZonePreference object.

Start-BrokerCatalogPvdImagePrepare

March 11, 2024

This cmdlet is no longer supported

Syntax

```
Start-BrokerCatalogPvdImagePrepare
      [-InputObject] <Catalog[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

PvD is no longer supported, use Citrix App Layering instead.

Examples

Parameters

-InputObject

Type:	Catalog[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

Outputs

None

By default, this cmdlet returns no output.

Start-BrokerDesktopGroupRebootCycle

March 11, 2024

Creates and starts a reboot cycle for each specified desktop group.

Syntax

```
Start-BrokerDesktopGroupRebootCycle
     [-InputObject] <DesktopGroup[]>
     -RebootDuration <Int32>
     [-RestrictToTagUid <Int32>]
     [-WarningDuration <Int32>]
     [-WarningTitle <String>]
     [-WarningMessage <String>]
     [-WarningRepeatInterval <Int32>]
     [-IgnoreMaintenanceMode <Boolean>]
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

The Start-BrokerDesktopGroupRebootCycle cmdlet is used to create and start a reboot cycle for specified desktop groups.

The functionality offered is similar to that of New-BrokerRebootSchedule but the resulting reboot cycles execute once as defined by the command parameters rather than on a repeating schedule.

Examples

EXAMPLE 1

Starts a new reboot cycle for the desktop group called “SampleGroup”. Each reboot cycle has a duration of six hours. Fifteen minutes prior to rebooting a machine, the message “Save your work”is displayed in each active user session. Only machines tagged with the tag having UID 2 will be rebooted.

```
Get-BrokerDesktopGroup "SampleGroup" | Start-
    BrokerDesktopGroupRebootCycle -RebootDuration 240 -WarningMessage "
    Save your work" -WarningDuration 15 -RestrictToTagUid 2
```

Parameters

-InputObject

Creates a reboot cycle for the specified desktop groups. Groups can be specified using UID values, name values (including wildcards) or desktop group SDK objects.

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-RebootDuration

Approximate maximum duration in minutes over which the reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RestrictToTagUid

If set to a Tag UID, only machines that have this tag will be rebooted.

Type:	Int32
Position:	Named
Default value:	Null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningDuration

Time in minutes prior to a machine reboot at which a warning message is displayed in all user sessions on that machine. If the warning duration value is zero then no message is displayed.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Number of minutes to wait before showing the reboot warning message again.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-IgnoreMaintenanceMode

Option to reboot machines in maintenance mode.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

Desktop groups may be specified through pipeline input. The groups can be specified using UID values, name values (including wildcards) or desktop group objects

Outputs

None

By default, this cmdlet returns no output.

Start-BrokerMachinePvdImagePrepare

March 11, 2024

This cmdlet is no longer supported

Syntax

```
Start-BrokerMachinePvdImagePrepare
     [-InputObject] <Machine[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

PvD is no longer supported, use Citrix App Layering instead.

Examples

Parameters

-InputObject

Type:	Machine[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Machine

Outputs

None

By default, this cmdlet returns no output.

Start-BrokerNaturalDesktopGroupRebootCycle

March 11, 2024

Reboots all machines from the specified desktop group when they are not in use.

Syntax

```
Start-BrokerNaturalDesktopGroupRebootCycle
     [-InputObject] <DesktopGroup[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Creating a natural reboot cycle for a desktop group ensures that all machines in the group are running the most recent image for the group.

The machines are rebooted in a non-disruptive manner, allowing machines that are in use to continue working and be restarted only after they become idle.

Examples

EXAMPLE 1

The above code applies a natural reboot cycle on desktop group with Id 1

```
$dg = Get-BrokerDesktopGroup -Uid 1
Start-BrokerNaturalDesktopGroupRebootCycle -InputObject $dg
```

Parameters

-InputObject

Reboots all machines from this input desktop group. The desktop groups can be specified using UID values, name values (including wildcards) or desktop group objects.

Type:	DesktopGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.DesktopGroup

Desktop Groups may be specified through pipeline input. The desktop groups can be specified using UID values, name values (including wildcards) or desktop groups objects

Outputs

None

By default, this cmdlet returns no output.

Notes

Natural reboot cycles do not apply to non-power managed machines or multi-session desktop groups

Start-BrokerNaturalRebootCycle

March 11, 2024

Reboots all machines from the specified catalog when they are not in use.

Syntax

```
Start-BrokerNaturalRebootCycle
      [-InputObject] <Catalog[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Creating a natural reboot cycle for a catalog ensures that all machines in the catalog are running the most recent image for the catalog.

The machines are rebooted in a non-disruptive manner, allowing machines that are in use to continue working and be restarted only after they become idle.

Examples

EXAMPLE 1

The above code applies a natural reboot cycle on catalog with Id 1

```
$c = Get-BrokerCatalog -Uid 1
Start-BrokerNaturalRebootCycle -InputObject $c
```

Parameters

-InputObject

Reboots all machines from this input catalog. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects.

Type:	Catalog[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

Catalogs may be specified through pipeline input. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects

Outputs

None

By default, this cmdlet returns no output.

Notes

Natural reboot cycles do not apply to non-power managed and multi session catalogs

- Start-BrokerDesktopGroupRebootCycle
- Start-BrokerNaturalDesktopGroupRebootCycle

Start-BrokerRebootCycle

March 11, 2024

Creates and starts a reboot cycle for each desktop group that contains machines from the specified catalog.

Syntax

```
Start-BrokerRebootCycle
     [-InputObject] <Catalog[]>
     -RebootDuration <Int32>
     [-WarningDuration <Int32>]
     [-WarningTitle <String>]
     [-WarningMessage <String>]
     [-WarningRepeatInterval <Int32>]
```

```
8       [-LoggingId <Guid>]
9       [<CitrixCommonParameters>]
10      [<CommonParameters>]
```

Description

The Start-BrokerRebootCycle cmdlet is used to create and start a reboot cycle for each desktop group that contains machines from the specified catalog. For a given desktop group, only the machines from the target catalog are rebooted and any machines from other catalogs are not rebooted.

Creating a reboot cycle for catalog ensures that all machines in the catalog are running the most recent image for the catalog.

Examples

EXAMPLE 1

Starts a new reboot cycle for each desktop group containing machines from the catalog "SampleCatalog". Each reboot cycle has a duration of six hours. Fifteen minutes prior to rebooting a machine, the message "Save your work"is displayed in each active user session.

```
1 Get-BrokerCatalog -Name "SampleCatalog" | Start-BrokerRebootCycle -
      RebootDuration 240 -WarningMessage "Save your work" -WarningDuration
       15
```

EXAMPLE 2

Starts a new reboot cycle for each desktop group containing machines from the catalog "SampleCatalog". Fifteen, ten and five minutes prior to rebooting each machine, the message "Rebooting in %m% minutes."will be displayed in each user session with the pattern '%m%'replaced with the number of minutes until the reboot.

```
1 Get-BrokerCatalog -Name "SampleCatalog" | Start-BrokerRebootCycle -
      WarningMessage "Rebooting in %m% minutes." -WarningDuration 15 -
      WarningRepeatInterval 5
```

Parameters

-InputObject

Creates a reboot cycle for each desktop group that contains machines from this input catalog SDK object. The catalogs can be specified using UID values, name values (including wildcards) or catalog

objects.

Type:	Catalog[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-RebootDuration

Approximate maximum duration in minutes over which the reboot cycle runs.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningDuration

Time in minutes prior to a machine reboot at which a warning message is displayed in all user sessions on that machine. If the warning duration value is zero then no message is displayed. In some cases the time required to process a reboot cycle may exceed the RebootDuration time by up to the WarningDuration value; Citrix recommends that the WarningDuration is kept small relative to the RebootDuration value.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-WarningTitle

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningMessage

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed. The optional pattern '%m%'is replaced by the number of minutes until the reboot.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningRepeatInterval

Number of minutes to wait before showing the reboot warning message again.

Type:	Int32
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Catalog

Catalogs may be specified through pipeline input. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects

Outputs

None

By default, this cmdlet returns no output.

Start-BrokerSessionRecording

March 11, 2024

Starts recording the specified session(s).

Syntax

```
Start-BrokerSessionRecording
      [-Sessions] <Session[]>
      [-NotifyUser <Boolean>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Start-BrokerSessionRecording
      [-User] <User>
      [-NotifyUser <Boolean>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Starts recording the specified session(s).

Only active sessions using the HDX protocol can be recorded. An error appears when unqualified sessions (non-existent, inactive, or non-HDX) are specified for recording. No warning appears when you trigger an action to record sessions that are already being recorded.

Examples

EXAMPLE 1

Starts recording the session Uid 10,11,12 without notifying the user.

```
1 Start-BrokerSessionRecording -Sessions 10,11,12 -NotifyUser 0
```

EXAMPLE 2

Starts recording all sessions of user Geffrey in the domain named MYDOMAIN and notifies user Geffrey.

```
1 Start-BrokerSessionRecording -User MYDOMAIN\Geffrey -NotifyUser 1
```

Parameters

-Sessions

Specifies the session(s) to be recorded.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-User

Specifies the user whose session is to be recorded.

Type:	User
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-NotifyUser

Determines whether to notify the end user of the recording activity.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

The session(s) to be recorded.

Citrix.Broker.Admin.SDK.User

The user whose sessions are to be recorded.

Outputs

None

By default, this cmdlet returns no output.

Notes

Sessions can be passed using the Sessions parameter as session objects or session Uids. A user can be passed using the User parameter as a user object or a user name.

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between the Delivery Controller and the VDA, or if bad arguments are passed to the cmdlet itself, or if the VDA cannot successfully execute the operation.

The Delivery Controller can fail to invoke the operation if the VDA is not in an appropriate state or if there are problems with communicating with the VDA. When an operation is invoked, the Delivery Controller detects and reports whether the operation is initiated successfully on the VDA. However, because the operation is non-blocking, the Delivery Controller does not detect or report whether or not the operation ultimately succeeds after the operation is initiated successfully.

Operation failures are reported through the Broker SDK error handling mechanism (see about_Broker_ErrorHandli
In the event of errors, the SdkErrorRecord error status code is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount: The number of operations attempted.
- OperationsFailedCount - The number of failed operations.
- OperationsSucceededCount - The number of successful operations.

The SdkErrorRecord message displays the number of attempted, failed, and successful operations in the following format:

"Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded:<OperationsSucceededCount>"

Stop-BrokerRebootCycle

March 11, 2024

Cancels the specified reboot cycle.

Syntax

```
Stop-BrokerRebootCycle
    [-InputObject] <RebootCycle[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Stop-BrokerRebootCycle cmdlet is used to cancel the specified reboot cycle.

Examples

EXAMPLE 1

Cancels every reboot cycle for the catalog that has the Uid of 7.

```
1  Get-BrokerRebootCycle -CatalogUid 7 | Stop-BrokerRebootCycle
```

Parameters

-InputObject

Cancels this reboot cycle.

Type:	RebootCycle[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.RebootCycle

Reboot cycles may be specified through pipeline input.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- Get-BrokerRebootCycle
- Start-BrokerRebootCycle
- Start-BrokerDesktopGroupRebootCycle

Stop-BrokerSession

March 11, 2024

Stop or log off a session.

Syntax

```
Stop-BrokerSession
    [-InputObject] <Session[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Stops or logs off sessions.

Examples

EXAMPLE 1

Stops all sessions for the user MyDomain\MyAccount.

```
Get-BrokerSession -UserName MyDomain\MyAccount | Stop-BrokerSession
```

EXAMPLE 2

Stops the session on MyMachine.

```
$desktop = Get-BrokerDesktop -DNSName MyMachine.MyDomain.com
Stop-BrokerSession $desktop.SessionUid
```

EXAMPLE 3

Stop sessions that have been disconnected for more than one day.

```
Get-BrokerSession -Filter {
  SessionState -eq 'Disconnected' -and SessionStateChangeTime -lt '-1'
      }
  | Stop-BrokerSession
```

EXAMPLE 4

Trap and display error information.

```
trap  [Citrix.Broker.Admin.SDK.SdkOperationException]
{

  write $("Exception name = " + $_.Exception.GetType().FullName)
  write $("SdkOperationException.Status = " + $_.Exception.Status)
  write $("SdkOperationException.ErrorData=")
  $_.Exception.ErrorData

  write $("SdkOperationException.InnerException = " + $_.Exception.
     InnerException)
  $_.Exception.InnerException
  continue
 }

Stop-BrokerSession -InputObject 10,11,12
```

Parameters

-InputObject

Identifies the session(s) to terminate. This can be expressed as either a session Uid or a session object.

Type:	Session[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

The sessions to stop can be piped into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between the controller and the machine, if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Stop-BrokerSession could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the stop session operation is invoked on the valid sessions.

The system can fail to invoke the operation if the machine is not in an appropriate state or if there are problems in communicating with the machine. When an operation is invoked the system detects if the operation was initiated successfully or not by the machine. As this operation is non-blocking the system doesn't detect or report whether the operation ultimately succeeded or failed after its successful initialization on the machine.

Operation failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandli
In the event of errors the SdkErrorRecord error status is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount - The number of operations attempted.
- OperationsFailedCount - The number of failed operations.
- OperationsSucceededCount - The number of successfully executed operations.
- UnresolvedSessionFailuresCount - The number of operations that failed due to invalid sessions being supplied.
- OperationInvocationFailuresCount - The number of operations that failed because they could not be invoked on the desktop.
- DesktopExecutionFailuresCount - The number of operations that failed because they could not be successfully executed by the desktop.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

"Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded:<OperationsSucceededCount>"

Related Links

Stop-BrokerSessionRecording

March 11, 2024

Stops recording the specified session(s).

Syntax

```
Stop-BrokerSessionRecording
    [-Sessions] <Session[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Stop-BrokerSessionRecording
    [-User] <User>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Stops recording the specified session(s).

Examples

EXAMPLE 1

Stops recording the session Uid 10,11,12.

```
Stop-BrokerSessionRecording -Sessions 10,11,12
```

EXAMPLE 2

Stops recording all sessions of user Administrator in the domain named MYDOMAIN.

```
Stop-BrokerSessionRecording -User MYDOMAIN\Administrator
```

Parameters

-Sessions

Specifies the session(s) to stop recording.

Type:	Session[]
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-User

Specifies the user whose sessions to stop recording.

Type:	User
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Broker.Admin.SDK.Session

The session(s) to stop recording.

Citrix.Broker.Admin.SDK.User

The user whose sessions to stop recording.

Outputs

None

By default, this cmdlet returns no output.

Notes

Sessions can be passed using the Sessions parameter as session objects or session Uids. A user can be passed using the User parameter as a user object or a user name. Either the Sessions or User parameter can be used at a time.

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between the Delivery Controller and the VDA, or if bad arguments are passed to the cmdlet itself, or if the VDA cannot successfully execute the operation.

The Delivery Controller can fail to invoke the operation if the VDA is not in an appropriate state or if there are problems with communicating with the VDA. When an operation is invoked, the Delivery Controller detects and reports whether the operation is initiated successfully on the VDA. However, because the operation is non-blocking, the Delivery Controller does not detect or report whether or not the operation ultimately succeeds after the operation is initiated successfully.

Operation failures are reported through the Broker SDK error handling mechanism (see about_Broker_ErrorHandli
In the event of errors, the SdkErrorRecord error status code is set to SessionOperationFailed, and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount: The number of operations attempted.
- OperationsFailedCount - The number of failed operations.
- OperationsSucceededCount - The number of successful operations.

The SdkErrorRecord message displays the number of attempted, failed, and successful operations in the following format:

“Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded:<OperationsSucceededCount>”

Test-BrokerAccessPolicyRuleNameAvailable

March 11, 2024

Determine whether the proposed AccessPolicyRule Name is available for use.

Syntax

```
Test-BrokerAccessPolicyRuleNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed AccessPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name “Test1”is available.

```
Test-BrokerAccessPolicyRuleNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerAccessPolicyRuleNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The AccessPolicyRule Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerAppAssignmentPolicyRuleNameAvailable

March 11, 2024

Determine whether the proposed AppAssignmentPolicyRule Name is available for use.

Syntax

```
Test-BrokerAppAssignmentPolicyRuleNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed AppAssignmentPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerAppAssignmentPolicyRuleNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerAppAssignmentPolicyRuleNameAvailable @("Test1","Test2","
    Test3")
```

Parameters

-Name

The AppAssignmentPolicyRule Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerAppEntitlementPolicyRuleNameAvailable

March 11, 2024

Determine whether the proposed AppEntitlementPolicyRule Name is available for use.

Syntax

```
Test-BrokerAppEntitlementPolicyRuleNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed AppEntitlementPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerAppEntitlementPolicyRuleNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerAppEntitlementPolicyRuleNameAvailable @("Test1","Test2","
    Test3")
```

Parameters

-Name

The AppEntitlementPolicyRule Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerApplicationGroupNameAvailable

March 11, 2024

Determine whether the proposed ApplicationGroup Name is available for use.

Syntax

```
Test-BrokerApplicationGroupNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed ApplicationGroup Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerApplicationGroupNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerApplicationGroupNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The ApplicationGroup Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerApplicationNameAvailable

March 11, 2024

Determine whether the proposed Application Name is available for use.

Syntax

```
Test-BrokerApplicationNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed Application Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerApplicationNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerApplicationNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The Application Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerAssignmentPolicyRuleNameAvailable

March 11, 2024

Determine whether the proposed AssignmentPolicyRule Name is available for use.

Syntax

```
Test-BrokerAssignmentPolicyRuleNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed AssignmentPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerAssignmentPolicyRuleNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerAssignmentPolicyRuleNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The AssignmentPolicyRule Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerCatalogNameAvailable

March 11, 2024

Determine whether the proposed Catalog Name is available for use.

Syntax

```
Test-BrokerCatalogNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed Catalog Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerCatalogNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerCatalogNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The Catalog Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of “True”indicates the Name is available for use, and “False”if it is not available.

Test-BrokerDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Broker Service.

Syntax

```
Test-BrokerDBConnection
    [-DBConnection] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-BrokerDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-BrokerDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Broker Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Broker SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Test-BrokerDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Broker Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-BrokerDBConnection cmdlet returns an object describing the status of the selected Broker Service instance that would result if the connection string were used with the Set-BrokerDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-BrokerDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Broker Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Broker Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Broker Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Broker Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Broker Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Broker Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-BrokerDesktopGroupNameAvailable

March 11, 2024

Determine whether the proposed DesktopGroup Name is available for use.

Syntax

```
Test-BrokerDesktopGroupNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed DesktopGroup Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name “Test1”is available.

```
Test-BrokerDesktopGroupNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerDesktopGroupNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The DesktopGroup Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerEntitlementPolicyRuleNameAvailable

March 11, 2024

Determine whether the proposed EntitlementPolicyRule Name is available for use.

Syntax

```
Test-BrokerEntitlementPolicyRuleNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed EntitlementPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name “Test1”is available.

```
Test-BrokerEntitlementPolicyRuleNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerEntitlementPolicyRuleNameAvailable @("Test1","Test2","Test3"
    )
```

Parameters

-Name

The EntitlementPolicyRule Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerLicenseServer

March 11, 2024

Tests whether or not a license server can be used by the broker.

Syntax

```
Test-BrokerLicenseServer
    [-ComputerName] <String>
    [[-Port] <Int32>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether or not a given license server can be used by the broker.

Examples

EXAMPLE 1

Tests whether or not the license server “machine.domain”with port number 1234 can be used.

```
Test-BrokerLicenseServer -LicenseServerAddress "machine.domain" 1234
```

EXAMPLE 2

Tests whether or not the license server “machine.domain”with port number 2700 can be used.

```
Test-BrokerLicenseServer -LicenseServerAddress "machine.domain"
```

Parameters

-ComputerName

The name of the license server to test (machine.domain).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Port

The port number to use on the server.

Type:	Int32
Position:	3
Default value:	27000
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Test-BrokerLicenseServer returns:

- 'Compatible'- the server is a compatible license server that can be used.
- 'Incompatible'- the server is an incompatible license server that can't be used.

- 'Inaccessible'- the server cannot be accessed. The server may be down, unreachable, or non-existent.
- 'InternalError - the server can't be used due to an internal error. A required licensing component on the server may not be installed, configured, or working correctly.

Test-BrokerMachineNameAvailable

March 11, 2024

Determine whether the proposed Machine MachineName is available for use.

Syntax

```
Test-BrokerMachineNameAvailable
    [-MachineName] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed Machine MachineName is available for use. It returns a record for each MachineName indicating the availability of that MachineName, with $true indicating that the MachineName is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the MachineName "Test1"is available.

```
Test-BrokerMachineNameAvailable -MachineName Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerMachineNameAvailable @("Test1","Test2","Test3")
```

Parameters

-MachineName

The Machine MachineName to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the MachineName to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each MachineName specified. An availability of "True"indicates the MachineName is available for use, and "False"if it is not available.

Related Links

- Get-BrokerMachine

Test-BrokerPowerTimeSchemeNameAvailable

March 11, 2024

Determine whether the proposed PowerTimeScheme Name is available for use.

Syntax

```
Test-BrokerPowerTimeSchemeNameAvailable
    [-Name] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed PowerTimeScheme Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the Name "Test1"is available.

```
Test-BrokerPowerTimeSchemeNameAvailable -Name Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerPowerTimeSchemeNameAvailable @("Test1","Test2","Test3")
```

Parameters

-Name

The PowerTimeScheme Name to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the Name to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True"indicates the Name is available for use, and "False"if it is not available.

Test-BrokerRemotePCAccountNameAvailable

March 11, 2024

Determine whether the proposed RemotePCAccount OU is available for use.

Syntax

```
Test-BrokerRemotePCAccountNameAvailable
    [-OU] <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet checks whether proposed RemotePCAccount OU is available for use. It returns a record for each OU indicating the availability of that OU, with $true indicating that the OU is unused and available for use, or $false if it is not available.

Examples

EXAMPLE 1

Checks whether the OU "Test1"is available.

```
Test-BrokerRemotePCAccountNameAvailable -OU Test1
```

EXAMPLE 2

Checks whether each of the specified names is available.

```
Test-BrokerRemotePCAccountNameAvailable @("Test1","Test2","Test3")
```

Parameters

-OU

The RemotePCAccount OU to be tested.

Type:	String[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains the OU to test.

Outputs

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each OU specified. An availability of "True"indicates the OU is available for use, and "False"if it is not available.

Update-BrokerGpoPolicySetBlob

March 11, 2024

Force an immediate update of a policy set's data blob.

Syntax

```
Update-BrokerGpoPolicySetBlob
      -PolicySetGuid <Guid>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Update-BrokerGpoPolicySetBlob cmdlet is used to force an immediate conversion of the policy set's data stored in database tables to the compiled data blob for the policy set. Normally this is not necessary because a site service regularly converts the policy data in a policy set to a data blob at 5 minute intervals. Use this command to have the data updated immediately.

Examples

EXAMPLE 1

Update the policy blob data of a policy set.

```
Update-BrokerGpoPolicySetBlob -PolicyGuid ([Guid]"abcdef12-...")
```

Parameters

-PolicySetGuid

The GUID of the policy set to be updated. Only a policy set of type DeliveryGroupPolicies can be updated. If a policy set of another type is specified or if a non-existent policy set is specified, this command does nothing.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

This cmdlet does not generate any output.

Related Links

- about_Broker_GroupPolicy

Update-BrokerImportedFTA

March 11, 2024

Imports or updates all of the file type associations for the

specified worker.

Syntax

```
Update-BrokerImportedFTA
      -DesktopUids <Int32[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Imports or updates the file type associations from a specified worker machine.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Initially the system is not aware of any extensions, and they must be imported by the Citrix administrator. To import or update file type associations from a worker machine, two criteria must be met:

- The worker machine must not be in use
- The worker machine must be in maintenance mode

For more information about putting a worker machine in maintenance mode, see the Set-BrokerPrivateDesktop and Set-BrokerSharedDesktop cmdlets.

Imported file type associations are grouped together based on the desktop group of the machine from which they were imported. All file types for a desktop group are deleted. There is no mechanism for deleting a subset imported file type associations for a specific desktop group.

If file type associations are imported more than once for a desktop group, for example, if this cmdlet is run twice for two workers belonging to the same desktop group, all existing imported file type associations for that desktop group are deleted and imported again.

Examples

EXAMPLE 1

Gets an object for the worker machine named

“Worker1”in the “ACME”domain, and ensures no users can

connect to it, before importing the file type associations from that

desktop and re-enabling it.

```
$desktop = Get-BrokerSharedDesktop -MachineName "ACME\Worker1"
Set-BrokerSharedDesktop $desktop -InMaintenanceMode $true
Update-BrokerImportedFTA -DesktopUids $desktop.Uid
Set-BrokerSharedDesktop $desktop -InMaintenanceMode $false
```

Parameters

-DesktopUids

Imports or updates the file type associations from the

specified desktop. The desktop must belong to a desktop group of the

Private or Shared desktop kind.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Int32[]

An array of Uids for desktops can be supplied as input.

Outputs

None

By default, this cmdlet returns no output.

Update-BrokerLocalLeaseCache

March 11, 2024

Flushes the local lease cache.

Syntax

```
Update-BrokerLocalLeaseCache
      [-Workers]
      [-Applications]
      [-Icons]
      [-Desktops]
      [-Leases]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes all local cached lease data and any state information stored in the registry.

Examples

EXAMPLE 1

Flushes the local lease cache for all objects and deletes any state information stored in the registry.

```
Update-BrokerLocalLeaseCache
```

EXAMPLE 2

Flushes the local lease cache for all workers and deletes any state information stored in the registry.

```
Update-BrokerLocalLeaseCache -Workers
```

Parameters

-Workers

Removes all locally cached workers on the controller. The worker cache will be repopulated from the current site database contents after a short delay.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Applications

Removes all locally cached applications on the controller. The application cache will be repopulated from the current site database contents after a short delay.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Icons

Removes all locally cached icons on the controller. The icon cache will be repopulated from the current site database contents after a short delay.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Desktops

Removes all locally cached desktops on the controller. The desktop cache will be repopulated from the current site database contents after a short delay.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Leases

Removes all locally cached leases on the controller. The lease cache will be repopulated from the current site database contents after a short delay.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

The local cache for lease and other data like worker, desktop, application and icon information is removed and will be repopulated from the current site database contents after a short delay.

Update-BrokerNameCache

March 11, 2024

Performs administrative operations on the user/group and machine name cache.

Syntax

```
Update-BrokerNameCache
      [-Machines]
      [-Users]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Update-BrokerNameCache
      [-Machines]
      [-Users]
      [-Purge]
      [-UnusedFor <TimeSpan>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Update-BrokerNameCache
      -Machine <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Update-BrokerNameCache
      -User <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Triggers an immediate asynchronous refresh of the name cache, or when used with the -Purge parameter removes cache entries that are unreferenced and have been unused for a period of time.

The Broker Service maintains a cache of the names of users/groups and machines in use by the site. By default, name information is obtained periodically from Active Directory and the cache refreshed automatically.

Triggering a cache refresh with this cmdlet ensures up-to-date name information is present in the cache after user/group or machine accounts are known to have changed and you need to see those changes immediately instead of waiting for the periodic automatic refresh.

Removing (purging) entries relating to no longer used user/group or machine accounts is useful to stop requests being made to Active Directory to refresh the names relating to those items.

For users/groups, the following name information is cached:

Windows name (DOMAIN\user)

User Principal Name or 'UPN'(user@upndomain)

Full Name or 'Common Name'(typically a user's full name)

For machines, the following name information is cached:

Windows name (DOMAIN\machine)

DNS name (machine.dnsdomain)

Examples

EXAMPLE 1

Triggers an immediate asynchronous refresh of all machine name information held within the name cache.

```
1  Update-BrokerNameCache -Machines
```

EXAMPLE 2

Triggers an immediate asynchronous refresh of all machine and user name information held within the name cache.

```
1  Update-BrokerNameCache -Machines -Users
```

Parameters

-Purge

Removes unused entries from the cache rather than refreshing the name data. Entries are only removed if they are not configured or referenced in any way within the site.

In addition, user entries are only removed if the user has not logged in for at least 90 days. Similarly machine entries are only removed if the machine has not registered with the site over the same period. The 90 day default can be overridden using the -UnusedFor parameter.

While removing genuinely unused cache entries is desirable to reduce the requests made to Active Directory, there is additional cost in repopulating the cache if a user/group or machine account is later used again after having been removed. Thus it is not recommended to routinely use very short intervals with -UnusedFor.

If a machine entry is removed from the cache and later used again, the Uid value associated with that machine changes (seen in the output of Get-BrokerMachine).

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Machine

Triggers an asynchronous refresh of the cached machine name information for the specified machine. The machine can be specified by SID or by its name as currently known to the Citrix Broker service (for example as shown by Get-BrokerMachine).

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-User

Triggers an asynchronous refresh of the cached user name information for the specified user. The user can be specified by SID or by its name as currently known to the Citrix Broker service (for example as shown by Get-BrokerUser).

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Machines

Triggers an asynchronous refresh of all cached machine name information, or with the -Purge parameter removes unused machine entries from the cache.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Users

Triggers an asynchronous refresh of all cached user/group name information, or with the -Purge parameter removes unused user/group entries from the cache.

Type:	SwitchParameter
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UnusedFor

Specifies the minimum period over which user or machine cache entries must have been unused before they can be be removed with the -Purge option.

Type:	TimeSpan
Position:	Named
Default value:	90 days
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

For some user accounts, for example, the built-in domain administrator, the UPN and/or Full Name values may not be available because they are not typically specified within Active Directory.

For group accounts, UPN and Full Name values are not available because they are not applicable or not specified within Active Directory.

The DNS name information for a machine is obtained from Active Directory and not from the DNS subsystem. If a machine has only recently been configured, the DNS information may not be available initially.

Update-BrokerScopeCache

March 11, 2024

Synchronise the scope information with the Delegated Administration service

Syntax

```
Update-BrokerScopeCache
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Force an immediate synchronisation of the scope information held by the Delegated Administration

service with the cached copy held by the Broker service. The scope data would be eventually synchronised anyway, but this

cmdlet can be used when the synchronisation is needed immediately.

Examples

EXAMPLE 1

Ensures the broker cache is up to date after a change to the scopes configured in the site

```
New-AdminScope -Name 'NewScopeName'
Update-BrokerScopeCache
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

about_ConfigConfigurationSnapIn

March 11, 2024

Topic

about_ConfigConfigurationSnapin

Short Description

The Configuration service PowerShell snap-in provides administrative functions for the Configuration service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Config'.

Long Description

The Configuration service PowerShell snap-in enables both local and remote administration of the Configuration service. It provides facilities to store details about other services that are used in the XenDesktop deployment.

All the services in the XenDesktop deployment use the Configuration service as a directory to locate other services with which they need to communicate. The directory publishes a list of all the services, the communication types they accept, and the facilities they offer.

The snap-in provides the following main entities:

Site Metadata

Metadata for the entire XenDesktop deployment. This metadata is not used directly by any of the XenDesktop services, but can be used by third parties to store information for other purposes.

Registered Service Instances

Service instance items that have been retrieved from the available services in the XenDesktop deployment and held in a directory in the Configuration service. Each physical service can host a collection of service instances to provide different facilities.

Service Groups

A collection of service instances that are considered equivalent. Service instances that are registered in the same service group provide the same state and offer the same functionality.

Only one service group of each type is supported. For example, there must not be more than one service group with a ServiceType of 'Config'.

Site and Features

The configuration site is a top-level, logical representation of the XenDesktop site, from the perspective of the configuration services running within the site.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also

search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter 'Enabled'# Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled'# Equivalent to 'Enabled -eq $false'

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle"}
Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z"}
$d = [DateTime]"2010-08-23T12:30:00.0Z"

Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2'} # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30'} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30'} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*"}
Get-<Noun> -Filter { Users -contains "Fred*"}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'

Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects

with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries. It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-ConfigRegisteredServiceInstanceMetadata

March 11, 2024

Adds metadata on the given ServiceInstance.

Syntax

```
Add-ConfigRegisteredServiceInstanceMetadata
   [-ServiceInstanceUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ConfigRegisteredServiceInstanceMetadata
   [-ServiceInstanceUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ConfigRegisteredServiceInstanceMetadata
   [-InputObject] <ServiceInstance[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ConfigRegisteredServiceInstanceMetadata
   [-InputObject] <ServiceInstance[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given ServiceInstance objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ConfigRegisteredServiceInstanceMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the ServiceInstance with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Add-ConfigRegisteredServiceInstanceMetadata -ServiceInstanceUid 4
   CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-ServiceInstanceUid

Id of the ServiceInstance

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceInstance[]

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the ServiceInstance specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.Metadata

Add-ConfigRegisteredServiceInstanceMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Add-ConfigServiceGroupMetadata

March 11, 2024

Adds metadata on the given ServiceGroup.

Syntax

```
Add-ConfigServiceGroupMetadata
   [-ServiceGroupUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ConfigServiceGroupMetadata
   [-ServiceGroupUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ConfigServiceGroupMetadata
   [-InputObject] <ServiceGroup[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ConfigServiceGroupMetadata
   [-InputObject] <ServiceGroup[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given ServiceGroup objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ConfigServiceGroupMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the ServiceGroup with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Add-ConfigServiceGroupMetadata -ServiceGroupUid 4CECC26E-48E1-423F-A1F0
    -2A06DDD0805C -Name property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-ServiceGroupUid

Id of the ServiceGroup

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the ServiceGroup specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.Metadata

Add-ConfigServiceGroupMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Export-ConfigConfiguration

March 11, 2024

Obtains an XML document containing the configuration of the Site

Syntax

```
Export-ConfigConfiguration
       [-ExistingConfigLastChangeTime <String>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Examples

Parameters

-ExistingConfigLastChangeTime

The value of ConfigLastChangeTime in the site object of any configuration already held by the caller. If nothing has changed, an empty configuration will be returned with the “Updated”attribute set to false.

Type: String

Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

This cmdlet does not accept input

Outputs

String

The XML document

Export-ConfigFeatureTable

March 11, 2024

Returns the current feature table.

Syntax

```
Export-ConfigFeatureTable
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Examples

EXAMPLE 1

Returns the current feature table.

```
Export-ConfigFeatureTable

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

Get-ConfigConnectorAppliance

March 11, 2024

Gets Connector Appliances configured for this site

Syntax

```
Get-ConfigConnectorAppliance
    [-Uid <Guid>]
    [[-Name] <String>]
    [-ConnectorType <String>]
    [-Description <String>]
    [-IsHealthy <Boolean>]
    [-MachineAddress <String>]
    [-TenantId <Guid>]
    [-Uuid <Guid>]
    [-ZoneName <String>]
    [-ZoneUid <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves Connector Appliances matching the specified criteria. If no parameters specified, returns all known connectors

Examples

Parameters

-Name

Gets the connector appliances with the specified name

Type: String

Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Uid

Gets the connector appliances with the specified UID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ConnectorType

Gets the connector appliance types

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets the connector appliances with the specified description

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsHealthy

Gets the connector appliances with the specified healthy state

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineAddress

Gets the connector appliances with the specified machine address

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantId

Gets the connector appliances associated with the specified Tenant ID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uuid

Gets the connector appliances with the specified uuid

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Gets the connector appliances located in the given zone specified by zone name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneUid

Gets the connector appliances located in the given zone specified by zone UID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Get-ConfigDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Configuration Service.

Syntax

```
Get-ConfigDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Configuration Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Configuration SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Configuration Service instance running on controller "controller1.mydomain.net".

```
1  Get-ConfigDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Configuration Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the ConfigurationService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Configuration Service.

Syntax

```
Get-ConfigDBSchema
   [-ZoneUid <Guid>]
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
```

```
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Configuration Service database schema, add a new Configuration service to an existing site, remove a Configuration service from a site, or create a database server logon for a Configuration service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Configuration service instance, otherwise the scripts relate to Configuration service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Configuration SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Configuration service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Configuration service roles

If ScriptType is Evict, the returned script contains:

- Removal of Configuration service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Configuration Service and copies it to a file called "C:\ConfigurationSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Configuration service schema.

```
Get-ConfigDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\ConfigurationSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Configuration service. This can be used when configuring a mirror server for use.

```
Get-ConfigDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    ConfigurationLogins.sql
```

Parameters

-ZoneUid

Allows adding a new Configuration Service instance to a specified Zone. If not specified the service instance is placed in the Primary zone. Can only be used with database script type Instance.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

Specifies the name of the database into which the new Configuration service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Configuration services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Configuration Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Configuration Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Configuration Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Configuration Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Configuration services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Configuration Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Configuration Service.

Syntax

```
Get-ConfigDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Configuration Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Configuration Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Configuration Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Configuration Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Configuration Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-ConfigServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-ConfigDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Configuration Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-ConfigDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Configuration Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Configuration services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ConfigServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigEdgeServer

March 11, 2024

Gets Edge Servers configured for this site

Syntax

```
Get-ConfigEdgeServer
    [-Uid <Guid>]
    [[-Name] <String>]
    [-Description <String>]
    [-IsHealthy <Boolean>]
    [-MachineAddress <String>]
    [-Metadata <String>]
    [-Sid <String>]
    [-TenantId <Guid>]
    [-Uuid <Guid>]
    [-ZoneName <String>]
    [-ZoneUid <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves Edge Servers matching the specified criteria. If no parameters specified, returns all known Edge Servers

Examples

EXAMPLE 1

This command returns all edge servers in the zone named MyZone

```
Get-ConfigEdgeServer -ZoneName MyZone
```

EXAMPLE 2

This command returns the edge server with the specified SID value

```
Get-ConfigEdgeServer -Sid 21-3623811015-3361044348-30300820
```

Parameters

-Name

Gets the edge servers with the specified name

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Uid

Gets the edge servers with the specified UID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Gets the edge servers with the specified description

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	True

-IsHealthy

Gets the edge servers with the specified healthy state

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineAddress

Gets the edge servers with the specified machine address

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Gets the edge servers with the specified SID value

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantId

Gets the edge servers associated with the specified Tenant ID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uuid

Gets the edge servers with the specified uuid

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Gets the edge servers located in the given zone specified by zone name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ZoneUid

Gets the edge servers located in the given zone specified by zone UID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Configuration.Sdk.EdgeServer

Get-ConfigEdgeServer returns an object for each matching Edge Server object.

- Set-ConfigEdgeServer
- Rename-ConfigEdgeServer
- Remove-ConfigEdgeServer

Get-ConfigEnabledFeature

March 11, 2024

Lists features of the site that are enabled.

Syntax

```
Get-ConfigEnabledFeature
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Examples

EXAMPLE 1

Retrieves the list of enabled features for the site's current configuration.

```
Get-ConfigEnabledFeature
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

Get-ConfigInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Configuration Service.

Syntax

```
Get-ConfigInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Configuration Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-ConfigDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Configuration Service database schema version number.

```
Get-ConfigInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Configuration Service database schema for which upgrade scripts are supplied.

```
Get-ConfigInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-ConfigInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Configuration

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigLicensingModel

March 11, 2024

Lists the supported licensing models.

Syntax

```
Get-ConfigLicensingModel
   -ProductCode <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Examples

EXAMPLE 1

Retrieves the list of supported licensing models for product code “XDT”.

```
Get-ConfigLicensingModel -ProductCode "XDT"
```

Parameters

-ProductCode

The product code

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by the Get-ConfigSite cmdlet contains the currently configured product code.

Get-ConfigLocalData

March 11, 2024

Gets the service local data.

Syntax

```
Get-ConfigLocalData
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Get-ConfigLocalData returns service-and-controller-specific local data. This information is not site-wide, but rather controller-specific. The Configuration Service currently stores the controller product version as local data. The overall site version used by Studio is an aggregate of the product versions from each controller.

Examples

EXAMPLE 1

Gets the service local data.

```
Get-ConfigLocalData

ControllerProductVersion
------------
7.40
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.DataModel.LocalData

Contains the ControllerProductVersion field

Get-ConfigProduct

March 11, 2024

Lists the site's supported product names and codes.

Syntax

```
Get-ConfigProduct
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Examples

EXAMPLE 1

Lists the supported products by name and code.

```
Get-ConfigProduct
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

Get-ConfigProductEdition

March 11, 2024

Lists the supported product editions.

Syntax

```
Get-ConfigProductEdition
    [-ProductCode] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Examples

EXAMPLE 1

Retrieves the list of supported editions for XenDesktop.

```
Get-ConfigProductEdition -ProductCode "XDT"
```

Parameters

-ProductCode

The product code

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by Get-ConfigSite cmdlet contains the currently configured product code.

Get-ConfigProductFeature

March 11, 2024

Lists the supported features.

Syntax

```
Get-ConfigProductFeature
   [-ProductCode] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Lists the supported features. Use the Get-ConfigEnabledFeature command to determine which features are currently enabled.

Examples

EXAMPLE 1

Retrieves the list of supported features for XenDesktop.

```
Get-ConfigProductFeature -ProductCode "XDT"
```

Parameters

-ProductCode

The product code

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by Get-ConfigSite cmdlet contains the currently configured product code.

Get-ConfigProductVersion

March 11, 2024

Lists the supported product versions.

Syntax

```
Get-ConfigProductVersion
   [-ProductCode] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Examples

EXAMPLE 1

Retrieves the list of supported versions for XenDesktop.

```
Get-ConfigProductVersion -ProductCode "XDS"
```

Parameters

-ProductCode

The product code

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by Get-ConfigSite cmdlet contains the currently configured product code.

Get-ConfigRegisteredServiceInstance

March 11, 2024

Gets the service instances that are registered in the directory.

Syntax

```
Get-ConfigRegisteredServiceInstance
    [-ServiceInstanceUid <Guid>]
    [-ServiceGroupUid <Guid>]
    [-ServiceGroupName <String>]
    [-ServiceType <String>]
    [-Address <String>]
    [-Binding <String>]
    [-Version <Int32>]
    [-ServiceAccountSid <String>]
    [-InterfaceType <String>]
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this cmdlet to retrieve the service instances currently registered with the Configuration Service that match the parameters supplied. If no parameters are supplied, all the service instances are returned.

Examples

EXAMPLE 1

Return all the service instances that are registered in the Configuration Service.

```
C:\>Get-ConfigRegisteredServiceInstance

ServiceInstanceUid : 8dc38b5a-3fbb-457c-b326-6c41c94c18d5
ServiceType        : MySnapIn
Version            : 1
```

Parameters

-ServiceInstanceUid

The unique identifier for the service instance.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ServiceGroupUid

The unique identifier for the service group to which the service instance belongs.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ServiceGroupName

The name for the service group to which the service instance belongs.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ServiceType

The service type for the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Address

The connection address for the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Binding

The binding for the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Version

The service instance version.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ServiceAccountSid

The AD account SID for the computer account that the computer hosting the service instance is running as.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-InterfaceType

The interface type for the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Config_Filtering for details.

Type:	Int32

Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Config_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters:

- ServiceGroupUid <Guid>

  The unique identifier for the service group to which the service instance belongs.
- ServiceGroupName <string>

  The name of the service group to which the service instance belongs.
- ServiceInstanceUid <Guid>

  The unique identifier for the service instance.
- ServiceType <string>

  The type of the service group.
- Address <string>

  The contact address for the service instance.
- Binding <string>

  The binding to use for connections to the service instance.
- Version <int>

  The version of the service instance.
- ServiceAccount <string>

  The AD computer account for the computer that is providing the service instance.
- ServiceAccountSid <string>

  The AD computer account SID for the computer that is providing the service instance.
- InterfaceType <string>

  The interface type for the service instance.
- Metadata <Citrix.Configuration.Sdk.Metadata[]>

  The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes ————PartialData

Only a subset of the available data was returned.

CouldNotQueueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-ConfigService

March 11, 2024

Gets the service record entries for the Configuration Service.

Syntax

```
Get-ConfigService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
```

```
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the Configuration Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Configuration Service running in the current service group.

```
Get-ConfigService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.Service

The Get-ConfigServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-ConfigServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Configuration Service on the controller.

Syntax

```
Get-ConfigServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Configuration Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Configuration Service.

```
1 Get-ConfigServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigServiceConfigurationData

March 11, 2024

Gets configuration data for the service.

Syntax

```
Get-ConfigServiceConfigurationData
    [-Name <String[]>]
    [-Value <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to determine the configuration parameters for the service

Examples

EXAMPLE 1

Get the Configuration data for the service.

```
Get-ConfigServiceConfigurationData

Name                : DeltaDiskDelete.timeDelay
Value               : 10
```

Parameters

-Name

The Configuration data item Name .

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Value

The Configuration data item value.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Config_Filtering for details.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.ServiceConfigurationData

This object provides details of the configuration data and contains the following information:

Name <string>

The Name for the configuration item.

Value <string>

The value for the configuration item.

Notes

In the case of failure the following errors can be produced.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-ConfigServiceGroup

March 11, 2024

Gets the service groups that match the parameters supplied.

Syntax

```
Get-ConfigServiceGroup
   [-ServiceGroupUid <Guid>]
   [-ServiceGroupName <String>]
   [-ServiceType <String>]
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to retrieve existing service groups that match the parameters supplied. If no parameters are supplied, all the service groups are returned.

Examples

EXAMPLE 1

Return all the service groups that are registered in the Configuration Service.

```
C:\>Get-ConfigServiceGroup
```

EXAMPLE 2

Return all the service groups that are registered in the Configuration Service and are of type 'config' (i.e. the service groups for the Configuration Service).

```
C:\>Get-ConfigRegisteredServiceInstance -ServiceType "config"
```

Parameters

-ServiceGroupUid

The unique identifier for the service group.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ServiceGroupName

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceType

The service type for the service group.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Config_Filtering for details.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Config_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.ServiceGroup

This represents a service instance and has the following parameters; ServiceGroupUid <Guid>

The unique identifier for the service group.

ServiceGroupName <string>

The name of the service group.

ServiceType <string>

The type of the service group.

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The metadata for the service group.

Notes

In the case of failure, the following errors can result.

Error Codes ————

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

PartialData

Only a subset of the available data was returned.

CouldNotQuueryDatabase

The Query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-ConfigServiceInstance

March 11, 2024

Gets the service instance entries for the Configuration Service.

Syntax

```
Get-ConfigServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Configuration Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Configuration Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-ConfigServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.ServiceInstance

The Get-ConfigServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Config.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigServiceStatus

March 11, 2024

Gets the current state of the Configuration Service on the controller.

Syntax

```
Get-ConfigServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Configuration Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Configuration Service.

```
Get-ConfigServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-ConfigServiceStatus command returns an object containing the status of the Configuration Service together with extra diagnostics information.

DBUnconfigured

The Configuration Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Configuration is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Configuration is connected to a database that is valid, but it does not have the full functionality required so the Configuration cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

DBOlderVersionThanService

The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Configuration Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Configuration Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Configuration and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Configuration service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ConfigSite

March 11, 2024

Gets the site.

Syntax

```
Get-ConfigSite
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-ConfigSite cmdlet gets the site.

A XenDesktop installation has only a single site instance.

Examples

EXAMPLE 1

Gets the site.

```
Get-ConfigSite
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.Site

Provides information about the site

Related Links

- Set-ConfigSite
- Import-ConfigFeatureTable
- about_ConfigConfigurationSnapin

Get-ConfigZone

March 11, 2024

Gets zones configured for this site.

Syntax

```
Get-ConfigZone
   [-Uid <Guid>]
   [[-Name] <String>]
   [-ControllerName <String>]
   [-ControllerSid <String>]
   [-Description <String>]
   [-ExternalUid <Guid>]
   [-HasValidEdgeServers <Boolean>]
   [-IsHealthy <Boolean>]
   [-IsPrimary <Boolean>]
   [-Metadata <String>]
   [-TenantId <Guid>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
```

```
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves zones matching the specified criteria. If no parameters are specified all zones will be returned.

Examples

EXAMPLE 1

Gets the details of the zone with the specific name.

```
Get-ConfigZone -Name "London"
```

EXAMPLE 2

Lists all non-primary zones.

```
Get-ConfigZone -IsPrimary $false
```

Parameters

-Name

Gets zones with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Uid

Gets the zone with the specified UID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ControllerName

Gets the zone that contains a specified Controller identified by Name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ControllerSid

Gets the zone that contains a specified Controller identified by SID.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Description

Gets zones with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExternalUid

Specifies the ExternalUid of the zone. This is used for cloud sites to link with the Citrix Resource Location.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-HasValidEdgeServers

Gets zones with the specified value of the HasValidEdgeServers property.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsHealthy

Gets zones with the specified value of the IsHealthy property.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsPrimary

Gets zones with the specified value of the IsPrimary flag. If true, only the primary zone may be returned; if false, all other zones may be returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Gets the zones associated with the specified Tenant ID

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Config_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Configuration.Sdk.Zone

Get-ConfigZone returns an object for each matching zone.

Import-ConfigFeatureTable

March 11, 2024

Sets the feature table of a site. This cmdlet can also be used to apply extra partial feature table files supplied by Citrix as needed to enable specific features. The XML feature table file is a signed file which Citrix provides for specific use cases on request.

Syntax

```
Import-ConfigFeatureTable
      [-Path] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Import-ConfigFeatureTable
      -Content <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Examples

EXAMPLE 1

Imports a feature table by specifying the path to a signed XML file provided by Citrix.

```
Import-ConfigFeatureTable -Path "XML_FeatureTable_File_Path\
   FeatureTableFilename.xml"
```

EXAMPLE 2

Imports the content of a signed XML feature table file provided by Citrix.

```
Import-ConfigFeatureTable -Content (Get-Content "
   XML_FeatureTable_File_Path\FeatureTableFilename.xml" | Out-String)
```

Parameters

-Path

The path to the file containing the feature table

Type:	String
Aliases:	PSPath
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Content

Set the site's feature table. (Can also update existing feature table by adding feature table fragments for specific extra features)

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

New-ConfigEdgeServer

March 11, 2024

Creates a new edge server object

Syntax

```
New-ConfigEdgeServer
    [-Description <String>]
    -MachineAddress <String>
    [-Name] <String>
    -Sid <String>
    -Uuid <Guid>
    [-ZoneUid <Guid>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

New-ConfigEdgeServer cmdlet creates a new edge server object.

An edge server is a machine which is running an agent service that performs a number of duties; these agent services are largely stateless and communicate back to the Citrix Workspace Cloud components in the cloud.

Examples

EXAMPLE 1

This command creates an edge server

```
New-ConfigEdgeServer W2K12R2 -MachineAddress "EdgeSrv.address.com" -Sid
    21-3623811015-3361044348-30300820
```

Parameters

-Name

Specifies a name for the edge server.

Each edge server must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-MachineAddress

The address used when contacted by local components such as VDAs

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Sid

The Security Identifier value in tenant AD domain

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Uuid

The uuid used when being contacted from cloud components such as controllers

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Optional value to specify a description for the edge server

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ZoneUid

Specifies the Zone affinity for the edge server

Type:	Guid
Position:	Named

Default value:	If no value is provided the edge server is placed in the Primary zone
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Configuration.Sdk.EdgeServer

The newly created edge server

New-ConfigZone

March 11, 2024

Creates a new zone in the site.

Syntax

```
New-ConfigZone
   [-Description <String>]
   [-EnableHybridConnectivityForResourceLeases <Boolean>]
   [-EnableVdaConnectivityForResourceLeases <Boolean>]
   [-ExternalUid <Guid>]
   [-Name] <String>
   [-TenantId <Guid>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new zone in the site.

A Zone represents a subset of the site infrastructure residing in a particular geographical location.

By default any new zone will be marked as secondary. To specify the primary zone use the Set-ConfigSite cmdlet.

To associate controllers with a zone use the Set-ConfigService cmdlet.

Examples

EXAMPLE 1

Creates a new zone called 'London', marks it as the primary zone and moves a controller to that zone.

```
1 $zone = New-ConfigZone -Name "London" -Description "London branch
     office"
2 Set-ConfigSite -PrimaryZone $zone
3 Set-ConfigService -Service "S
     -1-5-21-3384143951-2794580461-1950386216-8227" -Zone $zone
```

Parameters

-Name

Specifies the name of the zone. Each zone in a site must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Specifies the description of the zone.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-EnableHybridConnectivityForResourceLeases

Specifies the EnableHybridConnectivityForResourceLeases property associated with the zone. This enables both Gateway-Service and Direct launch for resource leases.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-EnableVdaConnectivityForResourceLeases

Specifies the EnableVdaConnectivityForResourceLeases property associated with the zone. This enables connectorless lease connection (ResolutionTypeVda) instead of lease connection with connectors.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ExternalUid

Specifies the ExternalUid of the zone. This is used for cloud sites to link with the Citrix Resource Location.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TenantId

Specifies the Tenant ID that the zone is associated with. This is used for cloud sites to associate zones with particular customers.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Configuration.Sdk.Zone

The newly created zone.

Register-ConfigServiceInstance

March 11, 2024

Allows the registration of a service instance.

Syntax

```
Register-ConfigServiceInstance
        [-LoggingId <Guid>]
        -ServiceInstance <ServiceInstance[]>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Register-ConfigServiceInstance
        -ServiceGroupUid <Guid>
        -ServiceGroupName <String>
        -ServiceType <String>
        -Address <String>
        -Binding <String>
        -Version <Int32>
        -ServiceAccount <String>
        -InterfaceType <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Register-ConfigServiceInstance
        -ServiceGroupUid <Guid>
        -ServiceGroupName <String>
        -ServiceType <String>
        -Address <String>
        -Binding <String>
        -Version <Int32>
        -ServiceAccountSid <String>
        -InterfaceType <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Use this cmdlet to register service instance items in the Configuration Service. Service instances can be registered either by retrieving the data directly from other services or by manually entering the details into this command.

If the service group specified by the service instance already exists, the service is added to the service group, otherwise a new service group is created to hold the service instance.

Examples

EXAMPLE 1

Gets the service instances for the Configuration Service and registers them.

```
Get-ConfigServiceInstance | Register-ConfigServiceInstance
```

Parameters

-ServiceGroupUid

The Service Group Unique Identifier

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceGroupName

The name of the service group

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceType

The type of the service group

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Address

The address that is used to access the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Binding

The binding type that must be used to access the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Version

The version of the service instance.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceAccount

The AD computer account name (domain qualified) for the computer on which the service instance is hosted.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-InterfaceType

The type of interface that the service provides (i.e. SDK, InterService, Peer).

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceAccountSid

The AD computer account Sid for the computer on which the service instance is hosted.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceInstance

The service instances to register.

Type:	ServiceInstance[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the logging id of the high-level operation that this cmdlet is part of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.ServiceInstance

An object with the following parameters can be used to register a service instance:

- Address
- ServiceGroupUid
- ServiceGroupName
- ServiceType
- Binding
- Version
- InterfaceType

Outputs

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters:

- ServiceGroupUid <Guid>

  The unique identifier for the service group to which the service instance belongs.

- ServiceGroupName <string>

  The name of the service group to which the service instance belongs.

- ServiceInstanceUid <Guid>

  The unique identifier for the service instance.

- ServiceType <string>

  The type of the service group.

- Address <string>

  The contact address for the service instance.

- Binding <string>

  The binding to use for connections to the service instance.

- Version <int>

  The version of the service instance.

- ServiceAccount <string>

  The AD computer account for the computer that is providing the service instance.

- ServiceAccountSid <string>

  The AD computer account SID for the computer that is providing the service instance.

- InterfaceType <string>

  The interface type for the service instance.

- Metadata <Citrix.Configuration.Sdk.Metadata[]>

  The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes ————ActiveDirectoryAccountResolutionFailed

The account name provided could not be found in Active Directory.

ServiceGroupWithSameUidExistsForDifferentServiceGroupNameOrSameUidExistsForDifferentServiceGroupNam

The service group name or service type do not match the service group found with the specified uid.

TypeAlreadyExists

A different service group with the same type is registered already in the Configuration Service.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ConfigEdgeServer

March 11, 2024

Removes edge servers from the site

Syntax

```
Remove-ConfigEdgeServer
      [-InputObject] <EdgeServer[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigEdgeServer
      [-Uid] <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigEdgeServer
      [-Name] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove edge servers from the site

Examples

EXAMPLE 1

Removes an edge server with the specified name

```
Remove-ConfigEdgeServer -Name W2K12R1
```

EXAMPLE 2

Removes all edge servers from the zone named Secondary

```
Get-ConfigEdgeServer -ZoneName Secondary | Remove-ConfigEdgeServer
```

Parameters

-InputObject

Specifies the edge server objects to delete

Type:	EdgeServer[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Specifies the UID of the edge server to delete

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the name of the edge server to delete

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.EdgeServer

You can pipe the edge servers to be deleted to Remove-ConfigEdgeServer.

Outputs

None

By default, this cmdlet returns no output.

Remove-ConfigEdgeServerMetadata

March 11, 2024

Removes metadata from the given EdgeServer.

Syntax

```
Remove-ConfigEdgeServerMetadata
      [-EdgeServerUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigEdgeServerMetadata
      [-EdgeServerUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigEdgeServerMetadata
      [-EdgeServerName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigEdgeServerMetadata
      [-EdgeServerName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigEdgeServerMetadata
      [-InputObject] <EdgeServer[]>
```

```
        -Name <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-ConfigEdgeServerMetadata
        [-InputObject] <EdgeServer[]>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given EdgeServer.

Examples

EXAMPLE 1

Remove all metadata from all EdgeServer objects.

```
Get-ConfigEdgeServer | % {
  Remove-ConfigEdgeServerMetadata -Map $_.MetadataMap  }
```

Parameters

-EdgeServerUid

Id of the EdgeServer

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-EdgeServerName

Name of the EdgeServer

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	EdgeServer[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-ConfigRegisteredServiceInstanceMetadata

March 11, 2024

Removes metadata from the given ServiceInstance.

Syntax

```
Remove-ConfigRegisteredServiceInstanceMetadata
      [-ServiceInstanceUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigRegisteredServiceInstanceMetadata
      [-ServiceInstanceUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigRegisteredServiceInstanceMetadata
      [-InputObject] <ServiceInstance[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigRegisteredServiceInstanceMetadata
      [-InputObject] <ServiceInstance[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given ServiceInstance.

Examples

EXAMPLE 1

Remove all metadata from all ServiceInstance objects.

```
Get-ConfigServiceInstance | % {
  Remove-ConfigRegisteredServiceInstanceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceInstanceUid

Id of the ServiceInstance

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceInstance[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-ConfigServiceConfigurationData

March 11, 2024

Removes configuration data from the service.

Syntax

```
Remove-ConfigServiceConfigurationData
      [[-Name] <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove data from the Configuration Service configuration data.

Examples

EXAMPLE 1

Removes the configuration data item with name “MyName”.

```
Remove-ConfigServiceConfigurationData -Name "MyName"
```

Parameters

-Name

The name of the configuration data item to remove.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Remove-ConfigServiceGroup

March 11, 2024

Removes service groups.

Syntax

```
Remove-ConfigServiceGroup
       [-ServiceGroupUid] <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Use this cmdlet to remove a service group and all the service instances that it contains.

Examples

EXAMPLE 1

Removes the service group (and all contained service instances) for the service group with a unique identifier of '31951f6f-7703-4abb-938a-2861d76ecfea'.

```
Remove-ConfigServiceGroup -ServiceGroupUid 31951f6f-7703-4abb-938a-2861
    d76ecfea
```

EXAMPLE 2

Removes all the service groups (and all contained service instances) for the XenDesktop deployment.

```
Get-ConfigServiceGroup | Remove-ConfigServiceGroup
```

Parameters

-ServiceGroupUid

The unique identifier for the service group.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes ————ServiceGroupObjectNotFound

The service group specified could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ConfigServiceGroupMetadata

March 11, 2024

Removes metadata from the given ServiceGroup.

Syntax

```
Remove-ConfigServiceGroupMetadata
      [-ServiceGroupUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigServiceGroupMetadata
      [-ServiceGroupUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigServiceGroupMetadata
      [-InputObject] <ServiceGroup[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigServiceGroupMetadata
       [-InputObject] <ServiceGroup[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given ServiceGroup.

Examples

EXAMPLE 1

Remove all metadata from all ServiceGroup objects.

```
Get-ConfigServiceGroup | % {
  Remove-ConfigServiceGroupMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceGroupUid

Id of the ServiceGroup

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-ConfigServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-ConfigServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-ConfigService | % {
  Remove-ConfigServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-ConfigSiteMetadata

March 11, 2024

Removes metadata from the given Site.

Syntax

```
Remove-ConfigSiteMetadata
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigSiteMetadata
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Site.

Examples

EXAMPLE 1

Remove all metadata from all Site objects.

```
Get-ConfigSite | % {
  Remove-ConfigSiteMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-ConfigZone

March 11, 2024

Removes a zone from the site.

Syntax

```
Remove-ConfigZone
      [-InputObject] <Zone[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigZone
      [-Uid] <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ConfigZone
       [-Name] <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet removes zones from a site.

You cannot remove a zone that is marked as primary or has associated controllers.

Examples

EXAMPLE 1

Remove the zone specified by name. This fails if one of the zones has controllers associated.

```
Remove-ConfigZone -Name 'Sydney'
```

EXAMPLE 2

Move all controllers to the primary zone. Remove all non-primary zones.

```
Get-ConfigService | Set-ConfigService -Zone (Get-ConfigZone -IsPrimary
   $true)
Get-ConfigZone -IsPrimary $false | Remove-ConfigZone
```

Parameters

-InputObject

Specifies the zone to remove (by zone object).

Type:	Zone[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-Uid

Specifies the zone to remove (by Uid).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the zone to remove (by Name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.Zone

You can pipe the zones to be deleted into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-ConfigZoneMetadata

March 11, 2024

Removes metadata from the given Zone.

Syntax

```
Remove-ConfigZoneMetadata
       [-ZoneUid] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ConfigZoneMetadata
       [-ZoneUid] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ConfigZoneMetadata
       [-ZoneName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ConfigZoneMetadata
       [-ZoneName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ConfigZoneMetadata
       [-InputObject] <Zone[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ConfigZoneMetadata
```

```
        [-InputObject] <Zone[]>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Zone.

Examples

EXAMPLE 1

Remove all metadata from all Zone objects.

```
Get-ConfigZone | % {
  Remove-ConfigZoneMetadata -Map $_.MetadataMap  }
```

Parameters

-ZoneUid

Id of the Zone

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ZoneName

Name of the Zone

Type:	String
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Zone[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Rename-ConfigEdgeServer

March 11, 2024

Renames an edge server

Syntax

```
Rename-ConfigEdgeServer
      [-InputObject] <EdgeServer>
      [-NewName] <String>
      [-PassThru]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-ConfigEdgeServer
      [-Uid] <Guid>
      [-NewName] <String>
      [-PassThru]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-ConfigEdgeServer
      [-Name] <String>
      [-NewName] <String>
```

```
        [-PassThru]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

The Rename-ConfigEdgeServer cmdlet changes the name of an edge server.

All edge servers in a site must have a unique name.

The following special characters are not allowed in the name: \ / ; : # . * ? = < > | [ ] ( ) “ ‘

Examples

EXAMPLE 1

Renames the edge server with the name “Old name”to “New Name”

```
Rename-ConfigEdgeServer -Name "Old name" -NewName "New Name"
```

EXAMPLE 2

Renames the edge server with the name “Old name”to “New Name”

```
 Get-ConfigEdgeServer "Old name" | Rename-ConfigEdgeServer -NewName "
    New name"
```

Parameters

-InputObject

Specifies the edge server to rename

Type:	EdgeServer
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Specifies the UID of the edge server to rename

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the name of the edge server to rename

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the edge server

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.EdgeServer

You can pipe edge servers to Rename-ConfigEdgeServer.

Outputs

None or Citrix.Configuration.Sdk.EdgeServer

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Configuration.Sdk.EdgeServer object.

Rename-ConfigZone

March 11, 2024

Rename a zone.

Syntax

```
Rename-ConfigZone
       [-InputObject] <Zone>
       [-NewName] <String>
       [-PassThru]
```

```
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Rename-ConfigZone
        [-Uid] <Guid>
        [-NewName] <String>
        [-PassThru]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Rename-ConfigZone
        [-Name] <String>
        [-NewName] <String>
        [-PassThru]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet renames a zone.

All zone names must be unique.

Examples

EXAMPLE 1

Renames the ‘New York’zone to ‘Manhattan’.

```
Rename-ConfigZone -Name 'New York' -NewName 'Manhattan'
```

Parameters

-InputObject

Specifies the zone to rename (by zone object).

Type:	Zone
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Specifies the zone to rename (by Uid).

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the zone to rename (by name).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the zone.

Type:	String
Position:	3

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.Zone

You can pipe the zone to be renamed into this command.

Outputs

None or Citrix.Configuration.Sdk.Zone

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the zone with new name.

Reset-ConfigEdgeServerList

March 11, 2024

Requests a refresh of the list of Edge Servers.

Syntax

```
Reset-ConfigEdgeServerList
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

This cmdlet can be used to request that the service refreshes its internal list of Edge Servers.

This will effectively synchronize the list of Edge Servers with the one of the Central Configuration Service.

Examples

EXAMPLE 1

Refresh the internal list of Edge Servers.

```
Reset-ConfigEdgeServerList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-ConfigEnabledFeatureList

March 11, 2024

Refreshes the Configuration service's list of enabled features.

Syntax

```
Reset-ConfigEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Configuration Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Configuration SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Configuration service instance's list of enabled features.

```
Reset-ConfigEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-ConfigServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the Configuration Service.

Syntax

```
Reset-ConfigServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload Configuration Service access permissions and configuration service locations. The Reset-ConfigServiceGroupMembership command must be run on at least one instance of the service type (Config) after installation and registration with the configuration service. Without this

operation, the Configuration services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ConfigServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
1 Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    ConfigServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
1 Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-ConfigServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-ConfigServiceGroupMembership command.

Outputs

Citrix.Configuration.Sdk.ServiceInstance

Reset-ConfigServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Configuration Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigConnectorAppliance

March 11, 2024

Changes the properties of a connector appliance

Syntax

```
Set-ConfigConnectorAppliance
   [-InputObject] <ConnectorAppliance[]>
   [-ConnectorType <String>]
   [-Description <String>]
   [-IsHealthy <Boolean>]
   [-MachineAddress <String>]
   [-Uuid <Guid>]
   [-ZoneUid <Guid>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigConnectorAppliance
   [-Uid] <Guid[]>
   [-ConnectorType <String>]
   [-Description <String>]
   [-IsHealthy <Boolean>]
   [-MachineAddress <String>]
   [-Uuid <Guid>]
   [-ZoneUid <Guid>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigConnectorAppliance
   [-Name] <String[]>
   [-ConnectorType <String>]
   [-Description <String>]
   [-IsHealthy <Boolean>]
   [-MachineAddress <String>]
```

```
    [-Uuid <Guid>]
    [-ZoneUid <Guid>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-ConfigConnectorAppliance cmdlet sets properties of a connector appliance

Examples

Parameters

-InputObject

Specifies the connector appliance objects to modify.

Type:	ConnectorAppliance[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Identifies the connector appliance to modify by its UID property.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Identifies the connector appliance to modify by name.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ConnectorType

Sets the connector types

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Supplies the new value of the Description property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsHealthy

Supplies the new value of the IsHealthy property.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineAddress

Supplies the new value of the MachineAddress property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uuid

Supplies the new value of the Uuid property.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

Allows moving the connector appliance to a new zone

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.ConnectorAppliance

You can pipe the connector appliances to be updated into this command.

Outputs

None or Citrix.Configuration.Sdk.ConnectorAppliance

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Configuration.Sdk.ConnectorAppliance object.

Set-ConfigDBConnection

March 11, 2024

Configures a database connection for the Configuration Service.

Syntax

```
Set-ConfigDBConnection
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Configuration Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Configuration SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-ConfigDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
1  Set-ConfigDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Configuration Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-ConfigDBConnection cmdlet returns an object describing the status of the Configuration Service together with extra diagnostics information. Possible values are:

- OK:

The Configuration Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the Configuration Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Configuration Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the Configuration Service currently in use is newer than, and incompatible with, the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

- DBOlderVersionThanService:

The version of the Configuration Service schema on the database is newer than, and incompatible with, the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the Configuration Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Configuration Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the Configuration Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigDBCredentials

March 11, 2024

Configures the database server SQL credentials for the Configuration Service.

Syntax

```
Set-ConfigDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Configuration Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Configuration Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Configuration SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-ConfigDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-ConfigDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-ConfigDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-ConfigDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-ConfigEdgeServer

March 11, 2024

Changes the properties of an edge server

Syntax

```
Set-ConfigEdgeServer
    [-InputObject] <EdgeServer[]>
    [-Description <String>]
    [-IsHealthy <Boolean>]
    [-MachineAddress <String>]
    [-Sid <String>]
    [-Uuid <Guid>]
    [-ZoneUid <Guid>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigEdgeServer
    [-Uid] <Guid[]>
    [-Description <String>]
    [-IsHealthy <Boolean>]
    [-MachineAddress <String>]
    [-Sid <String>]
    [-Uuid <Guid>]
    [-ZoneUid <Guid>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigEdgeServer
    [-Name] <String[]>
    [-Description <String>]
    [-IsHealthy <Boolean>]
    [-MachineAddress <String>]
    [-Sid <String>]
    [-Uuid <Guid>]
    [-ZoneUid <Guid>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-ConfigEdgeServer cmdlet sets properties of an edge server or a set of edge servers. The edge server can be specified by name or by one or more edge server instances can be passed to the command either by piping or by using the -InputObject parameter

Examples

EXAMPLE 1

Associates the edge server 'EdgeSrv1'to a zone specified by its UID

```
Set-ConfigEdgeServer EdgeSrv1 -ZoneUid d8fe27fa-f33c-47ee-b6b5-80241
    f536164
```

Parameters

-InputObject

Specifies the edge server objects to modify.

Type:	EdgeServer[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Identifies the edge server to modify by its UID property.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Identifies the edge server to modify by name.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Supplies the new value of the Description property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsHealthy

Supplies the new value of the IsHealthy property.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineAddress

Supplies the new value of the MachineAddress property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Supplies the new value of the SID property.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uuid

Supplies the new value of the Uuid property.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneUid

Allows moving the edge server to a new zone

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.EdgeServer

You can pipe the edge servers to be updated into this command.

Outputs

None or Citrix.Configuration.Sdk.EdgeServer

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Configuration.Sdk.EdgeServer object.

Set-ConfigEdgeServerMetadata

March 11, 2024

Adds or updates metadata on the given EdgeServer.

Syntax

```
Set-ConfigEdgeServerMetadata
   [-EdgeServerUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigEdgeServerMetadata
   [-EdgeServerUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigEdgeServerMetadata
   [-EdgeServerName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigEdgeServerMetadata
   [-EdgeServerName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigEdgeServerMetadata
   [-InputObject] <EdgeServer[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigEdgeServerMetadata
   [-InputObject] <EdgeServer[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given EdgeServer objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the EdgeServer with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ConfigEdgeServerMetadata -EdgeServerUid 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-EdgeServerUid

Id of the EdgeServer

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-EdgeServerName

Name of the EdgeServer

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	EdgeServer[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the EdgeServer specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ConfigEdgeServerMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigRegisteredServiceInstance

March 11, 2024

Updates a service instance.

Syntax

```
Set-ConfigRegisteredServiceInstance
   -ServiceInstanceUid <Guid>
   -Address <String>
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to change the address property of an existing service instance that is registered in the Configuration Service.

Examples

EXAMPLE 1

Update the service instance with the unique identifier of '9805f39d-99eb-44f0-8f63-9d8e3f1228e0'to use the new address.

```
Set-ConfigRegisteredServiceInstance -ServiceInstanceUid "9805f39d-99eb
   -44f0-8f63-9d8e3f1228e0" -Address "http://myServer.com/Citrix/
   sdkHostingUnitService"
```

Parameters

-ServiceInstanceUid

The unique identifier for the service instance to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Address

The new address for the service instance.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Defines whether or not the command returns a result showing the new state of the updated service instance.

Type:	SwitchParameter
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-LoggingId

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters:

- ServiceGroupUid <Guid>

  The unique identifier for the service group to which the service instance belongs.

- ServiceGroupName <string>

  The name of the service group to which the service instance belongs.

- ServiceInstanceUid <Guid>

  The unique identifier for the service instance.

- ServiceType <string>

  The type of the service group.

- Address <string>

  The contact address for the service instance.

- Binding <string>

  The binding to use for connections to the service instance.

- Version <int>

  The version of the service instance.

- ServiceAccount <string>

  The AD computer account for the computer that is providing the service instance.

- ServiceAccountSid <string>

  The AD computer account SID for the computer that is providing the service instance.

- InterfaceType <string>

  The interface type for the service instance.

- Metadata <Citrix.Configuration.Sdk.Metadata[]>

  The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes ————ObjectToUpdateDoesNotExist

The service instance specified could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Set-ConfigRegisteredServiceInstanceMetadata

March 11, 2024

Adds or updates metadata on the given ServiceInstance.

Syntax

```
Set-ConfigRegisteredServiceInstanceMetadata
   [-ServiceInstanceUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigRegisteredServiceInstanceMetadata
   [-ServiceInstanceUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigRegisteredServiceInstanceMetadata
    [-InputObject] <ServiceInstance[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigRegisteredServiceInstanceMetadata
    [-InputObject] <ServiceInstance[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given ServiceInstance objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the ServiceInstance with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-ConfigRegisteredServiceInstanceMetadata -ServiceInstanceUid 4
    CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-ServiceInstanceUid

Id of the ServiceInstance

Type:	Guid
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceInstance[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the ServiceInstance specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ConfigRegisteredServiceInstanceMetadata returns a dictionary containing the new (name, value)-pairs.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigService

March 11, 2024

Associate a Service with a Zone.

Syntax

```
Set-ConfigService
   [-InputObject] <Service[]>
   [-Zone] <Zone>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigService
   [-Uid] <Int32[]>
   [-Zone] <Zone>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigService
   [-MachineName] <String[]>
   [-Zone] <Zone>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet is used to change the association between Services (referred also as Controllers) and Zones. A Service can be associated with only one Zone. By default, all services are assigned to the primary Zone.

Examples

EXAMPLE 1

Associate a Service identified by SID with a Zone identified by name.

```
Set-ConfigService -InputObject "S
   -1-5-21-3384143951-2794580461-1950386216-8227" -Zone "London"
```

Parameters

-InputObject

The service to associate with a Zone.

The service can be referenced by Service object, Machine Name, Machine DNS Name, SID or UID.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Allows specifiying Services by the Service Uid

Type:	Int32[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-MachineName

Allows specifiying Services by the Machine Name

Type:	String[]
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Zone

Specifies the target Zone.

Zone can be referenced by Zone object, Name or UID.

Type:	Zone
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Fma.Sdk.CommonCmdlets.Service

You can pipe the Services to be associated with the Zone.

Outputs

None

By default, this cmdlet returns no output.

Notes

For historical reasons Service is also referred as Controller in FMA services.

Set-ConfigServiceConfigurationData

March 11, 2024

Sets the value for the given key in the service configuration data.

Syntax

```
Set-ConfigServiceConfigurationData
    [-Name] <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored for the Configuration Service.

Examples

EXAMPLE 1

Set data with a name of ‘customProperty1’and value of ‘value2’to the service configuration.

```
Set-ConfigServiceConfigurationData -Name "customProperty1" -Value "
    value2"

Name                           Value
--------                       -----
customProperty1                value2
```

Parameters

-Name

Specifies the key name of the metadata to be added. The key must be unique.

The Name cannot contain any of the following characters \/;:#.*?=<>|[]()’””

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the name. If the name already exists, its value is updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Configuration.Sdk.ServiceConfigurationData

Set-ConfigServiceConfigurationData returns an object containing the new definition of the configuration.

Name <string>

Specifies the name for the item of data.

Value <string>

Specifies the value of the data.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Set-ConfigServiceGroupMetadata

March 11, 2024

Adds or updates metadata on the given ServiceGroup.

Syntax

```
Set-ConfigServiceGroupMetadata
   [-ServiceGroupUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigServiceGroupMetadata
   [-ServiceGroupUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigServiceGroupMetadata
   [-InputObject] <ServiceGroup[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigServiceGroupMetadata
   [-InputObject] <ServiceGroup[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given ServiceGroup objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the ServiceGroup with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-ConfigServiceGroupMetadata -ServiceGroupUid 4CECC26E-48E1-423F-A1F0
   -2A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-ServiceGroupUid

Id of the ServiceGroup

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceGroup[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the ServiceGroup specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ConfigServiceGroupMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-ConfigServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ConfigServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                      Value
```

```
---                                  -----
property                             value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ConfigServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigSite

March 11, 2024

Changes the overall settings of the site.

Syntax

```
Set-ConfigSite
    [-SiteName <String>]
    [-ProductCode <String>]
    [-ProductEdition <String>]
    [-ProductVersion <String>]
    [-LicensingModel <String>]
    [-LicenseServerName <String>]
    [-LicenseServerPort <Int32>]
    [-LicenseServerUri <Uri>]
    [-PrimaryZone <Zone>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-ConfigSite cmdlet modifies properties of the site.

The site is a top-level, logical representation of the XenDesktop site, from the perspective of the configuration services running within the site.

A XenDesktop installation has only a single site instance.

Modifications to the product code, product edition, product version and licensing model properties are successful only if their values are consistent with the feature table. Use the Get-ConfigProduct, Get-ConfigProductEdition, Get-ConfigProductVersion and Get-ConfigLicensingModel cmdlets to determine consistent values.

To configure the site, first import the feature table using the Import-ConfigFeatureTable cmdlet.

Examples

EXAMPLE 1

Specifies the use of a Platinum edition license. A suitable license must be available on the site's license server.

```
Set-ConfigSite -ProductEdition PLT
```

Parameters

-SiteName

Changes the name of the site.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductCode

Changes the product code.

The Get-ConfigProduct cmdlet returns a list of supported values.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductEdition

Changes the license edition. A license matching the specified edition must be available within the site's license server.

The Get-ConfigProductEdition returns a list of supported values.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductVersion

Changes the product version.

The Get-ConfigProductVersion returns a list of supported values.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicensingModel

Changes the license model. A license matching the specified model must be available within the site's license server.

The Get-ConfigLicensingModel returns a list of supported values.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseServerName

Changes the machine used by the brokering services to obtain licenses for desktop and application session brokering. The specified machine must be running a Citrix license server and have suitable licenses installed.

The license server machine can be specified by its DNS name ('machine.domain') or its numeric IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseServerPort

Changes the port number on the license server machine used by the brokering services to contact the Citrix license server.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseServerUri

Changes the Uri of the web server for licensing. The hostname component of this Uri must match the Site's LicenseServerName property.

Type:	Uri
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrimaryZone

Changes the primary zone for the site.

Primary zone can be specified by Uid, Name or by passing a Zone object.

Type:	Zone
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Set-ConfigSiteMetadata

March 11, 2024

Adds or updates metadata on the Site.

Syntax

```
Set-ConfigSiteMetadata
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigSiteMetadata
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against the Site.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Site.

```
Set-ConfigSiteMetadata -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Site specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ConfigSiteMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-ConfigZone

March 11, 2024

Set the description of the zone.

Syntax

```
Set-ConfigZone
   [-NewUid <Guid>]
   [-InputObject] <Zone[]>
   [-Description <String>]
   [-EnableHybridConnectivityForResourceLeases <Boolean>]
   [-EnableVdaConnectivityForResourceLeases <Boolean>]
   [-ExternalUid <Guid>]
   [-TenantId <Guid>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigZone
   [-NewUid <Guid>]
   [-Uid] <Guid[]>
   [-Description <String>]
   [-EnableHybridConnectivityForResourceLeases <Boolean>]
   [-EnableVdaConnectivityForResourceLeases <Boolean>]
   [-ExternalUid <Guid>]
   [-TenantId <Guid>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ConfigZone
   [-NewUid <Guid>]
   [-Name] <String[]>
   [-Description <String>]
   [-EnableHybridConnectivityForResourceLeases <Boolean>]
   [-EnableVdaConnectivityForResourceLeases <Boolean>]
   [-ExternalUid <Guid>]
   [-TenantId <Guid>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet allows you to change the description of a zone.

Controllers can be moved between zones using Set-ConfigService cmdlet. To mark zone as primary use Set-ConfigSite cmdlet.

To update the metadata associated with a zone, use the Set-ConfigZoneMetadata and Remove-ConfigZoneMetadata cmdlets.

To change the name of a zone use Rename-ConfigZone cmdlet.

Examples

EXAMPLE 1

Change the description of the 'Sydney'zone.

```
Set-ConfigZone -Name 'Sydney' -Description 'Sydney branch office'
```

Parameters

-InputObject

Specifies the zone to update (by zone object).

Type:	Zone[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Specifies the zone to update (by Uid).

Type:	Guid[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the zone to update (by name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-NewUid

Specifies the new uid of the Zone object.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Supplies the new description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableHybridConnectivityForResourceLeases

Supplies the EnableHybridConnectivityForResourceLeases property of the zone

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableVdaConnectivityForResourceLeases

Supplies the EnableVdaConnectivityForResourceLeases property of the zone

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExternalUid

Supplies the external Uid of the zone

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Supplies the Tenant ID of the zone

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.Zone

You can pipe the zones to be updated into this command.

Outputs

None or Citrix.Configuration.Sdk.Zone

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Zone object.

Set-ConfigZoneMetadata

March 11, 2024

Adds or updates metadata on the given Zone.

Syntax

```
Set-ConfigZoneMetadata
    [-ZoneUid] <Guid>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigZoneMetadata
    [-ZoneUid] <Guid>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigZoneMetadata
    [-ZoneName] <String>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigZoneMetadata
    [-ZoneName] <String>
    -Map <PSObject>
    [-LoggingId <Guid>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigZoneMetadata
    [-InputObject] <Zone[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ConfigZoneMetadata
    [-InputObject] <Zone[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Zone objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Zone with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ConfigZoneMetadata -ZoneUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -
    Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-ZoneUid

Id of the Zone

Type:	Guid
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ZoneName

Name of the Zone

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Zone[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Zone specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ConfigZoneMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-ConfigDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix Configuration Service.

Syntax

```
Test-ConfigDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ConfigDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ConfigDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Configuration Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Configuration SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-ConfigDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Configuration Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login

and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-ConfigDBConnection cmdlet returns an object describing the status of the selected Configuration Service instance that would result if the connection string were used with the Set-

ConfigDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-ConfigDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the Configuration Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the Configuration Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The Configuration Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The Configuration Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the Configuration Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the Configuration Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-ConfigServiceInstanceAvailability

March 11, 2024

Tests whether the supplied service instances are responding to requests.

Syntax

```
Test-ConfigServiceInstanceAvailability
    [-ServiceInstance] <ServiceInstance[]>
    [-MaxDelaySeconds <Int32>]
    [-ForceWaitForOneOfEachType]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Examples

EXAMPLE 1

Test all the service instances that are registered in the Configuration Service, returning when one of each type is responding.

```
C:\>Get-ConfigRegisteredServiceInstance | Test-
   ConfigServiceInstanceAvailability -ForceWaitForOneOfEachType
```

EXAMPLE 2

Test each of the given services, allowing a 5 second time-out.

```
C:\>Test-ConfigServiceInstanceAvailability -ServiceInstance $services -
   MaxDelaySeconds 5
```

Parameters

-ServiceInstance

The service instances to test.

Type:	ServiceInstance[]
Position:	2

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-MaxDelaySeconds

The timeout period to wait before concluding that services are unresponsive.

Type:	Int32
Position:	Named
Default value:	Infinite
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ForceWaitForOneOfEachType

If at least one of each type of service responds, finish immediately.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

This represents a service instance and has the following parameters:

- ServiceGroupUid <Guid>

  The unique identifer for the service group to which the service instance belongs.
- ServiceGroupName <string>

  The name of the service group that the service instance is part of.
- ServiceInstanceUid <Guid>

  The unique identifier for the service instance.
- ServiceType <string>

  The type of the service group.
- Address <string>

  The contact address for the service instance.
- Binding <string>

  The binding to use for connections to the service instance.
- Version <int>

  The version of the service instance.
- ServiceAccount <string>

  The AD computer account for the computer that is providing the service instance.

- ServiceAccountSid <string>

  The AD computer account SID for the computer that is providing the service instance.

- InterfaceType <string>

  The interface type for the service instance.

- Metadata <Citrix.Configuration.Sdk.Metadata[]>

  The metadata for the service instance.

- Status <Citrix.Configuration.Sdk.Commands.Availability>

  An enumeration value indicating whether the service is Responding, NotResponding, Unknown, or BadBindingType.

- ResponseTime <System.TimeSpan>

  The interval elapsed between hailing the service and getting a definite response

Notes

The Availability Status Codes are

- Responding: Got a positive response
- NotResponding: Got a response, but it was negative or the connection was refused
- Unknown: Did not respond in time / timed-out
- BadBindingType: Binding parameter in ServiceInstance is not wcf_HTTP_kerb

Unregister-ConfigRegisteredServiceInstance

March 11, 2024

Removes a service instance from the Configuration Service registry.

Syntax

```
Unregister-ConfigRegisteredServiceInstance
           [-ServiceInstanceUid] <Guid>
           [-LoggingId <Guid>]
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Use this cmdlet to remove a service instance from the Configuration Service registry. This does not remove any service groups (if all service instances for a Service Group are removed, an empty service group remains and must be removed using the Remove-ConfigServiceGroup command).

Examples

EXAMPLE 1

Unregisters all the service instances that are for a service type of 'Config'from the Configuration Service instance register.

```
Get-ConfigRegisteredServiceInstance -ServiceType "Config" | Unregister-
    ConfigRegisteredServiceInstance
```

Parameters

-ServiceInstanceUid

The unique identifier for the service instance to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Configuration.Sdk.ServiceInstance

An object with a parameter called 'ServiceInstanceUid'can be used to unregister service instances.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes ————ServiceInstanceObjectNotFound

The service instance specified could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

about_LogConfigurationLoggingSnapIn

March 11, 2024

Topic

about_LogConfigurationLoggingSnapin

Short Description

The Configuration Logging Service PowerShell snap-in provides administrative functions for the Configuration Logging Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Log'.

Long Description

The Configuration Logging Service PowerShell snap-in enables both local and remote administration of the Configuration Logging Service.

The Configuration Logging Service logs configuration changes or administrator requested state changes made to the site. Configuration Logging can be configured, site wide, to be mandatory or optional. If mandatory logging is selected, then any attempts to change site configuration or state when the logging mechanism is unavailable are denied.

The Configuration Logging Service stores information about the logged changes in a database which can be configured to be separate from the site database.

The snap-in provides storage and configuration of these entities:

Site

The Configuration Logging Site object holds global settings which control the behaviour of the Configuration Logging Service. The site object can be configured by the Set-LogSite cmdlet. The properties of the site object are returned by the Get-LogSite cmdlet.

High Level Operations

A high level operation object represents a logged configuration change performed from Desktop Studio, Desktop Director or a PowerShell Script.

The XenDesktop consoles log high level operations when:

1. Executing operations which performs configuration changes.
2. Executing operations which performs administration related activities which may affect site configuration.

PowerShell scripts which carry out customized configuration changes can also log high level operations via cmdlets Start-LogHighLevelOperation and Stop-LogHighLevelOperation.

Low Level Operations

A low level operation object represents a logged configuration change performed by a service. One or more low level operation objects are used to record the actions performed by a services in order to fulfil a high level operation initiated from the consoles, or from PowerShell scripts.

Low level operations in the system are returned by cmdlet Get-LogLowLevelOperation.

Operation Details

A low level operation performed by a service can affect a number of individual objects, or a number of properties on an object. An operation detail log records each individual change to an object. This includes the creation and deletion of the object, as well as changes to individual properties of the object.

One or more operation detail objects are used to record specific changes to each object that is affected by a low level service operation.

Operation details are included in the data returned from the Get-LogLowLevelOperation cmdlet.

High Level Operations, Low Level Operations and Operation Details are arranged in a hierarchy. A High Level Operation can have multiple Low Level Operations, and each Low Level Operation can have multiple Operation Details.

Setting Up A Separate Logging Database

After creating the database on the database server, the logging database can be setup and configured for use by:

1. Generating the database schema, and applying it the logging database
2. Configuring the configuration logging service to use the new logging database.

The logging database schema can be generated from the Get-LogDBSchema cmdlet, as illustrated below:

```
1 Get-LogDBSchema -DatabaseName "loggingDB"
```

```
                -ServiceGroupName "service group name"
                -ScriptType Database
                -LocalDatabase:$LocalDB
                -DataStore Logging
```

The configuration logging service can be configured to use the logging database with the Set-LogDBConnection cmdlet, as illustrated below:

```
Set-LogDBConnection -DataStore Logging -DBConnection $null
Set-LogDBConnection -DataStore Logging -DBConnection "new logging db
    connection string"
```

Configuration Logging Site Settings

On the Site object:

- The 'State'setting allows configuration logging to be disabled, enabled, or made mandatory.
- The 'Locale'setting specifies the language in which configuration logging data text will be stored.

See Get-LogSite cmdlet help for further information on these settings.

This locale setting applies to the text description that is associated with each log , e.g. 'Create Catalog'. It doesn't apply to other textual information in the log like the names of parameters passed to operations, e.g. 'CatalogName'.

This localisation is applied when the data is logged, and not when the logs are viewed later. For example, logs which are created in English will be displayed in English on an end user system which may be configured with a different locale.

Topic

about_LogConfigurationLoggingSnapin

Short Description

The Configuration Logging Service PowerShell snap-in provides administrative functions for the Configuration Logging Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Log'.

Long Description

The Configuration Logging Service PowerShell snap-in enables both local and remote administration of the Configuration Logging Service.

The Configuration Logging Service logs configuration changes or administrator requested state changes made to the site. Configuration Logging can be configured, site wide, to be mandatory or optional. If mandatory logging is selected, then any attempts to change site configuration or state when the logging mechanism is unavailable are denied.

The Configuration Logging Service stores information about the logged changes in a database which can be configured to be separate from the site database.

The snap-in provides storage and configuration of these entities:

Site

The Configuration Logging Site object holds global settings which control the behaviour of the Configuration Logging Service. The site object can be configured by the Set-LogSite cmdlet. The properties of the site object are returned by the Get-LogSite cmdlet.

High Level Operations

A high level operation object represents a logged configuration change performed from Desktop Studio, Desktop Director or a PowerShell Script.

The XenDesktop consoles log high level operations when:

1. Executing operations which performs configuration changes.
2. Executing operations which performs administration related activities which may affect site configuration.

PowerShell scripts which carry out customized configuration changes can also log high level operations via cmdlets Start-LogHighLevelOperation and Stop-LogHighLevelOperation.

Low Level Operations

A low level operation object represents a logged configuration change performed by a service. One or more low level operation objects are used to record the actions performed by a services in order to fulfil a high level operation initiated from the consoles, or from PowerShell scripts.

Low level operations in the system are returned by cmdlet Get-LogLowLevelOperation.

Operation Details

A low level operation performed by a service can affect a number of individual objects, or a number of properties on an object. An operation detail log records each individual change to an object. This includes the creation and deletion of the object, as well as changes to individual properties of the object.

One or more operation detail objects are used to record specific changes to each object that is affected by a low level service operation.

Operation details are included in the data returned from the Get-LogLowLevelOperation cmdlet.

High Level Operations, Low Level Operations and Operation Details are arranged in a hierarchy. A High Level Operation can have multiple Low Level Operations, and each Low Level Operation can have multiple Operation Details.

Setting Up A Separate Logging Database

After creating the database on the database server, the logging database can be setup and configured for use by:

1. Generating the database schema, and applying it the logging database
2. Configuring the configuration logging service to use the new logging database.

The logging database schema can be generated from the Get-LogDBSchema cmdlet, as illustrated below:

```
1 Get-LogDBSchema -DatabaseName "loggingDB"
```

```
                -ServiceGroupName "service group name"
                -ScriptType Database
                -LocalDatabase:$LocalDB
                -DataStore Logging
```

The configuration logging service can be configured to use the logging database with the Set-LogDBConnection cmdlet, as illustrated below:

```
Set-LogDBConnection -DataStore Logging -DBConnection $null
Set-LogDBConnection -DataStore Logging -DBConnection "new logging db
    connection string"
```

Configuration Logging Site Settings

On the Site object:

- The 'State'setting allows configuration logging to be disabled, enabled, or made mandatory.
- The 'Locale'setting specifies the language in which configuration logging data text will be stored.

See Get-LogSite cmdlet help for further information on these settings.

This locale setting applies to the text description that is associated with each log , e.g. 'Create Catalog'. It doesn't apply to other textual information in the log like the names of parameters passed to operations, e.g. 'CatalogName'.

This localisation is applied when the data is logged, and not when the logs are viewed later. For example, logs which are created in English will be displayed in English on an end user system which may be configured with a different locale.

about_Log_Filtering

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                  # Matches Abc*
Get-<Noun> -Company "Abc`*"                   # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter 'Enabled'# Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled'# Equivalent to 'Enabled -eq $false'

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle"}
Get-<Noun> -Filter { Shape -like 'C*'}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for

objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings

formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Export-LogReportCsv

March 11, 2024

Exports Configuration Logging data into a CSV file.

Syntax

```
Export-LogReportCsv
      [-OutputFile <String>]
      [-StartDateRange <DateTime>]
      [-EndDateRange <DateTime>]
      [-RawReport]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet exports the Configuration Logging data into a CSV data file. The hierarchical logging data is flattened into a single CSV 'table'. The content of CSV file is not intended to be human-readable. It is meant to be input data for external reporting or manipulation tools (for example, a spread sheet application).

Examples

EXAMPLE 1

Export all logged operations to a csv file.

```
Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv"
```

EXAMPLE 2

Export to a CSV file logged operations started on or after a specified datetime..

```
1  Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv" -
       StartDateRange "2012-12-21 09:00"
```

EXAMPLE 3

Export to a CSV file logged operations started and completed between a date range.

```
1  Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv" -
       StartDateRange "2012-12-21 09:00" -EndDateRange "2012-12-311 18:00"
```

Parameters

-OutputFile

Specifies the path to a file where the CSV data will be saved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartDateRange

Specifies the start time of the earliest operation to include.

Type:	DateTime
Position:	Named
Default value:	DateTime.Min
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-EndDateRange

Specifies the end time of the latest operation to include.

Type:	DateTime
Position:	Named
Default value:	DateTime.UtcNow
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RawReport

Get a CSV raw string report without saving it to a file.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- Export-LogReportHtml

Export-LogReportHtml

March 11, 2024

Exports Configuration Logging data into a HTML report.

Syntax

```
Export-LogReportHtml
       [-OutputDirectory <String>]
       [-RawReport]
       [-StartDateRange <DateTime>]
       [-EndDateRange <DateTime>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet exports the Configuration Logging data into a HTML report. The report consists of two HTML files:

- Summary.Html - this shows summary information from the high level operation logs.

- Details.Html - this shows additional logging data from the low level operation and operation detail logs.

Hyperlinks in summary.html allow drill-down into the associated low level logging data contained within details.html.

Examples

EXAMPLE 1

Export all logged operations to HTML.

```
Export-LogReportHtml -OutputDirectory "c:\MyReports"
```

EXAMPLE 2

Export to a HTML logged operations started on or after a specified datetime..

```
Export-LogReportHtml -OutputDirectory "c:\MyReports" -StartDateRange "
    2012-12-21 09:00"
```

EXAMPLE 3

Export to HTML logged operations started and completed between a date range.

```
Export-LogReportHtml -OutputDirectory "c:\MyReports" -StartDateRange "
    2012-12-21 09:00" -EndDateRange "2012-12-311 18:00"
```

Parameters

-OutputDirectory

Specifies the path to a directory where the HTML report files will will be saved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-RawReport

Get a HTML raw string report without saving it to a file.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartDateRange

Specifies the start time of the earliest operation to include.

Type:	DateTime
Position:	Named
Default value:	DateTime.Min
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EndDateRange

Specifies the end time of the latest operation to include.

Type:	DateTime
Position:	Named
Default value:	DateTime.UtcNow
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Get-LogDataStore

March 11, 2024

Gets details for each of the ConfigurationLogging data stores.

Syntax

```
Get-LogDataStore
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns an object for each of the ConfigurationLogging data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

Examples

EXAMPLE 1

Get the database connection string for the ConfigurationLogging Service.

```
Get-LogDataStore

ConnectionString : Server=.\SQLEXPRESS;Initial Catalog = databaseName;
    Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : LogSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : LogSecondarySchema
Status           : DBUnconfigured
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the ConfigurationLogging Service.

Syntax

```
Get-LogDBConnection
    [[-DataStore] <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected ConfigurationLogging Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the ConfigurationLogging Service instance running on controller "controller1.mydomain.net".

```
Get-LogDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	2
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current ConfigurationLogging Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the ConfigurationLoggingService has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix ConfigurationLogging Service.

Syntax

```
Get-LogDBSchema
    [-DataStore <String>]
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix ConfigurationLogging Service database schema, add a new ConfigurationLogging service to an existing site, remove a ConfigurationLogging service from a site, or create a database server logon for a ConfigurationLogging service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected ConfigurationLogging service instance, otherwise the scripts relate to ConfigurationLogging service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to ConfigurationLogging service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to ConfigurationLogging service roles

If ScriptType is Evict, the returned script contains:

- Removal of ConfigurationLogging service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix ConfigurationLogging Service and copies it to a file called "C:\ConfigurationLoggingSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a ConfigurationLogging service schema.

```
Get-LogDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\ConfigurationLoggingSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the ConfigurationLogging service. This can be used when configuring a mirror server for use.

```
Get-LogDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    ConfigurationLoggingLogins.sql
```

EXAMPLE 3

Get the full database schema for the secondary data store of the ConfigurationLogging Service and copy it to a file called 'c:\LogSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB'that does not already contain a ConfigurationLogging Service secondary schema.

```
Get-LogDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup -
    DataStore Secondary > c:\LogSchema.sql
```

Parameters

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site'or the logical name of the secondary data store.

Type:	String
Position:	Named
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

Specifies the name of the database into which the new ConfigurationLogging service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the ConfigurationLogging services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix ConfigurationLogging Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a ConfigurationLogging Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a ConfigurationLogging Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the ConfigurationLogging Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for ConfigurationLogging services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the ConfigurationLogging Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.
- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix ConfigurationLogging Service.

Syntax

```
Get-LogDBVersionChangeScript
    [-DataStore <String>]
    -DatabaseName <String>
    -TargetVersion <Version>
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix ConfigurationLogging Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix ConfigurationLogging Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix ConfigurationLogging Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix ConfigurationLogging Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix ConfigurationLogging Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-LogServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-LogDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix ConfigurationLogging Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	Named
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-LogDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix ConfigurationLogging Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shut down during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any ConfigurationLogging services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-LogServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogHighLevelOperation

March 11, 2024

Gets high level operations

Syntax

```
Get-LogHighLevelOperation
    [-Id <Guid>]
    [-Text <String>]
    [-StartTime <DateTime>]
    [-Source <String>]
    [-EndTime <DateTime>]
    [-IsSuccessful <Boolean>]
    [-User <String>]
    [-AdminMachineIP <String>]
    [-OperationType <OperationType>]
    [-TargetType <String>]
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves high level operations matching the specified criteria. If no parameters are specified this cmdlet returns all high level operations.

Examples

EXAMPLE 1

Get all high level operations

```
Get-LogHighLevelOperation
```

EXAMPLE 2

Get high level operations which log configuration changes.

```
Get-LogHighLevelOperation -OperationType ConfigurationChange
```

EXAMPLE 3

Get high level operations which log administration activities.

```
Get-LogHighLevelOperation -OperationType AdminActivity
```

EXAMPLE 4

Use advanced filtering to get high level operations with a start time on or after "2013-02-27 09:00:00" and an end time on or before "2013-02-27 18:00:00".

```
Get-LogHighLevelOperation -Filter{
  StartTime -ge "2013-02-27 09:00:00" -and EndTime -le "2013-02-27
     18:00:00" }
```

EXAMPLE 5

Either of these commands will get high level operations which have not yet been completed.

```
Get-LogHighLevelOperation -EndTime $null
Get-LogHighLevelOperation -IsSuccessful $null
```

EXAMPLE 6

Get high level operations performed by user “DOMAIN\UserName”.

```
1  Get-LogHighLevelOperation -User "DOMAIN\UserName"
```

Parameters

-Id

Gets the high level operation with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Text

Gets high level operations with the specified text

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-StartTime

Gets high level operations with the specified start time

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Source

Gets high level operations with the specified source.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EndTime

Gets high level operations with the specified end time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSuccessful

Gets high level operations with the specified success indicator.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-User

Gets high level operations logged by the specified user.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminMachineIP

Gets high level operations logged from the machine with the specified IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OperationType

Gets high level operations with the specified operation type. Values can be:

- AdminActivity - to get operations which log administration activity.
- ConfigurationChange - to get operations which log configuration changes.

Type:	OperationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetType

Gets high level operations with the specified target type.

The target type describes the type of object that was the target of the

configuration change. For example, “Session”or “Machine”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.HighLevelOperation

The returned HighLevelOperation object has the following properties:

- Id - The unique identifier of the operation.
- Text - A description of the operation.
- StartTime - The date and time that the operation started.
- EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.
- IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation never completed.
- User - The identifier of the administrator who performed the operation.
- AdminMachineIP - The IP address of the machine that the operation was initiated from.
- Source - Identifies the XenDesktop console, or custom script, where the operation was initiated from. For example, "Studio", "Desktop Director", "My custom script".
- OperationType - The operation type. This can be 'AdminActivity' or 'ConfigurationChange'.
- TargetTypes - Identifies the type of objects that were affected by the operation. For example, "Catalog" or "Desktop","Machine".
- Parameters - The names and values of the parameters that were supplied for the operation.

Get-LogInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the ConfigurationLogging Service.

Syntax

```
Get-LogInstalledDBVersion
   [-DataStore <String>]
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix ConfigurationLogging Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-LogDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix ConfigurationLogging Service database schema version number.

```
Get-LogInstalledDBVersion
```

EXAMPLE 2

Get the versions of the ConfigurationLogging Service database schema for which upgrade scripts are supplied.

```
Get-LogInstalledDBVersion -Upgrade
```

Parameters

-DataStore

Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-LogInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the ConfigurationLogging

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogLowLevelOperation

March 11, 2024

Gets low level operations

Syntax

```
Get-LogLowLevelOperation
    [-Id <Guid>]
    [-HighLevelOperationId <Guid>]
    [-StartTime <DateTime>]
    [-EndTime <DateTime>]
    [-IsSuccessful <Boolean>]
    [-User <String>]
    [-AdminMachineIP <String>]
    [-Text <String>]
    [-Source <String>]
    [-SourceSdk <String>]
    [-OperationType <OperationType>]
    [-TargetType <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves low level operations matching the specified criteria. If no parameters are specified this cmdlet returns all low level operations.

Examples

EXAMPLE 1

Get all low level operations

```
Get-LogLowLevelOperation
```

EXAMPLE 2

Get low level operations which log configuration changes.

```
Get-LogLowLevelOperation -OperationType ConfigurationChange
```

EXAMPLE 3

Get low level operations which log administration activities.

```
Get-LogLowLevelOperation -OperationType AdminActivity
```

EXAMPLE 4

Use advanced filtering to get low level operations with a start time on or after "2013-02-27 09:00:00" and an end time on or before "2013-02-27 18:00:00".

```
Get-LogLowLevelOperation -Filter{
  StartTime -ge "2013-02-27 09:00:00" -and EndTime -le "2013-02-27
     18:00:00" }
```

EXAMPLE 5

Either of these commands will get low level operations which have not yet been completed.

```
Get-LogLowLevelOperation -EndTime $null
Get-LogLowLevelOperation -IsSuccessful $null
```

EXAMPLE 6

Get low level operations performed by user “DOMAIN\UserName”.

```
1  Get-LogLowLevelOperation -User "DOMAIN\UserName"
```

Parameters

-Id

Gets the low level operation with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HighLevelOperationId

Gets low level operations for the high level operation with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Gets low level operations with the specified start time

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EndTime

Gets low level operations with the specified end time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSuccessful

Gets low level operations with the specified success indicator.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-User

Gets low level operations logged by the specified administrator.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-AdminMachineIP

Gets low level operations logged from the machine with the specified IP address.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Text

Gets low level operations with the specified text

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Source

Gets low level operations with the specified source.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-SourceSdk

Gets low level operations logged from the SDK with the specified identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OperationType

Gets low level operations with the specified operation type. Values can be:

- AdminActivity - to get operations which log administration activity.
- ConfigurationChange - to get operations which log configuration changes.

Type:	OperationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetType

Gets low level operations with the specified target type. The target type describes the type of object that was the target of the configuration change. For example, “Session”or “Machine”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.LowLevelOperation

The returned LowLevelOperation object has the following properties:

- Id - The unique identifier of the operation.
- Text - A description of the operation.
- HighLevelOperationId - The unique identifier of the related high level operation.
- StartTime - The date and time that the operation started.
- EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.
- IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation never completed.
- AdminSid - The identifier of the administrator who performed the operation.

- AdminMachineIP - The IP address of the machine that the operation was performed on.
- Source - The name of the XenDesktop service that the operation was performed on; for example, “MachineCreation”, “DelegatedAdmin”.
- SourceSdk - The identifier of the XenDesktop service SDK through which the operation was performed; for example, “Prov”, “Admin”.
- OperationType - The operation type. This can be ‘AdminActivity’ or ‘ConfigurationChange’.
- TargetTypes - Identifies the type of objects that were affected by the operation. For example, “Catalog” or “Desktop”,”Machine”.
- Parameters - The names and values of the parameters that were supplied for the operation.
- Details - A collection of OperationDetail objects containing specific information about each object affected by the operation.

Each OperationDetail object in the ‘Details’collection has the following properties:

- TargetUid - The unique identifier of the target object affected by the operation.
- TargetName - The name of the target object affected by the operation.
- TargetType - The type of the target object.
- Text - The description of operation performed on the target object.
- StartTime - The date and time that the operation started.
- EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.
- IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation didn’t complete.

The following properties will be set if the operation changed a property on the object:

- PropertyName - The name of the changed property.
- NewValue - The new property value.
- PreviousValue - The previous property value.
- AddValue - If the object property contains a set of values,

  this specifies the new value which was added to the set.
- RemoveValue- If the object property contains a set of values,

  this specifies the value which was removed from the set.

Get-LogService

March 11, 2024

Gets the service record entries for the ConfigurationLogging Service.

Syntax

```
Get-LogService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the ConfigurationLogging Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the ConfigurationLogging Service running in the current service group.

```
Get-LogService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.Service

The Get-LogServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Related Links

- about_LogConfigurationLoggingSnapin

Get-LogServiceAddedCapability

March 11, 2024

Gets any added capabilities for the ConfigurationLogging Service on the controller.

Syntax

```
Get-LogServiceAddedCapability
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables updates to the ConfigurationLogging Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the ConfigurationLogging Service.

```
Get-LogServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_LogConfigurationLoggingSnapin

Get-LogServiceInstance

March 11, 2024

Gets the service instance entries for the ConfigurationLogging Service.

Syntax

```
Get-LogServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the ConfigurationLogging Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the ConfigurationLogging Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1 Get-LogServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.ServiceInstance

The Get-LogServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Log.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.ConfigurationLogging.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogServiceStatus

March 11, 2024

Gets the current state of the ConfigurationLogging Service on the controller.

Syntax

```
Get-LogServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the ConfigurationLogging Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the ConfigurationLogging Service.

```
Get-LogServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-LogServiceStatus command returns an object containing the status of the ConfigurationLogging Service together with extra diagnostics information.

DBUnconfigured

The ConfigurationLogging Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The ConfigurationLogging is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The ConfigurationLogging is connected to a database that is valid, but it does not have the full functionality required so the ConfigurationLogging cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService

The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The ConfigurationLogging Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the ConfigurationLogging Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the ConfigurationLogging and the database has been lost for an extended period of time, or has failed due to a configuration problem. The ConfigurationLogging service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-LogSite

March 11, 2024

Gets global configuration logging settings.

Syntax

```
Get-LogSite
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet retrieves the global configuration logging settings.

Examples

EXAMPLE 1

Gets configiration logging site settings.

```
Get-LogSite
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.Site

Get-LogSite returns an object containing the following properties:

- Locale - the current language that logs should be recorded in.

  Can be: 'en', 'ja', 'zh-CN', 'de', 'es'or 'fr'.

- State - the current state of configuration logging. Can be:

  Enabled, Disabled, Mandatory or NotSupported.

Get-LogSummary

March 11, 2024

Gets operations logged within time intervals inside a date range.

Syntax

```
Get-LogSummary
   [-StartDateRange <DateTime>]
   [-EndDateRange <DateTime>]
   [-IntervalSeconds <Int64>]
   [-GetLowLevelOperations]
   [-IncludeIncomplete]
   [-OperationType <OperationType>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Get-LogSummary cmdlet retrieves summary counts of operations logged within time intervals inside a date range. The returned data indicates the rate at which configuration changes and activities were performed out within a time period.

Examples

EXAMPLE 1

Get a summary of all completed high level operations. The returned log summary collection will contain a single item for the time period spanning the entire [1900-01-01 00:00:00]-[UtcNow] date range. e.g.

Key ==> Value

01/01/1900 00:00:00 ==> 41

```
$logSummary = Get-LogSummary
```

EXAMPLE 2

Gets a summarised count of completed high level operations logged over two weeks, at daily intervals. The returned log summary collection will contain multiple items; one for each day in the summary date range. - e.g.

Key ==> Value

01/02/2013 14:50:39 ==> 0

02/02/2013 14:50:39 ==> 4

03/02/2013 14:50:39 ==> 21

04/02/2013 14:50:39 ==> 0

05/02/2013 14:50:39 ==> 0

06/02/2013 14:50:39 ==> 0

07/02/2013 14:50:39 ==> 5

08/02/2013 14:50:39 ==> 0

09/02/2013 14:50:39 ==> 0

10/02/2013 14:50:39 ==> 0

11/02/2013 14:50:39 ==> 0

12/02/2013 14:50:39 ==> 7

13/02/2013 14:50:39 ==> 0

14/02/2013 14:50:39 ==> 0

15/02/2013 14:50:39 ==> 12

```
$daily = 60*60*24
[DateTime]$startRange = "2013-02-01 14:50:39"
[DateTime]$endRange = $startRange.AddDays(14)
Get-LogSummary -StartDateRange $startRange -EndDateRange $endRange -
    intervalSeconds $daily
```

EXAMPLE 3

Gets a summarised count of completed low level operations logged during a day, at hourly intervals. The returned log summary collection will contain multiple items; one for each hour in the summary date range - e.g.

Key ==> Value

04/03/2013 00:00:00 ==> 12

04/03/2013 01:00:00 ==> 10

04/03/2013 02:00:00 ==> 5

.

.

.

04/03/2013 21:00:00 ==> 26

04/03/2013 22:00:00 ==> 0

04/03/2013 23:00:00 ==> 9

```
$hourly = 60*60
[DateTime]$startRange = "2013-02-03 00:00:00"
[DateTime]$endRange = "2013-02-03 23:59:59"
Get-LogSummary -StartDateRange $startRange -EndDateRange $endRange -
    intervalSeconds $hourly -GetLowLevelOperations
```

Parameters

-StartDateRange

Specifies the start of the summary period date range

Type:	DateTime
Position:	Named
Default value:	1900-01-01 00:00:00
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EndDateRange

Specifies the end of the summary period date range.

Type:	DateTime
Position:	Named
Default value:	DateTime.UtcNow
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IntervalSeconds

Specifies the size, in seconds, of each time interval
required within the summary date range. If this is not specified,
is null, zero or exceeds the specified date range, it defaults to the
total number of seconds between EndDateRange and StartDateRange.

Type:	Int64
Position:	Named
Default value:	Total number of seconds in the EndDateRange and StartDateRange time span.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GetLowLevelOperations

Specifies if the cmdlet should return low level operation summary counts.

Type:	SwitchParameter
Position:	Named

Default value:	$false - high level operations counts are returned.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeIncomplete

Specifies if incomplete operations should be included

in the returned summary counts.

Type:	SwitchParameter
Position:	Named
Default value:	$false - incomplete operations are excluded.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationType

Specifies the type of logged operations to include.

Values can be ‘AdminActivity’or ‘ConfigurationChange’

Type:	OperationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary<string, int>

The summary data is returned as a collection of dictionary items. The 'Key'value of each dictionary item specifies the start of the time interval within the overall summary date range. The 'Value'data in each dictionary item contains the count of operations which were started within that time interval.

Notes

If the specified summary date range and interval period will result in more than 50,000 intervals being returned Get-LogSummary will generate an error and abort the operation.

Remove-LogHighLevelOperationMetadata

March 11, 2024

Removes metadata from the given HighLevelOperation.

Syntax

```
Remove-LogHighLevelOperationMetadata
      -Id <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogHighLevelOperationMetadata
      -Id <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogHighLevelOperationMetadata
      [-InputObject] <HighLevelOperation[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogHighLevelOperationMetadata
      [-InputObject] <HighLevelOperation[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given High Level Operation.

Examples

EXAMPLE 1

Remove all metadata from all HighLevelOperations objects.

```
Get-HighLevelOperation | % {
  Remove-LogHighLevelOperationMetadata -Map $_.MetadataMap  }
```

Parameters

-InputObject

The HighLevelOperations to remove the metadata from

Type:	HighLevelOperation[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Id of the HighLevelOperation.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-LogOperation

March 11, 2024

Deletes configuration logs

Syntax

```
Remove-LogOperation
      -DatabaseCredentials <PSCredential>
      [-StartDateRange <DateTime>]
      [-EndDateRange <DateTime>]
```

```
        [-IncludeIncomplete]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-LogOperation
       -UserName <String>
       -SecurePassword <SecureString>
       [-StartDateRange <DateTime>]
       [-EndDateRange <DateTime>]
       [-IncludeIncomplete]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-LogOperation
       -UserName <String>
       [-Password <String>]
       [-StartDateRange <DateTime>]
       [-EndDateRange <DateTime>]
       [-IncludeIncomplete]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-LogOperation
       -SqlCredentials <PSCredential>
       [-StartDateRange <DateTime>]
       [-EndDateRange <DateTime>]
       [-IncludeIncomplete]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-LogOperation
       -SqlLogin <String>
       -SqlPassword <SecureString>
       [-StartDateRange <DateTime>]
       [-EndDateRange <DateTime>]
       [-IncludeIncomplete]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Remove-LogOperation deletes logs from the Configuration Logging database. All high level operations within the specified time range are removed together with their associated low level operations.

Examples

EXAMPLE 1

Remove all completed operation logs

```
Remove-LogOperation  -UserName "DOMAIN\User"  -Password "UserPassword"
```

EXAMPLE 2

Remove all operations

```
Remove-LogOperation  -UserName "DOMAIN\User"  -Password "UserPassword"
    -IncludeIncomplete
```

EXAMPLE 3

Delete logs started on or after “2023-01-01 12:00:00”and completed on or before “2023-01-31 12:00:00”

```
Remove-LogOperation -username "domain\userName" -password "password" -
    StartDateRange "2023-01-01 12:00:00"  -EndDateRange "2023-01-31
    12:00:00"
```

EXAMPLE 4

Delete logs by supplying Windows user credentials via a credentials object.

```
$securePassword = ConvertTo-SecureString -String "UserPassword" -
    AsPlainText -Force
$credentials    = New-Object -TypeName System.Management.Automation.
    PSCredential -ArgumentList "DOMAIN\UserName", $securePassword
Remove-LogOperation -StartDateRange -DatabaseCredentials $credentials
```

Parameters

-DatabaseCredentials

Specifies the credentials of a Windows user with permission to delete records from the Configuration Logging database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserName

Specifies the Windows user name of a database user with permission to delete records from the Configuration Logging database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SecurePassword

Specifies the password a Windows user, in secure string form, with permission to delete records from the Configuration Logging database.

Type:	SecureString
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SqlCredentials

Specifies the SQL credentials of a database user with permission to delete records from the Configuration Logging database.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SqlLogin

Specifies the SQL login of a database user with permission to delete records from the Configuration Logging database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SqlPassword

Specifies the SQL password of a database user with permission to delete records from the Configuration Logging database.

Type:	SecureString
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Password

Specifies the password of a Windows user with permission to delete records from the Configuration Logging database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartDateRange

Specifies the start time of the earliest high level operation to delete

Type:	DateTime
Position:	Named
Default value:	DateTime.Min
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EndDateRange

Specifies the end time of the latest high level operation to delete

Type:	DateTime
Position:	Named

Default value:	DateTime.UtcNow
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeIncomplete

Specifies if incomplete high level operations should be deleted.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-LogServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-LogServiceMetadata
       [-ServiceHostId] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-LogServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-LogService | % {
  Remove-LogServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-LogSiteMetadata

March 11, 2024

Removes metadata from the given Site.

Syntax

```
Remove-LogSiteMetadata
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogSiteMetadata
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogSiteMetadata
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-LogSiteMetadata
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Site.

Examples

EXAMPLE 1

Remove all metadata from all Site objects.

```
Get-LogSite | % {
  Remove-LogSiteMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-LogDataStore

March 11, 2024

Refreshes the database string currently being used by the Log service.

Syntax

```
Reset-LogDataStore
      [-DataStore] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Returns the string for the database connection currently being used by the ConfigurationLogging Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Refresh the database connection string for the ConfigurationLogging Service.

```
Reset-LogDataStore -DataStore Secondary
OK
```

Parameters

-DataStore

Specifies the database connection logical name to be used by the ConfigurationLogging Service. Can be either be 'Site'or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

Type:	String
Position:	2
Default value:	Site
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.ServiceStatus

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-LogEnabledFeatureList

March 11, 2024

Refreshes the ConfigurationLogging service's list of enabled features.

Syntax

```
Reset-LogEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix ConfigurationLogging Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected ConfigurationLogging service instance's list of enabled features.

```
1  Reset-LogEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-LogServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the ConfigurationLogging Service.

Syntax

```
Reset-LogServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload ConfigurationLogging Service access permissions and configuration service locations. The Reset-LogServiceGroupMembership command must be run on at least one instance of the service type (Log) after installation and registration with the configuration service. Without this operation, the ConfigurationLogging services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-LogServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    LogServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-LogServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.ConfigurationLogging.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-LogServiceGroupMembership command.

Outputs

Citrix.ConfigurationLogging.Sdk.ServiceInstance

Reset-LogServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the ConfigurationLogging Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-LogDBConnection

March 11, 2024

Configures a database connection for the ConfigurationLogging Service.

Syntax

```
Set-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix ConfigurationLogging Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-LogDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
1  Set-LogDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the ConfigurationLogging Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site'or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-LogDBConnection cmdlet returns an object describing the status of the ConfigurationLogging Service together with extra diagnostics information. Possible values are:

- OK:

The ConfigurationLogging Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the ConfigurationLogging Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the ConfigurationLogging Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the ConfigurationLogging Service currently in use is newer than, and incompatible with, the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

- DBOlderVersionThanService:

The version of the ConfigurationLogging Service schema on the database is newer than, and incompatible with, the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the ConfigurationLogging Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the ConfigurationLogging Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the ConfigurationLogging Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-LogDBCredentials

March 11, 2024

Configures the database server SQL credentials for the ConfigurationLogging Service.

Syntax

```
Set-LogDBCredentials
    [[-DataStore] <String>]
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-LogDBCredentials
    [[-DataStore] <String>]
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix ConfigurationLogging Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional ConfigurationLogging Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-LogDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-LogDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-LogDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-LogDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-LogHighLevelOperationMetadata

March 11, 2024

Adds or updates metadata on the given HighLevelOperation.

Syntax

```
Set-LogHighLevelOperationMetadata
   -Id <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogHighLevelOperationMetadata
   -Id <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogHighLevelOperationMetadata
   [-InputObject] <HighLevelOperation[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogHighLevelOperationMetadata
   [-InputObject] <HighLevelOperation[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HighLevelOperations.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the High Level Operation.

```
Set-LogHighLevelOperationMetadata -Name property -Value value -Id {
 E6DF248A-D2C3-463E-B2BA-7B303D36BB54 }
```

Parameters

-InputObject

The HighLevelOperations to add the metadata to

Type:	HighLevelOperation[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Id of the HighLevelOperation.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the High Level Operation specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-LogServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-LogServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-LogServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-LogServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-LogSite

March 11, 2024

Sets global configuration logging settings.

Syntax

```
Set-LogSite
    [-State <LoggingState>]
    [-Locale <String>]
    [-LoggingDBPurgeDurationDays <Int32>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet sets the global configuration logging settings.

Examples

EXAMPLE 1

Set the logging language to Chinese. The logging state will be unchanged.

```
Set-LogSite -Locale "zh-CN"
```

EXAMPLE 2

Set the logging state to mandatory. The logging locale will be unaffected. In this state, no configuration change will be allowed unless it is successfully logged.

```
Set-LogSite -State "Mandatory"
```

EXAMPLE 3

Set the logging language to German and the state to Enabled.

```
Set-LogSite -Locale "de" -State "Enabled"
```

Parameters

-State

Sets the state of configuration logging. Values can be:

- Enabled - state changes will be logged. If logging is unavailable, the state change will still be permitted.
- Disabled - state changes will not be logged.
- Mandatory - state change will be logged. If logging is unavailable, the state change will not be permitted.
  When the state is set to Enabled or Mandatory, XenDesktop services will attempt to log operations (which perform configuration changes) before performing them.

Type:	LoggingState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Locale

Sets the language that logs should be recorded in. Values can be: ‘en’, ‘ja’, ‘zh-CN’, ‘de’, ‘es’or ‘fr’ .

Type:	String
Accepted values:	de, en, es, fr, ja, zh-CN
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDBPurgeDurationDays

Sets the number of days for which the configuration logging logs will be retained. Any config logging data older than number of days set in this property will be purged.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.Site

Current logging settings

Notes

Configuration logging will automatically transition to a 'NotSupported'state if the logging feature is not licensed. Set-LogSite will reject request to set logging to 'Enabled'or 'Mandatory'while the logging feature is not licensed.

- Get-LogSite

Set-LogSiteMetadata

March 11, 2024

Adds or updates metadata on the given Site.

Syntax

```
Set-LogSiteMetadata
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogSiteMetadata
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-LogSiteMetadata
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
    [<CommonParameters>]
```

```
Set-LogSiteMetadata
   -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Site objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Site.

```
Set-LogSiteMetadata -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Site specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-LogSiteMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Start-LogHighLevelOperation

March 11, 2024

Logs the start of a high level operation.

Syntax

```
Start-LogHighLevelOperation
      [-StartTime <DateTime>]
      -Text <String>
      -Source <String>
      [-OperationType <OperationType>]
      [-TargetTypes <String[]>]
      [-Parameters <Hashtable>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Start-LogHighLevelOperation creates a log entry to record the start of a high level operation.

Start-LogHighLevelOperation can be called to log high level configuration changes which originate from customized configuration scripts. Start-LogHighLevelOperation should be called before the script invokes service SDK cmdlets which execute the configuration changes.

Start-LogHighLevelOperation returns a HighLevelOperation object which contains information about the started high level operation. The “Id”property of the returned HighLevelOperation uniquely identifies the started high level operation. This can be supplied into the “-LoggingId”parameter which is implemented in all service SDK cmdlets which execute loggable configuration changes.

High level operation logs are automatically created by the XenDesktop consoles when:

- Initiating an operation which performs configuration changes.
- Initiating an operation which performs an administration activity.

Configuration Change and Administrator Activity

A configuration change is an operation which alters the configuration of the XenDesktop site. Examples of a configuration changes include:

- Creating or editing a host.

- Creating or editing a catalog.
- Adding a user to a delivery group.
- Deleting a machine.

An administrator activity operation doesn't directly alter site configuration, but it could be an operation carried out by an administrator as part of site management or helpdesk support. Examples of administrator activities include:

- Shutdown/start/restart of a user desktop.
- Studio or Director sending a message to a user.
- Rebooting a user's desktop.

Once the change being logged has completed (whether successfully or not) the Stop-LogHighLevelOperation cmdlet should be called to log the completion of a started high level operation.

Examples

EXAMPLE 1

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId"parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.

```
$succeeded = $false #indicates if high level operation succeeded.
# Log high level operation start.
$highLevelOp = Start-LogHighLevelOperation -Text "Create catalog" -
    Source "My Custom Script"

try
{

  # Create catalog object
  $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType
     Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -
     LoggingId $highLevelOp.Id

  # Add a machine to the catalog
  $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "
     DOMAIN\Machine" -LoggingId $highLevelOp.Id
  $succeeded = $true
 }

catch{
  "Error encountered"  }

finally{
```

```
21
22    # Log high level operation stop, and indicate its success
23    Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -
          IsSuccessful $succeeded
24  }
```

Parameters

-Text

Specifies text to describe the high level operation.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Source

Specifies the source of the high level operation.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Specifies the start time of the high level operation.

Type:	DateTime

Position:	Named
Default value:	DateTime.UtcNow
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationType

Specifies the type of operation being logged. Values can be:

- AdminActivity - If the operation being logged performs an administration activity.
- ConfigurationChange - If the operation being logged performs a configuration change.

Type:	OperationType
Position:	Named
Default value:	ConfigurationChange
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetTypes

Specifies the names of the object types that will be affected

by the operation being logged.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Parameters

Specifies the names and values of parameters that are supplied to the operation being logged.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.HighLevelOperation

The newly logged high level operation start.

Related Links

- Stop-LogHighLevelOperation
- Get-LogHighLevelOperation

Stop-LogHighLevelOperation

March 11, 2024

Logs the completion of a previously started high level operation.

Syntax

```
Stop-LogHighLevelOperation
    -HighLevelOperationId <String>
    [-EndTime <DateTime>]
    -IsSuccessful <Boolean>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Stop-LogHighLevelOperation logs the completion of a started high level operation.

Examples

EXAMPLE 1

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId"parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.

```
$succeeded = $false #indicates if high level operation succeeded.
# Log high level operation start.
$highLevelOp = Start-LogHighLevelOperation -Text "Create unmanaged
    catalog" -Source "My Custom Script"

try
{

```

```
  # Create catalog object
  $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType
      Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -
      LoggingId $highLevelOp.Id

  # Add a machine to the catalog
  $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "
      DOMAIN\Machine" -LoggingId $highLevelOp.Id
  $succeeded = $true
 }

catch{
  "Error encountered"  }

finally{

  # Log high level operation stop, and indicate its success
  Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -
      IsSuccessful $succeeded
 }
```

Parameters

-HighLevelOperationId

Specifies the identifier of the high level operation being completed.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSuccessful

Specifies if the started high level operation completed sucessfully.

Type:	Boolean
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-EndTime

Specifies the end time of the high level operation being completed.

Type:	DateTime
Position:	Named
Default value:	DateTime.UtcNow.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Test-LogDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix ConfigurationLogging Service.

Syntax

```
Test-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix ConfigurationLogging Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-LogDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix ConfigurationLogging Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-LogDBConnection cmdlet returns an object describing the status of the selected ConfigurationLogging Service instance that would result if the connection string were used with the Set-LogDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-LogDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the ConfigurationLogging Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the ConfigurationLogging Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The ConfigurationLogging Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The ConfigurationLogging Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the ConfigurationLogging Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the ConfigurationLogging Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

about_AdminDelegatedAdminSnapIn

March 11, 2024

Topic

about_AdminDelegatedAdminSnapin

Short Description

The Delegated Administration Service PowerShell snap-in provides administrative functions for the Delegated Administration Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Admin'.

Long Description

The Delegated Administration Service PowerShell snap-in enables both local and remote administration of the Delegated Administration Service.

The Delegated Administration Service (or DAS for short) stores information about Citrix administrators and the rights they have. Services in the XenDesktop deployment use the DAS to determine whether a particular user has the privilege to perform an operation or not.

The snap-in provides storage and configuration of these entities:

Administrators

Each administrator object represents an individual person or a group of people identified by their Active Directory account. Administrators can be enabled and disabled.

The effective rights that a user has is the union of any rights that they have by looking at their Active Directory group membership. Disabled administrator entries are ignored for this calculation.

Once a site is setup, there must always be a full administrator and the Delegated Administration snap-in rejects requests to remove or disable the last full administrator.

Roles

A role represents a job function. That is, anyone with a given role is expected to be able to use or perform the tasks, wizards, and actions associated with that role. Administrators may have multiple roles for a particular site.

Some roles are built-in, and some editions of the product allow custom roles to be created with different combinations of permissions.

Scopes

Scopes represent a collection of objects, and are used to group objects for administrative purposes in a way that is relevant to the organisation. They can be used to represent both hierarchical and non-hierarchical relationships.

Objects can exist in multiple scopes at once. You may find it easier to think of scopes as labels, or a non-exclusive grouping such as a play-list.

All objects are implicitly in the built-in 'All' scope.

Some objects are not scoped, and access to them is through either the 'All' scope or indirectly through a scoped object. For example sessions are not directly scoped but can be accessed using the scope of the desktop group.

The DAS stores information about scopes, but the mapping between scopes and objects is stored and updated using the PowerShell snap-ins of each corresponding service. For example, Delivery Group scopes are managed using the Broker PowerShell snap-in.

Rights

Rights determine what an administrator can do and where they can do it. They are expressed as a number of <role, scope> pairs associated with each administrator.

To gain access to any particular object, a person must match an administrator object that has an appropriate right that allows the required operation in a scope that the object is a member of.

Permissions

Each task, wizard or action in the Citrix Studio or Director consoles represents a unit of functionality that an administrator can perform. Permissions are expressed at a high level and generally correspond directly to the labels in the consoles. For example: "Edit catalog", or "Create delivery group".

Permission groups:

Permissions are grouped into related functionality when displayed by the console.

Operations

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to

individual cmdlets. Internally, each permission requires a number of operations to be performed, possibly by different services.

about_AdminDelegatedAdminSnapin

Short Description

The Delegated Administration Service PowerShell snap-in provides administrative functions for the Delegated Administration Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Admin'.

Long Description

The Delegated Administration Service PowerShell snap-in enables both local and remote administration of the Delegated Administration Service.

The Delegated Administration Service (or DAS for short) stores information about Citrix administrators and the rights they have. Services in the XenDesktop deployment use the DAS to determine whether a particular user has the privilege to perform an operation or not.

The snap-in provides storage and configuration of these entities:

Administrators

Each administrator object represents an individual person or a group of people identified by their Active Directory account. Administrators can be enabled and disabled.

The effective rights that a user has is the union of any rights that they have by looking at their Active Directory group membership. Disabled administrator entries are ignored for this calculation.

Once a site is setup, there must always be a full administrator and the Delegated Administration snap-in rejects requests to remove or disable the last full administrator.

Roles

A role represents a job function. That is, anyone with a given role is expected to be able to use or perform the tasks, wizards, and actions associated with that role. Administrators may have multiple roles for a particular site.

Some roles are built-in, and some editions of the product allow custom roles to be created with different combinations of permissions.

Scopes

Scopes represent a collection of objects, and are used to group objects for administrative purposes in a way that is relevant to the organisation. They can be used to represent both hierarchical and non-hierarchical relationships.

Objects can exist in multiple scopes at once. You may find it easier to think of scopes as labels, or a non-exclusive grouping such as a play-list.

All objects are implicitly in the built-in 'All' scope.

Some objects are not scoped, and access to them is through either the 'All' scope or indirectly through a scoped object. For example sessions are not directly scoped but can be accessed using the scope of the desktop group.

The DAS stores information about scopes, but the mapping between scopes and objects is stored and updated using the PowerShell snap-ins of each corresponding service. For example, Delivery Group scopes are managed using the Broker PowerShell snap-in.

Rights

Rights determine what an administrator can do and where they can do it. They are expressed as a number of <role, scope> pairs associated with each administrator.

To gain access to any particular object, a person must match an administrator object that has an appropriate right that allows the required operation in a scope that the object is a member of.

Permissions

Each task, wizard or action in the Citrix Studio or Director consoles represents a unit of functionality that an administrator can perform. Permissions are expressed at a high level and generally correspond directly to the labels in the consoles. For example: "Edit catalog", or "Create delivery group".

Permission groups:

Permissions are grouped into related functionality when displayed by the console.

Operations

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets. Internally, each permission requires a number of operations to be performed, possibly by different services.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

```
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces

quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
```

Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq ‘Circle’-or Shape -eq ‘Square’}
$shapes = ‘Circle’,’Square’
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq ‘Blue’-and Shape -eq ‘Circle’) }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Add-AdminPermission

March 11, 2024

Add permissions to the set of permissions of a role.

Syntax

```
Add-AdminPermission
   -Role <String>
   [-InputObject] <Permission[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AdminPermission
   -Role <String>
   [-Permission] <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Add extra permissions to the set of permissions that a role maps to.

Any administrator with a right including that role immediately gains the ability to use the operations of the new permissions.

Duplicate permissions do not produce an error, and permissions are skipped if the role already contains the permission (without error).

You cannot modify the permissions of built-in roles.

You are not permitted to add permissions that you yourself don't have rights to.

Examples

EXAMPLE 1

Add a couple of specific permissions to the 'MyRole'role.

```
Add-AdminPermission -Role MyRole -Permission Global_Read,Logging_Read
```

EXAMPLE 2

Add all of the permissions of the Delivery Administrator role to MyRole.

```
$list = Get-AdminRole "Delivery Administrator" | Select -Expand
    Permissions
Add-AdminPermission -Role MyRole -Permission $list
```

Parameters

-InputObject

Specifies the permissions to add.

Type:	Permission[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Permission

Specifies the list of permissions to add (by identifier).

Type:	String[]
Aliases:	Id
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Role

Role name or identifier of the role to update.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Permission

You can pipe a list of permissions to be added into this command.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- Test-AdminAccess

Add-AdminRight

March 11, 2024

Grants a given right to the specified administrator.

Syntax

```
Add-AdminRight
   -Scope <String>
   -Role <String>
   -Administrator <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AdminRight
   -Role <String>
   -Administrator <String>
   [-All]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AdminRight
   [-InputObject] <Right[]>
   -Administrator <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

```
6     [<CommonParameters>]
```

Description

Use the Add-AdminRight cmdlet to add rights (role and scope pairs) to an administrator.

For convenience, you can use the -All parameter to specify the 'All'scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

Examples

EXAMPLE 1

Assigns the 'Help Desk Administrator'role and 'London'scope to the 'Admin1'administrator.

```
1 Add-AdminRight -Role 'Help Desk Administrator' -Scope London -
    Administrator DOMAIN\Admin1
```

EXAMPLE 2

Assigns the 'Full Administrator'role and 'All'scope to the 'Admin1'administrator.

```
1 Add-AdminRight -Role 'Full Administrator' -All -Administrator DOMAIN\
    Admin1
```

EXAMPLE 3

Copies the administrator rights from 'ExistingAdmin'to 'NewAdmin'.

```
1 $admin = Get-AdminAdministrator -Name DOMAIN\ExistingAdmin
2 Add-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\
    NewAdmin
```

Parameters

-InputObject

Specifies the rights to add from Right objects.

Type:	Right[]

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Scope

Specifies the scope name or scope identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Role

Specifies the role name or role identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Administrator

Specifies the name or ID of the administrator.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-All

Specifies the 'All'scope. This parameter avoids localization issues or having to type the identifier of the 'All'scope.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Right

You can pipe the rights to be added into this command.

Outputs

None

By default, this cmdlet returns no output.

Get-AdminAdministrator

March 11, 2024

Gets administrators configured for this site.

Syntax

```
Get-AdminAdministrator
    [-Sid <String>]
    [[-Name] <String>]
    [-BuiltIn <Boolean>]
    [-Enabled <Boolean>]
    [-IsCloudGroup <Boolean>]
    [-Metadata <String>]
    [-UserIdentity <String>]
    [-UserIdentityType <UserIdentityType>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves administrators matching the specified criteria. If no parameters are specified this cmdlet enumerates all administrators.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

Finds the administrator object (if one exists) for user "DOMAIN\TestUser".

```
Get-AdminAdministrator -Name DOMAIN\TestUser
```

EXAMPLE 2

Finds all disabled administrator objects.

```
Get-AdminAdministrator -Enabled $false
```

Parameters

-Name

Gets administrators with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Sid

Gets administrators with the specified SID (security identifier).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-BuiltIn

Gets administrators that are builtin

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Enabled

Gets administrators with the specified value of Enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsCloudGroup

Gets administrators with the specified cloud group state

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserIdentity

Gets administrators with the specified UserIdentity (Windows security identifier or Citrix Cloud Identity). If the UserIdentityType is a Sid this will be the same as the Sid property. For Cloud administrators this will show cloud identity and the the Sid property will be null.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserIdentityType

Gets administrators with the specified UserIdentityType (Windows security identifier or Citrix Cloud Identity).

Type:	UserIdentityType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Administrator

Get-AdminAdministrator returns an object for each matching administrator.

Get-AdminDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the DelegatedAdmin Service.

Syntax

```
Get-AdminDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected DelegatedAdmin Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the DelegatedAdmin Service instance running on controller "controller1.mydomain.net".

```
Get-AdminDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current DelegatedAdmin Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the DelegatedAdminService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix DelegatedAdmin Service.

Syntax

```
Get-AdminDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix DelegatedAdmin Service database schema, add a new DelegatedAdmin service to an existing site, remove a DelegatedAdmin service from a site, or create a database server logon for a DelegatedAdmin service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected DelegatedAdmin service instance, otherwise the scripts relate to DelegatedAdmin service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to DelegatedAdmin service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to DelegatedAdmin service roles

If ScriptType is Evict, the returned script contains:

- Removal of DelegatedAdmin service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix DelegatedAdmin Service and copies it to a file called "C:\DelegatedAdminSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a DelegatedAdmin service schema.

```
Get-AdminDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\DelegatedAdminSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the DelegatedAdmin service. This can be used when configuring a mirror server for use.

```
Get-AdminDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    DelegatedAdminLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new DelegatedAdmin service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the DelegatedAdmin services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix DelegatedAdmin Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a DelegatedAdmin Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a DelegatedAdmin Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the DelegatedAdmin Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for DelegatedAdmin services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the DelegatedAdmin Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix DelegatedAdmin Service.

Syntax

```
Get-AdminDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix DelegatedAdmin Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix DelegatedAdmin Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix DelegatedAdmin Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix DelegatedAdmin Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix DelegatedAdmin Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-AdminServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-AdminDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix DelegatedAdmin Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-AdminDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix DelegatedAdmin Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shut down during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any DelegatedAdmin services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AdminServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminEffectiveAdministrator

March 11, 2024

Retrieve the effective administrator objects for a user.

Syntax

```
Get-AdminEffectiveAdministrator
   [-Name] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This command determines what groups the specified user belongs to and retrieves the matching administrator records. It includes the set of rights that would be granted to the user if he or she used the system.

As this command uses Active Directory to determine what groups the user has, the caller must have the ability to read this information from Active Directory.

Only enabled administrator records are returned.

Examples

EXAMPLE 1

Retrieve the administrator records matching user 'testuser'.

```
Get-AdminEffectiveAdministrator MYDOMAIN\testuser
```

Parameters

-Name

User name or ID of user to query

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

User name or ID of user to query

Outputs

Citrix.DelegatedAdmin.Sdk.Administrator

Administrator records matching the specified user

Related Links

- about_AdminDelegatedAdminSnapin
- Get-AdminAdministrator

Get-AdminEffectiveRight

March 11, 2024

Gets the set of Right objects associated with the current user.

Syntax

```
Get-AdminEffectiveRight
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-AdminEffectiveRight cmdlet returns the effective rights of the current user. This is the union of all rights of the enabled administrators that the current user matches, taking into account Active Directory group membership.

Examples

EXAMPLE 1

Return the effective rights for the current user.

```
Get-AdminEffectiveRight
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Right

The Rights associated with the current user

Related Links

- Get-AdminAdministrator
- Add-AdminRight
- Remove-AdminRight
- about_AdminDelegatedAdminSnapin

Get-AdminInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the DelegatedAdmin Service.

Syntax

```
Get-AdminInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix DelegatedAdmin Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-AdminDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix DelegatedAdmin Service database schema version number.

```
1  Get-AdminInstalledDBVersion
```

EXAMPLE 2

Get the versions of the DelegatedAdmin Service database schema for which upgrade scripts are supplied.

```
1  Get-AdminInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-AdminInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the DelegatedAdmin

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Get-AdminDBVersionChangeScript
- Get-AdminDBSchema

Get-AdminPermission

March 11, 2024

Gets permissions configured for the site.

Syntax

```
Get-AdminPermission
    [-Id <String>]
    [[-Name] <String>]
    [-Description <String>]
    [-GroupId <String>]
    [-GroupName <String>]
    [-IsHidden <Boolean>]
    [-Metadata <String>]
    [-Operation <String>]
    [-ReadOnly <Boolean>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves permission matching the specified criteria. If no parameters are specified this cmdlet enumerates all permissions.

Permissions are configured using the Import-AdminRoleConfiguration command, and are used to represent collections of operations that are needed to perform a particular task. These permissions are presented in Citrix Studio when configuring roles.

Permissions can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

Finds all permissions with 'Edit'in their names.

```
Get-AdminPermission -Name *Edit*
```

EXAMPLE 2

Finds permissions that contain specific operations, with the -Filter form needed to match multiple values.

```
Get-AdminPermission -Operation "Broker:SetCatalog"
Get-AdminPermission -Filter {
  Operations -contains "Broker:SetCatalog" -or Operations -contains "
     Broker:NewCatalog"  }
```

Parameters

-Name

Gets permissions with the specified name (localized)

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Id

Gets permissions with the specified identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Gets permissions with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-GroupId

Gets permissions that are a member of the specified permission group (by group id).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-GroupName

Gets permissions that are a member of the specified permission group (by group name).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsHidden

Gets permissions with the specified value for the IsHidden flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Operation

Gets permissions that contain a specific operation.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReadOnly

Gets permissions with the specified value for the ReadOnly flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Permission

Get-AdminPermission returns an object for each matching permission.

Related Links

- Add-AdminPermission
- Remove-AdminPermission
- Get-AdminRole
- Get-AdminPermissionGroup
- Test-AdminAccess

Get-AdminPermissionGroup

March 11, 2024

Gets permission groups configured for the site.

Syntax

```
Get-AdminPermissionGroup
    [-Id <String>]
    [[-Name] <String>]
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves permission groups matching the specified criteria. If no parameters are specified this cmdlet enumerates all permission groups.

Permission groups are configured using the Import-AdminRoleConfiguration command, and are primarily used to store the localized name for a group of permissions. Permission groups can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

Finds all permission groups that end with the letter 's'.

```
Get-AdminPermissionGroup -Name *s
```

EXAMPLE 2

Retrieve two specific permission group objects with the matching identifiers.

```
$list = @("Hosts","Other")
Get-AdminPermissionGroup -Filter {
  Id -in $list  }
  -SortBy Name
```

Parameters

-Name

Gets permission groups matching the given name. This is the localized name of the group.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Id

Gets permission groups with the given identifier. This is the non-localized identifier used to associate permissions with permission groups.

Type:	String
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.PermissionGroup

Get-AdminPermissionGroup returns an object for each matching permission group.

Get-AdminRevision

March 11, 2024

Gets the current revision of the delegated administration configuration data.

Syntax

```
Get-AdminRevision
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Delegated Administration Service maintains a revision number that is incremented whenever its configuration is changed. This command retrieves the current revision number.

Examples

EXAMPLE 1

Retrieve the current revision number.

```
Get-AdminRevision
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Int32

The configuration revision number

Notes

If Int32.MaxValue is reached the value of the revision number will wrap around to Int32.MinValue.

In some cases the value may be incremented by more than one.

Get-AdminRole

March 11, 2024

Gets roles configured for this site.

Syntax

```
Get-AdminRole
    [-Id <Guid>]
    [[-Name] <String>]
    [-BuiltIn <Boolean>]
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-ExclusivePermission <String>]
    [-Metadata <String>]
    [-Permission <String>]
    [-Property <String[]>]
```

```
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves roles matching the specified criteria. If no parameters are specified, this cmdlet enumerates all roles.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

Gets the details of the role with the specific id.

```
Get-AdminRole -Id 20852cdf-f527-4953-ba6e-e7545217122d
```

EXAMPLE 2

List all custom roles.

```
Get-AdminRole -BuiltIn $false
```

Parameters

-Name

Gets roles with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Id

Gets the role with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-BuiltIn

Gets roles with the specified value of the BuiltIn flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CanLaunchManage

Gets roles with the specified value of the CanLaunchManage flag.

Type:	Boolean
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CanLaunchMonitor

Gets roles with the specified value of the CanLaunchMonitor flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets roles with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExclusivePermission

Gets roles that contain a specific exclusive permission.

Type:	String
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Permission

Gets roles that contain a specific permission.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Role

Get-AdminRole returns an object for each matching role.

Get-AdminRoleConfiguration

March 11, 2024

Gets role configurations for this site.

Syntax

```
Get-AdminRoleConfiguration
    [-Id <Guid>]
    [[-Name] <String>]
    [-Locale <String>]
    [-Priority <Int32>]
    [-Version <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves role configurations matching the specified criteria. If no parameters are specified, this cmdlet enumerates and returns all role configurations.

Role configurations are part of the product configuration and define what permissions, permission groups, and built-in roles the product has. This cmdlet also provides the mapping of permissions to operations.

Examples

EXAMPLE 1

Retrieve the role configuration for the Citrix Director component.

```
1  Get-AdminRoleConfiguration -Name Director
```

Parameters

-Name

Gets role configurations matching the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Id

Gets role configurations with the specified id.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Locale

Gets role configurations with the specified locale. Role configurations usually have a consistent locale.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Priority

Gets role configurations with the specified priority.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Version

Gets role configurations with the matching version number.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.RoleConfiguration

Get-AdminRoleConfiguration returns an object for each matching role configuration.

Notes

This command is supplied for infrastructure purposes only and is not intended for public use.

Get-AdminScope

March 11, 2024

Gets scopes configured for this site.

Syntax

```
Get-AdminScope
    [-Id <Guid>]
    [[-Name] <String>]
    [-BuiltIn <Boolean>]
    [-Description <String>]
    [-Metadata <String>]
    [-TenantId <String>]
    [-TenantName <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves scopes matching the specified criteria. If no parameters are specified this cmdlet enumerates all scopes.

There is one special built-in scope, the 'All'scope.

To determine what objects are currently in a scope, use the Get-<Prefix>ScopedObject from each of the relevant PowerShell snap-ins.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

List all scopes that contain the word 'Sales'.

```
Get-AdminScope -Name *Sales*
```

EXAMPLE 2

Gets the details of the scope with the specific id.

```
Get-AdminScope -Id 21862daf-e529-4553-ba6e-f7543217111e
```

Parameters

-Name

Gets scopes with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Id

Gets the scope with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-BuiltIn

Gets scopes with the specified value of the BuiltIn flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

-Description

Gets scopes with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Gets scopes with the specified tenant customer identifier.

Type:	String

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantName

Gets scopes with the specified tenant customer name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline.

See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Scope

Get-AdminScope returns an object for each matching scope.

Get-AdminService

March 11, 2024

Gets the service record entries for the DelegatedAdmin Service.

Syntax

```
Get-AdminService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the DelegatedAdmin Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the DelegatedAdmin Service running in the current service group.

```
Get-AdminService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
```

```
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Service

The Get-AdminServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-AdminServiceAddedCapability

March 11, 2024

Gets any added capabilities for the DelegatedAdmin Service on the controller.

Syntax

```
Get-AdminServiceAddedCapability
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables updates to the DelegatedAdmin Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the DelegatedAdmin Service.

```
Get-AdminServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_AdminDelegatedAdminSnapin

Get-AdminServiceInstance

March 11, 2024

Gets the service instance entries for the DelegatedAdmin Service.

Syntax

```
Get-AdminServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the DelegatedAdmin Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the DelegatedAdmin Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-AdminServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.ServiceInstance

The Get-AdminServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Admin.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.DelegatedAdmin.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminServiceStatus

March 11, 2024

Gets the current state of the DelegatedAdmin Service on the controller.

Syntax

```
Get-AdminServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the DelegatedAdmin Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the DelegatedAdmin Service.

```
1  Get-AdminServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-AdminServiceStatus command returns an object containing the status of the DelegatedAdmin Service together with extra diagnostics information.

DBUnconfigured

The DelegatedAdmin Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The DelegatedAdmin is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The DelegatedAdmin is connected to a database that is valid, but it does not have the full functionality required so the DelegatedAdmin cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The DelegatedAdmin Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the DelegatedAdmin Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the DelegatedAdmin and the database has been lost for an extended period of time, or has failed due to a configuration problem. The DelegatedAdmin service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminSite

March 11, 2024

Gets the site level data for the admin service

Syntax

```
Get-AdminSite
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves the site level data such as when the most recent admin sync happened and the current database revision

Examples

EXAMPLE 1

Retrieves the site level data for the admin service such as when the recent admin sync happened and the current database revision

```
Get-AdminSite
```

Parameters

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Site

Get-AdminSite returns the site level data such as when the most

recent admin sync happened and the current database revision

- Get-AdminSite

Import-AdminRoleConfiguration

March 11, 2024

Imports role configuration data into the Delegated Administration Service.

Syntax

```
Import-AdminRoleConfiguration
      [-Path] <String>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Import-AdminRoleConfiguration
       -Content <String>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This command is intended for use by Citrix Studio to import definitions, roles, permissions, and their mappings to operations.

The supplied configuration requires a digital signature; this is used to validate the integrity of the configuration.

Examples

EXAMPLE 1

Imports the contents of 'C:\MyAdminConfig.xml'to the Delegated Administration Service.

```
Import-AdminRoleConfiguration -Path 'C:\MyAdminConfig.xml'
```

Parameters

-Path

The path to the file containing the role configuration data.

Type:	String
Aliases:	PSPath
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Content

The content of the role configuration data.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Force

Allows older versions of role configuration to replace newer versions.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

This command is supplied for infrastructure purposes only and is not intended for public use.

- about_AdminDelegatedAdminSnapin
- Get-AdminRoleConfiguration

New-AdminAdministrator

March 11, 2024

Adds a new administrator to the site.

Syntax

```
New-AdminAdministrator
   [-Enabled <Boolean>]
   [-IsHidden <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AdminAdministrator
   [-Enabled <Boolean>]
   [-IsHidden <Boolean>]
   [-Name] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AdminAdministrator
   [-Enabled <Boolean>]
   [-IsHidden <Boolean>]
   -Sid <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

New-AdminAdministrator creates a new administrator object in the site. Once a new administrator has been created you can assign rights (role and scope pairs) to the administrator.

Administrator objects are used to determine what rights, and therefore what permissions a particular Active Directory user has through the various SDKs and consoles of the site.

When the Enabled flag of an administrator is set to false, any rights of the administrator are ignored by the system when performing permission checks.

Examples

EXAMPLE 1

Creates a new administrator object for user "DOMAIN\TestUser". It defaults to enabled.

```
New-AdminAdministrator -Name DOMAIN\TestUser
```

EXAMPLE 2

Creates a new administrator object for user with SID "S-1-2-34-1234567890-1234567890-1234567890-123". It defaults to enabled.

```
New-AdminAdministrator -Sid S
    -1-2-34-1234567890-1234567890-1234567890-123
```

Parameters

-Name

Specifies the user or group name in Active Directory that this administrator corresponds to.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Sid

Specifies the SID (security identifier) of the user in Active Directory that this administrator corresponds to.

Type:	String
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new administrator starts off enabled or not.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IsHidden

Specifies whether the administrator is hidden or not.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Administrator

The newly created administrator.

- Set-AdminAdministrator
- Remove-AdminAdministrator

- Set-AdminAdministratorMetadata
- Remove-AdminAdministratorMetadata

New-AdminRole

March 11, 2024

Adds a new custom role to the site.

Syntax

```
New-AdminRole
   [-CanLaunchManage <Boolean>]
   [-CanLaunchMonitor <Boolean>]
   [-Description <String>]
   [-Name] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

New-AdminRole adds a new custom role object to the site. Once a new role has been created, you can add permissions to the role which define what operations the role conveys.

Roles represent a job function, such as 'help desk administrator', and contain a list of permissions that are required to perform that job function.

To assign a role to an administrator, you combine it with a scope which indicates what objects the role can operate on. This pair (also known as a 'right') can then be assigned to an administrator. See Add-AdminRight for further details.

The identifier of the new role is chosen automatically, and custom roles created with this cmdlet always have their BuiltIn flag set to false.

You cannot modify built-in roles.

The following license editions are supported for custom roles:

- Citrix DaaS supports custom roles in all editions.
- Citrix Virtual Apps and Desktops supports custom roles in Premium and Advanced editions.
- Citrix Virtual Apps supports custom roles in Premium and Advanced editions.

Examples

EXAMPLE 1

Creates a new role called 'Supervisor', and then copies the permissions from the help desk role and adds some extras. Then gives this role (with the all scope) to user 'TestUser'.

```
New-AdminRole -Name Supervisor -Description "My custom supervisor role"
$list = Get-AdminRole 'Help Desk Administrator' | Select -Expand
    Permissions
Add-AdminPermission -Role Supervisor -Permission $list
Add-AdminPermission -Role Supervisor -Permission $extras
Add-AdminRight -Administrator DOMAIN\TestUser -Role Supervisor -All
```

Parameters

-Name

Specifies the name of the role. Each role in a site must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-CanLaunchManage

Optionally Specifies whether the role has access to the Manage tab in Citrix Cloud.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CanLaunchMonitor

Optionally Specifies whether the role has access to the Monitor tab in Citrix Cloud.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Specifies the description of the role.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Role

The newly created role.

Notes

Roles are created without any permissions. Use the Add-AdminPermission to add permissions.

New-AdminScope

March 11, 2024

Adds a new scope to the site.

Syntax

```
New-AdminScope
    [-Description <String>]
    [-Name] <String>
    [-TenantId <String>]
    [-TenantName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

New-AdminScope adds a new scope object to the site.

A scope represents a collection of objects. Scopes are used to group objects in a way that is relevant to the organization; for example, the set of delivery groups used by the Sales team.

You can create objects in particular scopes by specifying the -Scope parameter of a New- cmdlet for an object that can be scoped. You can then modify the contents of a scope with Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the correpsonding PowerShell snap-ins.

To assign a scope to an administrator, combine it with a role and then assign this pair (also known as a 'right') to an administrator. See Add-AdminRight for further details.

The identifier of the new scope is chosen automatically.

Examples

EXAMPLE 1

Creates a new scope called 'Sales', adds a hypervisor connection object to the scope, and then assigns the right to use the hosting role on the Sales scope to the 'TestUser'administrator.

```
New-AdminScope -Name Sales -Description "Sales department scope"
Add-HypHypervisorConnectionScope -HypervisorConnectionName XenServer2 -
    Scope Sales
Add-AdminRight -Administrator DOMAIN\TestUser -Role Hosting -Scope
    Sales
```

Parameters

-Name

Specifies the name of the scope. Each scope in a site must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Specifies the description of the scope.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-TenantId

Specifies the tenant customer identifier of the scope.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-TenantName

Specifies the new tenant name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Scope

The newly created scope.

Remove-AdminAdministrator

March 11, 2024

Removes administrators from the site.

Syntax

```
Remove-AdminAdministrator
      [-InputObject] <Administrator[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministrator
      -Sid <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministrator
      [-Name] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-AdminAdministrator cmdlet deletes administrators from the site.

Examples

EXAMPLE 1

Remove the administrator called “DOMAIN\TestUser”.

```
Remove-AdminAdministrator DOMAIN\TestUser
```

EXAMPLE 2

Remove all disabled administrators.

```
Get-AdminAdministrator -Enabled $false | Remove-AdminAdministrator
```

Parameters

-InputObject

Specifies the administrators to delete.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the administrator to delete.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Sid

Specifies the SID of the administrator to delete.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Administrator

You can pipe the adminstrators to be deleted into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminAdministratorMetadata

March 11, 2024

Removes metadata from the given Administrator.

Syntax

```
Remove-AdminAdministratorMetadata
       -AdministratorSid <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
       -AdministratorSid <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
       [-AdministratorName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
      [-AdministratorName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
      [-InputObject] <Administrator[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
      [-InputObject] <Administrator[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Administrator.

Examples

EXAMPLE 1

Remove all metadata from all Administrator objects.

```
Get-AdminAdministrator | % {
  Remove-AdminAdministratorMetadata -Map $_.MetadataMap  }
```

Parameters

-AdministratorName

Name of the Administrator

Type:	String
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-AdministratorSid

Sid of the Administrator

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Name

The metadata property to remove.

Type:	String
Position:	Named

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AdminPermission

March 11, 2024

Remove permissions from the set of permissions of a role.

Syntax

```
Remove-AdminPermission
      -Role <String>
      [-InputObject] <Permission[]>
      [-LoggingId <Guid>]
```

```
5         [<CitrixCommonParameters>]
6         [<CommonParameters>]
```

```
1 Remove-AdminPermission
2       -Role <String>
3       [-Permission] <String[]>
4       [-LoggingId <Guid>]
5       [<CitrixCommonParameters>]
6       [<CommonParameters>]
```

```
1 Remove-AdminPermission
2       -Role <String>
3       [-All]
4       [-LoggingId <Guid>]
5       [<CitrixCommonParameters>]
6       [<CommonParameters>]
```

Description

Remove permissions from the set of permissions that a role maps to.

Any administrator with a right including that role immediately loses the ability to use the operations of the removed permissions.

Duplicate permissions do not produce an error, and permissions that the roles does not already have are skipped (without error).

You cannot modify the permissions of built-in roles.

Examples

EXAMPLE 1

Remove a couple of specific permissions from the 'MyRole'role.

```
1 Remove-AdminPermission -Role MyRole -Permission Global_Read,
     Logging_Read
```

EXAMPLE 2

Remove all permissions from the 'MyRole'role.

```
1 Remove-AdminPermission -Role MyRole -All
```

Parameters

-InputObject

Specifies the permissions to remove.

Type:	Permission[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Permission

Specifies the list of permissions to remove (by identifier).

Type:	String[]
Aliases:	Id
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Role

Role name or identifier of the role to update.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-All

Remove all permissions.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Permission

You can pipe a list of permissions to be removed into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminRight

March 11, 2024

Removes rights from an administrator.

Syntax

```
Remove-AdminRight
      -Scope <String>
      -Role <String>
      -Administrator <String>
```

```
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AdminRight
       -Role <String>
       -Administrator <String>
       [-All]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRight
       [-InputObject] <Right[]>
       -Administrator <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This command removes rights from the specified administrator.

For convenience, you can use the -All parameter to specify the 'All'scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

Examples

EXAMPLE 1

Removes the 'Help Desk Administrator'role and 'London'scope from user 'Admin1'

```
RemoveAdminRight -Role 'Help Desk Administrator' -Scope London -
    Administrator DOMAIN\Admin1
```

EXAMPLE 2

Removes all rights from administrator 'Admin'.

```
$admin = Get-AdminAdministrator -Name DOMAIN\Admin
Remove-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\
    Admin
```

Parameters

-InputObject

Specifies the rights to remove.

Type:	Right[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Scope

Specifies the scope name or scope identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Role

Specifies the role name or role identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Administrator

Specifies the name or ID of the administrator.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-All

Specifies the 'All'scope. This parameter avoids localization issues or having to type the identifier of the 'All'scope.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Right

You can pipe the rights to be removed into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminRole

March 11, 2024

Removes a role from the site.

Syntax

```
Remove-AdminRole
       [-InputObject] <Role[]>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRole
       [-Id] <Guid[]>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRole
       [-Name] <String[]>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-AdminRole cmdlet deletes roles from the site.

You cannot remove built-in roles.

An error will be produced if the role being removed is currently assigned to an administrator unless you specify the -Force option. When -Force is specified, any rights that reference the role are also removed.

Examples

EXAMPLE 1

Remove the Supervisor role.

```
Remove-AdminRole -Name Supervisor
```

EXAMPLE 2

Attempt to remove all custom roles. This fails if one of the roles is assigned to an administrator.

```
Get-AdminRole -BuiltIn $false | Remove-AdminRole
```

Parameters

-InputObject

Specifies the roles to remove (by role object).

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the roles to remove (by role id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the roles to remove (by role name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Force

Allow removal of roles that are still in use.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Role

You can pipe the roles to be deleted into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminRoleMetadata

March 11, 2024

Removes metadata from the given Role.

Syntax

```
Remove-AdminRoleMetadata
       [-RoleId] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
       [-RoleId] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
       [-RoleName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
       [-RoleName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
       [-InputObject] <Role[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
       [-InputObject] <Role[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
```

```
6         [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Role.

Examples

EXAMPLE 1

Remove all metadata from all Role objects.

```
1 Get-AdminRole | % {
2   Remove-AdminRoleMetadata -Map $_.MetadataMap  }
```

Parameters

-RoleId

Id of the Role

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RoleName

Name of the Role

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AdminScope

March 11, 2024

Removes a scope from the site.

Syntax

```
Remove-AdminScope
      [-InputObject] <Scope[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminScope
      [-Id] <Guid[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminScope
      [-Name] <String[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-AdminScope cmdlet deletes scopes from the site.

You cannot remove the built-in 'All'scope.

An error will be produced if the scope being removed is currently assigned to an administrator unless you specify the -Force option. When -Force is specified, any rights that reference the scope are also removed.

Examples

EXAMPLE 1

Remove the Sales scope.

```
1  Remove-AdminScope -Name Sales
```

EXAMPLE 2

Attempt to remove all scopes (excluding the built-in 'All'scope). This fails if one of the scopes is assigned to an administrator.

```
1  Get-AdminScope -BuiltIn $false | Remove-AdminScope
```

Parameters

-InputObject

Specifies the scopes to remove (by scope object).

Type:	Scope[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the scopes to remove (by scope id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the scopes to remove (by scope name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Force

Allow removal of scopes that are still in use.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Scope

You can pipe the scopes to be deleted into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminScopeMetadata

March 11, 2024

Removes metadata from the given Scope.

Syntax

```
Remove-AdminScopeMetadata
       [-ScopeId] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-ScopeId] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-ScopeName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-ScopeName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
      [-InputObject] <Scope[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
      [-InputObject] <Scope[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Scope.

Examples

EXAMPLE 1

Remove all metadata from all Scope objects.

```
Get-AdminScope | % {
  Remove-AdminScopeMetadata -Map $_.MetadataMap  }
```

Parameters

-ScopeId

Id of the Scope

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ScopeName

Name of the Scope

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Scope[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AdminServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-AdminServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminServiceMetadata
       [-InputObject] <Service[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminServiceMetadata
       [-InputObject] <Service[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-AdminService | % {
  Remove-AdminServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Rename-AdminRole

March 11, 2024

Rename a role

Syntax

```
Rename-AdminRole
       [-InputObject] <Role>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminRole
       [-Id] <Guid>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminRole
       [-Name] <String>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-AdminRole cmdlet changes the name of a role.

Role names must be unique, and you cannot modify the name of built-in roles.

Examples

EXAMPLE 1

Renames the 'Supervisor'role to 'HelpDeskLead'.

```
Rename-AdminRole -Name Supervisor -NewName HelpDeskLead
```

Parameters

-InputObject

Specifies the role to rename (by object).

Type:	Role
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the role to rename (by id).

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the role to rename (by name).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the role.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Role

You can pipe the role to be renamed into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Rename-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Rename-AdminScope

March 11, 2024

Rename a scope

Syntax

```
Rename-AdminScope
       [-InputObject] <Scope>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminScope
       [-Id] <Guid>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminScope
       [-Name] <String>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Rename-AdminScope cmdlet changes the name of a scope.

Scope names must be unique, and you cannot modify the name of the built-in 'All'scope.

Examples

EXAMPLE 1

Renames the 'Sales'scope to 'SalesDesktops'.

```
Rename-AdminScope -Name Sales -NewName SalesDesktops
```

Parameters

-InputObject

Specifies the scope to rename (by object).

Type:	Scope
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the scope to rename (by id).

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-Name

Specifies the scope to rename (by name).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the scope.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Scope

You can pipe the scope to be renamed into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Rename-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

Reset-AdminEnabledFeatureList

March 11, 2024

Refreshes the DelegatedAdmin service's list of enabled features.

Syntax

```
Reset-AdminEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix DelegatedAdmin Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected DelegatedAdmin service instance's list of enabled features.

```
Reset-AdminEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-AdminServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the DelegatedAdmin Service.

Syntax

```
Reset-AdminServiceGroupMembership
     [-ConfigServiceInstance] <ServiceInstance[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Enables you to reload DelegatedAdmin Service access permissions and configuration service locations. The Reset-AdminServiceGroupMembership command must be run on at least one instance of the service type (Admin) after installation and registration with the configuration service. Without this operation, the DelegatedAdmin services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AdminServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    AdminServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-AdminServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-AdminServiceGroupMembership command.

Outputs

Citrix.DelegatedAdmin.Sdk.ServiceInstance

Reset-AdminServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the DelegatedAdmin Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminAdministrator

March 11, 2024

Sets the properties of an administrator.

Syntax

```
Set-AdminAdministrator
   [-InputObject] <Administrator[]>
   [-Enabled <Boolean>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministrator
   -Sid <String[]>
   [-Enabled <Boolean>]
```

```
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminAdministrator
    [-Name] <String[]>
    [-Enabled <Boolean>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-AdminAdministrator cmdlet is used to enable or disable an existing administrator.

You can specify the administrators to modify in a number of ways, by piping in existing objects, by passing existing objects with the InputObject parameter, or by specifying the names or SIDs explicitly.

Examples

EXAMPLE 1

Enable all administrators that are currently disabled.

```
Get-AdminAdministrator -Enabled $false | Set-AdminAdministrator -
    Enabled $true
```

EXAMPLE 2

Enable two specific users specified by name (TestUser1 and TestUser2).

```
Set-AdminAdministrator -Name DOMAIN\TestUser1,DOMAIN\TestUser2 -Enabled
    $true
```

Parameters

-InputObject

Specifies the administrators to modify.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the names of the administrators to modify.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Sid

Specifies the SIDs of the administrators to modify.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Specifies the new value for the Enabled property.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Administrator

You can pipe the adminstrators to be modified into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Administrator

When you use the PassThru parameter, Set-AdminAdministrator generates a Citrix.DelegatedAdmin.Sdk.Administra object. Otherwise, this cmdlet does not generate any output.

Set-AdminAdministratorMetadata

March 11, 2024

Adds or updates metadata on the given Administrator.

Syntax

```
Set-AdminAdministratorMetadata
   -AdministratorSid <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   -AdministratorSid <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-AdministratorName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-AdministratorName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-InputObject] <Administrator[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-InputObject] <Administrator[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Administrator objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Administrator with the identifier ‘S-1-5-21-1505241163-3345470479-1241728991-1000’.

```
Set-AdminAdministratorMetadata -AdministratorSid S
    -1-5-21-1505241163-3345470479-1241728991-1000 -Name property -Value
    value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-AdministratorName

Name of the Administrator

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-AdministratorSid

Sid of the Administrator

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Administrator specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminAdministratorMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminDBConnection

March 11, 2024

Configures a database connection for the DelegatedAdmin Service.

Syntax

```
Set-AdminDBConnection
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix DelegatedAdmin Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-AdminDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
1  Set-AdminDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the DelegatedAdmin Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-AdminDBConnection cmdlet returns an object describing the status of the DelegatedAdmin Service together with extra diagnostics information. Possible values are:

- OK:

The DelegatedAdmin Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the DelegatedAdmin Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the DelegatedAdmin Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the DelegatedAdmin Service currently in use is newer than, and incompatible with, the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

- DBOlderVersionThanService:

The version of the DelegatedAdmin Service schema on the database is newer than, and incompatible with, the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the DelegatedAdmin Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the DelegatedAdmin Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the DelegatedAdmin Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminDBCredentials

March 11, 2024

Configures the database server SQL credentials for the DelegatedAdmin Service.

Syntax

```
Set-AdminDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix DelegatedAdmin Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional DelegatedAdmin Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-AdminDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-AdminDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-AdminDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-AdminDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-AdminRole

March 11, 2024

Set the properties of a role.

Syntax

```
Set-AdminRole
    [-InputObject] <Role[]>
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminRole
    [-Id] <Guid[]>
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminRole
    [-Name] <String[]>
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-AdminRole command allows the description of custom roles to be updated. You cannot modify built-in roles.

To modify the permissions of a role, use the Add-AdminPermission and Remove-AdminPermission cmdlets.

To update the metadata associated with a role, use the Set-AdminRoleMetadata and Remove-AdminRoleMetadata cmdlets.

Examples

EXAMPLE 1

Change the description of the 'Supervisor'role.

```
1  Set-AdminRole -Name Supervisor -Description "Helpdesk supervisor role"
```

Parameters

-InputObject

Specifies the roles to update (by object).

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the roles to update (by id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the roles to update (by name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CanLaunchManage

Supplies the new CanLaunchManage value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CanLaunchMonitor

Supplies the new CanLaunchMonitor value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Supplies the new description value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Role

You can pipe the roles to be updated into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Set-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Set-AdminRoleMetadata

March 11, 2024

Adds or updates metadata on the given Role.

Syntax

```
Set-AdminRoleMetadata
   [-RoleId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-RoleId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-RoleName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-RoleName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-InputObject] <Role[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-InputObject] <Role[]>
```

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Role objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Role with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-AdminRoleMetadata -RoleId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -
    Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-RoleId

Id of the Role

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RoleName

Name of the Role

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Role specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminRoleMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminScope

March 11, 2024

Set the properties of a scope.

Syntax

```
Set-AdminScope
   [-InputObject] <Scope[]>
   [-Description <String>]
   [-TenantName <String>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScope
   [-Id] <Guid[]>
   [-Description <String>]
   [-TenantName <String>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScope
   [-Name] <String[]>
   [-Description <String>]
   [-TenantName <String>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-AdminScope command allows the description of scopes and the tenant name to be updated. You cannot modify the built-in 'All' scope.

To change the contents of a scope, use the Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the corresponding PowerShell snap-in.

To update the metadata associated with a scope, use the Set-AdminScopeMetadata and Remove-AdminScopeMetadata cmdlets.

Examples

EXAMPLE 1

Change the description of the ‘Sales’scope.

```
Set-AdminScope -Name Sales -Description "Sales department desktops"
```

Parameters

-InputObject

Specifies the scopes to update (by object).

Type:	Scope[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the scopes to update (by id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the scopes to update (by name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Supplies the new description value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantName

Specifies the new tenant name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Scope

You can pipe the scopes to be updated into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Set-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

Set-AdminScopeMetadata

March 11, 2024

Adds or updates metadata on the given Scope.

Syntax

```
Set-AdminScopeMetadata
   [-ScopeId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-ScopeId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-ScopeName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-ScopeName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-InputObject] <Scope[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-InputObject] <Scope[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Scope objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Scope with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AdminScopeMetadata -ScopeId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -
    Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-ScopeId

Id of the Scope

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ScopeName

Name of the Scope

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Scope[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Scope specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminScopeMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-AdminServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminServiceMetadata
    [-ServiceHostId] <Guid>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminServiceMetadata
    [-InputObject] <Service[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminServiceMetadata
    [-InputObject] <Service[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AdminServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-AdminAccess

March 11, 2024

Retrieves the scopes where the specified operation is permitted.

Syntax

```
Test-AdminAccess
    [-Operation] <String[]>
    [-Annotate]
    [-RejectedScopes]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet evaluates what rights the current user has, and from these determines the scopes where the specified operation is permitted.

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets.

If you specify the -Annotate option or specify multiple operations to check, the resulting object is annotated with the operation the result relates to.

Examples

EXAMPLE 1

Queries the scopes where 'Broker:GetCatalog'is permitted.

```
Test-AdminAccess -Operation 'Broker:GetCatalog'
```

EXAMPLE 2

Queries the scopes where 'Broker:GetCatalog'or 'Broker:GetMachine'are permitted.

```
Test-AdminAccess -Operation 'Broker:GetCatalog','Broker:GetMachine'
```

Parameters

-Operation

The operation to query.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Annotate

Annotates each result with the operation it relates to.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RejectedScopes

Gets the scopes where operations are not allowed as well as the scopes where an operation is allowed

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.ScopeReference

The list of permissible scopes for the specified single operation.

PSObject

The list of permissible scopes for each operation. This type of object is returned when the -Annotate option or multiple operations are specified.

Notes

If the specified operation has unrestricted access a single object is returned representing the 'All' scope with a ScopeId of Guid.Empty (00000000-0000-0000-0000-000000000000).

Test-AdminDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix DelegatedAdmin Service.

Syntax

```
Test-AdminDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AdminDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AdminDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix DelegatedAdmin Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Test-AdminDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix DelegatedAdmin Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-AdminDBConnection cmdlet returns an object describing the status of the selected DelegatedAdmin Service instance that would result if the connection string were used with the Set-

AdminDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-AdminDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the DelegatedAdmin Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the DelegatedAdmin Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The DelegatedAdmin Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The DelegatedAdmin Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the DelegatedAdmin Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the DelegatedAdmin Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Update-AdminNameCache

March 11, 2024

Updates admin name cache

Syntax

```
Update-AdminNameCache
       [[-Name] <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This command marks the admin names that need to be resynced during the admin sync site service by setting their CloudNameExpiryTime

Examples

EXAMPLE 1

Marks the admin names ending with the letter s

```
Update-AdminNameCache -Name *s
```

Parameters

-Name

Specifies the wild card entry for admin names to be invalidated

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Name

Takes wild card entry of admin names as input

Outputs

None

By default, this cmdlet returns no output.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
1 # ReturnTotalRecord example
2 Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

```
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter ‘Name -like “High*”-or (Priority -eq 1 -and Severity -ge 2)’

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces

quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company “citrix”-Product ‘[X]EN*’
Get-<Noun> -Product “Xen*”-Company “CITRIX”
Get-<Noun> -Filter { Company -eq ‘Citrix’-and Product -like ‘Xen*’}

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
```

Get-<Noun> -Filter { StartTime -ge '-0:0:30'} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*"}
Get-<Noun> -Filter { Users -contains "Fred*"}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Get-EnvTestConfiguration

March 11, 2024

Gets the Environment Test Service’s configuation options

Syntax

```
Get-EnvTestConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the Environment Test Service's configuation options and returns them as key/value pairs.

Examples

EXAMPLE 1

Gets all configuration options

```
Get-EnvTestConfiguration
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Dictionary<string, object>

All configuration settings

Related Links

Get-EnvTestDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the EnvTest Service.

Syntax

```
Get-EnvTestDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected EnvTest Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the EnvTest Service instance running on controller "controller1.mydomain.net".

```
1  Get-EnvTestDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current EnvTest Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the EnvTestService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix EnvTest Service.

Syntax

```
Get-EnvTestDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix EnvTest Service database schema, add a new EnvTest service to an existing site, remove a EnvTest service from a site, or create a database server logon for a EnvTest service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected EnvTest service instance, otherwise the scripts relate to EnvTest service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to EnvTest service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user

- Addition of database user to EnvTest service roles

If ScriptType is Evict, the returned script contains:

- Removal of EnvTest service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix EnvTest Service and copies it to a file called "C:\EnvTestSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a EnvTest service schema.

```
Get-EnvTestDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\EnvTestSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the EnvTest service. This can be used when configuring a mirror server for use.

```
Get-EnvTestDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    EnvTestLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new EnvTest service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the EnvTest services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix EnvTest Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a EnvTest Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a EnvTest Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the EnvTest Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for EnvTest services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the EnvTest Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix EnvTest Service.

Syntax

```
Get-EnvTestDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix EnvTest Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix EnvTest Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix EnvTest Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix EnvTest Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix EnvTest Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-EnvTestServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-EnvTestDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix EnvTest Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-EnvTestDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix EnvTest Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any EnvTest services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-EnvTestServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestDefinition

March 11, 2024

Gets the one or more test definitions

Syntax

```
Get-EnvTestDefinition
   [-TestId <String[]>]
   [-CultureName <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of test definitions that are available from currently running components.

Examples

EXAMPLE 1

Retrieve all tests.

```
$allTestDefinitions = Get-EnvTestDefinition
```

EXAMPLE 2

Retrieve all tests with localized properties returned in Spanish.

```
$allTestDefinitionsTranslatedIntoSpanish = Get-EnvTestDefinition -
    CultureName es-ES
```

EXAMPLE 3

Retrieve the definition of the 'Monitor_RegisteredWithConfigurationService'test.

```
$monitorConfigServiceRegistrationDefinition = Get-EnvTestDefinition -
    TestId Monitor_RegisteredWithConfigurationService
```

Parameters

-TestId

The id of one or more tests.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CultureName

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

A test id.

String[]

An array of test ids.

Outputs

Citrix.EnvTest.Sdk.EnvTestDefinition

One or more test definitions.

Get-EnvTestInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the EnvTest Service.

Syntax

```
Get-EnvTestInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix EnvTest Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-EnvTestDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix EnvTest Service database schema version number.

```
Get-EnvTestInstalledDBVersion
```

EXAMPLE 2

Get the versions of the EnvTest Service database schema for which upgrade scripts are supplied.

```
Get-EnvTestInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-EnvTestInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the EnvTest

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestService

March 11, 2024

Gets the service record entries for the EnvTest Service.

Syntax

```
Get-EnvTestService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the EnvTest Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the EnvTest Service running in the current service group.

```
Get-EnvTestService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_EnvTest_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_EnvTest_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.Service

The Get-EnvTestServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-EnvTestServiceAddedCapability

March 11, 2024

Gets any added capabilities for the EnvTest Service on the controller.

Syntax

```
Get-EnvTestServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the EnvTest Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the EnvTest Service.

```
Get-EnvTestServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_EnvTestEnvTestSnapin

Get-EnvTestServiceInstance

March 11, 2024

Gets the service instance entries for the EnvTest Service.

Syntax

```
Get-EnvTestServiceInstance
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the EnvTest Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the EnvTest Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-EnvTestServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.ServiceInstance

The Get-EnvTestServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always EnvTest.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.EnvTest.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestServiceStatus

March 11, 2024

Gets the current state of the EnvTest Service on the controller.

Syntax

```
Get-EnvTestServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the EnvTest Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return

DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the EnvTest Service.

```
Get-EnvTestServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-EnvTestServiceStatus command returns an object containing the status of the EnvTest Service together with extra diagnostics information.

DBUnconfigured

The EnvTest Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The EnvTest is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The EnvTest is connected to a database that is valid, but it does not have the full functionality required so the EnvTest cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

DBOlderVersionThanService

The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The EnvTest Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the EnvTest Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the EnvTest and the database has been lost for an extended period of time, or has failed due to a configuration problem. The EnvTest service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestSuiteDefinition

March 11, 2024

Gets one or more test suite definitions.

Syntax

```
Get-EnvTestSuiteDefinition
   [-TestSuiteId <String[]>]
   [-CultureName <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of test suite definitions that are available from currently running components.

Examples

EXAMPLE 1

Retrieve all test suites.

```
$allTestSuiteDefinitions = Get-EnvTestSuiteDefinition
```

EXAMPLE 2

Retrieve all test suites with localized properties returned in Spanish.

```
$allTestSuiteDefinitionsTranslatedIntoSpanish = Get-
   EnvTestSuiteDefinition -CultureName es-ES
```

EXAMPLE 3

Retrieve the definition of the 'Infrastructure'test suite.

```
$infrastructureSuiteDefinition = Get-EnvTestSuiteDefinition -
   TestSuiteId Infrastructure
```

Parameters

-TestSuiteId

The id of one or more test suites.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CultureName

The culture name in which to produce results. The culture name is in standard language/region-code format; for example “en-US”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

A test suite id.

String[]

An array of test suite ids.

Outputs

Citrix.EnvTest.Sdk.EnvTestSuiteDefinition

The definition of a test suite

Get-EnvTestTask

March 11, 2024

Gets one or more EnvTestTask(s)

Syntax

```
Get-EnvTestTask
    [-TaskId <Guid>]
    [-List]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns either the current task, a specified task, or list of tasks that are currently known to the EnvTest Service.

Examples

EXAMPLE 1

Retrieve the current task. The current task is the most recently created task unless Switch-EnvTestTask explicitly changes it.

```
$currentTask = Get-EnvTestTask
```

EXAMPLE 2

Retrieve a fresh copy of a task object based on a known task id, which is always a Guid. This id can be retrieved from an existing task object via its $task.TaskId property.

```
$taskOfSpecificId = Get-EnvTestTask -TaskId 36C0EC52-2039-4D6E-B690-9
    F02F8CEFFCC
```

EXAMPLE 3

Retrieve the list of current tasks. This list includes any task started by the Start-EnvTestTask cmdlet since the service started that has not later been removed via Remove-EnvTestTask.

```
$allKnownTasks = Get-EnvTestTask -List
```

Parameters

-TaskId

Specifies the task identifier to be returned. This value can be retrieved from an existing task's $task.TaskId property.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-List

List all running tasks, including the current one.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.EnvTestTask

A description of a previously started task.

New-EnvTestDiscoveryTargetDefinition

March 11, 2024

Creates a new EnvTestDiscoveryTargetDefinition object

Syntax

```
New-EnvTestDiscoveryTargetDefinition
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-EnvTestDiscoveryTargetDefinition
   -TestId <String>
   [-TargetIdType <String>]
   [-TargetId <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-EnvTestDiscoveryTargetDefinition
   -TestSuiteId <String>
   [-TargetIdType <String>]
   [-TargetId <String>]
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Creates a new EnvTestDiscoveryTargetDefinition object that can be piped into Start-EnvTestTask to define one or more targets of execution, optionally including root objects for discovery.

Examples

EXAMPLE 1

Create a discovery target definition with a single test and no target object, then start a task based on it.

```
$singleSimpleTestTaskTarget = New-EnvTestDiscoveryTargetDefinition -
    TestId Monitor_RegisteredWithConfigurationService
$singleSimpleTestTaskTarget | Start-EnvTestTask
```

EXAMPLE 2

Create a discovery target definition with a single test suite and no target object, then start a task based on it.

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition
     -TestSuiteId Infrastructure
$singleSimpleTestSuiteTaskTarget | Start-EnvTestTask
```

EXAMPLE 3

Create a discovery target definition with a single test suite and a catalog target object, then start a task based on it.

```
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -
    TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-
    BrokerCatalog).Uuid
$singleTestSuiteTaskTarget | Start-EnvTestTask
```

EXAMPLE 4

Create two different discovery target definitions, put them in an array, then start a task based on both.

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition
    -TestSuiteId Infrastructure
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -
   TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-
   BrokerCatalog).Uuid
@($singleSimpleTestSuiteTaskTarget, $singleTestSuiteTaskTarget) | Start
   -EnvTestTask
```

Parameters

-TestId

Test identifiers. If specified, do not specify -TestSuiteId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TestSuiteId

Test suite identifiers. If specified, do not specify -TestId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetIdType

Describes the type of corresponding object passed with -TargetId

Type:	String
Position:	Named
Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetId

The Ids that object tests or test suites will target. By default, other components are queried for objects related to these.

Type:	String
Position:	Named
Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition

Defines a target of a task

Remove-EnvTestServiceMetadata

March 11, 2024

Removes metadata from the given Service.

Syntax

```
Remove-EnvTestServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-EnvTestService | % {
  Remove-EnvTestServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-EnvTestTask

March 11, 2024

Removes from the database completed tasks for the EnvTest Service.

Syntax

```
Remove-EnvTestTask
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTask
      [-TaskId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTask
      [-Task <EnvTestTask>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables completed tasks that have run within the EnvTest Service to be removed from the database.

Examples

EXAMPLE 1

Removes the current task from the EnvTest service.

```
Remove-EnvTestTask
```

EXAMPLE 2

Removes a task from the EnvTest service via its id, which is available from an existing task's $task.TaskId property.

```
Remove-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

EXAMPLE 3

Removes the second task in the list returned by Get-EnvTestTask -List.

```
$secondTask = $(Get-EnvTestTask -List)[1]
Remove-EnvTestTask -Task $secondTask
```

Parameters

-TaskId

Specifies the identifier of the task to be removed, retrieveable from the $task.TaskId property.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Task

Specifies the task to be removed.

Type:	EnvTestTask
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-EnvTestTaskMetadata

March 11, 2024

Removes metadata from the given Task.

Syntax

```
Remove-EnvTestTaskMetadata
      [-TaskTaskId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTaskMetadata
      [-TaskTaskId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTaskMetadata
      [-InputObject] <EnvTestTask[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTaskMetadata
      [-InputObject] <EnvTestTask[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Task.

Examples

EXAMPLE 1

Remove all metadata from all Task objects.

```
Get-EnvTestTask | % {
  Remove-EnvTestTaskMetadata -Map $_.MetadataMap  }
```

Parameters

-TaskTaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	EnvTestTask[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-EnvTestEnabledFeatureList

March 11, 2024

Refreshes the EnvTest service's list of enabled features.

Syntax

```
Reset-EnvTestEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix EnvTest Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take many minutes to propagate to all services in the site. Howerver, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected EnvTest service instance's list of enabled features.

```
Reset-EnvTestEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-EnvTestServiceGroupMembership

March 11, 2024

Reloads the access permissions and configuration service locations for the EnvTest Service.

Syntax

```
Reset-EnvTestServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables you to reload EnvTest Service access permissions and configuration service locations. The Reset-EnvTestServiceGroupMembership command must be run on at least one instance of the service type (EnvTest) after installation and registration with the configuration service. Without this operation, the EnvTest services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-EnvTestServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    EnvTestServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-EnvTestServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.EnvTest.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-EnvTestServiceGroupMembership command.

Outputs

Citrix.EnvTest.Sdk.ServiceInstance

Reset-EnvTestServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the EnvTest Service instance.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-EnvTestConfiguration

March 11, 2024

Sets the Environment Test Service's configuation options

Syntax

```
Set-EnvTestConfiguration
   [-PerTypeDiscoveredObjectLimit <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Sets the Environment Test Service's configuation options and broadcasts the changes to other machines in the Site.

Examples

EXAMPLE 1

Set the maximum to 100

```
Set-EnvTestConfiguration -PerTypeDiscoveredObjectLimit 100
```

Parameters

-PerTypeDiscoveredObjectLimit

Sets the maximum number of objects of a particular type to be explored when discovering objects during a test run. Default: 50

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Integer

Must be greater than zero.

Outputs

String

Related Links

Set-EnvTestDBConnection

March 11, 2024

Configures a database connection for the EnvTest Service.

Syntax

```
Set-EnvTestDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix EnvTest Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-EnvTestDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-EnvTestDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the EnvTest Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-EnvTestDBConnection cmdlet returns an object describing the status of the EnvTest Service together with extra diagnostics information. Possible values are:

- OK:

The EnvTest Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured:

No database connection string is set for the EnvTest Service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the EnvTest Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the configured connection string.

- DBNewerVersionThanService:

The version of the EnvTest Service currently in use is newer than, and incompatible with, the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

- DBOlderVersionThanService:

The version of the EnvTest Service schema on the database is newer than, and incompatible with, the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress:

A database schema upgrade is in progress.

- PendingFailure:

Connectivity between the EnvTest Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the EnvTest Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

The status of the EnvTest Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured.

After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-EnvTestDBCredentials

March 11, 2024

Configures the database server SQL credentials for the EnvTest Service.

Syntax

```
Set-EnvTestDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix EnvTest Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional EnvTest Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-EnvTestDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-EnvTestDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-EnvTestDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-EnvTestDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-EnvTestServiceMetadata

March 11, 2024

Adds or updates metadata on the given Service.

Syntax

```
Set-EnvTestServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Service objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-EnvTestServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                          Value
---                                          -----
property                                     value
```

Parameters

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-EnvTestServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-EnvTestTaskMetadata

March 11, 2024

Adds or updates metadata on the given Task.

Syntax

```
Set-EnvTestTaskMetadata
   [-TaskTaskId] <Guid>
   -Name <String>
   -Value <String>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-EnvTestTaskMetadata
    [-TaskTaskId] <Guid>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-EnvTestTaskMetadata
    [-InputObject] <EnvTestTask[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-EnvTestTaskMetadata
    [-InputObject] <EnvTestTask[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Task objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-EnvTestTaskMetadata -TaskTaskId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-TaskTaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	EnvTestTask[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-EnvTestTaskMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Start-EnvTestTask

March 11, 2024

Starts a new test task.

Syntax

```
Start-EnvTestTask
     [-IgnoreRelatedObjects]
     [-RunAsynchronously]
     [-ExcludeNotRunTests]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Start-EnvTestTask
     -TestId <String>
     [-TargetIdType <String>]
     [-TargetId <String>]
     [-CultureName <String>]
     [-IgnoreRelatedObjects]
     [-RunAsynchronously]
     [-ExcludeNotRunTests]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Start-EnvTestTask
     -TestSuiteId <String>
     [-TargetIdType <String>]
     [-TargetId <String>]
     [-CultureName <String>]
     [-IgnoreRelatedObjects]
     [-RunAsynchronously]
     [-ExcludeNotRunTests]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Start-EnvTestTask
     [-CultureName <String>]
     -InputObject <PSObject[]>
     [-IgnoreRelatedObjects]
     [-RunAsynchronously]
     [-ExcludeNotRunTests]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Starts a new test task based on a set of criteria provided via parameters or piped input and either waits for the tests to run or returns immediately depending on how it is called. When running a test suite and providing a target object for that suite, the service will discover related objects by default, but this behavior may be disabled if desired.

Examples

EXAMPLE 1

Create and start a task with a single test and no target object.

```
$singleSimpleTestTask = Start-EnvTestTask -TestId
    Monitor_RegisteredWithConfigurationService
```

EXAMPLE 2

Create and start a task with a single test and no target object, with localized properties translated into Spanish.

```
$singleSimpleTestTaskInSpanish = Start-EnvTestTask -TestId
    Monitor_RegisteredWithConfigurationService -CultureName es-ES
```

EXAMPLE 3

Create and start a task with a single test suite and no target object.

```
$singleSimpleTestSuiteTask = Start-EnvTestTask -TestSuiteId
    Infrastructure
```

EXAMPLE 4

Create and start a task with a single test suite and a catalog target object.

```
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -
    TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
```

EXAMPLE 5

Create and start a task with a single test suite and a catalog target object, and return immediately not waiting for the tests to complete.

```
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -
    TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid -
    RunAsynchronously
```

EXAMPLE 6

Create and start a task with a single test, a target object for that test, and no object discovery based on that target.

```
$adAccountPool = Get-AcctIdentityPool
$singleTestTaskWithNoObjectDiscovery = StartEnvTestTask -
    IgnoreRelatedObjects -TestId
    ADIdentity_IdentityPool_ValidatePoolIsUnlocked -TargetIdType
    IdentityPool -TargetId $adAccountPool.IdentityPoolUid
```

EXAMPLE 7

Create two different discovery target definitions, put them in an array, then start a task based on both via -InputObject.

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition
     -TestSuiteId Infrastructure
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -
    TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-
    BrokerCatalog).Uuid
$inputObjects = @($singleSimpleTestSuiteTaskTarget,
    $singleTestSuiteTaskTarget)
Start-EnvTestTask -InputObject $inputObjects
```

Parameters

-TestId

Test identifiers. If specified, do not specify -TestSuiteId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-TestSuiteId

Test suite identifiers. If specified, do not specify -TestId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

One or more test targets defining the task, see Input Types for details about what kind of objects are permissible. Any valid object passed to this parameter may also be piped into this cmdlet.

Type:	PSObject[]
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TargetIdType

Describes the type of corresponding object passed with -TargetId

Type:	String
Position:	Named
Default value:	Empty

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetId

The Ids that object tests or tests suites will target. By default, other components are queried for objects related to these.

Type:	String
Position:	Named
Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CultureName

The culture name in which to produce results. The culture name is in standard language/region-code format; for example “en-US”.

Type:	String
Position:	Named
Default value:	The current user interface culture
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreRelatedObjects

Do not ask other components for objects related to a specified target.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Do not wait for the test run to complete, return immediately.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludeNotRunTests

If set, tests that are not run because no object matching their requirements is found are NOT included in test counts and results.

Type:	SwitchParameter
Position:	Named
Default value:	False (include Not Run tests)
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition

A single EnvTestDiscoveryTargetDefinition can be specified to target one test or test suite.

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition[]

An array of EnvTestDiscoveryTargetDefinition(s) can be specified to target any combination of tests and/or test suites.

PSCustomObject

A single PSCustomObject with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target one test or test suite.

PSCustomObject[]

An array of PSCustomObject(s) with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target any combination of tests and/or test suites.

Outputs

Ctrix.EnvTest.Sdk.EnvTestTask

The newly started task.

Stop-EnvTestTask

March 11, 2024

Stops a still running task from completing.

Syntax

```
Stop-EnvTestTask
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Stop-EnvTestTask
    [-TaskId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Stop-EnvTestTask
    [-Task <EnvTestTask>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Stops a still running task from completing. A task may still be retreived via Get-EnvTestTask until it Remove-EnvTestTask is called with its task id.

Examples

EXAMPLE 1

Stops the current task from completing if it is still running.

```
Stop-EnvTestTask
```

EXAMPLE 2

Stops a task from completing via its id, which is available from an existing task's $task.TaskId property.

```
Stop-EnvTestTask -TestId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

EXAMPLE 3

Stops the second task in the list returned by Get-EnvTestTask -List.

```
$secondTask = $(Get-EnvTestTask -List)[1]
Stop-EnvTestTask -Task $secondTask
```

Parameters

-TaskId

The id of the task to stop, retrieveable from the $task.TaskId property.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Task

An EnvTestTask representing the task to stop

Type:	EnvTestTask
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Switch-EnvTestTask

March 11, 2024

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Syntax

```
Switch-EnvTestTask
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Switch-EnvTestTask
      [-TaskId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Switch-EnvTestTask
      [-Task <EnvTestTask>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Examples

EXAMPLE 1

Switches the current task to another via its id, which is available from an existing task's $task.TaskId property.

```
Switch-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

EXAMPLE 2

Switches the current task to the second in the list returned by Get-EnvTestTask -List.

```
$secondTask = $(Get-EnvTestTask -List)[1]
Switch-EnvTestTask -Task $switchTask
```

Parameters

-TaskId

Specifies the identifier of the task to be made current.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Task

The task object to be made current, retrieveable from the $task.TaskId property.

Type:	EnvTestTask
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-EnvTestTask command.

Outputs

None

By default, this cmdlet returns no output.

Test-EnvTestDBConnection

March 11, 2024

Tests whether a database is suitable for use by the Citrix EnvTest Service.

Syntax

```
Test-EnvTestDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-EnvTestDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-EnvTestDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix EnvTest Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-EnvTestDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix EnvTest Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-EnvTestDBConnection cmdlet returns an object describing the status of the selected EnvTest Service instance that would result if the connection string were used with the Set-EnvTestDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK:

The Set-EnvTestDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured:

No database connection string is set for the service instance.

- DBRejectedConnection:

The database rejected the logon attempt from the EnvTest Service instance. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured:

The specified database does not exist, is not visible to the EnvTest Service instance, or the service's schema within the database is invalid.

- DBNotFound:

The specified database could not be located with the given connection string.

- DBNewerVersionThanService:

The EnvTest Service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

- DBOlderVersionThanService:

The EnvTest Service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

- DBVersionChangeInProgress:

A database schema upgrade is currently in progress.

- PendingFailure:

Connectivity between the EnvTest Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed:

Connectivity between the EnvTest Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown:

Service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

about_HypHostSnapIn

March 11, 2024

Topic

about_HypHostSnapin

Short Description

The Host Service PowerShell snap-in provides administrative functions for the Host Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Hyp'.

Long Description

The Host Service PowerShell snap-in enables both local and remote administration of the Host Service. It lets you configure XenDesktop deployments to make use of hypervisors, networks, and storage, and enables browsing of their contents using the Host PowerShell provider (Citrix.HypervisorProvider).

The provider creates a default PSDrive with a drive identifier of 'XDHyp'. This drive provides two root folders:

HostingUnits Folder

Contains a list of all the hosting units that have been defined using the new-Item provider command.

Hosting units define not only a hypervisor connection, but also reference networks and storage. Hosting units are used by the Machine Creation Service to provide the information required to create and manage virtual machines that can be used by other services. A hosting unit references a root path. This is a specific point in the provider connection tree. The hosting unit is constrained to provide only items below this point in the tree. This restricts the locations that the Machine Creation Service can use to create virtual machines and the networks and storage that can be used.

Connections Folder

Contains a list of all the hosting unit connections that are defined using the new-Item provider command.

Change directory to a specific connection and use the dir/Get-ChildItem command to list all of the infrastructure (such as folders, hypervisors, networks, storage, and virtual machines) that is available in the hosting unit to which the connection refers. The paths to these items are used as the input to commands in the Host Service and Machine Creation Service snap-ins.

The contents of the Hosting Unit and Connection folders reflect the content and structure of the hypervisor to which they refer. The item extensions

reflect the object type for each item. Not all item types are appropriate for all hypervisor types. Possible item types are:

Virtual Machine (.vm)
Snapshot (.snapshot)
Cluster (.cluster)
Host (.host)
HostGroup (.hostgroup)
DataCenter (.datacenter)
Folder (.folder)
ResourcePool (.resourcepool)
ComputeResource (.computeresource)

When used with a path that refers to the Host provider (with a default drive of 'XDHyp:'), the Host provider extends the standard New-Item, Get-Item, Get-ChildItem, Remove-Item, Rename-Item, and Set-Item commands as described below. For more information about the basic behavior of these commands, see the help for the command. The Move-Item and Copy-Item commands are not supported for the Host provider.

New-Item

The following parameters are available when using New-Item in the Connections directory (or a path that refers to the directory). The Credential parameter is not supported.

-Name

Specifies the name of the connection, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the connection name must be specified as part of the Path parameter.

-HypervisorAddress <String[]>

Specifies an array of addresses that can be used to contact the required hypervisor. All the addresses are considered equivalent, that is, all of the addresses provide access to the same virtual machines, snapshots, network, and storage.

-ConnectionType <ConnectionType>

Specifies the type of hypervisor that the connection is for. Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)

vCenter (VMware vSphere/ESX)
Custom

-PluginId <String>

Specifies the class name for the Citrix Managed Machine library that is used to access the hypervisor. You can obtain this list using the Get-HypHypervisorPlugin command. The PluginId parameter must be specified if the ConnectionType is set to 'Custom'.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. You can specify the password as either Password or SecurePassword, but not both. The UserName parameter, and either Password or SecurePassword, specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as UserName and either Password or SecurePassword, so use of one precludes use of the other.

-Persist

Specifies that the connection details are persistent. If this parameter is not included, the connection is held only for the duration of the current runspace and PSDrive combination. Only persistent connection items are visible to administrators in other runspaces and PSDrives. Hosting units cannot be created from connections that are not persistent.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create

high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-Scopes <String[]>

Specifies the list of administrative scopes that the new connection will be a part of. The scopes control which administrators are able to work with the connection.

-ZoneUid <Guid>

Specifies the ZoneUid the connection belongs to. The zone determines which connections are local to the controller.

-IncludeUnavailable <Boolean>

Specifies whether or not to show all hypervisor plug-ins regardless of availability.

The following parameters are available when using New-Item in the HostingUnits directory (or a path that refers to the directory).

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-HypervisorConnectionName <String>

Specifies the name of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-HypervisorConnectionUid <Guid>

Specifies the unique identifier of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-RootPath <String>

Specifies the location in a connection that is used as the starting reference for the hosting unit. The path must point to an item in the connection that is marked as a SymLink. The root of a XenServer connection is a special case that is also considered a SymLink. If this parameter is not included, the current location in the provider is used.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-StoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. If the connection is based on cloud infrastructure, storage items are typically not available, in which case this parameter can be omitted.

-PersonalvDiskStoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates disks for the virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command will communicate with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that

the virtual machines created for this hosting unit will use local storage caching for their disk images.

-GpuGroup

Specifies a path to a GPU Group in a connection that will be used when Machine Creation Services creates VMs. Only a single GPU Group is supported and the value is immutable.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-JobGroup <Guid>

Specifies the Uid associuated with the HypStorage object created with the New-HypStorage command. This HypStorage object specifies any additional storage details required for the new connection.

The following parameters are available when using New-Item relative to a connection or hosting unit.

-ItemType <String>

Specifies the type of item to create when invoked relative to a connection or hosting unit. Supported ItemType values are:

SecurityGroup (cloud only)

-Description

Specifies a description for the security group.

-VpcId

Specifies a VPC ID for the security group.

Get-Item

Get-ChildItem (alias dir)

Rename-Item

Remove-Item

The following additional parameters are available.

AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

You can specify the Path parameter by name or by using the unique identifier for the connection or hosting unit enclosed in braces. For example:

-Path XDHyp:{1233-3213ACDF-12323}

The Filter parameter is not supported. Virtual machines created by the Machine Creation Service are returned only if the -Force parameter is used or if virtual machine tagging was disabled on the hosting unit with the NoVmTagging parameter when the VMs were created.

Set-Item

The following parameters are available when using Set-Item in the Connections directory.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. The password can be given as either Password or SecurePassword, but not both. The UserName parameter and either Password or SecurePassword specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as the UserName parameter and either Password or SecurePassword, so use of one precludes use of the other.

-HypervisorAddress <String[]>

Specifies the addresses of the hypervisor that this connection represents. This replaces all existing addresses.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-MaintenanceMode <Boolean>

Places the connection into maintenance mode which disables all communication between XenDesktop and the Hypervisor. Use this mode when making changes to the hypervisor; for instance, if the password for the access account needs to be changed.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command tries to use a local Host Service.

The Credential parameter is not supported. Addresses can be modified with the Add-HypHypervisorConnectionAddress and Remove-HypHypervisorConnectionAddress commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The following parameters are available when using New-Item in the HostingUnits directory.

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching <Boolean>

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Storage can be modified with the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The item types returned when these commands are used in the Host Service provider are defined in the Object Definitions section below.

Examples

To Create a Persistent Hypervisor Connection

new-item -path “xdhyp:\Connections”-Name MyConn -ConnectionType

```
XenServer -HypervisorAddress “http:\\address”-UserName user
-Password password -Persist

PSPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\Connections\MyConn

PSParentPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\Connections

PSChildName: MyConn
PSDrive: XDHyp
PSProvider: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor

PSIsContainer: True
HypervisorConnectionUid: 04e6daa2-5cbd-4491-b70c-6daf733ee82a
HypervisorConnectionName: MyConn
ConnectionType: XenServer
HypervisorAddress: {http:\\address}
UserName: user
Persistent: True
PluginId: XenFactory
SupportsPvsVMs: True
Revision: 1b0b0d02-bc1b-49d8-b2b0-be6fb7f150ad
MaintenanceMode: False
Metadata: {MaxAbsoluteActiveActions = 100,

MaxAbsoluteNewActionsPerMinute = 100,
MaxPowerActionsPercentageOfDesktops = 20}

To Create a Hosting Unit

new-item -Path “xdhyp:\HostingUnits”

-Name MyHU
-HypervisorConnectionName MyConn
-RootPath XDHYP:\Connections\MyConn
-NetworkPath XDHYP:\Connections\MyConn\Network 0.network
-StoragePath XDHYP:\Connections\MyConn\Local storage on
myXenServer.storage

PSPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\HostingUnits\MyHU

PSParentPath: Citrix.HostingUnitService.Admin.V1.0\
```

Citrix.Hypervisor::XDHyp:\HostingUnits

PSChildName: MyHU
PSDrive: XDHyp
PSProvider: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor

PSIsContainer: True
HostingUnitUid: df91f886-1141-4280-bd59-2ee260a4df79
HostingUnitName: MyHU
HypervisorConnection: MyConn
RootPath: /
RootId:
NetworkPath: /Network 0.network
NetworkId: ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage: {/Local storage on myXenServer.storage}
VMTaggingEnabled: True
Metadata: {}

Relative paths can be used for all parameters.

Object Definitions

Citrix.XDInterServiceTypes.HypervisorConnection

The hypervisor connection object is returned when a connection item is located. This item has the following parameters.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the connection item.

HypervisorConnectionName <String>

Specifies the name of the connection item.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the type of hypervisor that the connection is for.
Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

HypervisorAddress <String[]>

Specifies the addresses that can be used to contact the required hypervisor.

Username <String>

Specifies the administrator user name for the connection to the hypervisor (from the user name and password given as administrator credentials when

setting up this connection)

Persistent <Boolean>

Specifies whether or not the connection is persistent.

PluginId <String>

Specifies the Citrix Managed Machine class identifier for the hypervisor.

SupportsPvsVM <Boolean>

Specifies whether or not the connection can be used as part of a hosting unit. If this parameter is set to 'True', a hosting unit referencing this connection can be created.

Revision <Guid>

A unique identifier that is changed every time any properties of the connection are changed.

MaintenanceMode <Boolean>

Specifies whether or not the connection is currently in maintenance mode.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

The collection of metadata associated with the connection.

Citrix.XDInterServiceTypes.HostingUnit

The hosting unit object is returned when a hosting unit item is located. This item has the following parameters.

HostingUnitName <String>

Specifies the name of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HypervisorConnection <Citrix.XDInterServiceTypes.HypervisorConnection>

Specifies the hypervisor connection item that the hosting unit references.

NetworkId <String>

Specifies the unique identifier for the network in the hypervisor context that the hosting unit references.

NetworkPath <String>

Specifies the path to the network in the Host Service provider.

RootId <String>

Specifies the unique identifier for the root connection item in the hypervisor context that the hosting unit references.

RootPath <String>

Specifies the path to the root of the hosting unit from within the Host Service provider.

Storage <Citrix.XDInterServiceTypes.Storage[]>

Specifies the collection of storage objects that are defined for use as part of the hosting unit. This object contains the following parameters.

StorageID <String>

Specifies the identifier for the storage in the hypervisor context.

StoragePath <String>

Specifies the path to the storage in the Host Service provider.

VMTaggingEnabled <Boolean>

Specifies whether or not virtual machine metadata is used to tag virtual machines created by XenDesktop.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

Specifies the collection of metadata associated with the hosting unit.

Citrix.HostingUnitService.Sdk.HypervisorObject

The hypervisor object is returned when any item is located from within a Connection or HostingUnit folder. This item has the following parameters.

AdditionalData <Dictionary<String,String>

Stores extra untyped data for the item. This dictionary contains
different information for each item type.

For Storage Items

Key = StorageType
Values = Shared or Local

For VM Items

Key = PowerState
Values = PoweredOn,

PoweredOff,
Suspended,
TransitioningToOn,
TransitioningToOff,
Suspending,
Resuming,
Unknown,
Error

Key = TemplateIsWindowsTemplate
Values = True or False

For Snapshot Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure Managed Disk Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure SIG Image Definition Items

Key = TemplateIsWindowsTemplate
Values = True or False

Name <String>

Specifies the name of the item.

FullName <String>

Specifies the name with the appropriate file extension.

ObjectPath <String>

Specifies the relative path to the item from the root of the connection of which the item is part.

FullPath <String>

Specifies the absolute path to the item in the Citrix.Hypervisor provider.

Id <String>

Specifies the identity of the item in the hypervisor context.

IsContainer <Boolean>

Specifies whether or not the item can contain other items.

IsSymLink <Boolean>

Specifies whether or not the item can be used as a RootPath of a hosting unit.

ObjectType <Citrix.HostingUnitService.Sdk.NodeType>

Specifies the item type.

Error Codes

The provider commands can return the following error codes.

New-Item

ConnectionNameOrUidInvalid

The name or unique identifier of the hypervisor connection specified for the hosting unit is invalid.

HostingUnitRootPathInvalid

The root path specified for the hosting unit is invalid. The root path must be a valid item in the hypervisor tree and a SymLink.

HostingUnitNetworkPathInvalid

The network path specified for the hosting unit is invalid. The network path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitStoragePathInvalid

The storage path specified for the hosting unit is invalid. The storage path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitDuplicateObjectExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HostingUnitStorageDuplicateObjectExists

A hosting unit storage object with the same storage path already exists for this hosting unit. There can be only one object for each combination of hosting unit and storage path.

HypervisorNotContactable

The hypervisor could not be contacted at the supplied address, which is either invalid or unreachable.

HypervisorAddressInvalidFormat

The address is not in a valid form for the specified hypervisor type.

ConnectionAddressInvalid

The specified address is invalid and does not belong to the same pool.

HypervisorConnectionDuplicateObjectExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

HypervisorConnectionAddressDuplicateObjectExists

A hypervisor connection address object with the same address already exists for this hypervisor connection. There can be only one object for each combination of hypervisor connection and address.

HypervisorConnectionForHostingUnitIsVirtual

The specified hypervisor connection for the hosting unit is a virtual non-persistent connection. A persistent connection is required when creating a hosting unit.

InputNameInvalid

The name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ScopeNotFound

One or more of the scopes nominated for the new connection do not exist.

CannotCreateSecurityGroupHere

Security groups can only be created in a virtual private cloud (VPC).

Get-Item and Get-ChildItem

HypervisorConnectionObjectNotFound

The hypervisor connection object specified in the path could not be found.

HostingUnitObjectNotFound

The specified hosting unit object could not be found.

HypervisorInMaintenanceMode

The hypervisor for the specified connection is currently in maintenance mode and cannot be accessed.

FailureToRetrieveConnectionPassword

The password for the HypervisorConnection cannot be retrieved or decrypted.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Remove-Item

HostingUnitObjectToDeleteDoesNotExist

The specified hosting unit object does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The specified hypervisor connection object does not exist.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HypervisorConnectionObjectToDeleteIsInUse

The specified hypervisor connection object cannot be deleted because it is being used by one or more hosting units.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

ObjectCannotBeRemoved

The specified object cannot be removed.

Rename-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitDuplicateNameExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HypervisorConnectionDuplicateNameExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

InputNameInvalid

The new name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Set-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitObjectToUpdateDoesNotExist

The specified hosting unit object does not exist.

HostingUnitNetworkPathInvalid

The new network path specified for the hosting unit is invalid.
Either the network path does not exist or it is not relative to the
root path of the hosting unit.

HypervisorConnectionObjectToUpdateDoesNotExist

The specified hypervisor connection object does not exist.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

DatabaseNotConfigured
The operation could not be completed because the database for the service
is not configured.

DataStoreException
An error occurred in the service while attempting a database operation.
Communication with the database failed for various reasons.

CommunicationError

There was a problem communicating with the remote service.

about_HypHostSnapIn

March 11, 2024

Topic

about_HypHostSnapin

Short Description

The Host Service PowerShell snap-in provides administrative functions for
the Host Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Hyp'.

Long Description

The Host Service PowerShell snap-in enables both local and remote administration of the Host Service. It lets you configure XenDesktop deployments to make use of hypervisors, networks, and storage, and enables browsing of their contents using the Host PowerShell provider (Citrix.HypervisorProvider).

The provider creates a default PSDrive with a drive identifier of 'XDHyp'. This drive provides two root folders:

HostingUnits Folder

Contains a list of all the hosting units that have been defined using the new-Item provider command.

Hosting units define not only a hypervisor connection, but also reference networks and storage. Hosting units are used by the Machine Creation Service to provide the information required to create and manage virtual machines that can be used by other services. A hosting unit references a root path. This is a specific point in the provider connection tree. The hosting unit is constrained to provide only items below this point in the tree. This restricts the locations that the Machine Creation Service can use to create virtual machines and the networks and storage that can be used.

Connections Folder

Contains a list of all the hosting unit connections that are defined using the new-Item provider command.

Change directory to a specific connection and use the dir/Get-ChildItem command to list all of the infrastructure (such as folders, hypervisors, networks, storage, and virtual machines) that is available in the hosting unit to which the connection refers. The paths to these items are used as the input to commands in the Host Service and Machine Creation Service snap-ins.

The contents of the Hosting Unit and Connection folders reflect the content and structure of the hypervisor to which they refer. The item extensions reflect the object type for each item. Not all item types are appropriate for all hypervisor types. Possible item types are:

Virtual Machine (.vm)
Snapshot (.snapshot)
Cluster (.cluster)

Host (.host)
HostGroup (.hostgroup)
DataCenter (.datacenter)
Folder (.folder)
ResourcePool (.resourcepool)
ComputeResource (.computeresource)

When used with a path that refers to the Host provider (with a default drive of 'XDHyp:'), the Host provider extends the standard New-Item, Get-Item, Get-ChildItem, Remove-Item, Rename-Item, and Set-Item commands as described below. For more information about the basic behavior of these commands, see the help for the command. The Move-Item and Copy-Item commands are not supported for the Host provider.

New-Item

The following parameters are available when using New-Item in the Connections directory (or a path that refers to the directory). The Credential parameter is not supported.

-Name

Specifies the name of the connection, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the connection name must be specified as part of the Path parameter.

-HypervisorAddress <String[]>

Specifies an array of addresses that can be used to contact the required hypervisor. All the addresses are considered equivalent, that is, all of the addresses provide access to the same virtual machines, snapshots, network, and storage.

-ConnectionType <ConnectionType>

Specifies the type of hypervisor that the connection is for. Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

-PluginId <String>

Specifies the class name for the Citrix Managed Machine library that is used to access the hypervisor. You can obtain this list

using the Get-HypHypervisorPlugin command. The PluginId parameter must be specified if the ConnectionType is set to 'Custom'.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. You can specify the password as either Password or SecurePassword, but not both. The UserName parameter, and either Password or SecurePassword, specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as UserName and either Password or SecurePassword, so use of one precludes use of the other.

-Persist

Specifies that the connection details are persistent. If this parameter is not included, the connection is held only for the duration of the current runspace and PSDrive combination. Only persistent connection items are visible to administrators in other runspaces and PSDrives. Hosting units cannot be created from connections that are not persistent.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-Scopes <String[]>

Specifies the list of administrative scopes that the new connection will be a part of. The scopes control which administrators are able to work with the connection.

-ZoneUid <Guid>

Specifies the ZoneUid the connection belongs to. The zone determines which connections are local to the controller.

-IncludeUnavailable <Boolean>

Specifies whether or not to show all hypervisor plug-ins regardless of availability.

The following parameters are available when using New-Item in the HostingUnits directory (or a path that refers to the directory).

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-HypervisorConnectionName <String>

Specifies the name of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-HypervisorConnectionUid <Guid>

Specifies the unique identifier of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-RootPath <String>

Specifies the location in a connection that is used as the starting reference for the hosting unit. The path must point to an item in the connection that is marked as a SymLink. The root of a XenServer connection is a special case that is also considered a SymLink. If this parameter is not included, the current location in the provider is used.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-StoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. If the connection is based on cloud infrastructure, storage items are typically not available, in which case this parameter can be omitted.

-PersonalvDiskStoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates disks for the virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command will communicate with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-GpuGroup

Specifies a path to a GPU Group in a connection that will be used when Machine Creation Services creates VMs. Only a single GPU Group is supported and the value is immutable.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-JobGroup <Guid>

Specifies the Uid assocuiated with the HypStorage object created with the New-HypStorage command. This HypStorage object specifies any additional storage details required for the new connection.

The following parameters are available when using New-Item relative to a connection or hosting unit.

-ItemType <String>

Specifies the type of item to create when invoked relative to a connection or hosting unit. Supported ItemType values are:

SecurityGroup (cloud only)

-Description

Specifies a description for the security group.

-VpcId

Specifies a VPC ID for the security group.

Get-Item

Get-ChildItem (alias dir)

Rename-Item

Remove-Item

The following additional parameters are available.

AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection

has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

You can specify the Path parameter by name or by using the unique identifier for the connection or hosting unit enclosed in braces. For example:

-Path XDHyp:{1233-3213ACDF-12323}

The Filter parameter is not supported. Virtual machines created by the Machine Creation Service are returned only if the -Force parameter is used or if virtual machine tagging was disabled on the hosting unit with the NoVmTagging parameter when the VMs were created.

Set-Item

The following parameters are available when using Set-Item in the Connections directory.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. The password can be given as either Password or SecurePassword, but not both. The UserName parameter and either Password or SecurePassword specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as the UserName parameter and either Password or SecurePassword, so use of one precludes use of the other.

-HypervisorAddress <String[]>

Specifies the addresses of the hypervisor that this connection represents. This replaces all existing addresses.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-MaintenanceMode <Boolean>

Places the connection into maintenance mode which disables all communication between XenDesktop and the Hypervisor. Use this mode when making changes to the hypervisor; for instance, if the password for the access account needs to be changed.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command tries to use a local Host Service.

The Credential parameter is not supported. Addresses can be modified with the Add-HypHypervisorConnectionAddress and Remove-HypHypervisorConnectionAddress commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The following parameters are available when using New-Item in the HostingUnits directory.

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created

by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching <Boolean>

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Storage can be modified with the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The item types returned when these commands are used in the Host Service provider are defined in the Object Definitions section below.

Examples

To Create a Persistent Hypervisor Connection

new-item -path “xdhyp:\Connections”-Name MyConn -ConnectionType

XenServer -HypervisorAddress “http:\\address”-UserName user
-Password password -Persist

PSPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\Connections\MyConn

PSParentPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\Connections

PSChildName: MyConn
PSDrive: XDHyp
PSProvider: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor

PSIsContainer: True
HypervisorConnectionUid: 04e6daa2-5cbd-4491-b70c-6daf733ee82a
HypervisorConnectionName: MyConn
ConnectionType: XenServer
HypervisorAddress: {http:\\address}
UserName: user
Persistent: True
PluginId: XenFactory
SupportsPvsVMs: True
Revision: 1b0b0d02-bc1b-49d8-b2b0-be6fb7f150ad
MaintenanceMode: False
Metadata: {MaxAbsoluteActiveActions = 100,

MaxAbsoluteNewActionsPerMinute = 100,
MaxPowerActionsPercentageOfDesktops = 20}

To Create a Hosting Unit

new-item -Path “xdhyp:\HostingUnits”

-Name MyHU
-HypervisorConnectionName MyConn
-RootPath XDHYP:\Connections\MyConn
-NetworkPath XDHYP:\Connections\MyConn\Network 0.network
-StoragePath XDHYP:\Connections\MyConn\Local storage on
myXenServer.storage

PSPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\HostingUnits\MyHU

PSParentPath: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor::XDHyp:\HostingUnits

PSChildName: MyHU
PSDrive: XDHyp

PSProvider: Citrix.HostingUnitService.Admin.V1.0\

Citrix.Hypervisor

PSIsContainer: True
HostingUnitUid: df91f886-1141-4280-bd59-2ee260a4df79
HostingUnitName: MyHU
HypervisorConnection: MyConn
RootPath: /
RootId:
NetworkPath: /Network 0.network
NetworkId: ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage: {/Local storage on myXenServer.storage}
VMTaggingEnabled: True
Metadata: {}

Relative paths can be used for all parameters.

Object Definitions

Citrix.XDInterServiceTypes.HypervisorConnection

The hypervisor connection object is returned when a connection item is located. This item has the following parameters.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the connection item.

HypervisorConnectionName <String>

Specifies the name of the connection item.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the type of hypervisor that the connection is for.
Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

HypervisorAddress <String[]>

Specifies the addresses that can be used to contact the required hypervisor.

Username <String>

Specifies the administrator user name for the connection to the hypervisor (from the user name and password given as administrator credentials when

setting up this connection)

Persistent <Boolean>

Specifies whether or not the connection is persistent.

PluginId <String>

Specifies the Citrix Managed Machine class identifier for the hypervisor.

SupportsPvsVM <Boolean>

Specifies whether or not the connection can be used as part of a hosting unit. If this parameter is set to 'True', a hosting unit referencing this connection can be created.

Revision <Guid>

A unique identifier that is changed every time any properties of the connection are changed.

MaintenanceMode <Boolean>

Specifies whether or not the connection is currently in maintenance mode.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

The collection of metadata associated with the connection.

Citrix.XDInterServiceTypes.HostingUnit

The hosting unit object is returned when a hosting unit item is located. This item has the following parameters.

HostingUnitName <String>

Specifies the name of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HypervisorConnection <Citrix.XDInterServiceTypes.HypervisorConnection>

Specifies the hypervisor connection item that the hosting unit references.

NetworkId <String>

Specifies the unique identifier for the network in the hypervisor context that the hosting unit references.

NetworkPath <String>

Specifies the path to the network in the Host Service provider.

RootId <String>

Specifies the unique identifier for the root connection item in the hypervisor context that the hosting unit references.

RootPath <String>

Specifies the path to the root of the hosting unit from within the Host Service provider.

Storage <Citrix.XDInterServiceTypes.Storage[]>

Specifies the collection of storage objects that are defined for use as part of the hosting unit. This object contains the following parameters.

StorageID <String>

Specifies the identifier for the storage in the hypervisor context.

StoragePath <String>

Specifies the path to the storage in the Host Service provider.

VMTaggingEnabled <Boolean>

Specifies whether or not virtual machine metadata is used to tag virtual machines created by XenDesktop.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

Specifies the collection of metadata associated with the hosting unit.

Citrix.HostingUnitService.Sdk.HypervisorObject

The hypervisor object is returned when any item is located from within a Connection or HostingUnit folder. This item has the following parameters.

AdditionalData <Dictionary<String,String>

Stores extra untyped data for the item. This dictionary contains
different information for each item type.

For Storage Items

Key = StorageType
Values = Shared or Local

For VM Items

Key = PowerState
Values = PoweredOn,

PoweredOff,
Suspended,
TransitioningToOn,
TransitioningToOff,
Suspending,
Resuming,
Unknown,
Error

Key = TemplateIsWindowsTemplate
Values = True or False

For Snapshot Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure Managed Disk Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure SIG Image Definition Items

Key = TemplateIsWindowsTemplate
Values = True or False

Name <String>

Specifies the name of the item.

FullName <String>

Specifies the name with the appropriate file extension.

ObjectPath <String>

Specifies the relative path to the item from the root of the
connection of which the item is part.

FullPath <String>

Specifies the absolute path to the item in the Citrix.Hypervisor provider.

Id <String>

Specifies the identity of the item in the hypervisor context.

IsContainer <Boolean>

Specifies whether or not the item can contain other items.

IsSymLink <Boolean>

Specifies whether or not the item can be used as a RootPath of a hosting unit.

ObjectType <Citrix.HostingUnitService.Sdk.NodeType>

Specifies the item type.

Error Codes

The provider commands can return the following error codes.

New-Item

ConnectionNameOrUidInvalid

The name or unique identifier of the hypervisor connection specified for the hosting unit is invalid.

HostingUnitRootPathInvalid

The root path specified for the hosting unit is invalid. The root path must be a valid item in the hypervisor tree and a SymLink.

HostingUnitNetworkPathInvalid

The network path specified for the hosting unit is invalid. The network path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitStoragePathInvalid

The storage path specified for the hosting unit is invalid. The storage path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitDuplicateObjectExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HostingUnitStorageDuplicateObjectExists

A hosting unit storage object with the same storage path already exists for this hosting unit. There can be only one object for each combination of hosting unit and storage path.

HypervisorNotContactable

The hypervisor could not be contacted at the supplied address, which is either invalid or unreachable.

HypervisorAddressInvalidFormat

The address is not in a valid form for the specified hypervisor type.

ConnectionAddressInvalid

The specified address is invalid and does not belong to the same pool.

HypervisorConnectionDuplicateObjectExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

HypervisorConnectionAddressDuplicateObjectExists

A hypervisor connection address object with the same address already exists for this hypervisor connection. There can be only one object for each combination of hypervisor connection and address.

HypervisorConnectionForHostingUnitIsVirtual

The specified hypervisor connection for the hosting unit is a virtual non-persistent connection. A persistent connection is required when creating a hosting unit.

InputNameInvalid

The name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ScopeNotFound

One or more of the scopes nominated for the new connection do not exist.

CannotCreateSecurityGroupHere

Security groups can only be created in a virtual private cloud (VPC).

Get-Item and Get-ChildItem

HypervisorConnectionObjectNotFound

The hypervisor connection object specified in the path could not be found.

HostingUnitObjectNotFound

The specified hosting unit object could not be found.

HypervisorInMaintenanceMode

The hypervisor for the specified connection is currently in maintenance mode and cannot be accessed.

FailureToRetrieveConnectionPassword

The password for the HypervisorConnection cannot be retrieved or decrypted.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Remove-Item

HostingUnitObjectToDeleteDoesNotExist

The specified hosting unit object does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The specified hypervisor connection object does not exist.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HypervisorConnectionObjectToDeleteIsInUse

The specified hypervisor connection object cannot be deleted because it is being used by one or more hosting units.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

ObjectCannotBeRemoved

The specified object cannot be removed.

Rename-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitDuplicateNameExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HypervisorConnectionDuplicateNameExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

InputNameInvalid

The new name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Set-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitObjectToUpdateDoesNotExist

The specified hosting unit object does not exist.

HostingUnitNetworkPathInvalid

The new network path specified for the hosting unit is invalid. Either the network path does not exist or it is not relative to the root path of the hosting unit.

HypervisorConnectionObjectToUpdateDoesNotExist

The specified hypervisor connection object does not exist.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

CommunicationError

There was a problem communicating with the remote service.

about_HypStorage

March 11, 2024

Topic

about_HypStorage

Short Description

The HypStorage object defines parameters for a hosting unit. The parameters specify a storage tier definition made up of the storage type and one or more storage locations. When created it is assigned a job group uid with the -JobGroup parameter.

The HypStorage can then be used with a subsequent New-Item operation via the -JobGroup reference.

Long Description

A HypStorage object defines a set of parameters for a hosting unit. The parameters specify a storage tier definition and the HypStorage can then be used with a subsequent New-Item operation via the -JobGroup reference.

-JobGroup <Uid>

Specifies the unique id of the new job group

-StoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines.

-StorageType <storage type>

Specifies the type of the new storage tier. Currently the only storage type supported is TemporaryStorage.

Once added to the HostingUnit with the New-Item cmdlet, the additional storage can subsequently be modified or removed with the Add-HypHostingUnitStorage, Set-HypHostingUnitStorage and Remove-HypHostingUnitStorage cmdlets.

Examples

To create a HypStorage and use it when defining a new Hosting Unit

Get A Unique Id For The Job Group

$job = [Guid]::NewGuid()

Define The Storage Tier

New-HypStorage -JobGroup $job -StorageType TemporaryStorage -StoragePath @('XDHyp:\Connections\MyConn
Storage.storage')

Use It In The New-Item Call

New-Item -HypervisorConnectionName 'MyConnection'-JobGroup $job -NetworkPath @('XD-Hyp:\Connections\MyConnection\Network 1.network') <additional New-Item parameters…>

Topic

XenServer SDK - Custom Properties

Short Description

Overview of custom properties settings for a HypervisorConnection object.

Long Description

Custom properties are properties of the HypervisorConnection object, which are specific to the object's hosting hypervisor infrastructure. Custom properties can be used to control or tune behaviors of the hosting connection.

Custom Properties For Azure Resource Manager

The following custom properties are specific to AzureRM.

- SubscriptionId: (String) The Azure Subscription ID.
- TenantId: (String) The Azure Tenant ID.
- AuthenticationAuthority: (String) The Microsoft user authentication endpoint.
  e.g. "https://login.microsoftonline.com/"
- ManagementEndpoint: (String) The Azure Resource Manager endpoint used to establish communications with Azure APIs.
  e.g. "https://management.azure.com/"

- StorageSuffix: (String) The DNS suffix of the Azure Storage endpoint URL. There are 4 default suffix strings, each one belonging to a different Azure environment:
  Azure Global: "core.windows.net"
  Azure China: "core.chinacloudapi.cn"
  Azure US Government: "core.usgovcloudapi.net"
  Azure Germany: "core.cloudapi.de"
- ResourceManagementOperationPollingInterval: (Int) How long Azure waits before polling the status of all running operations managed by Azure's ResourceManagementClient class. Default is 3 seconds in order to poll often without throttling Azure by polling more often than necessary.
- MaximumConcurrentProvisioningOperations: (Int) The number of threads to use within the hypervisor manager, which limits number of simultaneous MCS Operations that are permitted in the provisioning workflow. Default is 500 threads for Azure, where each thread manages exactly one MCS Operation. Increasing the number of threads is not recommended.
- PowerStateCacheExpirationInMinutes: (Int) The number of minutes until the memory cache, where the power state is stored, is expired. Once expired, one Azure API call will be made to get the latest power status for all Azure related catalogs in the site. This effectively refreshes the memory cache. Default is 5 mins.
- PowerStateCacheDegreeOfParallelism: (Int) The number of threads that should be used to fetch missing power states, individually, in parallel, in the event where some machines may be missing from an Azure Resource Graph (ARG) response. In such cases, power states for machines are fetched individually, either through another ARG query or a Virtual Machine 'Get'call. Default number of threads is 10. The number of threads provided as an argument must be between 1 and 512.
- PowerStateCacheUseCachedValuesOnlyAfterInSeconds: (Int) The number of seconds that can elapse before individual 'Get'state calls to Azure are no longer queried and instead machine power states are returned from the memory cached.

  Querying machine power states follows a three step process:

  1. A single Azure Resource Graph (ARG) call is used to query all machine

  power states.

  1. Machine power states that were not picked up by ARG are subsequently

individually queried by Azure 'Get'state calls.

1. Machine power states not successfully queried by Azure 'Get'state

calls within this custom property's timeframe will be returned from the memory cache.

If a machine's power state is not found in the memory cache, then it will be reported as Unknown. Default is 180 seconds. This property does not check if any query has timed out.

Custom Properties For Aws

The following custom properties are specific to the HypervisorConnection object using the AWS plugin.

- MaximumConcurrentProvisioningOperations: (Int) The number of threads to use within the hypervisor manager, which limits number of simultaneous MCS Operations that are permitted in the provisioning workflow. Default is 100 threads for AWS, where each thread manages exactly one MCS Operation. Increasing the number of threads is not recommended.

Custom Properties For Gcp

The following custom properties are specific to the HypervisorConnection object using the GCP plugin.

- MaximumConcurrentProvisioningOperations: (Int) The number of threads to use within the hypervisor manager, which limits number of simultaneous MCS Operations that are permitted in the provisioning workflow. Default is 500 threads for GCP, where each thread manages exactly one MCS Operation. Increasing the number of threads is not recommended.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

Get-<Noun> | Where { $_.Size = 'Small'} | Sort 'Date'| Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

Get-<Noun> -Size 'Small'-SortBy 'Date'-MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

Get-<Noun> -MaxRecordCount 9

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying

the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like ''High*''-or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company ''citrix''-Product '[X]EN*'
Get-<Noun> -Product ''Xen*''-Company ''CITRIX''
Get-<Noun> -Filter { Company -eq 'Citrix'-and Product -like 'Xen*'}

See about_Quoting_Rules and about_Wildcards for details about PowerShell
handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape
the wildcards using the normal PowerShell escape mechanisms (see
about_Escape_Characters), or switch to a filter expression and the -eq
operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
```

```
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

Get-<Noun> -Filter ‘Capacity -ge 10gb’
Get-<Noun> -Filter ‘Age -ge 20 -and Age -lt 40’
Get-<Noun> -Filter ‘VolumeLevel -like “[123]”’
Get-<Noun> -Filter ‘Enabled -ne $false’
Get-<Noun> -Filter ‘NullableProperty -ne $null’

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

Get-<Noun> -Filter ‘Enabled’# Equivalent to ‘Enabled -eq $true’
Get-<Noun> -Filter ‘-not Enabled’# Equivalent to ‘Enabled -eq $false’

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan

values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge “2010-08-23T12:30:00.0Z”}
$d = [DateTime]“2010-08-23T12:30:00.0Z”
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’} # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’} # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’} # 30 seconds ago

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like “Fred*”}
Get-<Noun> -Filter { Users -contains “Fred*”}

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

Get-<Noun> -Filter { Shape -eq 'Circle'-or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue'-and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue'-and Shape -eq 'Circle') }

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid

```
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-HypHostingUnitMetadata

March 11, 2024

Adds metadata on the given HostingUnit.

Syntax

```
Add-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
   [-HostingUnitName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
   [-HostingUnitName] <String>
```

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
    [-InputObject] <HostingUnit[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
    [-InputObject] <HostingUnit[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HostingUnit objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHostingUnitMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the HostingUnit with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Add-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-HostingUnitUid

Id of the HostingUnit

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HostingUnitName

Name of the HostingUnit

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HostingUnit[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.Metadata

Add-HypHostingUnitMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Add-HypHostingUnitNetwork

March 11, 2024

Makes additional hypervisor networks available for use in a HostingUnit.

Syntax

```
Add-HypHostingUnitNetwork
   [-NetworkPath] <String>
   [-LiteralPath] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to extend the set of hypervisor networks that are made available through the HostingUnit to the Citrix Machine Creation Service. When new machines are created, their virtual NICs can be associated only with networks that are in this set. This command cannot be used if the connection for the hosting unit is in maintenance mode.

Examples

EXAMPLE 1

The command adds a new network called “newNetwork.network”to the hosting unit called “MyHostingUnit”.

```
Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
   newNetwork.network'

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage }

          PersonalvDiskStorage : {
  }

          VMTaggingEnabled     : True
          Metadata             : {
  }

          PermittedNetworks    : {
 /Network 0.network, /newNetwork.network }
```

EXAMPLE 2

The command adds a new network called “newNetwork.network”to the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\MyHostingUnit>Add-HypHostingUnitNetwork -
   LiteralPath . -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
   newNetwork.network'

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage }

```

```
13            PersonalvDiskStorage : {
14    }
15
16            VMTaggingEnabled     : True
17            Metadata             : {
18    }
19
20            PermittedNetworks    : {
21   /Network 0.network, /newNetwork.network }
```

EXAMPLE 3

The command adds all of the networks that are available in the hosting unit to the specified hosting unit.

```
1  XDHyp:\HostingUnits\MyHostingUnit>dir *.network | Add-
       HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit
```

EXAMPLE 4

The command adds a new network location called “newNetwork.network”to the hosting unit called “MyHostingUnit”.

```
1  Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\
       MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
       newNetwork.network'
2
3  HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
4  HostingUnitName      : MyHostingUnit
5  HypervisorConnection : MyConnection
6  RootPath             : /
7  RootId               :
8  NetworkPath          : /Network 0.network
9  NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
10 Storage              : {
11  /Local storage.storage }
12
13 PersonalvDiskStorage : {
14   }
15
16 VMTaggingEnabled     : True
17 Metadata             : {
18   }
19
20 PermittedNetworks    : {
21  /Network 0.network, /newNetwork.network }
```

Parameters

-LiteralPath

Specifies the path to the hosting unit to which the network will be added. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkPath

Specifies the path to the network that will be added. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyNetwork.network

or <drive>:\Connections{<Connection Uid>}\MyNetwork.network

or <drive>:\HostingUnits\<HostingUnitName>\MyNetwork.network

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyNetwork.network

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Add-HypHostingUnitNetwork (NetworkPath parameter).

Outputs

Citrix.Host.Sdk.HostingUnit

Add-HypHostingUnitNetwork returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.Host.Sdk.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the default network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the default network specified for the hosting unit.

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

PermittedNetworks <Citrix.Host.Sdk.Network[]>

A full list of the hypervisor networks that are exposed for use in the hosting unit.

Notes

The network path must be valid for the hosting unit. The rules that are applied are as follows:

XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The network path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

NA

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkPathInvalid

The specified path is invalid.

HostingUnitNetworkPathInvalid

The network path cannot be found or is invalid. See notes above about validity.

HostingUnitNetworkDuplicateObjectExists

The specified network path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Add-HypHostingUnitStorage

March 11, 2024

Adds storage locations to a hosting unit.

Syntax

```
Add-HypHostingUnitStorage
   [-StoragePath] <String>
   [-StorageType <StorageType>]
   [-LiteralPath] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to add storage locations for storing the hard disks required by the virtual machines created by the Citrix Machine Creation Service. You cannot use this command if the connection for the hosting unit is in maintenance mode.

Examples

EXAMPLE 1

The command adds a new storage location called "newStorage.storage"to the hosting unit called "MyHostingUnit".

```
Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage'

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage, /newStorage.storage }

          PersonalvDiskStorage : {
 /newStorage.storage }

          VMTaggingEnabled     : True
          AdditionalStorage    : {
 TemporaryStorage }

          Metadata             : {
  }
```

EXAMPLE 2

The command adds a new storage location called "newStorage.storage"to the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\MyHostingUnit>Add-HypHostingUnitStorage -
   LiteralPath . -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage' -StorageType OSStorage

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage, /newStorage.storage }

```

```
13            PersonalvDiskStorage : {
14   /Local storage.storage }
15
16            VMTaggingEnabled     : True
17            AdditionalStorage    : {
18   TemporaryStorage }
19
20            Metadata             : {
21    }
```

EXAMPLE 3

The command adds all of the storage that is available in the hosting unit to the specified hosting unit.

```
1  XDHyp:\HostingUnits\MyHostingUnit>dir *.storage | Add-
       HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit
```

EXAMPLE 4

The command adds a new storage location called “newStorage.storage”to the hosting unit called “MyHostingUnit”.

```
1  Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
       MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
       newStorage.storage' -StorageType PersonalvDiskStorage
2
3  HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
4  HostingUnitName      : MyHostingUnit
5  HypervisorConnection : MyConnection
6  RootPath             : /
7  RootId               :
8  NetworkPath          : /Network 0.network
9  NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
10 Storage              : {
11  /Local storage.storage }
12
13 PersonalvDiskStorage : {
14  /Local storage.storage, /newStorage.storage }
15
16 VMTaggingEnabled     : True
17 AdditionalStorage    : {
18  TemporaryStorage }
19
20 Metadata             : {
21   }
```

Parameters

-LiteralPath

Specifies the path to the hosting unit to which storage will be added. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path to the storage that will be added. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyStorage.storage

or <drive>:\Connections{<Connection Uid>}\MyStorage.storage

or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyStorage.storage

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StorageType

Specifies the type of storage in StoragePath. Supported storage types are:

OSStorage

PersonalvDiskStorage

TemporaryStorage

Type:	StorageType
Position:	Named
Default value:	OSStorage
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

Outputs

Citrix.Host.Sdk.HostingUnit

Add-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.Host.Sdk.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

AdditionalStorage

The list of additional storage items that the hosting unit can use.

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

The storage path must be valid for the hosting unit. The rules that are applied are as follows:

XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStoragePathInvalid

The specified path is invalid.

HostingUnitStoragePathInvalid

The storage path cannot be found or is invalid. See notes above about validity.

HostingUnitStorageDuplicateObjectExists

The specified storage path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Add-HypHypervisorConnectionAddress

March 11, 2024

Add a connection address to a hypervisor connection.

Syntax

```
Add-HypHypervisorConnectionAddress
   [-LiteralPath] <String>
   [-HypervisorAddress] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to add addresses by which a hypervisor can be contacted. All addresses added to a single hypervisor connection are assumed to be equivalent (i.e. they all result in the ability to communicate with the same hypervisors). The hypervisor that the addresses reference is stored at the point of creation of the hypervisor connection. Once this is done, to be valid, all addresses must resolve to this hypervisor.

The addresses required are;

XenServer - The address of the XenServer machines (must all reference the same XenServer pool).

VMWare vSphere/ESX - The address of a vCenter Server.

Microsoft SCVMM/Hyper-V - the address of an SCVMM server.

Examples

EXAMPLE 1

Add the address ‘http:\\myserver.com’to the hypervisor connection called “MyConnection”.

```
Add-HypHypervisorConnectionAddress -LiteralPath XDHyp:\Connections\
   MyConnection -HypervisorAddress http:\\myserver.com

PSPath                   : Citrix.HostingUnitService.Admin.V1.0\Citrix.
   Hypervisor::XDHyp:\Connections\MyConnection
PSParentPath             : Citrix.HostingUnitService.Admin.V1.0\Citrix.
   Hypervisor::XDHyp:\Connections
PSChildName              : MyConnection
PSDrive                  : XDHyp
PSProvider               : Citrix.HostingUnitService.Admin.V1.0\Citrix.
   Hypervisor
PSIsContainer            : True
HypervisorConnectionUid  : 85581f42-c5da-4976-970c-ebc3448ea1e3
HypervisorConnectionName : MyConnection
ConnectionType           : XenServer
HypervisorAddress        : {
 http:\\myserver2.com,http:\\myserver.com }
```

```
14
15 UserName                : root
16 Persistent              : False
17 PluginId                : XenFactory
18 SupportsPvsVMs          : True
19 Revision                : 4c95c857-c54d-4f92-abef-0cce32c02502
20 Metadata                :
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats;

<drive>:\Connections\<HypervisorConnectionName>

or <drive>:\Connections{HypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorAddress

Specifies the address to be used. The address will be validated and the hypervisor must be contactable at the address supplied.

XenServer (ConnectionType = XenServer)

The address being added must reference the same XenServer pool referenced by any existing addresses for the same connection.

Type:	String
Position:	2
Default value:	None
Required:	True

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.HypervisorConnection

Add-HypHypervisorConnectionAddress returns an object containing the new definition of the hypervisor connection.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the hypervisor connection.

HypervisorConnectionName <string>

Specifies the name of the hypervisor connection.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the connection type of the connection.

XenServer - A XenServer hypervisor

SCVMM - A Microsoft SCVMM/Hyper-V hypervisor

vCenter - A VMWare vSphere/ESX hypervisor

Custom - A 3rd party hypervisor

HypervisorAddress <string[]>

A list of addresses that can be used to communicate with the hypervisor.

UserName <string>

The user name that is used when connecting to the hypervisor.

Persistent <Boolean>

Indicates whether the connection is stored in the database or is a temporary connection only with the same lifetime as the current Powershell session.

PlugInId <string>

The Citrix identifier for the Citrix Machine Management plug-in.

Revision <Guid>

Identifier for the current version of the hypervisor connection. This value changes every time a property of the hypervisor connection is updated.

SupportsPvsVMs <Boolean>

Indicates whether or not the connection can be used as part of a hosting unit and therefore used by the Citrix XenDesktop Machine Creation Service to create virtual machines. Only the built-in supported hypervisor connection types can be used for this (i.e. XenServer, SCVMM and vCenter).

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information relating to the hosting unit.

Notes

The address format must be valid for the hypervisor connection. The rules that are applied are as below:

XenServer (HypervisorConnection Type = XenServer)

http:\\<IP Address>

or http:\\<server Name>

or https:\\<server Name>

Note: To use multiple addresses to the same XenServer pool to provide failover functionality, all XenServers in the pool must have a shared block storage device. If the use of https connections and failover is required, the certificates on the servers must be trusted by all of the controllers (typically this means having a root certificate installed).

Note: If XenServers are moved to new XenServer pools after being added to a hypervisor connection, unpredictable results can occur. Once a XenServer is assigned to a hypervisor connection, it must not be moved to a new XenServer pool.

In the case of failure the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub directory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist

The hypervisor connection to which the address is to be added could not be located.

ConnectionAddressInvalid

The address could not be used to contact a hypervisor or the validation rules have not been met.

HypervisorConnectionAddressDuplicateObjectExists

The address specified is already part of the hypervisor connection.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Add-HypHypervisorConnectionMetadata

March 11, 2024

Adds metadata on the given HypervisorConnection.

Syntax

```
Add-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Name <String>
   -Value <String>
```

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
    [-HypervisorConnectionUid] <Guid>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
    [-HypervisorConnectionName] <String>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
    [-HypervisorConnectionName] <String>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
    [-InputObject] <HypervisorConnection[]>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
    [-InputObject] <HypervisorConnection[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHypervisorConnectionMetadata

cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the HypervisorConnection with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Add-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E
    -48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Property                                    Value
--------                                    -----
property                                    value
```

Parameters

-HypervisorConnectionUid

Id of the HypervisorConnection

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Name of the HypervisorConnection

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	False
Accept wildcard characters:	False

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.Metadata

Add-HypHypervisorConnectionMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- Set-HypHypervisorConnectionMetadata
- Remove-HypHypervisorConnectionMetadata

Add-HypHypervisorConnectionScope

March 11, 2024

Add the specified HypervisorConnection(s) to the given scope(s).

Syntax

```
Add-HypHypervisorConnectionScope
   [-Scope] <String[]>
   -InputObject <HypervisorConnection[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionScope
   [-Scope] <String[]>
   -HypervisorConnectionUid <Guid[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionScope
   [-Scope] <String[]>
   -HypervisorConnectionName <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-HypHypervisorConnectionScope command is used to associate one or more HypervisorConnection objects with given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter
- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid
- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To add a HypervisorConnection to a scope you need permission to change the scopes of the HypervisorConnection and permission to add objects to all of the scopes you have specified.

If the HypervisorConnection is already in a scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Adds a single HypervisorConnection to the 'Finance' scope.

```
Add-HypHypervisorConnectionScope Finance -HypervisorConnectionUid 6702
    C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Adds a single HypervisorConnection to the multiple scopes.

```
Add-HypHypervisorConnectionScope Finance,Marketing -
    HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Adds all visible HypervisorConnection objects to the 'Finance' scope.

```
Get-HypHypervisorConnection | Add-HypHypervisorConnectionScope Finance
```

EXAMPLE 4

Adds HypervisorConnection objects with a name starting with an 'A' to the 'Finance' scope.

```
Add-HypHypervisorConnectionScope Finance -HypervisorConnectionName A*
```

Parameters

-Scope

Specifies the scopes to add the objects to.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

Accept wildcard characters:	False

-InputObject

Specifies the HypervisorConnection objects to be added.

Type:	HypervisorConnection[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Specifies the HypervisorConnection objects to be added by HypervisorConnectionUid.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Specifies the HypervisorConnection objects to be added by HypervisorConnectionName.

Type:	String[]
Position:	Named
Default value:	None
Required:	True

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Add-HypMetadata

March 11, 2024

Adds metadata to a hypervisor connection or a hosting unit.

Syntax

```
Add-HypMetadata
   [-Property] <String>
   [-Value] <String>
   [-LiteralPath] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to store additional custom data against a hosting unit or hypervisor connection. This data is not used by the Machine Creation Service, and is provided only for consumers of the services to store any data that may be required for their operations. The metadata is returned along with the hypervisor connection or hosting unit that it is assigned to.

Examples

EXAMPLE 1

The command adds the metadata with the property name of “MyProperty”and value of “MyValue”to the hypervisor connection item called “MyConnection”.

```
Add-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -Property
    MyProperty -Value MyValue

Property                                                        Value
--------                                                        -----
MyProperty                                                      MyValue
```

EXAMPLE 2

The command adds the metadata with the property name of “MyProperty”and value of “MyValue”to all the hypervisor connection items that begin with the string “Citrix”.

```
dir xdhyp\connections\Citrix* | Add-HypMetadata -Property MyProperty -
    Value MyValue

Property                                                        Value
--------                                                        -----
MyProperty                                                      MyValue
MyProperty                                                      MyValue
MyProperty                                                      MyValue
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the hosting unit or hypervisor connection item to which to add the metadata. The path specified must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

or <drive>:\Connections\<Connection Name>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Property

Specifies the property name of the metadata to be added. The property must be unique for the item specified by the path.

The property cannot contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Value

Specifies the value for the property.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string the contains a path to Add-HypMetadata (Path parameter).

Outputs

Citrix.Host.Sdk.Metadata

Add-HypMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataForeignKeyObjectDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionMetadataForeignKeyObjectDoesNotExist

The hypervisor connection supplied in the path does not exist.

HostingUnitMetadataDuplicateObjectExists

Metadata for the specified hosting unit item already exists with the same property name.

HypervisorConnectionMetadataDuplicateObjectExists

Metadata for the specified hypervisor connection item already exists with the same property name.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

- Remove-HypMetadata

Get-HypConfigurationDataForItem

March 11, 2024

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

```
Get-HypConfigurationDataForItem
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in, the only provider items that can be used with this operation are VM items. For a VM, this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (in GB).

Examples

EXAMPLE 1

This command gets the configuration properties for a VM called ‘MyVm.vm’within a hypervisor connection called ‘MyConnection’.

```
Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
    MyConnection\MyVm.vm

                                CpuCount
                                    MemoryMB
                                    HardDiskSizeGB
                                --------
                                    --------
                                    --------------
                                        1

                                            1024

                                            24
```

EXAMPLE 2

This command gets the configuration properties for a VM called ‘MyVm.vm’within the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\
    MyVm.vm

                                CpuCount
                                    MemoryMB
                                    HardDiskSizeGB
                                --------
                                    --------
                                    --------------
                                        1

                                            1024

                                            24
```

EXAMPLE 3

This command gets the CPU count for a VM called ‘MyVm.vm’. The CPUCount is just one property of the VM items. To see all properties of an item, type “(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member”.

```
(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
    MyConnection\MyVm.vm).CPUCount
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats;

<drive>:\Connections\<Connection Name>\<Item Path of VM object>

or <drive>:\Connections{<connection Uid>\<Item Path of VM object>}

or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>

or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Outputs

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item ——————- CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

Notes

For this release, this cmdlet provides only configuration data for VM objects in the provider. Using a path to an item that is not a VM results in a error.

In the case of failure the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-HypConfigurationObjectForItem

March 11, 2024

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

```
Get-HypConfigurationObjectForItem
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in the only provider items that can be used with this operation are VM items. For a VM this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (GB).

Examples

EXAMPLE 1

This command gets the configuration properties for a VM called 'MyVm.vm'within a hypervisor connection called 'MyConnection'.

```
Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
    MyConnection\MyVm.vm

                                CpuCount
                                    MemoryMB
                                    HardDiskSizeGB
                                --------
                                    --------
                                    --------------
                                        1

                                            1024

                                            24
```

EXAMPLE 2

This command gets the configuration properties for a VM called 'MyVm.vm'within the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\
    MyVm.vm

                                CpuCount
                                    MemoryMB
                                    HardDiskSizeGB
```

```
4                                   --------
                                        --------
                                        --------------
5                                           1

                                                1024

                                                24
```

EXAMPLE 3

This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type "(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member".

```
1  (Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
      MyConnection\MyVm.vm).CPUCount
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats;

<drive>:\Connections\<Connection Name>\<Item Path of VM object>

or <drive>:\Connections{<connection Uid>\<Item Path of VM object>}

or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>

or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string the contains a path to Get-HypConfigurationDataForItem

Outputs

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item ——————- CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

Network Map

The networks that this VM or Snaphot is connected to.

Notes

For this release this cmdlet only provides configuration data for VM objects in the provider. Using a path to an item that is not a VM will result in a error.

In the case of failure the following errors can be produced.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError

An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured

The operation could not be completed as the database for the service is not configured.

DataStoreException

An error occurred in the service whilst attempting a database operation - communication to database failed for

for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

- Get-Item

Get-HypConnectionRegion

March 11, 2024

Enumerates the regions of a hypervisor connection that are based on cloud technology.

Syntax

```
Get-HypConnectionRegion
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to enumerate the available regions within a public or private cloud, when making hypervisor connections to cloud services. Sometimes, regions need to be selected and applied before the cloud connection can be used in a meaningful way. This cmdlet allows the supported regions to be listed so that one may be selected.

Once a region has been chosen, use the standard Set-Item provider cmdlet to select it. See the examples for further details.

This cmdlet may return no output, in which case the cloud connection can be considered "regionless" (or, implicitly, all within a single region). In such cases, there is no need to select a region, and the hypervisor connection can be used as is.

Examples

EXAMPLE 1

This sequence of commands enumerates the available regions of an Amazon AWS cloud connection, and then selects one of them for use in the connection.

```
Get-HypConnectionRegions -LiteralPath XDHyp:\Connections\AWS

          RegionName           : us-east-1
          Endpoint             : ec2.us-east-1.amazonaws.com

          RegionName           : us-west-1
          Endpoint             : ec2.us-west-1.amazonaws.com

          RegionName           : eu-west-1
```

```
10          Endpoint              : ec2.eu-west-1.amazonaws.com
11
12          (...)
13
14          c:\PS>Set-Item -Path XDHyp:\Connections\AWS -Region "us-east
               -1"
```

Parameters

-LiteralPath

Specifies the path to the hypervisor connection whose regions are being examined. This cmdlet is valid only for hypervisor connections that have the UsesCloudInfrastructure flag set to true. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConnectionRegion (LiteralPath parameter).

Outputs

Citrix.Host.Sdk.HypervisorRegion

Get-HypConnectionRegion returns zero or more instances of the HypervisorConnectionRegion object, each of which contain the following properties:

Name <string>

Specifies the unique name of the region.

Endpoint <string>

Specifies the URL endpoint that is specific to the region, if relevant. This may be an empty string, and is returned only for information purposes.

A full list of the hypervisor networks that are exposed for use in the hosting unit.

Notes

In the case of failure, the following errors can be produced.

Error Codes

ConnectionsPathInvalid

The path provided is not to an item in the Connections subdirectory of the host service provider.

HypervisorConnectionObjectNotFound

The path provided could not be resolved to an existing hypervisor connection. The name or GUID is invalid.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

ConnectionIsNotCloud

The hypervisor connection is not associated with cloud infrastructure, making it invalid to enumerate regions.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-HypDBConnection

March 11, 2024

Gets the database connection string for the specified data store used by the Host Service.

Syntax

```
Get-HypDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the database connection string from the currently selected Host Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Host Service instance running on controller "controller1.mydomain.net".

```
1  Get-HypDBConnection -AdminAddress controller1.mydomain.net
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Host Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the HostService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypDBSchema

March 11, 2024

Gets SQL scripts to create or maintain the database schema for the Citrix Host Service.

Syntax

```
Get-HypDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Host Service database schema, add a new Host service to an existing site, remove a Host service from a site, or create a database server logon for a Host service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Host service instance, otherwise the scripts relate to Host service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Host service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user

- Addition of database user to Host service roles

If ScriptType is Evict, the returned script contains:

- Removal of Host service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Host Service and copies it to a file called "C:\HostSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Host service schema.

```
Get-HypDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\HostSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Host service. This can be used when configuring a mirror server for use.

```
Get-HypDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    HostLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Host service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Host services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

Creates a database schema for the Citrix Host Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

Adds a Host Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

Removes a Host Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

Adds a logon for the Host Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Host services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Host Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.

  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypDBVersionChangeScript

March 11, 2024

Gets an SQL service schema update script for the Citrix Host Service.

Syntax

```
Get-HypDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Host Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Host Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Host Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Host Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Host Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-HypServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-HypDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Host Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-HypDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Host Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.

  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Host services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-HypServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypHypervisorPlugin

March 11, 2024

Gets the available hypervisor types.

Syntax

```
Get-HypHypervisorPlugin
    [-ZoneUid <Guid>]
    [-IncludeUnavailable <Boolean>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to retrieve a list of all the available hypervisor types, and their localized names.

Examples

EXAMPLE 1

Get the available hypervisor management plug-ins.

```
Get-HypHypervisorPlugin | Format-Table -AutoSize

           ConnectionType DisplayName              PluginFactoryName
              UsesCloudInfrastructure CitrixVerified
           -------------- -----------              -----------------
              ----------------------- --------------
                 SCVMM Microsoft virtualization MicrosoftPSFactory
                                       False           True
                VCenter VMware virtualization    VmwareFactory
                                         False           True
              XenServer XenServer                XenFactory
                                          False           True
```

EXAMPLE 2

Get the available hypervisor management plug-ins for the zone with the specified ZoneUid.

```
Get-HypHypervisorPlugin -ZoneUid 2534080e-9226-4af2-a2fc-ec6be14f9552
```

EXAMPLE 3

Get all Citrix supported hypervisor plug-ins for the specified ZoneUid.

```
Get-HypHypervisorPlugin -ZoneUid 2534080e-9226-4af2-a2fc-ec6be14f9552 -
    IncludeUnavailable $true
```

Parameters

-ZoneUid

ID of the Zone

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeUnavailable

Specifies whether or not to show all hypervisor plug-ins regardless of availability.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Outputs

Citrix.Host.Sdk.HypervisorPlugin

Get-HypHypervisorPlugin returns a list of objects containing the definition of the hypervisor plug-ins.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

The hypervisor connection type. This can be one of the following:

XenServer - XenServer hypervisor

SCVMM - Microsoft SCVMM/Hyper-V

vCenter - VMWare vSphere/ESX

Custom - a third-party hypervisor

DisplayName <string>

The localized display name (localized using the locale of the Powershell snap-in session)

PluginFactoryName <string>

The name of the hypervisor plug-in factory used to manage the hypervisor connections.

UsesCloudInfrastructure <Boolean>

Specifies whether or not the underlying hypervisor plug-in factory employs cloud-hosted infrastructure.

CitrixVerified <Boolean>

Specifies whether or not the underlying hypervisor plug-in is verified by Citrix.

Notes

To use third-party plug-ins, the plug-in assemblies must be installed into the appropriate location on each controller machine that forms part of the Citrix controller site. Failure to do this can result in unpredictable behavior, especially during service failover conditions.

In the case of failure the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-HypInstalledDBVersion

March 11, 2024

Gets a list of all available database schema versions for the Host Service.

Syntax

```
Get-HypInstalledDBVersion
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Host Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-HypDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Host Service database schema version number.

```
1 Get-HypInstalledDBVersion
```

EXAMPLE 2

Get the versions of the Host Service database schema for which upgrade scripts are supplied.

```
1 Get-HypInstalledDBVersion -Upgrade
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be updated should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be reverted should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-HypInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Host

Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypInventoryItem

March 11, 2024

Gets the resource items and child items from specified inventory locations using the resource type and a set of filtering and pagination parameters.

Syntax

```
Get-HypInventoryItem
   -ResourceType <String>
    [-ContinuationToken <String>]
    [-MaxRecords <Int32>]
    [-Skip <Int32>]
    [-ContainsName <String>]
    [-ForwardDirection <Boolean>]
    [-Tags <String>]
    [-Id <String>]
    [-AdditionalDataFilter <String>]
    [-Template <String>]
    [-Warn <Boolean>]
    [-Force <Boolean>]
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The ‘Get-HypInventoryItem‘ cmdlet gets the resource items and child items from specified inventory locations using the resource type and a set of filtering and pagination parameters.

‘Get-HypInventoryItem‘ requires a Hosting Unit path and the ResourceType parameter. The Resource-Type specifies the resource extension, such as ‘template‘, ‘vm‘, etc.

Optional parameters control how many items to return, where to start the list of items and how to filter items so that only a subset are returned.

Examples

EXAMPLE 1

Gets the first template resource from the ctx-test Hosting Unit

```
PS C:\Users\admin> Get-HypInventoryItem -LiteralPath "XDHyp:\
   HostingUnits\ctx-test" -ResourceType vm

AdditionalData : {

Parameters

-LiteralPath

This specifies the XDHyp:\ path to the Hosting Unit for the inventory to use. This parameter is required.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

Accept wildcard characters:	True

-ResourceType

This parameter specifies the type of the resources to return. This is a required parameter and corresponds to the resource Name extension, such as 'template', 'vm', 'launchtemplateversion'(only supported in AWS), or 'snapshot'(only supported in VMware).

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-ContinuationToken

This parameter controls where to start including items from the inventory. This is usually the 'Id' of an item and the included items begin after the given item is found.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-MaxRecords

The maximum number of items to return for the given call of the cmdlet. The default is to return one item.

Type:	Int32
Position:	Named
Default value:	1
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ContainsName

This parameter filters items so that only the ones containing the given string in the ‘Name‘ are included.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-ForwardDirection

Specifies whether the items are returned in forward page order (the default) or reverse.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Tags

This parameter specifies a JSON dictionary where the keys are the tag names and the values are the tag values. The parameter is used to filter items which have the given tags. An item must have all the given tags to match. Special values of ‘Not tagged‘ and ‘All values‘ are supported. For VMware, refer for additional usage details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Id

This parameter returns a single item with the given Identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-AdditionalDataFilter

This specifies a JSON dictionary of parameters to use in filtering resources using the AdditionalData properties. All values given must match for an item to be included.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Template

This parameter is used for the Machine Profile ResourceTypes only. It specifies a Template identifier or name to use in validation of the Machine Profile with the given Template. The validation will pass if the given Machine Profile resource is compatible with the given Template. Only Machine Profiles which pass this validation are included.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Warn

This parameter is used for along with any validation filtering parameter (such as TemplateId). It specifies that rather than excluding the items which failed validation, the item is included but with a Warn-

ing property added to the AdditionalData. This property carries a string which describes the reason for validation failure.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Force

Specifies whether to return the full list of items or whether to exclude the items created as part of Machine Creation Services. The default behavior is to exclude the MCS created items.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

A list of inventory items which are found in the given Hosting Unit inventory of the given ResourceType and matching any optional filtering parameters. As a convenience the first item of the list contains AdditionalData fields for 'TotalItemsCount', 'TotalFilteredItemsCount' and 'Tags'. These fields provide the counts of all the items of the ResourceType in the inventory, the set of items which would match the filters and a set of tags which may be used to filter the items, respectively.

Notes

For filtering in VMware, Tag's name is treated as the key and its category name as the value. Apart from Tags, VMware also has Custom Attributes which are key-value pair based metadata for the resources. Both of them can be applied to filtering using '-Tags' parameter.

In VMware, snapshots don't have tags or custom attributes of their own. So, these values are fetched from their parent VMs.

Get-HypLocalizedString

March 11, 2024

Obtains human-readable and locale-aware status messages from a hosting connection.

Syntax

```
Get-HypLocalizedString
    [-Locale] <String>
    [-Category] <String>
    [[-LookupKey] <String>]
    [-LiteralPath] <String>
```

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

TODO

Examples

EXAMPLE 1

This command illustrates how a single error/exception message can be obtained for a hosting operation that failed (such as a provisioning operation). The caller specifies that they need to display the message in the en-US locale. They also specify a lookup key or message ID for the message, which will have been obtained as an exception code from the failed operation. The locale and key/ID are traded for a readable message, which also includes substitutions.

```
Get-HypLocalizedString -LiteralPath XDHyp:\Connections\MyCloud -
    Category Exception -Locale "en-US" -LookupKey "MyCloud.
    InsufficientFreeIpSpace"

          Category             : Exception
          LookupKey            : MyCloud.InsufficientFreeIpSpace
          DisplayText          : There are not enough free IP addresses
              on the network {
 0 }
```

Parameters

-LiteralPath

Specifies the path to the hypervisor connection whose strings are being queried. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Locale

The requested locale for the message, such as “en-US”.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Category

The category of the localized string.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LookupKey

The lookup key or message ID.

Type:	String
Position:	4

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypLocalizedString (LiteralPath parameter).

Outputs

Citrix.Host.Sdk.HypervisorString

Get-HypLocalizedString returns zero or more instances of the HypervisorString object, each of which contain the following properties:

Category <string>

Specifies the category of the string, such as “Exception”.

LookupKey <string>

Specifies the unique lookup key or message ID within the category.

DisplayText <string>

Specifies the locale-aware and human-readable text.

Notes

In the case of failure, the following errors can be produced.

Error Codes

ConnectionsPathInvalid

The path provided is not to an item in the Connections subdirectory of the host service provider.

HypervisorConnectionObjectNotFound

The path provided could not be resolved to an existing hypervisor connection. The name or GUID is invalid.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-HypPvsDiskInfo

March 11, 2024

Gets instances of Pvs Disk Info.

Syntax

```
Get-HypPvsDiskInfo
   -FarmId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsDiskInfo
   [-FarmId <Guid>]
   -SiteId <Guid>
   -StoreId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsDiskInfo
   [-FarmId <Guid>]
   -SiteId <Guid>
   -DiskLocatorId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsDiskInfo
   -SiteId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve Pvs Disk Info of the farm ID provided

Examples

EXAMPLE 1

This command lists the PVS disk Locators of a farm.

```
Get-HypPvsDiskInfo -FarmId 00000000-0000-0000-0000-000000000000
```

Parameters

-FarmId

Specifies a filter for the FarmId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SiteId

Specifies a filter for the SiteId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StoreId

Specifies a filter for the StoreId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DiskLocatorId

Specifies a filter for the DiskLocatorId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a farm to retrieve from.

Guid

The GUID of a site to retrieve from.

Guid

The GUID of a site to retrieve from.

Outputs

None

By default, this cmdlet returns no output.

- Unregister-HypPvsSite

Get-HypPvsServer

March 11, 2024

Gets instances of PvsServers.

Syntax

```
Get-HypPvsServer
    [-ServerId <Guid>]
    [-ServerName <String>]
    [-ServerAddress <String>]
    [-Property <String[]>]
```

```
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve PvsServer whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all PvsSite objects.

Examples

EXAMPLE 1

This command lists the PVS servers that match the corresponding filters.

```
Get-HypPvsServer -ServerId 00000000-0000-0000-0000-000000000000 -
    ServerName "exampleServer" -ServerAddress "xyz.abc.local"
```

Parameters

-ServerId

Specifies a filter for the ServerId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServerName

Specifies a filter for the ServerName.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ServerAddress

Specifies a filter for the ServerAddress.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a server to retrieve.

Outputs

Citrix.Host.Sdk.PvsServer

This cmdlet returns matching PvsServer objects.

- Register-HypPvsServer
- Unregister-HypPvsServer

Get-HypPvsSite

March 11, 2024

Gets instances of PvsSites.

Syntax

```
Get-HypPvsSite
    [-SiteId <Guid>]
    [-SiteName <String>]
    [-FarmId <Guid>]
    [-FarmName <String>]
    [-ResourceLocation <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve PvsSite whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all PvsSite objects.

Examples

EXAMPLE 1

This command lists the PVS sites that match the corresponding filters.

```
Get-HypPvsSite -SiteId 00000000-0000-0000-0000-000000000000 -SiteName "
    exampleSite" -FarmId 00000000-0000-0000-0000-000000000000 -FarmName
    "exampleFarm" -ResourceLocation 00000000-0000-0000-0000-000000000000
```

Parameters

-SiteId

Specifies a filter for the SiteId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-SiteName

Specifies a filter for the SiteName.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-FarmId

Specifies a filter for the FarmId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)

Accept wildcard characters:	False

-FarmName

Specifies a filter for the FarmName.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ResourceLocation

Specifies a filter for the ResourceLocation.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a site to retrieve.

Outputs

Citrix.Host.Sdk.PvsSite

This cmdlet returns matching PvsSite objects.

- Unregister-HypPvsSite

Get-HypPvsStore

March 11, 2024

Gets instances of Pvs Store.

Syntax

```
Get-HypPvsStore
   -FarmId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsStore
   [-FarmId <Guid>]
   -SiteId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve Pvs Disk Locators of the farm ID provided

Examples

EXAMPLE 1

This command lists the PVS stores of a farm.

```
Get-HypPvsStore -FarmId 00000000-0000-0000-0000-000000000000
```

Parameters

-FarmId

Specifies a filter for the FarmId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SiteId

Specifies a filter for the SiteId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a farm to retrieve from.

Guid

The GUID of a site to retrieve from.

Outputs

None

By default, this cmdlet returns no output.

Get-HypScopedObject

March 11, 2024

Gets the details of the scoped objects for the Host Service.

Syntax

```
Get-HypScopedObject
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-ObjectType <ScopedObjectType>]
    [-ObjectId <String>]
    [-ObjectName <String>]
    [-Description <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Examples

EXAMPLE 1

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

```
Get-HypScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

```

```
ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Parameters

-ScopeId

Gets scoped object entries for the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ScopeName

Gets scoped object entries with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectType

Gets scoped object entries for objects of the given type.

Type:	ScopedObjectType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ObjectId

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectName

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Gets scoped object entries for objects with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.ScopedObject

The Get-HypScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-HypServerAddressDetails

March 11, 2024

Gets all the available addresses for a hypervisor connection.

Syntax

```
Get-HypServerAddressDetails
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to retrieve all the available hypervisor connection addresses that can be used to connect to the same Server pool. When used in conjunction with Add-HypHypervisorAddress, you can easily populate a connection with all the addresses that can be used to provide full failover support for a Server connection.

If the addresses are https addresses, the command uses the certificates installed on the Servers to provide https addresses along with thumbprints and pem certs.

Examples

EXAMPLE 1

Gets the available addresses for the connection "MyConnection".

```
Get-HypServerAddressDetails -LiteralPath XDHyp:\Connections\
   MyConnection

https:\\myserver.com
https:\\myServer1.com
```

EXAMPLE 2

Adds all the available addresses for the Server pool in “MyConnection”to the hypervisor connection.

```
Get-HypServerAddressDetails -LiteralPath XDHyp:\Connections\
    MyConnection | Add-HypHypervisorConnectionAddress -LiteralPath XDHyp
    :\Connections\MyConnectionPath
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats:

<drive>:\Connections\<HypervisorConnectionName>

or <drive>:\Connections{HHypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

HypervisorHostDetails

Get-HypServerAddressDetails returns a list of strings containing the available address and their certs/tumbprint info.

Notes

For this to work as required with https connections, the certificates installed on the Servers must be trusted by all controllers. Typically this means having the root certificate for the certificate trust chain installed on all controllers.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub-directory of a hosting unit item.

SupportsEnumerateHypervisorHostDetailsCapabilityMissing

The hypervisor is missing EnumerateHypervisorHostDetailsCapability.

HypervisorConnectionObjectNotFound

The hypervisor connection at the path specified cannot be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the Desktop logs.

Get-HypService

March 11, 2024

Gets the service record entries for the Host Service.

Syntax

```
Get-HypService
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns instances of the Host Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Host Service running in the current service group.

```
Get-HypService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.Service

The Get-HypServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-HypServiceAddedCapability

March 11, 2024

Gets any added capabilities for the Host Service on the controller.

Syntax

```
Get-HypServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Host Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Host Service.

```
Get-HypServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypServiceInstance

March 11, 2024

Gets the service instance entries for the Host Service.

Syntax

```
Get-HypServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Host Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Host Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1  Get-HypServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.ServiceInstance

The Get-HypServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Hyp.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Host.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

- about_HypHostSnapin
- Get-HypServiceStatus
- Reset-HypServiceGroupMembership

Get-HypServiceStatus

March 11, 2024

Gets the current state of the Host Service on the controller.

Syntax

```
Get-HypServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Host Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured. Before using this command, you don't have to configure the database connection to the Service.

Examples

EXAMPLE 1

Get the current status of the Host Service.

```
Get-HypServiceStatus
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-HypServiceStatus command returns an object containing the status of the Host Service together with extra diagnostics information.

DBUnconfigured

The Host Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The Host is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The Host is connected to a database that is valid, but it does not have the full functionality required so the Host cannot function. Upgrading the database is required.

DBNewerVersionThanService

The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

DBOlderVersionThanService

The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Host Service is running and is connected to a database containing a valid schema.

PendingFailure

Connectivity between the Host Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the Host and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Host service cannot operate while its connection to the database is unavailable.

Unknown

The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypVMMacAddress

March 11, 2024

Retrieves a list the MAC addresses for the VMs in the specified connection.

Syntax

```
Get-HypVMMacAddress
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to obtain a list of MAC addresses of all the virtual machines in the specified connection.

Examples

EXAMPLE 1

This command gets the MAC addresses for the connection called "MyConnection".

```
Get-HypVMMacAddress -LiteralPath XDHyp:\Connections\MyConnection

MacAddress                                VMId
----------                                ----
52:b0:1c:ed:60:fa                         f3395d2a-a196-41c2-e37d-764
    acf871599
62:6f:f0:40:d5:af                         5f4457b0-cc3c-f806-8ca7-5
    f57e4bdf2d1
4e:a5:9f:00:b2:0c                         3115177b-85a9-d8ee-d0f9-0
    c7437483c09
```

EXAMPLE 2

This command gets the MAC addresses for the connection at the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\Connections\MyConnection>Get-HypVMMacAddress -Path .

MacAddress                                VMId
----------                                ----
52:b0:1c:ed:60:fa                         f3395d2a-a196-41c2-e37d-764
    acf871599
62:6f:f0:40:d5:af                         5f4457b0-cc3c-f806-8ca7-5
    f57e4bdf2d1
4e:a5:9f:00:b2:0c                         3115177b-85a9-d8ee-d0f9-0
    c7437483c09
```

EXAMPLE 3

This command gets the MAC addresses for the connection that has a ConnectionUid of 268c66db-9b8c-47f6-9265-42326dbff006.

```
Get-HypVMMacAddress -LiteralPath Xdhyp:\connections\"{
 268c66db-9b8c-47f6-9265-42326dbff006 }
 "
```

Parameters

-LiteralPath

The path to a connection item in the hosting provider. Paths to anything other than a connection item will result in an error being returned. The path can be provided as either

<drive>:\connections\<Connection Name>

or <drive:>\connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Outputs

Citrix.Host.Sdk.HypervisorVMObject

Get-HypVMMMacAddress returns an object containing the following properties.

MacAddress <string> - specifies the MAC address of the VM. VMId <string> - specifies the identifier for the VM as defined in the hypervisor hosting it.

Notes

The path must refer to a connection item. Hosting unit items are not valid.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

If the path is not provided in an expected format, an InputConnectionsPathInvalid error results.

HypervisorConnectionObjectNotFound

The hypervisor connection object specified cannot be found.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-HypVolumeServiceConfiguration

March 11, 2024

Gets instances of the VolumeServiceConfiguration that are configured for this site.

Syntax

```
Get-HypVolumeServiceConfiguration
   [-VolumeServiceConfigurationUid <Guid>]
   [[-VolumeServiceConfigurationName] <String>]
   [-ConnectionType <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve VolumeServiceConfigurations whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all VolumeServiceConfiguration objects.

Examples

EXAMPLE 1

This command lists the site default volume service configuration for connections that use Citrix Cloud Platform.

```
Get-HypVolumeServiceConfiguration -VolumeServiceConfigurationName
    SiteDefault -ConnectionType CloudPlatform
```

Parameters

-VolumeServiceConfigurationName

Specifies a filter for the configuration name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-VolumeServiceConfigurationUid

Specifies a filter for the configuration ID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ConnectionType

Specifies a filter for the cloud connection type, such as “AWS”or “CloudPlatform”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The name of a configuration (or set of configurations) to retrieve.

Outputs

Citrix.Host.Sdk.VolumeServiceConfiguration

This cmdlet returns matching VolumeServiceConfiguration objects.

Get-HypXenServerAddress

March 11, 2024

Gets all the available addresses for a XenServer hypervisor connection.

Syntax

```
Get-HypXenServerAddress
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this cmdlet to retrieve all the available hypervisor connection addresses that can be used to connect to the same XenServer pool. When used in conjunction with Add-HypHypervisorAddress, you can easily populate a connection with all the addresses that can be used to provide full failover support for a XenServer connection.

If the addresses are https addresses, the command uses the certificates installed on the XenServers to provide suitable https addresses where possible. Only servers that can be resolved are returned.

Examples

EXAMPLE 1

Gets the available addresses for the connection "MyConnection".

```
Get-HypXenServerAddress -LiteralPath XDHyp:\Connections\MyConnection

https:\\myserver.com
https:\\myServer1.com
```

EXAMPLE 2

Adds all the available addresses for the XenServer pool in "MyConnection"to the hypervisor connection.

```
Get-HypXenServerAddress -LiteralPath XDHyp:\Connections\MyConnection |
    Add-HypHypervisorConnectionAddress -LiteralPath XDHyp:\Connections\
    MyConnectionPath
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats:

<drive>:\Connections\<HypervisorConnectionName>

or <drive>:\Connections{HHypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

Get-HypXenServerAddress returns a list of strings containing the available address.

Notes

For this to work as required with https connections, the certificates installed on the XenServers must be trusted by all controllers. Typically this means having the root certificate for the certificate trust chain installed on all controllers. Wildcard certificates are not supported for this operation.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub-directory of a hosting unit item.

HypervisorConnectionNotXenServer

The hypervisor connection to which the path refers is not for XenServer.

HypervisorConnectionObjectNotFound

The hypervisor connection at the path specified cannot be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Grant-HypSecurityGroupEgress

March 11, 2024

Adds an egress rule to a security group.

Syntax

```
Grant-HypSecurityGroupEgress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -GroupId <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Grant-HypSecurityGroupEgress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -IPRange <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is deprecated. Adding an egress rule permits network traffic from instances within the security group to pass to one or more destination CIDR IP address ranges or security groups.

Examples

EXAMPLE 1

Create a security group and grant full egress to anywhere.

```
$Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup -Description 'Example group'
Grant-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '
    0.0.0.0/16'
```

EXAMPLE 2

Make 2 security groups and permit group 1 to ping group 2.

```
$Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
     -Name MySecurityGroup1 -Description 'Example group 1'
$Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
