This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-MonitorWebhookProfile

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Removes the specified webhook profile.

Syntax

```
Remove-MonitorWebhookProfile
      -Uid <Int64>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet removes a webhook profile identified by its unique identifier (Uid) from the Monitor. It is used to manage webhook profiles by deleting unnecessary or outdated configurations.

Examples

EXAMPLE 1

This example removes the webhook profile with the specified unique identifier (Uid).

```
Remove-MonitorWebhookProfile -Uid 1
```

Parameters

-Uid

Specifies the unique identifier of the webhook profile to remove.

Type:	Int64
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Boolean

Returns a boolean stating whether respective webhook profile is removed successfully

Notes

Use Get-MonitorWebhookProfile to find the Uid of the profile you wish to remove.

Reset-MonitorDataStore

August 14, 2025

Refreshes the database string currently being used by the Monitor service.

Syntax

```
Reset-MonitorDataStore
      [-DataStore] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Returns the string for the database connection currently being used by the Monitor Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Refresh the database connection string for the Monitor Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Reset-MonitorDataStore -DataStore Secondary
OK
```

Parameters

-DataStore

Specifies the database connection logical name to be used by the Monitor Service. Can be either be 'Site'or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

Type:	String
Position:	2
Default value:	Site
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.ServiceStatus

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops 7 logs.

Reset-MonitorEnabledFeatureList

August 14, 2025

Refreshes the Monitor service's list of enabled features.

Syntax

```
Reset-MonitorEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Monitor Service instance's list of enabled features with that held by the Central Configuration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Monitor service instance's list of enabled features.

```
1  Reset-MonitorEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Reset-MonitorServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the Monitor Service.

Syntax

```
Reset-MonitorServiceGroupMembership
     [-ConfigServiceInstance] <ServiceInstance[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the Monitor Service.

The Reset-MonitorServiceGroupMembership cmdlet must be run on at least one instance of the service type (Monitor) after installation and registration with the configuration service. Without this operation, the Monitor services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-MonitorServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
   MonitorServiceGroupMembership
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-MonitorServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Monitor.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-MonitorServiceGroupMembership command.

Outputs

Citrix.Monitor.Sdk.ServiceInstance

Reset-MonitorServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Monitor Service instance.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-DirectorAgentHttps

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Enables or disables HTTPS configuration used by Citrix Infra Monitor Service as per the input.

Syntax

```
Set-DirectorAgentHttps
   -EnableHttps <Boolean>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Enables or disables HTTPS configuration used by Citrix Infra Monitor Service as per the input. This setting is used to modify the behavior of the service.

Examples

EXAMPLE 1

Enables or disables HTTPS configuration used by Citrix Infra Monitor Service as per the input.

```
Set-DirectorAgentHttps -EnableHttps $false
```

Parameters

-EnableHttps

the updated input for the HTTPS configuration used by Citrix Infra Monitor Service.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Sets the configuration settings used by the Monitor Service. Use these settings to modify the behavior of the service.

A database connection need not be configured for this command to be used.

Examples

EXAMPLE 1

Updates the settings in the site database with the newly specified values.

```
Set-MonitorConfiguration -GroomSessionsRetentionDays 5 -
    GroomFailuresRetentionDays 4 ...
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-GroomSessionsRetentionDays

Determines how many days to keep Session and Connection records after the Session is terminated.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomFailuresRetentionDays

Determines how many days to keep MachineFailureLog and ConnectionFailureLog records after these are created.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomLoadIndexesRetentionDays

Determines how many days to keep LoadIndex records after these are created.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-GroomDeletedRetentionDays

Determines how many days to keep Machine, Catalog, DesktopGroup and Hypervisor entities around that have a LifecycleState of 'Deleted'. This also deletes any related Session, Connection, Summary, Failure or LoadIndex records.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomSummariesRetentionDays

Determines how many days to keep DesktopGroupSummary, FailureLogSummary and LoadIndex-Summary records at the daily granularity.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMachineHotfixLogRetentionDays

Determines how many days to keep Machine-Hotfix history records at the daily granularity.

Type:	Int32

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	90
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMinuteRetentionDays

Determines how many days to keep minute data.

Type:	Int32
Position:	Named
Default value:	3
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomHourlyRetentionDays

Determines how many days to keep hourly data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 32 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataCollectionEnabled

Starts / stops data collection. Stopping data collection turns off polling, and does not persist operational event data to the database.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FullPollStartHour

Hour of day when Full Poll should begin.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomStartHour

Hour of day when Grooming should begin. Time with respect to UTC. Expected Values 0-23.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomStartMinuteOffsetEarliest

Earliest minute of day when Grooming should begin. Time with respect to UTC. Expected Values 0-1439.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

-GroomStartMinuteOffsetLatest

Latest minute of day when Grooming should begin. Time with respect to UTC. Expected Values 0-1439.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

-SyncDataToCasStartHour

Hour of the day when sync to CAS via blob path should start. Default is 1 AM

Type:	Int32
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResolutionPollTimeHours

Start time for the Resolution Poll worker.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SyncPollTimeHours

Start time for Sync Poll worker.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DetailedSqlOutputEnabled

Determines if the SqlLog should be enabled to send SQL statements to the CDF Trace

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorQueryTimeoutSeconds

Determines the maximum time Monitoring Service will wait for the database query execution

Type:	Int32
Position:	Named
Default value:	300
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CollectHotfixDataEnabled

This setting determines if the hotfix inventory data should be collected and stored in the database or if it should be thrown away.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationInstanceRetentionDays

Determines how many days to keep the history of application instances.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0 for non-platinum, 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationErrorsRetentionDays

Determines how many days to keep the history of application errors.

Type:	Int32
Position:	Named
Default value:	1 for Platinum, Enterprise and Non-Platinum licenses
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomApplicationFaultsRetentionDays

Determines how many days to keep the history of application faults.

Type:	Int32
Position:	Named
Default value:	1 for Platinum, Enterprise and Non-Platinum licenses
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomNotificationLogRetentionDays

FIXME

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageRawDataRetentionDays

Determines how many days to keep Resource Utilization data.

Type:	Int32
Position:	Named
Default value:	1 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageMinuteDataRetentionDays

Determines how many days to keep Resource Utilization summary minute data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomResourceUsageHourDataRetentionDays

Determines how many days to keep Resource Utilization summary hour data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 30 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomResourceUsageDayDataRetentionDays

Determines how many days to keep Resource Utilization summary day data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomProcessUsageHourDataRetentionDays

Determines how many days to keep Process Utilization summary hour data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomProcessUsageDayDataRetentionDays

Determines how many days to keep Process Utilization summary day data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 30 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomSessionMetricsDataRetentionDays

Determines how many days to keep SessionMetrics data.

Type:	Int32
Position:	Named
Default value:	2 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomEndpointMetricsDataRetentionDays

Determines how many days to keep EndpointMetrics data.

Type:	Int32
Position:	Named
Default value:	2 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-GroomMachineMetricDataRetentionDays

Determines how many days to keep MachineMetrics data.

Type:	Int32
Position:	Named
Default value:	3 for non-platinum and platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-GroomMachineMetricDaySummaryDataRetentionDays

Determines how many days to keep MachineMetricsSummary data.

Type:	Int32
Position:	Named
Default value:	7 for non-platinum and 90 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableDayLevelGranularityProcessUtilization

This setting is used to determine to enable or disable Day Level granularity for Process Data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomApplicationProbeLogsRetentionDays

Determines how many days to keep the history of application probe logs.

Type:	Int32
Position:	Named
Default value:	7 for Platinum, Enterprise and Non-Platinum licenses
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableHourLevelGranularityProcessUtilization

This setting is used to determine to enable or disable Hour Level granularity for Process Data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnableMinLevelGranularityProcessUtilization

This setting is used to determine to enable or disable Minute Level granularity for Process Data.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomSessionAutoReconnectsRetentionDays

Determines how many days to keep SessionAutoReconnects data

Type:	Int32
Position:	Named
Default value:	7 for non-platinum, 31 for platinum.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisableHypervisorMonitoring

Disable Hypervisor Monitoring for Cloud

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2206

-SendProcessDataToCASAndDatabase

This setting is useful for sending VDA Process data to CAS and Database

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2203

-SendProcessDataToCASAndSkipDatabase

This setting is useful for sending VDA Process data to CAS and skip Database

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2203

-EnableProcessDataLimitedMachines

Enable Process Data to be sent for 5000 Machines when number of VDAs is greater than 5k

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-SessionRecordingDataProcessing

This setting is useful for Processing Session Recording Events that are coming from VDA

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-GroomProcessDataLimitedMachinesRetentionDays

Delete all the table entry

Type:	Int32
Position:	Named
Default value:	7 Days
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-ProcessDataLimitedMachinesCount

Number of Machines to be allowed for sending the Process Data

Type:	Int32
Position:	Named
Default value:	5000
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomLhcReportRetentionDays

Determines how many days to keep LhcReport data

Type:	Int32
Position:	Named
Default value:	90
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-GroomMachinePowerActionLogRetentionDays

Determines how many days to keep MachinePowerActionLog data

Type:	Int32
Position:	Named
Default value:	1
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-GroomMachineCostSavingsSummaryHourlyRetentionDays

Determines how many days to keep MachineCostSavingsSummary data at hour level

Type:	Int32
Position:	Named
Default value:	45
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-GroomMachineCostSavingsSummaryDailyRetentionDays

Determines how many days to keep MachineCostSavingsSummary data at day level

Type:	Int32
Position:	Named
Default value:	32
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-GroomMachineCostSavingsSummaryMonthlyRetentionDays

Determines how many days to keep MachineCostSavingsSummary data at month level

Type:	Int32
Position:	Named
Default value:	1825
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-GroomMachineCostAllocationSummaryHourlyRetentionDays

Determines how many days to keep MachineCostAllocationSummary data at hour level

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	2
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomMachineCostAllocationSummaryDailyRetentionDays

Determines how many days to keep MachineCostAllocationSummary data at day level

Type:	Int32
Position:	Named
Default value:	32
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomMachineCostAllocationSummaryMonthlyRetentionDays

Determines how many days to keep MachineCostAllocationSummary data at month level

Type:	Int32
Position:	Named
Default value:	279
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomUserMachineLogSummaryRetentionDays

Determines how many days to keep UserMachineLogSummary data

Type:	Int32
Position:	Named
Default value:	95
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomMonthlyCostSummaryRetentionDays

Determines how many days to keep MonthlyCostSummary data

Type:	Int32
Position:	Named
Default value:	279
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-EnableVdaDataCollection

Enable the VDA Data Collection feature for pushing the config to VDA and send events to CAS EH

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-GroomComponentMetricsRetentionDays

Determines how many days to keep ComponentMetrics data

Type:	Int32
Position:	Named
Default value:	7
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-GroomComponentResourceUtilizationRetentionDays

Determines how many days to keep ComponentResourceUtilization data

Type:	Int32
Position:	Named
Default value:	3
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-DirectorAgentDefaultPollIntervalInSeconds

Determines the Director Agent polling interval.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-DirectorAgentDefaultPollStartupDelayMinutes

Determines delay of the Director Agent polling start after service startup.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-DirectorAgentEnableHttps

Determines Whether HTTPS is enabled on Director Agent or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomAutoScalePredictionRetentionDays

Determines how many days to keep AutoScalePrediction data

Type:	Int32
Position:	Named
Default value:	45
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-GroomUserResourceUtilizationSummaryRetentionDays

Determines how many days to keep UserResourceUtilizationSummary data at day level

Type:	Int32
Position:	Named
Default value:	32
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomSessionIdleTimeRetentionDays

Determines how many days to keep SessionIdleTime data

Type:	Int32
Position:	Named
Default value:	2
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomOldSpaSessionsRetentionDays

Determines how many days to keep Spa sessions data

Type:	Int32
Position:	Named
Default value:	7
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomOldSpaEnumerationsRetentionDays

Determines how many days to keep Spa enumerations data

Type:	Int32
Position:	Named
Default value:	7
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-GroomDevicePostureAnalysisRetentionDays

Determines how many days to device posture data

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	3
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-GroomApplicationNameIdRetentionDays

Determines how many days to keep ApplicationNameId data

Type:	Int32
Position:	Named
Default value:	120
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-GroomApplicationIdDesktopGroupIdMappingRetentionDays

Determines how many days to keep ApplicationIdDesktopGroupIdMapping data

Type:	Int32
Position:	Named
Default value:	120
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-GroomHistoricalApplicationLaunchRetentionDays

Determines how many days to keep HistoricalApplicationLaunch data

Type:	Int32
Position:	Named
Default value:	30
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-GroomApplicationUsageSummaryRetentionDays

Determines how many days to keep ApplicationUsageSummary data

Type:	Int32
Position:	Named
Default value:	90
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-GroomActiveApplicationLaunchRetentionDays

Determines how many days to keep ActiveApplicationLaunch data

Type:	Int32
Position:	Named
Default value:	30
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-GroomProcessGUIDCacheRetentionDays

Determines how many days to keep ProcessGUIDCache data

Type:	Int32
Position:	Named
Default value:	1
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-DisablePendoTrackEvents

Disable Pendo Track Events

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308
Removed in:	Citrix Virtual Apps and Desktop 7 2503

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

- Get-MonitorConfiguration

Set-MonitorDBConnection

August 14, 2025

Configures a database connection for the Monitor Service.

Syntax

```
Set-MonitorDBConnection
   [[-DataStore] <String>]
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Monitor Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-MonitorDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-MonitorDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Monitor Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-MonitorDBConnection cmdlet returns an object describing the status of the Monitor Service together with extra diagnostics information. Possible values are:

- OK

  The Monitor Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the Monitor Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Monitor Service instance, or the service's schema within the database is invalid.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Monitor Service currently in use is newer than, and incompatible with, the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

- DBOlderVersionThanService

  The version of the Monitor Service schema on the database is newer than, and incompatible with, the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Monitor Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Monitor Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Monitor Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- DatabaseError

  An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-MonitorDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the Monitor Service.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-MonitorDBCredentials
    [[-DataStore] <String>]
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-MonitorDBCredentials
    [[-DataStore] <String>]
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Monitor Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Monitor Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-MonitorDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$sqlCred = Get-Credential
Set-MonitorDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-MonitorDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-MonitorDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-MonitorDirectorAgent

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Returns a boolean

Syntax

```
Set-MonitorDirectorAgent
   -Component <String>
   -Fqdn <String>
   [-ResourceLocationId <Guid>]
   [-Domain <String>]
   [-Username <String>]
   [-Password <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a boolean stating whether respective stack monitoring agent is reconfigured successfully

Examples

EXAMPLE 1

Reconfigures the agent and saves its information in Monitor DB

```
Set-MonitorDirectorAgent -ComponentType "PVS" -Fqdn "AWPVS-1HBF0.bvt.
    local"
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Component

Type of component this agent is installed on

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Fqdn

FQDN for the machine where the component and agent are installed

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLocationId

Resource location the agent is targeted for

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Domain

Domain for the admin user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Username

Username for the admin user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

Password for the admin user

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Boolean

Returns a boolean stating whether respective stack monitoring agent is reconfigured successfully

Set-MonitorNotificationEmailServerConfiguration

August 14, 2025

Saves a new email server configuration

Syntax

```
Set-MonitorNotificationEmailServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationEmailServerConfiguration
   [-InputObject] <MonitorNotificationEmailServerConfiguration>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationEmailServerConfiguration
   -ProtocolType <EmailProtocolType>
   -ServerName <String>
   -PortNumber <Int32>
   -SenderEmailAddress <String>
   -RequiresAuthentication <Boolean>
   [-Credential <PSCredential>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The saved configuration describes the new settings to be used to send emails

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Set new email server configration using the specified parameters

```
$secpasswd = ConvertTo-SecureString "PasswordHere" -AsPlainText -Force
$mycreds = New-Object System.Management.Automation.PSCredential ("username", $secpasswd)

Set-MonitorNotificationEmailServerConfiguration -ProtocolType Smtp -ServerName "mail.citrix.com" -PortNumber 1111 -SenderEmailAddress "user1@abc.com" -RequiresAuthentication $true -Credential $mycreds
```

Parameters

-ProtocolType

Email protocol type.

Possible values are

Smtp

SmtpSsl

SmtpTls

Type:	EmailProtocolType
Accepted values:	Unknown, Smtp, SmtpSsl, SmtpTls
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Email server name

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PortNumber

Email server port number

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SenderEmailAddress

Sender's email address

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RequiresAuthentication

Whether the server requires authentication

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Configuration object to persist

Type:	MonitorNotificationEmailServerConfiguration
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credential

Configuration credential

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationEmailServerConfiguration

The saved configuration

Set-MonitorNotificationPolicy

August 14, 2025

Set/Modify MonitorNotificationPolicy object

Syntax

```
Set-MonitorNotificationPolicy
   [-WebhookProfileId <Int64>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationPolicy
   -InputObject <MonitorNotificationPolicy>
   [-WebhookProfileId <Int64>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationPolicy
   -Uid <Int64>
   [-Name <String>]
   [-Description <String>]
   [-Webhook <String>]
   [-IsSnmpEnabled <Boolean>]
   [-Enabled <Boolean>]
   [-WebhookProfileId <Int64>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a new policy instance using the specified parameters

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Enable the policy with the id 1

```
Set-MonitorNotificationPolicy -Id 1 -Enable
```

EXAMPLE 2

Update the policy with the id 1 to add new email address

```
$policy = Get-MonitorNotificationPolicy -Uid 1

$policy.EmailAddresses += "newemail@abc.com"

Set-MonitorNotificationPolicy -InputObject $policy
```

EXAMPLE 3

Update the policy with the id 1 to add new target value

```
$policy = Get-MonitorNotificationPolicy -Uid 1
$policy.TargetIds += "766cde70-3c69-4481-a658-4e11247ac70c"

$Policy = Set-MonitorNotificationPolicy -Id 1 -InputObject $policy
```

EXAMPLE 4

Update the policy with the id 1 to add/update Webhook Profile

```
$Policy = Set-MonitorNotificationPolicy -Uid 1 -WebhookProfileId 1
```

EXAMPLE 5

Update the policy with the id 1 to remove Webhook Profile

```
$Policy = Set-MonitorNotificationPolicy -Uid 1 -WebhookProfileId 0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-InputObject

Specifies the new policy object to adjust.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Unique identifier for policy to bet set.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

New Name of the policy.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Description

String value representing the new Policy description

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Webhook

String value representing the new Policy webhook

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSnmpEnabled

boolean value representing if SNMP is enabled for new Policy

Type:	Boolean
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean paramter indicating the enabled state of the policy. true - Enabled, false - Disabled

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WebhookProfileId

Unique identifier for the webhook profile to be associated with the policy.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Set-MonitorNotificationSnmpServerConfiguration

August 14, 2025

Saves a new Snmp server configuration

Syntax

```
Set-MonitorNotificationSnmpServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationSnmpServerConfiguration
   [-InputObject] <MonitorNotificationSnmpServerConfiguration>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorNotificationSnmpServerConfiguration
   [-ServerName <String>]
   [-PortNumber <Int32>]
   [-SnmpSender <String>]
   [-EngineId <String>]
   [-AuthPassword <SecureString>]
   [-PrivPassword <SecureString>]
   [-PrivPasswordProtocol <PrivacyProtocolType>]
   [-AuthPasswordProtocol <AuthProtocolType>]
   [-CommunityString <String>]
   [-Protocol <SnmpProtocolType>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The saved configuration describes the new settings to be used to send Snmps

Examples

EXAMPLE 1

Set new Snmp server configration using the specified parameters

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-MonitorNotificationSnmpServerConfiguration -ServerName "
    192.168.100.100" -PortNumber 162 -SnmpSender directoradmin -
    AuthPassword authpassword -AuthPasswordProtocol MD5 -PrivatePassword
     PrivPassword -PrivatePasswordProtocol DES
```

Parameters

-InputObject

Configuration object to persist

Type:	MonitorNotificationSnmpServerConfiguration
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Snmp listener server name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PortNumber

Snmp server port number

Type:	Int32

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SnmpSender

Sender's Name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EngineId

Engine ID

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AuthPassword

Password used for authentication

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivPassword

Password used for encryption

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PrivPasswordProtocol

Protocol used for encryption

Type:	PrivacyProtocolType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AuthPasswordProtocol

Protocol used for hash Authentication

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	AuthProtocolType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CommunityString

Comunity String for SNMP V2

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Protocol

Snmp protocol used for trap

Type:	SnmpProtocolType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Set-MonitorServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

```
Set-MonitorServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-MonitorServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Monitor Service objects.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-MonitorServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Monitor service objects to which metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-MonitorServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-MonitorWebhookProfile

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Updates an existing webhook profile.

Syntax

```
Set-MonitorWebhookProfile
   -Uid <Int64>
   -Name <String>
   -Description <String>
   -Url <String>
   -Headers <System.Collections.Generic.Dictionary`2[System.String,
      System.String]>
   -PayloadFormat <String>
   -Platform <WebhookProfilePlatform>
   -Type <WebhookProfileType>
   -MethodType <WebhookMethodType>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Updates the properties of an existing webhook profile identified by its unique identifier (Uid). This cmdlet allows modifying the name, description, URL, headers, and payload format of the webhook profile.

Examples

EXAMPLE 1

Updates the webhook profile with Uid 1, setting a new description, URL, headers, payload format, platform, type of call, and method type.

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
    ()
$headers.Add("Content-Type", "application/json")
$headers.Add("Authorization", "Basic **********")
$payloads = '{
  "text": "$PAYLOAD"  }
 '
$url ="https://url.net"
Set-MonitorWebhookProfile -Uid 1 -Name "webhookprofile1" -Description "
    Description" -Url $url -Headers $headers -PayloadFormat $payloads -
    Platform Slack -Type Webhook -MethodType POST
```

Parameters

-Uid

The unique identifier of the webhook profile to update.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

The new name for the webhook profile.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

The new description for the webhook profile.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Url

The new URL for the webhook.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Headers

Dictionary of headers for the webhook, where each key-value pair represents a header name and its value.

Type:	System.Collections.Generic.Dictionary‘2[System.String,Syste
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PayloadFormat

Template for the data payload in JSON format to be sent to the webhook URL.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Platform

webhook platform type. Possible values are Slack MicrosoftTeams ServiceNow Others

Type:	WebhookProfilePlatform
Accepted values:	Unknown, Slack, MicrosoftTeams, ServiceNow, Others
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-Type

webhook call type. Possible values are Webhook Api

Type:	WebhookProfileType
Accepted values:	Unknown, Webhook, Api
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-MethodType

http method type to make call to webhook Possible values are POST PUT

Type:	WebhookMethodType
Accepted values:	POST, PUT
Position:	Named
Default value:	POST
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Indicates whether the webhook profile was updated successfully.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

Ensure the Uid provided corresponds to an existing webhook profile.

Test-MonitorDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix Monitor Service.

Syntax

```
Test-MonitorDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Monitor Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-MonitorDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Monitor Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login

© 1997–2025 Citrix Systems, Inc. All rights reserved.

and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-MonitorDBConnection cmdlet returns an object describing the status of the selected Monitor Service instance that would result if the connection string were used with the Set-MonitorDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-MonitorDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the Monitor Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Monitor Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Monitor Service currently in use is newer than, and incompatible with, the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

- DBOlderVersionThanService

  The version of the Monitor Service schema on the database is newer than, and incompatible with, the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Monitor Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Monitor Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Monitor Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Test-MonitorNotificationEmailServerConfiguration

August 14, 2025

FIXME

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Test-MonitorNotificationEmailServerConfiguration
    [-InputObject] <MonitorNotificationEmailServerConfiguration>
    [-Credential <PSCredential>]
    -EmailAddresses <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorNotificationEmailServerConfiguration
    -EmailAddresses <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-MonitorNotificationEmailServerConfiguration
    -ProtocolType <EmailProtocolType>
    -ServerName <String>
    -PortNumber <Int32>
    -SenderEmailAddress <String>
    -RequiresAuthentication <Boolean>
    [-Credential <PSCredential>]
    -EmailAddresses <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

FIXME

Examples

EXAMPLE 1

Test whether email can be sent using the specified oncfiguration

```
$secpasswd = ConvertTo-SecureString "PasswordHere" -AsPlainText -Force
$mycreds = New-Object System.Management.Automation.PSCredential ("
    username", $secpasswd)

Test-MonitorNotificationEmailServerConfiguration -ProtocolType Smtp -
    ServerName "mail.abc.com" -PortNumber 25 -SenderEmailAddress "
    user1@citrix.com" -RequiresAuthentication $true -EmailAddresses "
    user2@abc.com" -Credential $mycreds
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-EmailAddresses

Email addresses to which the test mail to be sent

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ProtocolType

Email protocol Possible values are Smtp SmtpSsl SmtpTls

Type:	EmailProtocolType
Accepted values:	Unknown, Smtp, SmtpSsl, SmtpTls
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

Email server name

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-PortNumber

Email server port number

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SenderEmailAddress

Sender's email address

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RequiresAuthentication

Whether the server requires authentication

Type:	Boolean
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Configuration object to test

Type:	MonitorNotificationEmailServerConfiguration
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credential

Configuration credential

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

True - when test mail is successfully sent, otherwise false

Test-MonitorWebhookProfile

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Tests a webhook profile configuration.

Syntax

```
Test-MonitorWebhookProfile
    -Url <String>
    -Headers <System.Collections.Generic.Dictionary`2[System.String,
       System.String]>
    -PayloadFormat <String>
    -MethodType <WebhookMethodType>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Verifies the functionality of a webhook profile by sending a test payload to the specified URL with the provided headers and payload format. It returns a boolean indicating the success or failure of the test.

Examples

EXAMPLE 1

Tests the webhook configuration by sending a test payload to the specified URL with the given headers and payload format.

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
   ()
$headers.Add("Content-Type", "application/json")
$headers.Add("Authorization", "Basic ************")
$payloads = '{
  "text": "$PAYLOAD"  }
 '
$url ="https://url.net"
Test-MonitorWebhookProfile -Url $url -Headers $headers -PayloadFormat
   $payloads -MethodType POST
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Url

Url of the webhook

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Headers

Dictionary of headers for the webhook, where each key-value pair represents a header name and its value.

Type:	System.Collections.Generic.Dictionary‘2[System.String,Syste
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PayloadFormat

Template for the data payload in JSON format to be sent to the webhook URL.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-MethodType

http method type to make call to webhook Possible values are POST PUT

Type:	WebhookMethodType
Accepted values:	POST, PUT
Position:	Named
Default value:	POST
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Indicates whether the test was successful.

about_Orch_Filtering

August 14, 2025

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
6
7    $sessions = @(Get-BrokerSession -Filter {
8    Uid -gt $lastUid  }
9    -MaxRecordCount 1000 -Sortby 'Uid')
```

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Get-OrchBackupRestoreValues

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Gets all backup restore values.

Syntax

```
Get-OrchBackupRestoreValues
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets all backup restore values.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets all of the the backup/Restore names and their values.

```
Get-OrchBackupRestoreValues
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-OrchBackupRestoreValues cmdlet returns an object containing queried name's value.

Get-OrchDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the Orchestration Service.

Syntax

```
Get-OrchDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected Orchestration Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets the database connection string in use by the Orchestration Service instance running on controller "controller1.mydomain.net".

```
Get-OrchDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
   Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Orchestration Service instance.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- NoDBConnections

  The database connection string for the OrchestrationService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-OrchDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix Orchestration Service.

Syntax

```
Get-OrchDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Gets SQL scripts that can be used to create a new Citrix Orchestration Service database schema, add a new Orchestration service to an existing site, remove a Orchestration service from a site, or create a database server logon for a Orchestration service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Orchestration service instance, otherwise the scripts relate to Orchestration service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Orchestration service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Orchestration service roles

If ScriptType is Evict, the returned script contains:

- Removal of Orchestration service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Orchestration Service and copies it to a file called "C:\OrchestrationSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Orchestration service schema.

```
Get-OrchDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\OrchestrationSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Orchestration service. This can be used when configuring a mirror server for use.

```
Get-OrchDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    OrchestrationLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Orchestration service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Orchestration services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix Orchestration Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a Orchestration Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a Orchestration Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Adds a logon for the Orchestration Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Orchestration services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Orchestration Service instance to remove from the database is running (only valid for a script type of Evict).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-OrchDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix Orchestration Service.

Syntax

```
Get-OrchDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Orchestration Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Orchestration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Orchestration Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Orchestration Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Orchestration Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-OrchServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-OrchDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Orchestration Service schema to be updated.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-OrchDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Orchestration Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Orchestration services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-OrchServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Related Links

- Get-OrchInstalledDBVersion
- Get-OrchServiceStatus
- Get-OrchDBSchema

Get-OrchInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the Orchestration Service.

Syntax

```
Get-OrchInstalledDBVersion
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Orchestration Service database schema when called with no parameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-OrchDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Orchestration Service database schema version number.

```
Get-OrchInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the Orchestration Service database schema for which upgrade scripts are supplied.

```
Get-OrchInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type: SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Version

Get-OrchInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the Orchestration Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-OrchService

August 14, 2025

Gets the service record entries for the Orchestration Service.

Syntax

```
Get-OrchService
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns instances of the Orchestration Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Orchestration Service running in the current service group.

```
Get-OrchService

Uid                : 1
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Orch_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Orch_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Orchestration.Sdk.Service

The Get-OrchServiceInstance command returns an object containing the following properties.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-OrchServiceAddedCapability

August 14, 2025

Gets any added capabilities for the Orchestration Service on the controller.

Syntax

```
Get-OrchServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Orchestration Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Orchestration Service.

```
Get-OrchServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- about_OrchOrchestrationSnapin

Get-OrchServiceInstance

August 14, 2025

Gets the service instance entries for the Orchestration Service.

Syntax

```
Get-OrchServiceInstance
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Orchestration Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Orchestration Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-OrchServiceInstance
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Orchestration.Sdk.ServiceInstance

The Get-OrchServiceInstance command returns an object containing the following properties.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.Orchestration.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-OrchServiceStatus

August 14, 2025

Gets the current status of the Orchestration Service on the controller.

Syntax

```
Get-OrchServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Enables the status of the Orchestration Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

Examples

EXAMPLE 1

Get the current status of the Orchestration Service.

```
Get-OrchServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-OrchServiceStatus cmdlet returns an object containing the status of the Orchestration Service together with extra diagnostics information.

- DBUnconfigured

  The Orchestration Service does not have a database connection configured.

- DBRejectedConnection

  The database rejected the logon attempt from the Orchestration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the Orchestration Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The Orchestration is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The Orchestration is connected to a database that is valid, but it does not have the full functionality required so the Orchestration cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the Orchestration Service currently in use is incompatible with the version of the Orchestration Service schema on the database. Upgrade the Orchestration Service to a more recent version.

- DBOlderVersionThanService

  The version of the Orchestration Service schema on the database is incompatible with the version of the Orchestration Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- OK

  The Orchestration Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the Orchestration Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Orchestration and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Orchestration service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Remove-OrchServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-OrchServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-OrchServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-OrchServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-OrchServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability to remove metadata from the given Orchestration Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-OrchService | % {
  Remove-OrchServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Orchestration Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Orchestration service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Reset-OrchEnabledFeatureList

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Refreshes the Orchestration service's list of enabled features.

Syntax

```
Reset-OrchEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Orchestration Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Orchestration service instance's list of enabled features.

```
Reset-OrchEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-OrchServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the Orchestration Service.

Syntax

```
Reset-OrchServiceGroupMembership
     [-ConfigServiceInstance] <ServiceInstance[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the Orchestration Service.

The Reset-OrchServiceGroupMembership cmdlet must be run on at least one instance of the service type (Orch) after installation and registration with the configuration service. Without this operation, the Orchestration services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-OrchServiceGroupMembership

© 1997–2025 Citrix Systems, Inc. All rights reserved.

command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    OrchServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-OrchServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Orchestration.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-OrchServiceGroupMembership command.

Outputs

Citrix.Orchestration.Sdk.ServiceInstance

Reset-OrchServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Orchestration Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-OrchBackupRestoreValue

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Sets a backup restore value to int, string or both.

Syntax

```
Set-OrchBackupRestoreValue
   -Name <String>
    [-StringValue <String>]
    [-IntValue <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Sets a backup restore value to int, string or both.

Examples

EXAMPLE 1

Sets the Backup Max Pinned Backups value to 10.

```
Set-OrchBackupRestoreValue -Name MaxPinnedBackups 10
```

Parameters

-Name

Specifies the name of the backup/restore to set.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StringValue

The string value to set. Either a string or int value must be specified.

Type:	String
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IntValue

The int value to set. Either a string or int value must be specified.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-OrchBackupRestoreValue cmdlet returns an object describing the success or failure of the set call.

- Get-OrchBackupRestoreValues

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Set-OrchDBConnection

August 14, 2025

Configures a database connection for the Orchestration Service.

Syntax

```
Set-OrchDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Orchestration Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-OrchDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-OrchDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Orchestration Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-OrchDBConnection cmdlet returns an object describing the status of the Orchestration Service together with extra diagnostics information. Possible values are:

- OK

  The Orchestration Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the Orchestration Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Orchestration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Orchestration Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Orchestration Service currently in use is newer than, and incompatible with, the version of the Orchestration Service schema on the database. Upgrade the Orchestration Service to a more recent version.

- DBOlderVersionThanService

  The version of the Orchestration Service schema on the database is newer than, and incompatible with, the version of the Orchestration Service currently in use. Upgrade the database schema to a more recent version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Orchestration Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Orchestration Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Orchestration Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-OrchDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the Orchestration Service.

Syntax

```
Set-OrchDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Orchestration Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Orchestration Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-OrchDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-OrchDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-OrchDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-OrchDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-OrchServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

```
Set-OrchServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-OrchServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Allows you to store additional custom data against given Orchestration Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-OrchServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-InputObject

Orchestration service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-OrchServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Start-OrchRestApi

August 14, 2025

Starts the Orchestration Service REST API.

Syntax

```
Start-OrchRestApi
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Initializes the PowerShell business logic and starts the REST API that is hosted by the selected instance of the Orchestration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Starts the Orchestration Service REST API.

```
Start-OrchRestApi
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned. Error Codes

---

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Stop-OrchRestApi

August 14, 2025

Stops the Orchestration Service REST API.

Syntax

```
Stop-OrchRestApi
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Disposes the PowerShell business logic and stops the REST API that is hosted by the selected instance of the Orchestration Service.

Examples

EXAMPLE 1

Stops the Orchestration Service REST API.

```
Stop-OrchRestApi
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

Test-OrchDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix Orchestration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Test-OrchDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-OrchDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-OrchDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Orchestration Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Orchestration SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-OrchDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Orchestration Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-OrchDBConnection cmdlet returns an object describing the status of the selected Orchestration Service instance that would result if the connection string were used with the Set-OrchDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-OrchDBConnection command would succeed if it were executed with the supplied connection string.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBUnconfigured

  No database connection string is set for the Orchestration Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Orchestration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Orchestration Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Orchestration Service currently in use is newer than, and incompatible with, the version of the Orchestration Service schema on the database. Upgrade the Orchestration Service to a more recent version.

- DBOlderVersionThanService

  The version of the Orchestration Service schema on the database is newer than, and incompatible with, the version of the Orchestration Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Orchestration Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Orchestration Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Orchestration Service cannot be determined.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

about_Sf_Filtering

August 14, 2025

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
          # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
       # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned

© 1997–2025 Citrix Systems, Inc. All rights reserved.

property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Add-SfServerToCluster

August 14, 2025

Adds a new server to an existing cluster.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Add-SfServerToCluster
   [-StorefrontUrl <Uri>]
   -ClusterId <Guid>
   -ServerName <String>
   [-FarmName <String>]
   [-XmlServices <Uri[]>]
   [-RunAsynchronously <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Adds a new server to an existing cluster. Optionally updates Farm and Storefront Url. After operation succeeds, all servers are configured identically.

Examples

EXAMPLE 1

Adds “NewSfServer”to cluster with id (Guid).

```
Add-SfServerToCluster -ClusterId (Guid) -ServerName NewSfServer -
   RunAsynchronously $true
```

Parameters

-ClusterId

The id of the cluster to perform operation on.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServerName

The name of the server to join to exisiting cluster. The name must be one of the values returned by Get-SfCluster

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FarmName

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Get-SfCluster

August 14, 2025

Gets all Storefront clusters present in the site.

Syntax

```
Get-SfCluster
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets all Storefront clusters present in the site. There is one special Cluster with null id that lists the servers that are not part to any cluster (they are available to join any).

Examples

EXAMPLE 1

```
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.DataModel.Cluster[]

Returns array of clusters available in current deployment.

- New-SfCluster
- Add-SfServerToCluster
- Remove-SfServerFromCluster
- Set-SfCluster

Get-SfDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the Storefront Service.

Syntax

```
Get-SfDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected Storefront Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets the database connection string in use by the Storefront Service instance running on controller "controller1.mydomain.net".

```
Get-SfDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
   Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Storefront Service instance.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- NoDBConnections

  The database connection string for the StorefrontService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-SfDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix Storefront Service.

Syntax

```
Get-SfDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Gets SQL scripts that can be used to create a new Citrix Storefront Service database schema, add a new Storefront service to an existing site, remove a Storefront service from a site, or create a database server logon for a Storefront service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Storefront service instance, otherwise the scripts relate to Storefront service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Storefront service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Storefront service roles

If ScriptType is Evict, the returned script contains:

- Removal of Storefront service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Storefront Service and copies it to a file called "C:\StorefrontSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Storefront service schema.

```
Get-SfDBSchema -DatabaseName MySiteDB -ServiceGroupName  MyServiceGroup
    > C:\StorefrontSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Storefront service. This can be used when configuring a mirror server for use.

```
Get-SfDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
   StorefrontLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Storefront service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Storefront services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix Storefront Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a Storefront Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a Storefront Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Adds a logon for the Storefront Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Storefront services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Storefront Service instance to remove from the database is running (only valid for a script type of Evict).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix Storefront Service.

Syntax

```
Get-SfDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Storefront Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Storefront Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Storefront Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Storefront Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Storefront Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-SfServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-SfDBVersionChangeScript -DatabaseName MyDb -TargetVersion
      7.40.0.0
2 $update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Storefront Service schema to be updated.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-SfDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Storefront Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Storefront services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-SfServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-SfInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the Storefront Service.

Syntax

```
Get-SfInstalledDBVersion
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Storefront Service database schema when called with no parameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-SfDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Storefront Service database schema version number.

```
Get-SfInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the Storefront Service database schema for which upgrade scripts are supplied.

```
Get-SfInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Version

Get-SfInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the Storefront Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-SfIsStorefrontInstalled

August 14, 2025

Tells whether StoreFront Services and Privileged Service are installed.

Syntax

```
Get-SfIsStorefrontInstalled
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Examples

EXAMPLE 1

```
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

bool

True if both StoreFront Services and Privileged Service are installed, false otherwise.

Get-SfOptimalGateway

August 14, 2025

Gets the configured optimal gateways for farms.

Syntax

```
Get-SfOptimalGateway
   -SiteId <Int64>
   -ResourcesVirtualPath <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the configured optimal gateways for farms.

Examples

EXAMPLE 1

```
Get-DSOptimalGatewayForFarms -siteId 1 -ResourcesVirtualPath "/Citrix/
    MyStore"
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-SiteId

Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourcesVirtualPath

Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: “/Citrix/Store”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.OptimalGateway

Related Links

- Set-SfOptimalGateway

Get-SfService

August 14, 2025

Gets the service record entries for the Storefront Service.

Syntax

```
Get-SfService
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns instances of the Storefront Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get all the instances of the Storefront Service running in the current service group.

```
Get-SfService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Service

The Get-SfServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-SfServiceAddedCapability

August 14, 2025

Gets any added capabilities for the Storefront Service on the controller.

Syntax

```
Get-SfServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Storefront Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Storefront Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-SfServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-SfServiceInstance

August 14, 2025

Gets the service instance entries for the Storefront Service.

Syntax

```
Get-SfServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Storefront Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented

© 1997–2025 Citrix Systems, Inc. All rights reserved.

as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Storefront Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1  Get-SfServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.ServiceInstance

The Get-SfServiceInstance command returns an object containing the following properties.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.Storefront.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- Get-SfServiceStatus
- Reset-SfServiceGroupMembership

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-SfServiceStatus

August 14, 2025

Gets the current status of the Storefront Service on the controller.

Syntax

```
Get-SfServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Storefront Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

Examples

EXAMPLE 1

Get the current status of the Storefront Service.

```
Get-SfServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-SfServiceStatus cmdlet returns an object containing the status of the Storefront Service together with extra diagnostics information.

- DBUnconfigured

  The Storefront Service does not have a database connection configured.

- DBRejectedConnection

  The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The Storefront is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The Storefront is connected to a database that is valid, but it does not have the full functionality required so the Storefront cannot function. Upgrading the database is required.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNewerVersionThanService

  The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

- DBOlderVersionThanService

  The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The Storefront Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the Storefront Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Storefront and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Storefront service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-SfTask

August 14, 2025

Gets the task history for the Storefront Service.

Syntax

```
Get-SfTask
   [[-TaskId] <Guid>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Returns a list of tasks that have run or are currently running within the Storefront Service.

Examples

EXAMPLE 1

Parameters

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-TaskId

Specifies the task identifier to be returned.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

New-SfCluster

August 14, 2025

Creates new Storefront cluster with default set of services.

Syntax

```
New-SfCluster
   [-StorefrontUrl <Uri>]
   -ServerName <String>
   -FarmName <String>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -XmlServices <Uri[]>
    [-RunAsynchronously <Boolean>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The server will have a default set of services containing fully-functionaly Storefront server with Authentication, Store, Receiver for Web and Desktop Appliance.

Examples

EXAMPLE 1

Creates a new cluster on server "SfServer". The server will have a default set of services containing fully-functionaly Storefront server with Authentication, Store, Receiver for Web, Desktop Appliance site and the required infrastructure. The Store service will have a farm named "XdSiteName"that will contain servers farm1 and farm2, whose will be contacted using http on default port 80.

```
New-SfCluster -FarmName "XdSiteName" -XmlServices http://farm1,http://
    farm2 -ServerName SfServer -RunAsynchronously $true
```

Parameters

-ServerName

The name of the server to build a cluster on. The name must be one of the values returned by Get-SfCluster

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FarmName

Name of the farm that will be used within Store service.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Remove-SfOptimalGateway

August 14, 2025

Removes the optimal gateway for farms configuration.

Syntax

```
Remove-SfOptimalGateway
       -SiteId <Int64>
       -ResourcesVirtualPath <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes the optimal gateway for farms configuration.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

```
Remove-DSOptimalGatewayForFarms -siteId 1 -ResourcesVirtualPath "/
    Citrix/MyStore"
```

Parameters

-SiteId

Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourcesVirtualPath

Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: “/Citrix/Store”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Remove-SfServerFromCluster

August 14, 2025

Removes server from the cluster.

Syntax

```
Remove-SfServerFromCluster
      -ClusterId <Guid>
      [-StorefrontUrl <Uri>]
      -ServerName <String>
      [-FarmName <String>]
      [-XmlServices <Uri[]>]
      [-RunAsynchronously <Boolean>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes server from the cluster and propagates information to other servers. The configuration of the server is wiped out, so the server can be reused.

Examples

EXAMPLE 1

Removes Server “BrokenSfServer”from a Cluster with id (Guid).

```
Remove-SfServerFromCluster -ClusterId (Guid) -ServerName BrokenSfServer
    -RunAsynchronously $true
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ClusterId

The if of the cluster to perform operation on.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServerName

The name of the server to remove from cluster. The name must be one of the values returned by Get-SfCluster.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-FarmName

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Remove-SfServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-SfServiceMetadata
       [-ServiceHostId] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-SfServiceMetadata
       [-ServiceHostId] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-SfServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-SfServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Storefront Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-SfService | % {
  Remove-SfServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Storefront Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Storefront service objects from which metadata is to be removed.

Type:	Service[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-SfTask

August 14, 2025

Removes from the database completed tasks for the Storefront Service.

Syntax

```
Remove-SfTask
      [-TaskId] <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables completed tasks that have run within the Storefront Service to be removed from the database.

Examples

EXAMPLE 1

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-TaskId

Specifies the identifier for the task to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-SfTask command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration service.

OperationDeniedByConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Remove-SfTaskMetadata

August 14, 2025

Removes metadata from the given Task.

Syntax

```
Remove-SfTaskMetadata
      [-TaskId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-SfTaskMetadata
      [-TaskId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-SfTaskMetadata
      [-InputObject] <Task[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-SfTaskMetadata
      [-InputObject] <Task[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Task.

Examples

EXAMPLE 1

Remove all metadata from all Task objects.

```
Get-SfTask | % {
  Remove-SfTaskMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-SfEnabledFeatureList

August 14, 2025

Refreshes the Storefront service's list of enabled features.

Syntax

```
Reset-SfEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Storefront Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Storefront service instance's list of enabled features.

```
Reset-SfEnabledFeatureList
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-SfServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the Storefront Service.

Syntax

```
Reset-SfServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Reloads the access permissions and configuration service locations for the Storefront Service.

The Reset-SfServiceGroupMembership cmdlet must be run on at least one instance of the service type (Sf) after installation and registration with the configuration service. Without this operation, the Storefront services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-SfServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    SfServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-SfServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.Storefront.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-SfServiceGroupMembership command.

Outputs

Citrix.Storefront.Sdk.ServiceInstance

Reset-SfServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Storefront Service instance.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-SfCluster

August 14, 2025

Sets the parameters on the given cluster.

Syntax

```
Set-SfCluster
   [-StorefrontUrl <Uri>]
   -ClusterId <Guid>
   [-FarmName <String>]
   [-XmlServices <Uri[]>]
   [-RunAsynchronously <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Sets the parameters on the given cluster and propagate the changes to all servers within a given cluster.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Sets a Storefront Url in a Cluster with id (Guid). Propagates changes to all servers that are part of the cluster.

```
Set-SfCluster -StorefrontUrl http://SfUrl -ClusterId (Guid) -
    RunAsynchronously $true
```

Parameters

-ClusterId

The if of the cluster to perform operation on.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StorefrontUrl

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Type:	Uri
Position:	Named
Default value:	Server name and http binding.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FarmName

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-XmlServices

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Type:	Uri[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

If set, the command will run asynchronously.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Set-SfDBConnection

August 14, 2025

Configures a database connection for the Storefront Service.

Syntax

```
Set-SfDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Storefront Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-SfDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-SfDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Storefront Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-SfDBConnection cmdlet returns an object describing the status of the Storefront Service together with extra diagnostics information. Possible values are:

- OK

  The Storefront Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the Storefront Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Storefront Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Storefront Service currently in use is newer than, and incompatible with, the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBOlderVersionThanService

  The version of the Storefront Service schema on the database is newer than, and incompatible with, the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Storefront Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Storefront Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Storefront Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-SfDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the Storefront Service.

Syntax

```
Set-SfDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Storefront Service instance to authenticate with the database server. By default Windows authentication is used and no SQL cre-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

dentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Storefront Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-SfDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-SfDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-SfDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-SfDBCredentials $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Set-SfOptimalGateway

August 14, 2025

Set the farms and the optimal gateway to use for launch.

Syntax

```
Set-SfOptimalGateway
   -SiteId <Int64>
   -ResourcesVirtualPath <String>
   -HostNames <String[]>
   -StaUrls <String[]>
   -Farm <String>
   [-StasBypassDuration <TimeSpan>]
   [-StasUseLoadBalancing]
   [-EnableSessionReliability]
   [-UseTwoTickets]
   [-EnabledOnDirectAccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Set the farms and the optimal gateway to use for launch.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

```
Set-DSOptimalGatewayForFarms -SiteId 1 -ResourcesVirtualPath /Citrix/
    Store -Hostnames @("gateway1.citrix.com:2222") -StaUrls @("https://
    server1.citrix.com/staurl") -StasBypassDuration "00.02:00:00" -
    EnabledOnDirectAccess
```

Parameters

-SiteId

Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ResourcesVirtualPath

Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: “/Citrix/Store”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-HostNames

Specifies the fully qualified domain name (FQDN) and port of the optimal NetScaler Gateway appliance.

Example1 for standard vServer port 443: gateway.example.com

Example2 for nonstandard vServer port 500: gateway.example.com:500

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StaUrls

Specifies the URLs for XenDesktop, XenApp, and VDI-in-a-Box servers running the Secure Ticket Authority (STA). If using multiple farms, list the STA servers on each using a comma separated list:

Example: "http://xenapp-a.ptd.com/scripts/ctxsta.dll","http://xendesktop-a.ptd.com/scripts/ctxsta.dll"

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Farm

Specificies the set of delivery controllers, as named when they were configured with StoreFront.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StasBypassDuration

Set the time period, in hours, minutes, and seconds, for which an STA is considered unavailable after a failed request.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StasUseLoadBalancing

Set to true: randomly obtains session tickets from all STAs, evenly distributing requests across all the STAs.

Set to false: users are connected to the first available STA in the order in which they are listed in the configuration, minimizing the number of STAs in use at any given time.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-EnableSessionReliability

Set to true: keeps disconnected sessions open while Receiver attempts to reconnect automatically. If you configured multiple STAs and want to ensure that session reliability is always available, set the value of the UseTwoTickets attribute to true to obtain session tickets from two different STAs in case one STA becomes unavailable during the session.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseTwoTickets

Set to true: obtains session tickets from two different STAs in case one STA becomes unavailable during the session.

Set to false: uses only a single STA server.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EnabledOnDirectAccess

Set to true: ensures that when local users on the internal network log on to StoreFront directly, connections to their resources are still routed through the optimal appliance defined for the farm.

Set to false: connections to resources are not routed through the optimal appliance for the farm unless users access StoreFront through a NetScaler Gateway.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-SfServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

```
Set-SfServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-SfServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Storefront Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-SfServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Storefront service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-SfServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-SfTaskMetadata

August 14, 2025

Adds or updates metadata on the given Task.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-SfTaskMetadata
   [-TaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfTaskMetadata
   [-TaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfTaskMetadata
   [-InputObject] <Task[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-SfTaskMetadata
   [-InputObject] <Task[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Task objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-SfTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name
   property -Value value

Key                                     Value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
---                                 -----
property                            value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "Sys-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tem.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-SfTaskMetadata returns a dictionary containing the new (name, value)-pairs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Test-SfDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix Storefront Service.

Syntax

```
Test-SfDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-SfDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-SfDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Storefront Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Storefront SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-SfDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Storefront Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login

© 1997–2025 Citrix Systems, Inc. All rights reserved.

and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-SfDBConnection cmdlet returns an object describing the status of the selected Storefront Service instance that would result if the connection string were used with the Set-SfDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-SfDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the Storefront Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Storefront Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Storefront Service currently in use is newer than, and incompatible with, the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

- DBOlderVersionThanService

  The version of the Storefront Service schema on the database is newer than, and incompatible with, the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Connectivity between the Storefront Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Storefront Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Storefront Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get-cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
          # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
       # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Confirm-TrustVdaEnrollmentToken

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

This cmdlet will validate or confirm that the provided VDA enrollment token is valid.

Syntax

```
Confirm-TrustVdaEnrollmentToken
        [-Token] <String>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

If the token is valid it will assume the token is being used and therefore it will increment the total number of times the token was used to add a machine by one and update the last used date.

Examples

EXAMPLE 1

Determines if the provided VDA enrollment JWT token is valid.

```
Confirm-TrustVdaEnrollmentToken -Token {
 your vda token here }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Token

The JWT token that delegates the ability to enroll VDA machines with a particular machine catalog.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Returns true if the token is valid or false if the token is not valid.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Related Links

Get-TrustDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the Trust Service.

Syntax

```
Get-TrustDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected Trust Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Trust Service instance running on controller "controller1.mydomain.net".

```
Get-TrustDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
    Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Trust Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the TrustService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-TrustDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix Trust Service.

Syntax

```
Get-TrustDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Trust Service database schema, add a new Trust service to an existing site, remove a Trust service from a site, or create a database server logon for a Trust service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Trust service instance, otherwise the scripts relate to Trust service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Trust service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Trust service roles

If ScriptType is Evict, the returned script contains:

- Removal of Trust service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Trust Service and copies it to a file called "C:\TrustSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Trust service schema.

```
Get-TrustDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\TrustSchema.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Trust service. This can be used when configuring a mirror server for use.

```
1  Get-TrustDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
       TrustLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Trust service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Trust services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix Trust Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a Trust Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a Trust Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

  Adds a logon for the Trust Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Trust services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Trust Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix Trust Service.

Syntax

```
Get-TrustDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Trust Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Trust Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Trust Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Trust Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Trust Services that are incompatible with the updated schema will cease to operate. The service state, as reported by

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-TrustServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-TrustDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Trust Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

PSObject

The Get-TrustDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Trust Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Trust services are running. However, this depends on the specific update being carried out.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-TrustServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-TrustInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the Trust Service.

Syntax

```
Get-TrustInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Trust Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-TrustDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Trust Service database schema version number.

```
Get-TrustInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Get the versions of the Trust Service database schema for which upgrade scripts are supplied.

```
Get-TrustInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-TrustInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the Trust Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-TrustMultiTenantAccessData

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

This cmdlet will get all the multi-tenant service access records.

Syntax

```
Get-TrustMultiTenantAccessData
   [-Uid <Int32>]
   [[-ServiceName] <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The multi-tenant access record is used to determine if a multi-tenant service is allowed access to certain FMA Trust APIs. Currently this is restricted to Bearer Token generation APIs.

Examples

EXAMPLE 1

Gets all the multi-tenant service access records.

```
Get-TrustMultiTenantAccessData
```

Parameters

-Uid

The ID of the multi-tenant service access record to retrieve.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceName

The service name for the multi-tenant service access record to retrieve.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.MultiTenantAccessData[]

The multi-tenant service access record that matches the provided filters.

Related Links

Get-TrustService

August 14, 2025

Gets the service record entries for the Trust Service.

Syntax

```
Get-TrustService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Returns instances of the Trust Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Trust Service running in the current service group.

```
Get-TrustService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.Service

The Get-TrustServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-TrustServiceAddedCapability

August 14, 2025

Gets any added capabilities for the Trust Service on the controller.

Syntax

```
Get-TrustServiceAddedCapability
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables updates to the Trust Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Trust Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-TrustServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-TrustServiceInstance

August 14, 2025

Gets the service instance entries for the Trust Service.

Syntax

```
Get-TrustServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Trust Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as

© 1997–2025 Citrix Systems, Inc. All rights reserved.

a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Trust Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1  Get-TrustServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Trust.Sdk.ServiceInstance

The Get-TrustServiceInstance command returns an object containing the following properties.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.Trust.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-TrustServiceKey

August 14, 2025

Gets register ServiceKey configured for this site.

Syntax

```
Get-TrustServiceKey
    [[-Uid] <Int32>]
    [-InstanceId <String>]
    [-InstanceName <String>]
    [-IsTrustService <Boolean>]
    [-LastUpdated <DateTime>]
    [-RotationNeeded <Boolean>]
    [-ServiceName <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves registered ServiceKey matching the specified criteria. If no parameters are specified, all registered ServicesKey will be returned.

Examples

EXAMPLE 1

Gets all service keys.

```
Get-TrustServiceKey
```

EXAMPLE 2

Gets all service keys for a Trust Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-TrustServiceKey -IsTrustService $true
```

EXAMPLE 3

Mark all the service keys whose public key were last updated before October 20, 2015 to rotate their public keys.

```
Get-TrustServiceKey -Filter "LastUpdated -lt '10-20-2015'" | Set-
    TrustServiceKeyRotation
```

EXAMPLE 4

Revoke the previous public key of all service keys that were updated after October 20, 2016.

```
Get-TrustServiceKey -Filter "LastUpdated -gt '10-20-2016'" | Revoke-
    TrustPreviousServiceKey
```

Parameters

-InstanceId

Get ServiceKey with the specified instance identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-InstanceName

Get ServiceKey with the specified instance name

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsTrustService

Get ServiceKey with the specified value of the IsTrustService flag.

If true, only Service Keys for the Trust Service will be returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LastUpdated

Get ServiceKey where the public key was last updated at the specified time.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RotationNeeded

Get ServiceKey with the specified value of the RotationNeeded flag.

If true, only ServiceKey that need to be rotated will be returned.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If false, only ServiceKey where key rotation is not pending will be returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceName

Get ServiceKey with the specified service name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-Uid

Get ServiceKey with the specified Unique Identifier.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Trust.Sdk.ServiceKey

Get-TrustServiceKey returns an object for each matching registered Service Key.

Get-TrustServiceStatus

August 14, 2025

Gets the current status of the Trust Service on the controller.

Syntax

```
Get-TrustServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Trust Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Before using this cmdlet, you don't have to configure the database connection for the Service.

Examples

EXAMPLE 1

Get the current status of the Trust Service.

```
Get-TrustServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-TrustServiceStatus cmdlet returns an object containing the status of the Trust Service together with extra diagnostics information.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBUnconfigured

  The Trust Service does not have a database connection configured.

- DBRejectedConnection

  The database rejected the logon attempt from the Trust Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the Trust Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The Trust is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The Trust is connected to a database that is valid, but it does not have the full functionality required so the Trust cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the Trust Service currently in use is incompatible with the version of the Trust Service schema on the database. Upgrade the Trust Service to a more recent version.

- DBOlderVersionThanService

  The version of the Trust Service schema on the database is incompatible with the version of the Trust Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The Trust Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the Trust Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Connectivity between the Trust and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Trust service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-TrustVdaEnrollmentToken

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

This cmdlet will get all the metadata records for all the VDA enrollment tokens.

Syntax

```
Get-TrustVdaEnrollmentToken
    [-Id <Guid>]
    [[-TokenName] <String>]
    [-CatalogId <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This will not return the tokens themselves only the metadata used to create the tokens. The tokens are not stored after they are generated.

Examples

EXAMPLE 1

Get all the metadata records for all the VDA enrollment tokens.

```
Get-TrustVdaEnrollmentToken
```

Parameters

-Id

The JWT token ID of the VDA enrollment token meta data to retrieve.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CatalogId

The Catalog Id that this VDA enrollment token allows machines to be added to.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Trust_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Trust_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TokenName

The name used to more easily identify this VDA enrollment token.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Trust.Sdk.VdaEnrollmentToken[]

The vda enrollment token metadata that matches the provided filters

New-TrustBearerToken

August 14, 2025

Creates a new bearer token for the current user.

Syntax

```
New-TrustBearerToken
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new bearer token for the current user. This uses the current Windows identity.

Examples

EXAMPLE 1

Obtains the bearer token and stores it in the $bearerData variable and uses it to authenticate with the Broker.

```
$bearerData = New-TrustBearerToken
New-BrokerDBConnection -BearerToken $bearerData.Token
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Trust.Sdk.BearerTokenData

The bearer token.

New-TrustMultiTenantAccessData

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

This cmdlet create a new multi-tenant service access record.

Syntax

```
New-TrustMultiTenantAccessData
   -IsAccessAllowed <Boolean>
   [-ServiceName] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The multi-tenant access record is used to determine if a multi-tenant service is allowed access to certain FMA Trust APIs. Currently this is restricted to Bearer Token generation APIs.

Examples

EXAMPLE 1

Creates a new multi-tenant service access record for the MyTestService allowing it access.

```
1  New-TrustMultiTenantAccessData -ServiceName MyTestService -
       IsAccessAllowed True
```

Parameters

-IsAccessAllowed

Gets or sets a value indicating whether this multi-tenant service is allowed access or not.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceName

The service name for the multi-tenant service access record to retrieve.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Trust.Sdk.MultiTenantAccessData

The multi-tenant service access record that was created.

Related Links

New-TrustVdaEnrollmentToken

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

This cmdlet creates a new VDA enrollment token from the provided metadata.

Syntax

```
New-TrustVdaEnrollmentToken
   -CatalogId <Guid>
   [-ExpirationDate <DateTime>]
   [-HostConnectionId <Guid>]
   [-IssuedToUser <String>]
   [-NotValidBeforeDate <DateTime>]
   -NumMachinesAllowed <Int32>
   [-TokenName] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

VDA enrollment tokens are JWT tokens issued for limited use to add VDA machines to a machine catalog.

Examples

EXAMPLE 1

Creates a VDA enrollment token that allows the bearer to add up to 3 machines to machine catalog ID 30e1a941-cc17-4cc9-a4d7-2a49c7350430 that will expire on 4/1/2023.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
New-TrustVdaEnrollmentToken -TokenName MyNewVdaToken -ExpirationDate
    4/1/2023 -NotValidBeforeDate 3/20/2023 -NumMachinesAllowed 3 -
    CatalogId 30e1a941-cc17-4cc9-a4d7-2a49c7350430
```

EXAMPLE 2

Creates a VDA registration token that allows the bearer to add up to 3 machines to machine catalog ID 30e1a941-cc17-4cc9-a4d7-2a49c7350430. Since no expiration date or not valid before date were provided this token will expire 14 days after the date it was created.

```
New-TrustVdaEnrollmentToken -TokenName MyNewVdaToken -
    NumMachinesAllowed 3 - CatalogId 30e1a941-cc17-4cc9-a4d7-2
    a49c7350430
```

EXAMPLE 3

Creates a VDA registration token that allows the bearer to add up to 3 machines to machine catalog ID 30e1a941-cc17-4cc9-a4d7-2a49c7350430 that is not valid before 7/4/2023 and will expire on 7/18/2023.

```
New-TrustVdaEnrollmentToken -TokenName MyNewVdaToken -
    NumMachinesAllowed 3 - CatalogId 30e1a941-cc17-4cc9-a4d7-2
    a49c7350430 -NotValidBeforeDate 7/4/2023
```

Parameters

-CatalogId

The machine catalog Id that this VDA enrollment token allows machines to be added to.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-NumMachinesAllowed

The number of machines this VDA enrollment token allows to be added to the machine catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TokenName

The name used to more easily identify this VDA enrollment token.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ExpirationDate

Optional - The UTC date this VDA enrollment token expires. This will default to creation date or Not-ValidBeforeDate plus the threshold of 14 days.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-HostConnectionId

The HostConnectionId that orchestration service can use to determine how to handle power management.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-IssuedToUser

Optional - The user to which this new VDA enrollment token has been issued.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NotValidBeforeDate

Optional - The UTC date before which this VDA enrollment token will not be valid. This will default to the creation date.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Trust.Sdk.VdaEnrollmentToken

This token result object contains the VDA enrollment token and some additional metadata.

Register-TrustServiceKey

August 14, 2025

Creates a new trusted Service Key

Syntax

```
Register-TrustServiceKey
        -ServiceName <String>
        [-InstanceId <String>]
        -PublicKey <String>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Creates a new trusted Service Key. If this is a Service Key with the ServiceName of "ConnectorProxy", it will also result in adding of the corresponding Edge Server.

Examples

EXAMPLE 1

Register DCCHN-Proxy.xd.local ConnectorProxy with the Trust Service using the specified Public Key

```
Register-TrustServiceKey -ServiceName ConnectorProxy -InstanceId DCCHN-
   Proxy.xd.local -PublicKey
   PFJTQUtleVZhbHVlPjxNb2R1bHVzPnU2b0lCaFR2NXl...
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ServiceName

The Name of the Service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PublicKey

The primary public key being registered.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Trust.Sdk.ServiceKey

The newly created Service Key.

Notes

This command should only be needed to register a ConnectorProxy that cannot do so using the installer and repair tool.

Remove-TrustMultiTenantAccessData

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

This cmdlet will remove the multi-tenant service access record specified.

Syntax

```
Remove-TrustMultiTenantAccessData
      [-InputObject] <MultiTenantAccessData[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustMultiTenantAccessData
      [-Uid] <Int32[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustMultiTenantAccessData
      [-ServiceName] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The multi-tenant access record is used to determine if a multi-tenant service is allowed access to certain FMA Trust APIs. Currently this is restricted to Bearer Token generation APIs.

Examples

EXAMPLE 1

Removes the multi-tenant service access record for the service MyTestService.

```
Remove-TrustMultiTenantAccessData -ServiceName MyTestService
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-InputObject

Specifies the multi-tenant service access recordcls objects to delete.

Type:	MultiTenantAccessData[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

The ID of the multi-tenant service access record to remove.

Type:	Int32[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServiceName

The service name for the multi-tenant service access record to remove.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Remove-TrustServiceKeyMetadata

August 14, 2025

Removes metadata from the given ServiceKey.

Syntax

```
Remove-TrustServiceKeyMetadata
      [-ServiceKeyUid] <Int32>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceKeyMetadata
      [-ServiceKeyUid] <Int32>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceKeyMetadata
      [-InputObject] <ServiceKey[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceKeyMetadata
      [-InputObject] <ServiceKey[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability to remove metadata from the given ServiceKey.

Examples

EXAMPLE 1

Remove all metadata from all ServiceKey objects.

```
Get-TrustServiceKey | % {
  Remove-TrustServiceKeyMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceKeyUid

Id of the ServiceKey

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceKey[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-TrustServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-TrustServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Trust Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-TrustService | % {
  Remove-TrustServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServiceHostId

Id of the Trust Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Trust service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-TrustVdaEnrollmentToken

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

This cmdlet will delete the specified VDA enrollment token.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-TrustVdaEnrollmentToken
      [-InputObject] <VdaEnrollmentToken[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustVdaEnrollmentToken
      [-Id] <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-TrustVdaEnrollmentToken
      [-TokenName] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet will delete the specified VDA enrollment token metadata from the database making the token useless.

Examples

EXAMPLE 1

Deletes the VDA enrollment token metadata with an ID of 00f1f4e4-ce0c-4255-ae81-17d631d23eb7.

```
Remove-TrustVdaEnrollmentToken -Id 00f1f4e4-ce0c-4255-ae81-17d631d23eb7
```

Parameters

-InputObject

Specifies the VDA enrollment token meta data objects to delete

Type:	VdaEnrollmentToken[]
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

The JWT token ID of the VDA enrollment token to delete.

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-TokenName

The TokenName of the VDA enrollment token to delete.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-TrustEnabledFeatureList

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Refreshes the Trust service's list of enabled features.

Syntax

```
Reset-TrustEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix Trust Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Trust service instance's list of enabled features.

```
Reset-TrustEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Reset-TrustServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the Trust Service.

Syntax

```
Reset-TrustServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the Trust Service.

The Reset-TrustServiceGroupMembership cmdlet must be run on at least one instance of the service type (Trust) after installation and registration with the configuration service. Without this operation, the Trust services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-TrustServiceGroupMembership

© 1997–2025 Citrix Systems, Inc. All rights reserved.

command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    TrustServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-TrustServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-TrustServiceGroupMembership command.

Outputs

Citrix.Trust.Sdk.ServiceInstance

Reset-TrustServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Trust Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Revoke-TrustBearerToken

August 14, 2025

Revokes the user's current bearer token.

Syntax

```
Revoke-TrustBearerToken
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Revokes the user's current bearer token.

Examples

EXAMPLE 1

Revokes any bearer token issued for the current user.

```
Revoke-TrustBearerToken
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Revoke-TrustPreviousServiceKey

August 14, 2025

This cmdlet removes the older public key from the service key

Syntax

```
Revoke-TrustPreviousServiceKey
      -ServiceKey <ServiceKey>
      [-PassThru]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Revoke-TrustPreviousServiceKey
      -ServiceName <String>
      [-InstanceId <String>]
      [-PassThru]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet removes the older public key from the service key

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Revoke the previous public key for the DCCHN-Proxy.xd.local ConnectorProxy service.

```
Revoke-TrustPreviousServiceKey -ServiceName ConnectorProxy -InstanceId
    DCCHN-Proxy.xd.local
```

EXAMPLE 2

Revoke the previous public key of all service keys that were updated after October 20, 2016.

```
Get-TrustServiceKey -Filter "LastUpdated -gt '10-20-2016'" | Revoke-
    TrustPreviousServiceKey
```

Parameters

-ServiceName

The Name of the service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceKey

An existing Service key. Usually the results piped from another command.

Type:	ServiceKey
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceKey

You can pipe the service keys to be updated into this command.

Outputs

None or Citrix.Trust.Sdk.ServiceKey

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a ServiceKey object.

Revoke-TrustVdaEnrollmentToken

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

This cmdlet will mark the specified VDA enrollment token as revoked.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Revoke-TrustVdaEnrollmentToken
      [-TokenId] <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

If the token is revoked it will no longer be valid. Revoked tokens will eventually be deleted.

Examples

EXAMPLE 1

Marks the VDA enrollment token with an ID of 00f1f4e4-ce0c-4255-ae81-17d631d23eb7 as revoked.

```
Revoke-TrustVdaEnrollmentToken -TokenId 00f1f4e4-ce0c-4255-ae81-17
   d631d23eb7
```

Parameters

-TokenId

The JWT token ID of the VDA enrollment token to revoke.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-TrustDBConnection

August 14, 2025

Configures a database connection for the Trust Service.

Syntax

```
Set-TrustDBConnection
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Trust Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-TrustDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-TrustDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Trust Service. Passing in $null will clear any existing database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-TrustDBConnection cmdlet returns an object describing the status of the Trust Service together with extra diagnostics information. Possible values are:

- OK

  The Trust Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the Trust Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Trust Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Trust Service instance, or the service's schema within the database is invalid.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Trust Service currently in use is newer than, and incompatible with, the version of the Trust Service schema on the database. Upgrade the Trust Service to a more recent version.

- DBOlderVersionThanService

  The version of the Trust Service schema on the database is newer than, and incompatible with, the version of the Trust Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Trust Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Trust Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Trust Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-TrustDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the Trust Service.

Syntax

```
Set-TrustDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Specifies SQL credentials to be used by the currently selected Citrix Trust Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Trust Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-TrustDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-TrustDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-TrustDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-TrustDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Set-TrustMultiTenantAccessData

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

This cmdlet a multi-tenant service access record.

Syntax

```
Set-TrustMultiTenantAccessData
   -Uid <Int32>
   -ServiceName <String>
   -IsAccessAllowed <Boolean>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The multi-tenant access record is used to determine if a multi-tenant service is allowed access to certain FMA Trust APIs. Currently this is restricted to Bearer Token generation APIs.

Examples

EXAMPLE 1

Updates a multi-tenant service access record for the MyTestService allowing it access.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-TrustMultiTenantAccessData -ServiceName MyTestService -
    IsAccessAllowed $True
```

Parameters

-Uid

The ID of the multi-tenant service access record to update.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceName

The service name for the multi-tenant service access record to update.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IsAccessAllowed

Gets or sets a value indicating whether or not this multi-tenant service is allowed access or not.

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-TrustServiceKeyMetadata

August 14, 2025

Adds or updates metadata on the given ServiceKey.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-TrustServiceKeyMetadata
   [-ServiceKeyUid] <Int32>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyMetadata
   [-ServiceKeyUid] <Int32>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyMetadata
   [-InputObject] <ServiceKey[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyMetadata
   [-InputObject] <ServiceKey[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given ServiceKey objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the ServiceKey with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-TrustServiceKeyMetadata -ServiceKeyUid 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                        Value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the ServiceKey specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "Sys-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tem.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceKeyUid

Id of the ServiceKey

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	ServiceKey[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-TrustServiceKeyMetadata returns a dictionary containing the new (name, value)-pairs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-TrustServiceKeyRotation

August 14, 2025

Mark a service key as needing to be rotated

Syntax

```
Set-TrustServiceKeyRotation
   -ServiceKey <ServiceKey>
   [-PassThru]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceKeyRotation
   -ServiceName <String>
   [-InstanceId <String>]
   [-PassThru]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Mark a service key as needing to be rotated. Key rotation will not happen immediately. Typically, it should take about an hour for the keys to be rotated but it can take longer if the service that owns the key is down or unable to contact the Trust Service.

Use Get-TrustServiceKey and look at the “LastUpdated”and “RotationNeeded”fields to determine when it was last rotated and if the Service Key has already been marked for Rotation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Mark the Service Key for the DCCHN-Proxy.xd.local ConnectorProxy to be rotated.

```
Set-TrustServiceKeyRotation -ServiceName ConnectorProxy -InstanceId
    DCCHN-Proxy.xd.local
```

EXAMPLE 2

Mark all the Service Keys that were last updated before October 20, 2015 to rotate their public keys.

```
Get-TrustServiceKey -Filter "LastUpdated -lt '10-20-2015'" | Set-
    TrustServiceKeyRotation
```

Parameters

-ServiceName

The Name of the Service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceKey

An existing Service key. Usually the results piped from another command.

Type:	ServiceKey
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceKey

You can pipe the service keys to be updated into this command.

Outputs

None or Citrix.Trust.Sdk.ServiceKey

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a ServiceKey object.

Set-TrustServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-TrustServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-TrustServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given Trust Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-TrustServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                          Value
---                                          -----
property                                     value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Trust service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-TrustServiceMetadata returns a dictionary containing the new (name, value)-pairs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Test-TrustDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix Trust Service.

Syntax

```
Test-TrustDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-TrustDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-TrustDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Trust Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Trust SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Test-TrustDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
      Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Trust Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-TrustDBConnection cmdlet returns an object describing the status of the selected Trust Service instance that would result if the connection string were used with the Set-TrustDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-TrustDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the Trust Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Trust Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Trust Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Trust Service currently in use is newer than, and incompatible with, the version of the Trust Service schema on the database. Upgrade the Trust Service to a more recent version.

- DBOlderVersionThanService

  The version of the Trust Service schema on the database is newer than, and incompatible with, the version of the Trust Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Connectivity between the Trust Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Trust Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Trust Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Unregister-TrustServiceKey

August 14, 2025

Unregister and Revoke the service keys for a specified service from the site.

Syntax

```
Unregister-TrustServiceKey
           -ServiceKey <ServiceKey>
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

```
Unregister-TrustServiceKey
           -ServiceName <String>
           [-InstanceId <String>]
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Unregister and Revoke the service keys for a specified service. If this is a service key with the Service-Name of “ConnectorProxy”, it will also result in the removal of the corresponding Edge Server.

Examples

EXAMPLE 1

Remove the service key for the ConnectorProxy DCCHN-Proxy.xd.local

```
Unregister-TrustServiceKey -ServiceName ConnectorProxy -InstanceId
    DCCHN-Proxy.xd.local
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Unregister all the service keys associated with DCCHN-DDC1.xd.local

```
1  Get-TrustServiceKey -InstanceId DCCHN-DDC1.xd.local | Unregister-
       TrustServiceKey
```

Parameters

-ServiceName

The Name of the Service being effected

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceKey

An existing Service key. Usually the results piped from another command.

Type:	ServiceKey
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-InstanceId

The instance ID of the service. This is usually the FQDN of the machine the service is running on.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Trust.Sdk.ServiceKey

You can pipe the service keys to be updated into this command.

Outputs

None

By default, this cmdlet returns no output.

Update-TrustBearerToken

August 14, 2025

Requests a renewed bearer token.

Syntax

```
Update-TrustBearerToken
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Requests a renewed bearer token.

Examples

EXAMPLE 1

Obtains a bearer token for the current user and immediately refreshes it.

```
$bearerData = New-TrustBearerToken
Update-TrustBearerToken -BearerToken $bearerData.Token
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe the bearer token string into this command.

Outputs

None

By default, this cmdlet returns no output.

Update-TrustServiceKey

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2103

Update\Rotate the public key of a service

Syntax

```
Update-TrustServiceKey
      -ServiceName <String>
      [-InstanceId <String>]
      -PublicKey <String>
      [-InstanceName <String>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Updates primary public key for a given service and (optional) instance id, rotating keys accordingly.

Use Get-TrustServiceKey and look at the “LastUpdated”and “RotationNeeded”fields to determine when it was last rotated and if the Service Key needs to be rotated.

Examples

EXAMPLE 1

Rotate the Service Key for the DCCHN-Proxy.xd.local ConnectorProxy.

```
Update-TrustServiceKey -ServiceName ConnectorProxy -InstanceId DCCHN-
    Proxy.xd.local -PublicKey "newKey" -InstanceName "Instance1"
```

Parameters

-ServiceName

The Name of the Service being updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PublicKey

A new Service key.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-InstanceId

The instance ID of the service.

Type:	String
Position:	Named
Default value:	$null
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InstanceName

The name of the instance for this service.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None or Citrix.Trust.Sdk.ServiceKey

This cmdlet returns a ServiceKey object.

about_UserProfileManager_Filtering

August 14, 2025

Topic

XenDesktop - Advanced Dataset Filtering

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Company "Abc`*"                    # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan

© 1997–2025 Citrix Systems, Inc. All rights reserved.

values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Get-UserProfileDefinition

August 14, 2025

Gets the high level description of a configuration for profile management, based on a byte array (blob).

Syntax

```
Get-UserProfileDefinition
   [-ByteArray] <Byte[]>
   [-ExcludeUnconfigured]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Use this command to convert a configuration byte array into a set of named property settings. The byte array will either have been retrieved from the Broker, or from the New-UserProfileConfiguration cmdlet.

Examples

EXAMPLE 1

The first command creates a fresh configuration set in its default state, and stores it in a Windows PowerShell variable. The second command interprets the new blob, and would output the individual properties of the default configuration.

```
$blob = New-UserProfileConfiguration

Get-UserProfileDefinition -ByteArray $blob
```

EXAMPLE 2

This command creates a fresh configuration set in its default state, and pipes the resulting byte array through to Get-UserProfileDefinition, which will interpret it and output its individual properties.

```
New-UserProfileConfiguration | Get-UserProfileDefinition
```

Parameters

-ByteArray

Specifies the low-level byte array (blob) to be interpreted.

Type:	Byte[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ExcludeUnconfigured

When this switch is supplied, the returned object will only carry the properties whose values have been explicitly set. Properties whose values are unconfigured will be omitted. When this switch is not supplied, the full set of configuration properties will be returned, and any unconfigured settings will just appear to be set to their default value.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Byte[]

The cmdlet accepts the ByteArray parameter as pipeline input.

Outputs

PSObject

This cmdlet outputs a single PSObject with multiple properties. Each property denotes one setting within the configuration set. The following is a summary of the properties and their data types:

ServiceActive (bool?)

ProcessedGroups (string[])

ExcludedGroups (string[])

ProcessAdmins (bool?)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

UserStorePath (string)

PSMidSessionWriteBack (bool?)

OfflineSupport (bool?)

DeleteCachedProfilesOnLogoff (bool?)

ProfileDeleteDelay (int?)

MigrateWindowsProfilesToUserStore (MigrateWindowsProfilesToUserStoreEnum?)

LocalProfileConflictHandling (LocalProfileConflictHandlingEnum?)

TemplateProfilePath (string)

TemplateProfileOverridesLocalProfile (bool?)

TemplateProfileOverridesRoamingProfile (bool?)

TemplateProfileIsMandatory (bool?)

LoadRetries (int?)

ProcessCookieFiles (bool?)

DisableDynamicConfig (bool?)

LogoffRatherThanTempProfile (bool?)

DebugMode (bool?)

LogLevel_Warnings (bool?)

LogLevel_Information (bool?)

LogLevel_FileSystemNotification (bool?)

LogLevel_FileSystemActions (bool?)

LogLevel_RegistryActions (bool?)

LogLevel_RegistryDifference (bool?)

LogLevel_ActiveDirectoryActions (bool?)

LogLevel_PolicyUserLogon (bool?)

LogLevel_Logon (bool?)

LogLevel_Logoff (bool?)

LogLevel_UserName (bool?)

MaxLogSize (int?)

DebugFilePath (string)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExclusionList (string[])

IncludeListRegistry (string[])

ExclusionListSyncFiles (string[])

ExclusionListSyncDir (string[])

SyncDirList (string[])

SyncFileList (string[])

MirrorFoldersList (string[])

PSEnabled (bool?)

PSAlwaysCache_Enabled (bool?)

PSAlwaysCache (int?)

PSPendingLockTimeout (int?)

PSUserGroups (string[])

CPEnable (bool?)

CPUserGroups (string[])

CPSchemaPathData (string)

CPPathData (string)

CPMigrationFromBaseProfileToCPStore (bool?)

FRAdminAccess (bool?)

FRIncDomainName (bool?)

FRAppDataEnabled (FRAppDataEnum?)

FRAppDataPath (string)

FRDesktopEnabled (FRDesktopEnum?)

FRDesktopPath (string)

FRStartMenuEnabled (FRStartMenuEnum?)

FRStartMenuPath (string)

FRDocumentsEnabled (FRDocumentsEnum?)

FRDocumentsPath (string)

FRPicturesEnabled (FRPicturesEnum?)

FRPicturesPath (string)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

FRMusicEnabled (FRMusicEnum?)

FRMusicPath (string)

FRVideosEnabled (FRVideosEnum?)

FRVideosPath (string)

FRFavoritesEnabled (FRFavoritesEnum?)

FRFavoritesPath (string)

FRContactsEnabled (FRContactsEnum?)

FRContactsPath (string)

FRDownloadsEnabled (FRDownloadsEnum?)

FRDownloadsPath (string)

FRLinksEnabled (FRLinksEnum?)

FRLinksPath (string)

FRSearchesEnabled (FRSearchesEnum?)

FRSearchesPath (string)

FRSavedGamesEnabled (FRSavedGamesEnum?)

FRSavedGamesPath (string)

Get-UserProfileManagerServiceAddedCapability

August 14, 2025

Lists the properties that can be configured through user profile configuration.

Syntax

```
Get-UserProfileManagerServiceAddedCapability
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

This command produces an array containing the names of the properties that can be configured as part of a user profile configuration. Any name that occurs in the array can be used as a parameter for the Set-UserProfileDefinition cmdlet.

Examples

EXAMPLE 1

This command creates a list of all the properties that can be set through Set-UserProfileDefinition and stores them in $properties.

```
$properties = Get-UserProfileManagerServiceAddedCapability
```

Parameters

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this command

Outputs

Object[]

The names of the properties that can be configured through user profile configurations

Related Links

- New-UserProfileConfiguration
- Set-UserProfileDefinition

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-UserProfilePath

August 14, 2025

Gets the path (or paths) at which an individual user's profile is stored.

Syntax

```
Get-UserProfilePath
   -User <String>
   -PathToUserStore <String>
   [<CommonParameters>]
```

Description

Use this cmdlet to search for specific user profile folders, based on a configured store path.

The cmdlet will perform automatic substitutions on all of the dynamic parts of the store path. These substitutions will be made based either on the details of the individual user given, or by enumerating all possible strings that are permitted by the variable in question. The approach taken depends on the variable. User-specific variables such as %USERNAME% will be substituted based on the user. Variables such as !CTX_OSNAME! will be substituted by enumerating the possibilities.

Once all substitutions have been made, the cmdlet will search the user store for any directories that exist, matching the substituted path. All such directories are then reported as outputs of the cmdlet.

Once this cmdlet has been used to locate the profile store, other Windows PowerShell scripts can be written to inspect or manipulate the contents of the profile, provided that such access is allowed by the permissions of the profile store.

Examples

EXAMPLE 1

This command attempts to locate the user profile folder for the user account Fred within the domain FABRIKAM, where the user has been specified as an NT account name. This user's details will be substituted into the profile store path. A likely return result would be \\server\Profiles$\Fred.FABRIKAM.

```
Get-UserProfilePath -PathToUserStore \\server\Profiles$\%USERNAME%.%
   USERDOMAIN% -User FABRIKAM\Fred
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

This command attempts to locate the user profile folder for the user account Fred within the domain FABRIKAM, where the user has been specified as a User Principal Name (UPN). This user's details will be substituted into the profile store path. Possible return results might be \\server\Profiles$\Fred.FABRIKAM\Win7 or \\server\Profiles$\Fred.FABRIKAM\WinXP.

```
Get-UserProfilePath -PathToUserStore \\server\Profiles$\%USERNAME%.%
    USERDOMAIN%\!CTX_OSNAME! -User Fred@FABRIKAM
```

EXAMPLE 3

This command attempts to locate the user profile folder for the user account whose Security Identifier (SID) has been specified. This user's details will be substituted into the profile store path. Possible return results might be \\server\Profiles$\Fred.FABRIKAM\x86 or \\server\Profiles$\Fred.FABRIKAM\x64.

```
Get-UserProfilePath -PathToUserStore \\server\Profiles$\%USERNAME%.%
    USERDOMAIN%\!CTX_OSBITNESS! -User S
    -1-5-32-1045337234-12924708993-5683276719-19000
```

Parameters

-User

Specifies the user whose profile is to be found within the store. Users can be identified in terms of their account name, UPN or SID.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-PathToUserStore

Specifies the UNC path to the configured profile store.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The pipeline accepts any valid User parameter, as an account name, UPN or SID.

Outputs

String

The UNC path to the profile folder(s) belonging to the specified user. Each reported path will denote a directory that exists within the store, and will have all of its dynamic elements substituted with static strings.

New-UserProfileConfiguration

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Creates a new configuration for Citrix Profile Management, with all settings in their default initial state.

Syntax

```
New-UserProfileConfiguration
   [<CommonParameters>]
```

Description

This command returns a byte array (or "blob"), which can be passed to the Get-UserProfileDefinition and Set-UserProfileDefinition commands to inspect and modify a configuration set.

Use this command to bootstrap the configuration process in the case where no configuration policy objects are available in the Broker's database, or when you wish to create a fresh configuration that is separate from any that already exist.

No settings will be explicitly configured in the new configuration set. The properties of the configuration will be based on documented default values. Use Set-UserProfileDefinition to alter the state of any property within the configuration set.

Examples

EXAMPLE 1

The first command creates a fresh configuration set in its default state, and stores it in a Windows PowerShell variable. The second command interprets the new blob, and would output the individual properties of the default configuration.

```
$blob = New-UserProfileConfiguration

Get-UserProfileDefinition -ByteArray $blob
```

EXAMPLE 2

This command creates a fresh configuration set in its default state, and pipes the resulting byte array through to Get-UserProfileDefinition, which will interpret it and output its individual properties.

```
New-UserProfileConfiguration | Get-UserProfileDefinition
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

The new configuration set, which can be piped directly into Get-UserProfileDefinition to receive the named properties.

New-UserProfileShare

August 14, 2025

Creates a new Windows network share on a nominated computer, making it suitable for use as a profile store.

Syntax

```
New-UserProfileShare
   -ServerName <String>
   -ShareName <String>
   -PathOnServer <String>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -UserGroups <String[]>
    -AdminGroups <String[]>
    [<CommonParameters>]
```

Description

Use this command as part of the procedure for creating a new profile store when configuring profile management for first use. A suitable folder is assumed to already exist locally on the nominated computer. If no such folder exists, then you will need to create it on the machine before running this command. This command automates the process of transforming that folder into a published network share with suitable access control for profile management.

When using this command to publish a share, you will need to supply information about the security groups of users who will be storing their profiles on the share. You can also optionally specify security groups who will be given an administrative level of access, should your organisation require this.

Examples

EXAMPLE 1

This command creates a new network share called "Profiles$"on the machine called "ProfileServer". It does this by sharing the folder "C:\ProfileStore", which will already be resident on ProfileServer. The store can be used by all domain users in the FABRIKAM domains. The store (including all of the user profiles that are subsequently stored within it) will also be accessible to the domain administrators. Following successful execution of this command, the network share whose UNC name is "\\ProfileServer\Profiles$"will exist. This makes it possible, for instance, to establish "\\ProfileServer\Profiles$\%USERNAME%.%USERDOMAIN"as a valid store path when configuring profile management.

```
C:PS> New-UserProfileShare -ServerName ProfileServer -ShareName
    Profiles$ -PathOnServer C:\ProfileStore -UserGroups @("FABRIKAM\
    Domain Users") -AdminGroups @("FABRIKAM\Administrators")
```

Parameters

-ServerName

This string specifies the network identity of the computer on which the share is being published.

Type: String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ShareName

This specifies the desired name of the share itself. It is recommended (although not required) that share names end with the "$"character, so that they are excluded from casual enumerations of available shares.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PathOnServer

This string specifies the absolute path of the local directory on the server computer, which will become the shared folder. This path must make sense from the point of view of the server, so it must not be a UNC path. A path might, for example, be of the form "C:\UserProfiles\FinanceDepartment".

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-UserGroups

This array of strings specifies the names of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Domain Users".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroups

This array of strings specifies the names of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Administrators".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- about_UpmSnapInUserProfileManagerSnapin

Remove-UserProfileShare

August 14, 2025

Removes a nominated network share.

Syntax

```
Remove-UserProfileShare
      [-Path] <String>
      [<CommonParameters>]
```

Description

This command might be used as part of a final tear-down procedure for a profile store that is no longer needed.

This command will not delete any folders or data from the server computer, nor will it alter any access permissions on the folder. It will only restore the shared folder into an unshared state.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

This command will unpublish the network share called "Profiles$"on the computer called "Profile-Server". The contents of the folder itself will not be affected. Any required deletion of profile store contents must be performed manually by an appropriate administrator of the folder.

```
C:PS> Remove-UserProfileShare -Path \\ProfileServer\Profiles$
```

Parameters

-Path

This string specifies the full UNC name of the network share to be removed. Since it is a UNC name, it will naturally specify both the name of the server computer and the name of the share to be removed. Consequently, no additional inputs are required.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Repair-UserProfileShare

August 14, 2025

Carries out one or more remedial actions on a profile store.

Syntax

```
Repair-UserProfileShare
      -Path <String>
      [-Mandatory]
      [-RedirectedFolders]
      -UserGroups <String[]>

Description

Use this command in situations where the Test-UserProfileShare cmdlet reported one or more fixable faults with the profile store.

The inputs and outputs of this command are identical to those of Test-UserProfileShare. The only difference between the two cmdlets is that this cmdlet will attempt to fix the issues, where Test-UserProfileShare will only report them.

Issues that cannot be fixed will be reported as test failures, just as they would with Test-UserProfileShare.

This cmdlet can only be used to fix issues that were claimed to be fixable in the output report from Test-UserProfileShare.

Examples

EXAMPLE 1

This command ensures that the path "\\ProfileServer\Profiles$\%USERAME%.%USERDOMAIN%"is suitable for use as a profile store. This path is syntactically valid, so the cmdlet will check for the existence of the share "\\ProfileServer\Profiles$". Provided that the share exists, it will also ensure that its permissions are configured such that all domain users would be permitted to create profile folders within the store, and that all domain administrators will be permitted to access the store for administrative purposes.

```
C:PS> Repair-UserProfileShare -Path \\ProfileServer\Profiles$\%USERNAME
    %.%USERDOMAIN% -UserGroups @("FABRIKAM\Domain Users") -AdminGroups @
    ("FABRIKAM\Administrators")
```

EXAMPLE 2

This command ensures that the path "\\ProfileServer\Profiles$\FinanceDept\FixedProfile"contains a valid Citrix mandatory profile. This path is syntactically valid, so the cmdlet will check that the share "\\ProfileServer\Profiles$"exists. If it exists, the cmdlet will go on to ensure that its permissions are configured such that all domain users would be permitted to read data from the profile, and that all domain administrators will be permitted to access the profile for administrative purposes.

Additional repair actions will be performed on the contents of the profile to ensure that there is nothing within the profile that might reveal details about the user who logged in to create it.

```
C:PS> Repair-UserProfileShare -Path \\ProfileServer\Profiles$\
    FinanceDept\FixedProfile -UserGroups @("FABRIKAM\Domain Users") -
    AdminGroups @("FABRIKAM\Administrators") -Mandatory
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Path

This string contains the prospective profile store path to be examined, such as "\\ProfileServer\Profiles$\%USERNAME%.%USERDOMAIN%".

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-UserGroups

This array of strings specifies the names of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Domain Users".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroups

This array of strings specifies the names of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Administrators".

Type:	String[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserGroupsSids

This array of strings specifies the SID of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as security identifier string, such as "S-1-1-0".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroupsSids

This array of strings specifies the SID of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as security identifier string, such as "S-1-5-32-544".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Mandatory

This switch indicates whether the profile store is intended to house a mandatory profiles. Mandatory profile stores are subjected to additional checks.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RedirectedFolders

This switch indicates whether the path indicates the location of redirected folder directories.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

PSObject

This cmdlet outputs a sequence of objects, each of which has the following properties:

Name - This property indicates the name of the test.

Status - This property indicates whether the repair action succeeded or failed.

Details - This property provides additional information about the test in the case where it has failed. The interpretation of this property depends on the name of the test.

CanFix - In the case where the test has failed, this boolean property indicates whether the problem can be fixed with the Repair-UserProfileShare cmdlet.

    [-FRSavedGamesPath <String>]
    [<CommonParameters>]
```

Description

Use this cmdlet to edit the configurations for profile management. The cmdlet defines one input parameter for each settable property. Any number of these settings can be modified in a single call to the cmdlet. The cmdlet also requires the low-level byte array blob containing the original configuration set to be modified. It will return an updated byte array with the settings applied. The resulting byte array can then be stored back at the Broker.

Examples

EXAMPLE 1

The first command creates a new user profile configuration in its default state, and stores the byte array in a Windows PowerShell variable. The second command then edits this configuration by setting the ServiceActive property to TRUE (which has the effect of enabling the profile management service), and by setting the path to the profile store. All other settings remain unaffected, and hence in their default state.

```
C:PS> $blob = New-UserProfileConfiguration

C:PS> $updatedBlob = Set-UserProfileDefinition -ByteArray $blob -
    ServiceActive $true -UserStorePath \\ProfileServer\Profiles$\%
    USERNAME%.%USERDOMAIN
```

Parameters

-ByteArray

Specifies the original configuration set that is being modified by this invocation of the command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Byte[]
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceActive

Applies to: both file-based and container-based profile solutions

By default, to facilitate deployment, Profile management does not process logons or logoffs.

Turn on processing by enabling this setting.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, Profile management does not process Windows user profiles in any way.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessedGroups

Applies to: both file-based and container-based profile solutions

Both computer local groups and domain groups (local, global and universal) can be used. Domain groups should be specified in the format: <DOMAIN NAME>\<GROUP NAME>.

If this setting is configured here, Profile management processes only members of these user groups.

If this setting is disabled, Profile management processes all users.

If this setting is not configured here, the value from the .ini file is used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If this setting is not configured here or in the .ini file, members of all user groups are processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedGroups

Applies to: both file-based and container-based profile solutions

You can use computer local groups and domain groups (local, global, and universal) to prevent particular user profiles from being processed. Specify domain groups in the form <DOMAIN NAME>\<GROUP NAME>.

If this setting is configured here, Profile management excludes members of these user groups.

If this setting is disabled, Profile management does not exclude any users.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no members of any groups are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessAdmins

Applies to: both file-based and container-based profile solutions

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies whether logons of members of the local group “Administrators”are processed by Profile management.

If this setting is disabled, logons by local administrators are not processed by Profile management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, administrators will not be processed.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserStorePath

Applies to: both file-based and container-based profile solutions

Sets the path to the directory in which the user settings (registry changes and synchronized files) are saved (user store).

The path can be an absolute UNC path or a path relative to the home directory.

In both cases, the following types of variables can be used: system environment variables enclosed in percent signs and attributes of the Active Directory user object enclosed in hashes.

Examples: The folder Windows\%ProfileVer% stores the user settings in the subfolder called Windows\W2k3 of the user store (if %ProfileVer% is a system environment variable resolving to W2k3).

\\server\share#SAMAccountName# stores the user settings to the UNC path \\server\share\JohnSmith (if #SAMAccountName# resolves to JohnSmith for the current user).

User environment variables cannot be used, except for %username% and %userdomain%.

If this setting is disabled, the user settings are saved in the Windows subdirectory of the home directory.

If this setting is not configured here, the setting from the .ini file is used.

If this setting is not configured here or in the .ini file, the Windows directory on the home drive is used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSMidSessionWriteBack

Applies to: file-based profile solution only

With this setting, files and folders (but not Registry entries) that are modified can be synchronized to the user store in the middle of a session, before logoff.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, active write back is disabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OfflineSupport

Applies to: file-based profile solution only

Enables the offline profiles feature. This is intended for computers that are commonly removed from networks, typically laptops or mobile devices not servers or desktops.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, offline profile support is disabled.

Type:	Boolean

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeleteCachedProfilesOnLogoff

Applies to: file-based profile solution only

Specifies whether locally cached profiles are deleted after logoff.

If this setting is enabled, a user's local profile cache is deleted after they have logged off. This is recommended for terminal servers.

If this setting is disabled cached profiles are not deleted.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, cached profiles are not deleted.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProfileDeleteDelay

Applies to: file-based profile solution only

Works only if 'Delete locally cached profiles on logoff'is enabled. Sets an optional extension to the delay before locally cached profiles are deleted at logoff. A value of 0 deletes the profiles immediately during logoff processing. Checks take place every minute, so a value of 60 ensures that profiles are deleted between one and two minutes after users have logged off (depending on when the last check took place). Extending the delay is useful if you know that a process keeps files or the user registry hive open during logoff. With large profiles, this can also speed up logoff.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If this policy is not configured here, the value from the .ini file is used.

If this policy is not configured here or in the .ini file, profiles are deleted immediately.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MigrateWindowsProfilesToUserStore

Applies to: file-based profile solution only

Profile management can migrate existing profiles "on the fly"during logon if the user has no profile in the user store.

The following event takes place during logon: if an existing Windows profile is found and the user does not yet have a Citrix user profile in the user store, the Windows profile is migrated (copied) to the user store on the fly. After this process, the user store profile is used by Profile management in the current and any other session configured with the path to the same user store.

If this setting is enabled, profile migration can be activated for roaming and local profiles (the default), roaming profiles only, local profiles only, or profile migration can be disabled altogether.

If profile migration is disabled and no Citrix user profile exists in the user store, the existing Windows mechanism for creating new profiles is used as in a setup without Profile management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all types of existing profiles are migrated.

Type:	MigrateWindowsProfilesToUserStoreEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LocalProfileConflictHandling

Applies to: file-based profile solution only

This setting configures what Profile management does if both a profile in the user store and a local Windows user profile (not a Citrix user profile) exist.

If this setting is disabled or set to the default value of "Use local profile", Profile management uses the local profile, but does not change it in any way.

If this setting is set to "Delete local profile", Profile management deletes the local Windows user profile, and then imports the Citrix user profile from the user store.

If this setting is set to "Rename local profile", Profile management renames the local Windows user profile (in order to back it up) and then imports the profile from the user store.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, existing local profiles are used.

Type:	LocalProfileConflictHandlingEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfilePath

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfileOverridesLocalProfile

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-TemplateProfileOverridesRoamingProfile

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TemplateProfileIsMandatory

Applies to: both file-based and container-based profile solutions

By default, new user profiles are created from the default user profile on the computer where a user first logs on. Profile management can alternatively use a centrally stored template when creating new user profiles. Template profiles are identical to normal profiles in that they reside in any file share on the network. Use UNC notation to specifying paths to templates. Users need read access to a template profile.

If this setting is disabled, templates are not used.

If this setting is enabled, Profile management uses the template instead of the local default profile when creating new user profiles.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). This can be changed by enabling the setting "Template profile overrides local profile".

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoadRetries

Applies to: both file-based and container-based profile solutions

Sets the number of retries when accessing locked files.

If this setting is disabled the default value of five retries is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value of five retries is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProcessCookieFiles

Applies to: file-based profile solution only

Some deployments leave extra Internet cookies that are not referenced by the file index.dat. The extra cookies left in the file system after sustained browsing can lead to profile bloat. Enable this setting to

© 1997–2025 Citrix Systems, Inc. All rights reserved.

force processing of index.dat and remove the extra cookies. The setting might slightly increase logoff time. Enable this setting only when you experience the issue.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no processing of index.dat takes place.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DisableDynamicConfig

Applies to: both file-based and container-based profile solutions

Profile management 5.x examines its environment and configures itself accordingly. To disable this for troubleshooting or to retain the settings you used in an earlier version, enable this setting.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, automatic configuration is turned on so Profile management settings might change if the environment changes.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffRatherThanTempProfile

Applies to: both file-based and container-based profile solutions

If a problem is encountered when the user logs on (for example, if the user store is unavailable) a temporary profile is provided.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Alternatively, enabling this setting displays an error message and logs the user off.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, a temporary profile is provided.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DebugMode

Applies to: both file-based and container-based profile solutions

Activation of this setting enables debug mode (verbose logging). In debug mode, extensive status information is logged in the log files in "%SystemRoot%\System32\Logfiles\UserProfileManager"or in the location specified by the "Path to log file"policy setting.

If this setting is disabled only errors are logged.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only errors are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Warnings

Applies to: both file-based and container-based profile solutions

Detailed log settings.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Information

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_FileSystemNotification

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_FileSystemActions

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_RegistryActions

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_RegistryDifference

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_ActiveDirectoryActions

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_PolicyUserLogon

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Logon

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_Logoff

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogLevel_UserName

Applies to: both file-based and container-based profile solutions

Detailed log settings.

Define events or actions that Profile management logs in depth.

If this setting is not configured here, Profile management uses the settings from the .ini file.

If this setting is not configured here or in the .ini file, errors and general information are logged.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxLogSize

Applies to: both file-based and container-based profile solutions

Sets the maximum size of the log file in bytes. If the log file grows beyond this size an existing backup of the file (.bak) is deleted, the log file is renamed to .bak, and a new log file is created.

The log file is created in "%SystemRoot%\System32\Logfiles\UserProfileManager"or in the location specified by the "Path to log file"policy setting.

If this setting is disabled, the default value of 10 MB is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default of 10 MB is used.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DebugFilePath

Applies to: both file-based and container-based profile solutions

Sets an alternative path to which the log files are saved.

The path can point to a local drive or a remote, network-based one (a UNC path). Remote paths can be useful in large, distributed environments but they can create significant network traffic, which may

© 1997–2025 Citrix Systems, Inc. All rights reserved.

be inappropriate for log files. For provisioned, virtual machines with a persistent hard drive, set a local path to that drive. This ensures log files are preserved when the machine restarts. For virtual machines without a persistent hard drive, setting a UNC path allows you to retain the log files but the system account for the machines must have write access to the UNC share. Use a local path for any laptops managed by the offline profiles feature.

Examples: D:\LogFiles\ProfileManagement. \\servername\LogFiles\ProfileManagement

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default location "%SystemRoot%\System32\Logfiles\UserP
is used.

If a UNC path is used for log files then Citrix recommends that an appropriate access control list is applied to the log file folder to ensure that only authorized user or computer accounts can access the stored files.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExclusionList

Applies to: both file-based and container-based profile solutions

List of registry keys in the HKCU hive that are ignored during logoff.

Example: Software\Policies.

If this setting is disabled, no registry keys are excluded.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no registry keys are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeListRegistry

Applies to: both file-based and container-based profile solutions

List of registry keys in the HKCU hive that are processed during logoff. Example: Software\Adobe.

If this setting is enabled, only keys on this list are processed.

If this setting is disabled, the complete HKCU hive is processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all of HKCU is processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExclusionListSyncFiles

Applies to: file-based profile solution only

List of files that are ignored during synchronization.

File names should be specified as paths relative to the user profile. Wildcards are allowed. Wildcards in file names are applied recursively while wildcards in folder names are not.

Note: As of Profile Management 7.15, you can use the vertical bar '|'for applying a policy to only the current folder without propagating it to the subfolders.

Examples: Desktop\Desktop.ini ignores the Desktop.ini file in the Desktop folder.

AppData*.tmp ignores all files with the .tmp extension in the AppData folder and its subfolders.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

AppData*.tmp| ignores all files with the .tmp extension in the AppData folder.

Downloads*\a.txt ignores a.txt in any immediate subfolder of the Downloads folder. Note that wildcards in folder names are not applied recursively.

If this setting is disabled, no files are excluded.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no files are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExclusionListSyncDir

Applies to: file-based profile solution only

List of directories that are ignored during synchronization.

Folder names should be specified as paths relative to the user profile.

Wildcards are supported but they are not applied recursively.

Examples: Desktop ignores the Desktop folder in the user profile.

Downloads* ignores all immediate subfolders of the Downloads folder.

If this setting is disabled, no folders are excluded.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no folders are excluded.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SyncDirList

Applies to: file-based profile solution only

Profile management synchronizes each user's entire profile between the system it is installed on and the user store.

It allows you to include subfolders of excluded folders.

Paths on this list should be relative to the user profile.

Wildcards are supported but they are not applied recursively.

Examples: Desktop\exclude\include specifies the include subfolder of the Desktop\exclude folder.

Desktop\exclude* specifies all immediate subfolders of the Desktop\exclude folder.

Disabling this setting has the same effect as enabling it and configuring an empty list.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only non-excluded folders in the user profile are synchronized.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SyncFileList

Applies to: file-based profile solution only

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Profile management synchronizes each user's entire profile between the system it is installed on and the user store.

This setting allows for the inclusion of files below excluded folders.

Paths on this list should be relative to the user profile. Wildcards are allowed. Wildcards in file names are applied recursively while wildcards in folder names are not.

Note: As of Profile Management 7.15, you can use the vertical bar '|'for applying a policy to only the current folder without propagating it to the subfolders.

Examples: AppData\Local\Microsoft\Office\Access.qat specifies a file below a folder excluded in the default configuration.

AppData\Local\MyApp*.cfg specifies all files with the extension .cfg in the profile folder AppData\Local\MyApp and its subfolders.

AppData\Local\MyApp*.cfg| specifies all files with the extension .cfg in the profile folder AppData\Local\MyApp.

Downloads*\b.txt specifies b.txt in any immediate subfolder of the Downloads folder. Note that wildcards in folder names are not applied recursively.

Disabling this setting has the same effect as enabling it and configuring an empty list.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only non-excluded files in the user profile are synchronized.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MirrorFoldersList

Applies to: file-based profile solution only

Profile management can mirror a folder relative to the profile's root folder. Use this setting for files whose contents index data and where separate instances of the data are likely to exist. For example,

© 1997–2025 Citrix Systems, Inc. All rights reserved.

you can mirror the Internet Explorer cookies folder so that index.dat is synchronized with the cookies that it indexes. Be aware that, in these situations the "last write wins"so files in mirrored folders that have been modified in more than one session are overwritten by the last update, resulting in loss of profile changes.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSEnabled

Applies to: file-based profile solution only

With profile streaming, users'profiles are synchronized on the local computer only when they are needed. Registry entries are cached immediately, but files and folders are only cached when accessed by users.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSAlwaysCache_Enabled

Applies to: file-based profile solution only

Optionally, to enhance the user experience, use this setting with the Profile streaming setting, which imposes a lower limit on the size of files that are streamed. Any files this size or larger are cached as soon as possible after logon. To use the cache entire profile feature, set this limit to zero (which caches all of the profile contents).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSAlwaysCache

Applies to: file-based profile solution only

Optionally, to enhance the user experience, use this setting with the Profile streaming setting, which imposes a lower limit on the size of files that are streamed. Any files this size or larger are cached as soon as possible after logon. To use the cache entire profile feature, set this limit to zero (which caches all of the profile contents).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSPendingLockTimeout

Applies to: file-based profile solution only

You can set a timeout period that frees up users'files so they are written back to the user store from the pending area in the event that the user store remains locked when a server becomes unresponsive (for example, when it goes down). Use this setting to prevent bloat in the pending area and to ensure the user store always contains the most up-to-date files.

Type:	Int32
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PSUserGroups

Applies to: file-based profile solution only

Enter one or more Windows user groups.

If this setting is enabled, only the profiles of those groups' members are streamed. If this setting is disabled, all user groups are processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all users are processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPEnable

Applies to: both file-based and container-based profile solutions

By default, to facilitate deployment, cross-platform settings is disabled.

Turn on processing by enabling this setting.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no cross-platform settings will be applied.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPUserGroups

Applies to: both file-based and container-based profile solutions

Enter one or more Windows user groups.

If this setting is configured, the cross-platform settings feature of Profile management processes only members of these user groups. If this setting is disabled, all user groups are processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all user groups are processed.

Note: Use Enter to separate multiple entries.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPSchemaPathData

Applies to: both file-based and container-based profile solutions

Specify a folder where the definition files are located.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no cross-platform settings will be applied.

Note:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- The folder can be local or it can reside on an SMB file share.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPPathData

Applies to: both file-based and container-based profile solutions

Sets the path to the directory in which users' cross-platform settings are saved (cross-platform settings store).

The path can be an absolute UNC path or a path relative to the home directory.

In both cases, the following types of variables can be used: system environment variables enclosed in percent signs and attributes of the Active Directory user object enclosed in hashes.

User environment variables cannot be used, except for %username% and %userdomain%.

If this setting is disabled, the path Windows\PM_CP is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value Windows\PM_CP is used.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CPMigrationFromBaseProfileToCPStore

Applies to: both file-based and container-based profile solutions

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default: Disabled

Definition files contain a set of definitions that configure an application. If the cross-platform settings store contains a definition with no data, or the cached data in the single-platform profile is newer than the definition's data in the store, Profile management only migrates the data from the single-platform profile to the store if you enable this setting.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRAdminAccess

Applies to: file-based profile solution only

By default, users are granted exclusive access to the contents of their redirected folders.

Enabling this option allows administrator access to the contents of the users redirected folders.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRIncDomainName

Applies to: file-based profile solution only

Enabling this option will include the %userdomain% environment variable as part of the UNC path.

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRAppDataEnabled

Applies to: file-based profile solution only

Lets you specify how to redirect the AppData(Roaming) folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRAppDataEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FRAppDataPath

Applies to: file-based profile solution only

Lets you specify how to redirect the AppData(Roaming) folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

Type:	FRPicturesEnum
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FRPicturesPath

Applies to: file-based profile solution only

Lets you specify how to redirect the Pictures folder. To do so, select Enabled and then type the redirected path. Caution: Potential data loss might occur. See below for details. You might want to modify the path after the policy takes effect. However, consider potential data loss before you do so. The data contained in the redirected folder might be deleted if the modified path points to the same location as the previous path. For example, suppose you specify the Contacts path as path1. Later, you change path1 to path2. If path1 and path2 point to the same location, all data contained in the redirected folder is deleted after the policy takes effect. To avoid potential data loss, complete the following steps:

1. Apply Microsoft policy to machines where Profile Management is running through Active Directory Group Policy Objects. To do so, open the Group Policy Management Console, navigate to Computer Configuration > Administrative Templates > Windows Components > File Explorer, and then enable Verify old and new Folder Redirection targets point to the same share before redirecting.
2. If applicable, apply hotfixes to machines where Profile Management is running. For details, see https://support.microsoft.com/en-us/help/977229 and https://support.microsoft.com/en-us/help/2799904.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Byte[]

The new configuration set, with all of the given modifications applied.

Test-UserProfileShare

August 14, 2025

Tests a prospective user profile store path for its suitability for use with Citrix Profile Management.

Syntax

```
Test-UserProfileShare
    -Path <String>
    [-Mandatory]
    [-RedirectedFolders]
    -UserGroups <String[]>
    -AdminGroups <String[]>
    [<CommonParameters>]
```

```
Test-UserProfileShare
    -Path <String>
    [-Mandatory]
    [-RedirectedFolders]
    -UserGroupsSids <String[]>
    -AdminGroupsSids <String[]>
    [<CommonParameters>]
```

```
Test-UserProfileShare
    [-PathSyntaxOnly]
    -Path <String>
    [-Mandatory]
    [-RedirectedFolders]
    [<CommonParameters>]
```

Description

This command can be used as a validation step prior to configuring the profile store path in a production environment, in order to gain confidence that the profile manager and the store will function together correctly.

This command runs a sequence of tests on the nominated path, and reports the results via the output pipeline. The tests are organised into two distinct phases. The first phase examines the syntax of the supplied store path string. The second phase examines the profile store itself, checking that the required network shares exist, and that their permissions are appropriately configured according to best practices. If any faults are discovered with the syntax of the path string, these will be reported via the output pipeline, and the command will halt early without attempting to examine the profile store. The profile store will only be examined if the path is syntactically correct.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

This command can be used in combination with the Repair-UserProfileShare cmdlet, which is able to automatically correct some of the problems that are found during inspection of the profile store. Problems with the syntax of the path can never be repaired. Syntactic issues must be fixed by the administrator re-typing the path and testing the store again.

Examples

EXAMPLE 1

This command tests that the path "\\ProfileServer\Profiles$\%USERAME%.%USERDOMAIN%"is suitable for use as a profile store. This path is syntactically valid, so the cmdlet will check for the existence of the share "\\ProfileServer\Profiles$". Provided that the share exists, it will also check that its permissions are configured such that all domain users would be permitted to create profile folders within the store, and that all domain administrators will be permitted to access the store for administrative purposes.

```
C:PS> Test-UserProfileShare -Path \\ProfileServer\Profiles$\%USERNAME
    %.%USERDOMAIN% -UserGroups @("FABRIKAM\Domain Users") -AdminGroups @
    ("FABRIKAM\Administrators")
```

EXAMPLE 2

This command tests that the path "\\ProfileServer\Profiles$\FinanceDept\FixedProfile"contains a valid Citrix mandatory profile. This path is syntactically valid, so the cmdlet will check that the share "\\ProfileServer\Profiles$"exists. If it exists, the cmdlet will go on to check that its permissions are configured such that all domain users would be permitted to read data from the profile, and that all domain administrators will be permitted to access the profile for administrative purposes.

Additional checks will be performed on the contents of the profile to ensure that there is nothing within the profile that might reveal details about the user who logged in to create it.

```
C:PS> Test-UserProfileShare -Path \\ProfileServer\Profiles$\FinanceDept
    \FixedProfile -UserGroups @("FABRIKAM\Domain Users") -AdminGroups @(
    "FABRIKAM\Administrators") -Mandatory
```

Parameters

-PathSyntaxOnly

This switch indicates the the command should only check the syntax of the user store path.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Path

This string contains the prospective profile store path to be examined, such as "\\ProfileServer\Profiles$\%USERNAME%.%USERDOMAIN%".

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-UserGroups

This array of strings specifies the names of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Domain Users".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AdminGroups

This array of strings specifies the names of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as a Windows object identifier, such as "FABRIKAM\Administrators".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UserGroupsSids

This array of strings specifies the SID of security groups whose members will be creating their profiles in the store. This array must contain at least one entry. Each string must be specified as security identifier string, such as "S-1-1-0".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminGroupsSids

This array of strings specifies the SID of security groups that should be given an administrative level of access to the profile share. If no such access is required, the array can be supplied as empty. Each string must be specified as security identifier string, such as "S-1-5-32-544".

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Mandatory

This switch indicates whether the profile store is intended to house a mandatory profiles. Mandatory profile stores are subjected to additional checks.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RedirectedFolders

This switch indicates whether the path indicates the location of redirected folder directories.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

This cmdlet outputs a sequence of objects, each of which has the following properties:

Name - This property indicates the name of the test.

Status - This property indicates whether the test has passed or failed.

Details - This property provides additional information about the test in the case where it has failed. The interpretation of this property depends on the name of the test.

CanFix - In the case where the test has failed, this boolean property indicates whether the problem can be fixed with the Repair-UserProfileShare cmdlet.

Topic

about_VusVdaUpdateServiceSnapin

Short Description

The VDA Update Service PowerShell snap-in provides administrative functions for the VDA Update Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Vus'.

Long Description

The VDA Update Service PowerShell snap-in enables both local and remote administration of the VDA Update Service.

The VDA Update Service (or VUS for short) allows Citrix administrators to schedule updates for VDA machines.

The snap-in provides storage and configuration of these entities:

ComponentVersion

Represents the version of a particular component on a machine. Component are defined by the ComponentConfiguration table.

ComponentConfiguration

Represents the configuration to find current version of component installed on VDA

Catalog

Represents the machine catalog related persistent information.

Schedule

Represents the Schedule information. A schedule can either be a catalog or group of machines.

MachineSchedule

Represents the Machine Upgrade information.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

© 1997–2025 Citrix Systems, Inc. All rights reserved.

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see

© 1997–2025 Citrix Systems, Inc. All rights reserved.

about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier

© 1997–2025 Citrix Systems, Inc. All rights reserved.

helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Confirm-VusMachineComponentSelection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Validate the component selection choices at machine level that can be Included/Excluded during an upgrade using VDA Upgrade Service

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Confirm-VusMachineComponentSelection
       -MachineName <String[]>
       [-SelectedComponents <ComponentSelection[]>]

Description

The ConfirmVusMachineComponentSelection cmdlet is used to verify and Validate the component Selections(New Components to be included in Upgrade), Exclusions(Installed Components that should not be upgraded) and features to be used in a Machine Upgrade using the VDA Upgrade Service.

Confirm-VusMachineComponentSelection returns true if the Selection is Valid. If the Selection is invalid it returns false and information as to why the selection is invalid.

Examples

EXAMPLE 1

SCList represents the Selected Components List comprising of ComponentA and ComponentB with Component ID's indicated below, which were previously not installed on VDAs of Machine but needs to be installed/included during the VDA Upgrade. $EmptyParamList = @()

$ComponentA = [PSCustomObject]@{ ComponentId = [System.guid]::new('396394b3-53f0-48e0-8d8c-61dad39e3f17') Parameters = $EmptyParamList }

$ComponentB = [PSCustomObject]@{ ComponentId = [System.guid]::new('3ce3c043-5f32-497c-9099-0e1a6dc06647') Parameters = $EmptyParamList } $SCList = @($ComponentA, $ComponentB)

$ComponentC Represent a Component installed on all VDAs of a Machine but needs to be excluded during the VDA Upgrade. $ComponentC = [PSCustomObject]@{ ComponentId = [System.guid]::new('bddec677-9afb-49f0-9908-59a64f0f54f8') Parameters = $EmptyParamList }

$FeatureA and FeatureB represents features that needs to be enabled on the VDAs of the Machine during the Upgrade.

$FeatureA = '44FF6E61-E3CC-45D0-BE9B-F52B5AB72A08'$FeatureB = 'D9167E2C-2088-4301-BFA1-698F934B4E6B'

$FeaturesList = @($FeatureA,$FeatureB)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The above input parameters instruct the cmdlet to check if the ComponentA and ComponentB can be installed/Included for installation and ComponentC can be excluded from installation and FeatureA can be enabled on the VDAs of the Machine during the next Machine Upgrade scheduled from VDA Upgrade Service.

The cmdlet validates with the VUS SDK and responds with

- true: If the above Selection of Selected Components and Excluded Components and Features is Valid.
- false: If the above Selection is Invalid with an associated message as to why the selection is invalid.

```
ConfirmVusMachineComponentSelection -MachineUid 1 -SelectedComponents
    SCList -ExcludedComponents $ComponentC -Features $FeaturesList
```

EXAMPLE 2

The XML Schema Definition (xsd) with which the xml string provided for parameters: SelectedComponentsXml and ExcludedComponentsXml is validated is as given below: The ComponentId, ParamterId, FeatureId needed can be obtained from the output of Get-VusComponents.

SCXml represents a ComponentList in XML String format comprising of Component with Component ID(f515acf6-a309-4fe1-8ec6-5023cd0073f4) which has a Paramter with ParameterId(9c365ddc-6e25-48a0-9390-e58c03137d8a) and ParameterValue(testval) that was previously not installed on VDAs of machine but needs to be installed/included during the VDA Upgrade.

$ScXml = ‘“‘

$EcXml represents 2 Components in XML String format with ComponentIDs:(396394b3-53f0-48e0-8d8c-61dad39e3f17, 3ce3c043-5f32-497c-9099-0e1a6dc06647) that is installed on all VDAs of a Machine but needs to be excluded during the VDA Upgrade.

$EcXml = ‘“‘

Features represents the List of strings (feature ID Guids) that needs to be enabled on the VDAs during the Upgrade.

$FeatureA and FeatureB represents features that needs to be enabled on the VDAs during the Upgrade.

$FeatureA = ‘44FF6E61-E3CC-45D0-BE9B-F52B5AB72A08’

$FeatureB = ‘D9167E2C-2088-4301-BFA1-698F934B4E6B’

$FeaturesList = @($FeatureA,$FeatureB)

The above input parameters instruct the cmdlet to check if the components represented by ScXml can be installed/Included for installation and Component represented by EcXml can be excluded from

© 1997–2025 Citrix Systems, Inc. All rights reserved.

installation and Features represented by FeatureList can be enabled on the VDAs of the during the next Machine Upgrade scheduled from VDA Upgrade Service.

The cmdlet validates with the VUS SDK and responds with

- true: If the above Selection of Selected Components and Excluded Components and Features is Valid.
- false: If the above Selection is Invalid with an associated message as to why the selection is invalid.

```
ConfirmVusMachineComponentSelection -MachineUid 1 -
    SelectedComponentsXml $ScXml -ExcludedComponentsXml $EcXml -Features
     $Featurelist
```

Parameters

-MachineUid

UID of the machine(s) provided by broker service

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SelectedComponentsXml

List of New Components(in XML format) that are to be included/added in the Upgrade. The XML Scehma definition(xsd) is provided in the examples section.ComponentId, ParameterId can be obtianed from the GetVusMachineComponentsCommand cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedComponentsXml

List of Installed Components that are to be excluded/omitted in the Upgrade.This parameter accepts XML string. The XML Scehma definition(xsd) is provided in the examples section. ComponentId, ParameterId can be obtianed from the GetVusMachineComponentsCommand cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUuid

UUID of the machine(s) provided by broker service

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Name of the machine(s) provided by broker service

Type:	String[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SelectedComponents

List of New Components that are to be included/added in the Upgrade. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the GetVusMachineComponentsCommand cmdlet.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedComponents

List of Installed Components that are to be excluded/omitted in the Upgrade. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the GetVusMachineComponentsCommand cmdlet.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Features

List of string (FeatureId GUIDs) to be enabled on VDA. FeatureId can be obtained from the GetVusMachineComponentsCommand cmdlet

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeVersion

VDA Version of which the components and parameters are to be fetched

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.ComponentSelection

Component Information for the Selected/Excluded Component

Citrix.VdaUpdateService.Sdk.ComponentParameter

Feature/Parameter information for the selected feature/parameter

Outputs

Citrix.VdaUpdateService.Sdk.ConfirmVusMachineComponentResult

Info/result related to Component Selections and Exclusion

Related Links

Confirm-VusSelection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Validate the component selection choices at catalog level that can be Included/Excluded during an upgrade using VDA Upgrade Service

Syntax

```
Confirm-VusSelection
       -CatalogName <String>
       [-SelectedComponents <ComponentSelection[]>]
       [-ExcludedComponents <ComponentSelection[]>]
       [-Features <String[]>]
       [-UpgradeVersion <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Confirm-VusSelection
       -CatalogName <String>
       [-Features <String[]>]
       -ExcludedComponentsXml <String>
       [-UpgradeVersion <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Confirm-VusSelection
       -CatalogName <String>
       [-Features <String[]>]
       -SelectedComponentsXml <String>
       [-UpgradeVersion <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Confirm-VusSelection
       -CatalogName <String>
       [-Features <String[]>]
       -SelectedComponentsXml <String>
       -ExcludedComponentsXml <String>
       [-UpgradeVersion <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```

```
Confirm-VusSelection
        -CatalogUuid <String>
        [-Features <String[]>]
        -SelectedComponentsXml <String>
        [-UpgradeVersion <String>]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Confirm-VusSelection
        -CatalogUuid <String>
        [-Features <String[]>]
        -SelectedComponentsXml <String>
        -ExcludedComponentsXml <String>
        [-UpgradeVersion <String>]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

The Confirm-VusSelection cmdlet is used to verify and Validate the component Selections(New Components to be included in Upgrade), Exclusions(Installed Components that should not be upgraded) and features to be used in a Catalog Upgrade using the VDA Upgrade Service.

Confirm-VusSelection returns true if the Selection is Valid. If the Selection is invalid it returns false and information as to why the selection is invalid.

Examples

EXAMPLE 1

SCList represents the Selected Components List comprising of ComponentA and ComponentB with Component ID's indicated below, which were previously not installed on VDAs of catalog but needs to be installed/included during the VDA Upgrade.

$ComponentA = [PSCustomObject]@{ ComponentId = [System.guid]::new('396394b3-53f0-48e0-8d8c-61dad39e3f17') Parameters = $EmptyParamList }

$ComponentB = [PSCustomObject]@{ ComponentId = [System.guid]::new('3ce3c043-5f32-497c-9099-0e1a6dc06647') Parameters = $EmptyParamList } $SCList = @($ComponentA, $ComponentB)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

$ComponentC Represent a Component installed on all VDAs of a Catalog but needs to be excluded during the VDA Upgrade. $ComponentC = [PSCustomObject]@{ ComponentId = [System.guid]::new(‘bddec677-9afb-49f0-9908-59a64f0f54f8’) Parameters = $EmptyParamList }

$FeatureA and FeatureB represents features that needs to be enabled on the VDAs of the catalog during the Upgrade.

$FeatureA = ‘44FF6E61-E3CC-45D0-BE9B-F52B5AB72A08’$FeatureB = ‘D9167E2C-2088-4301-BFA1-698F934B4E6B’

$FeaturesList = @($FeatureA,$FeatureB)

The above input parameters instruct the cmdlet to check if the ComponentA and ComponentB can be installed/Included for installation and ComponentC can be excluded from installation and FeatureA can be enabled on the VDAs of the Catalog during the next Catalog Upgrade scheduled from VDA Upgrade Service.

The cmdlet validates with the VUS SDK and responds with

- true: If the above Selection of Selected Components and Excluded Components and Features is Valid.
- false: If the above Selection is Invalid with an associated message as to why the selection is invalid.

```
Confirm-VusSelection -CatalogUid 1 -SelectedComponents SCList -
    ExcludedComponents $ComponentC -Features $FeaturesList
```

EXAMPLE 2

The XML Schema Definition (xsd) with which the xml string provided for parameters: SelectedComponentsXml and ExcludedComponentsXml is validated is as given below: The ComponentId, ParamterId, FeatureId needed can be obtained from the output of Get-VusComponents.

SCXml represents a ComponentList in XML String format comprising of Component with Component ID(f515acf6-a309-4fe1-8ec6-5023cd0073f4) which has a Paramter with ParameterId(9c365ddc-6e25-48a0-9390-e58c03137d8a) and ParameterValue(testval) that was previously not installed on VDAs of catalog but needs to be installed/included during the VDA Upgrade.

$ScXml = ‘“‘

$EcXml represents 2 Components in XML String format with ComponentIDs:(396394b3-53f0-48e0-8d8c-61dad39e3f17, 3ce3c043-5f32-497c-9099-0e1a6dc06647) that is installed on all VDAs of a Catalog but needs to be excluded during the VDA Upgrade.

$EcXml = ‘“‘

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Features represents the List of strings (feature ID Guids) that needs to be enabled on the VDAs of the catalog during the Upgrade.

$FeatureA and FeatureB represents features that needs to be enabled on the VDAs of the catalog during the Upgrade.

$FeatureA = '44FF6E61-E3CC-45D0-BE9B-F52B5AB72A08'

$FeatureB = 'D9167E2C-2088-4301-BFA1-698F934B4E6B'

$FeaturesList = @($FeatureA,$FeatureB)

The above input parameters instruct the cmdlet to check if the components represented by ScXml can be installed/Included for installation and Component represented by EcXml can be excluded from installation and Features represented by FeatureList can be enabled on the VDAs of the Catalog during the next Catalog Upgrade scheduled from VDA Upgrade Service.

The cmdlet validates with the VUS SDK and responds with

- true: If the above Selection of Selected Components and Excluded Components and Features is Valid.
- false: If the above Selection is Invalid with an associated message as to why the selection is invalid.

```
1 Confirm-VusSelection -CatalogUid 1 -SelectedComponentsXml $ScXml -
    ExcludedComponentsXml $EcXml -Features $Featurelist
```

Parameters

-CatalogUid

UID of the catalog provided by broker service

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SelectedComponentsXml

List of New Components(in XML format) that are to be included/added in the Upgrade. The XML Scehma definition(xsd) is provided in the examples section.ComponentId, ParameterId can be obtianed from the Get-VusComponents cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedComponentsXml

List of Installed Components that are to be excluded/omitted in the Upgrade.This parameter accepts XML string. The XML Scehma definition(xsd) is provided in the examples section. ComponentId, ParameterId can be obtianed from the Get-VusComponents cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUuid

UUID of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Name of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SelectedComponents

List of New Components that are to be included/added in the Upgrade. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the Get-VusComponents cmdlet.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedComponents

List of Installed Components that are to be excluded/omitted in the Upgrade. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the Get-VusComponents cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Features

List of string (FeatureId GUIDs) to be enabled on VDA. FeatureId can be obtained from the Get-VusComponents cmdlet

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeVersion

VDA Version of which the components and parameters are to be fetched

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.ComponentSelection

Component Information for the Selected/Excluded Component

Citrix.VdaUpdateService.Sdk.ComponentParameter

Feature/Parameter information for the selected feature/parameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.VdaUpdateService.Sdk.ConfirmVus

Info/result related to Component Selections and Exclusion

Export-VusVdaReleasesMetadata

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Returns the current VDA releases metadata.

Syntax

```
Export-VusVdaReleasesMetadata
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Examples

EXAMPLE 1

Save the current VDA releases metadata to a file.

```
Export-VusVdaReleasesMetadata > VusVdaReleasesMetadata.xml
```

EXAMPLE 2

Returns the current VDA releases metadata.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Export-VusVdaReleasesMetadata
<?xml version="1.0" encoding="utf-8">
<VdaReleases Version="7.43.0.0">
<VdaRelease">
<...">
<...">
<\VdaRelease">
<VdaRelease">
<...">
<...">
<\VdaRelease">
<...">
<\VdaReleases">
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

VDA releases metadata

Notes

This functionality is only available in On-Prem deployments.

Get-VusAvailableVdaVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets latest available VDA versions for CR, LTSR, EAR_CR and EAR_LTSR release

Syntax

```
Get-VusAvailableVdaVersion
    [-All]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-VusAvailableVdaVersion
    [-CatalogName <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-VusAvailableVdaVersion
    [-CatalogUid <Int32>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-VusAvailableVdaVersion
    [-CatalogUuid <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-VusAvailableVdaVersion
    [-MachineName <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-VusAvailableVdaVersion
    [-MachineUid <Int32>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-VusAvailableVdaVersion
    [-MachineUuid <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Get-VusAvailableVdaVersion cmdlet gets the latest available versions for all release types including CR, LTSR, EAR_CR and EAR_LTSR.

Examples

EXAMPLE 1

Return the list of latest VDA versions.

```
Get-VusAvailableVdaVersiom
```

Parameters

-CatalogUuid

Retrieves versions for Catalog with CatalogUUID

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogName

Retrieves versions for Catalog with Catalog Name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogUid

Retrieves versions for Catalog with CatalogUid

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-All

Retrieves versions for all release types

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

-MachineUid

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

-MachineUuid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.VdaUpdateService.Sdk.VDAVersion

The version info for VDA releases

Related Links

Get-VusCatalog

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Retrieves VUS related information for catalog

Syntax

```
Get-VusCatalog
    [-Name <String>]
    [-ProvisioningType <ProvisioningType>]
    [-SessionSupport <SessionSupport>]
    [-StateId <ScheduleState>]
    [-Uid <Int32>]
    [-UpgradeState <UpgradeState>]
    [-UpgradeType <UpgradeType>]
    [-UpgradeVersion <String>]
    [-Uuid <Guid>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves catalog matching specified criteria. If no parameters are specified, this cmdlet returns all catalogs.

The Get-VusCatalog cmdlet returns the VUS-related machine information such as UUID, Name, UpgradeType, UpgradeState and information about recent upgrade of a specific catalog or all catalogs.

Examples

EXAMPLE 1

Retrieve the Catalog info of the catalog corresponding to the UUID.

```
Get-VusCatalog -Uuid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9"
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Retrieve the catalog info of all catalogs.

```
Get-VusCatalog
```

EXAMPLE 3

Retrieve the catalog info of all catalogs which are in UpgradeAvailable state.

```
Get-VusCatalog -UpgradeState UpgradeAvailable
```

EXAMPLE 4

Retrieve the catalog info of all catalogs which satisfy the filters

```
Get-VusCatalog -Filter {
  ProvisioningType -eq 'Manual' -and UpgradeState -eq "UpToDate"  }
  -MaxRecordCount 1000
```

Parameters

-Name

Name of the Catalog or list of catalog names provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningType

The ProvisioningType of entity

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

The SessionSupport type of entity

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StateId

Filter Catalogs by its ScheduleState

Type:	ScheduleState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

UID of the Catalog or list of UIDs for catalog provided by broker service

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeState

Filter Catalogs by its UpgradeState

Type:	UpgradeState
Accepted values:	MissingUpgradeType, UpgradeScheduled, UpgradeAvailable, UpToDate, Unknown
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeType

Filter Catalogs by its UpgradeType i.e CR/LTSR/EAR_CR/EAR_LTSR

Type:	UpgradeType
Accepted values:	NotSet, LTSR, CR, EAR_LTSR, EAR_CR
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-UpgradeVersion

The Version the catalog is/was being upgraded to

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Uuid

UUID of the Catalog or list of UUIDs for catalogs provided by broker service

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.UpgradeState

Citrix.VdaUpdateService.Sdk.UpgradeType

Citrix.VdaUpdateService.Sdk.ScheduleState

Citrix.VdaUpdateService.Sdk.SessionSupport

Citrix.VdaUpdateService.Sdk.ProvisioningType

Get-VusComponents

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets list of Components Installed, Components Available for Installation and Available features for a catalog

Syntax

```
Get-VusComponents
   -CatalogName <String>
    [-UpgradeVersion <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-VusComponents
   -CatalogUid <Int32>
   [-UpgradeVersion <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-VusComponents
   -CatalogUuid <String>
   [-UpgradeVersion <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

For a given catalog, this cmdlet retrieves a list of Components Installed, Components that are available for installation and features that can be enabled on VDAs of a catalog,. Retrieves the information matching the specified catalogName/CatalogUid/CatalogUuid. If no paramaters are specified, then no response is returned.

Examples

EXAMPLE 1

Returns the component related information: InstalledComponents, AvailableComponents and AvailableFeatures for Catalog with Uid 1.

```
Get-VusComponents -CatalogUid 1
```

Parameters

-CatalogUid

UID of the catalog provided by broker service

Type:	Int32
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUuid

UUID of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-CatalogName

Name of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-UpgradeVersion

VDA Version of which the components and parameters are to be fetched

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Guid

Outputs

Citrix.VdaUpdateService.Sdk.CatalogComponent

Components and feature Information related to Catalog

Get-VusComponentVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets component version data.

Syntax

```
Get-VusComponentVersion
   [[-Uid] <Guid>]
   [-ComponentType <ComponentType>]
   [-MachineId <Guid>]
   [-Version <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The VDA Update Service maintains a list of components installed on VDA machines that can be updated by the service and their version number.

Examples

EXAMPLE 1

Retrieve the list of components that may be updated by the VDA Update Service on the specified machine

```
Get-VusComponent -MachineId "26C82B4E-A8E7-4013-8055-9110FD9FFDC9"
```

EXAMPLE 2

Retrieve the version of the specified component that may be updated by the VDA Update Service on the specified machine

```
Get-VusComponent -MachineId "26C82B4E-A8E7-4013-8055-9110FD9FFDC9" -
    ComponentId "58F01716-492A-4E38-B412-6A8D841BE96C"
```

Parameters

-ComponentType

The component being upgraded through this schedule VDA/VUS

Type:	ComponentType
Accepted values:	Unknown, VDA, VUS, AppV, McsIo, Mps, RendezvousV2, SupportabilityTools, Upl, Upm, UpmVdaPlugin
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MachineId

The unique identifier of the machine

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Version

The version number

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

A unique identifier for the data record

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.ComponentType

Outputs

Citrix.VdaUpdateService.Sdk.Component

Get-VusDBConnection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Returns the database connection string for the specified data store used by the VdaUpdateService Service.

Syntax

```
Get-VusDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected VdaUpdateService Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a VdaUpdateService SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets the database connection string in use by the VdaUpdateService Service instance running on controller "controller1.mydomain.net".

```
Get-VusDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
   Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current VdaUpdateService Service instance.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- NoDBConnections

  The database connection string for the VdaUpdateServiceService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-VusDBSchema

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets SQL scripts to create or maintain the database schema for the Citrix VdaUpdateService Service.

Syntax

```
Get-VusDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
   [-Sid <String>]
   [-DatabaseRights <String>]
   [-AzureDatabase]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix VdaUpdateService Service database schema, add a new VdaUpdateService service to an existing site, remove a VdaUpdateService service from a site, or create a database server logon for a VdaUpdateService service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected VdaUpdateService service instance, otherwise the scripts relate to VdaUpdateService service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a VdaUpdateService SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to VdaUpdateService service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to VdaUpdateService service roles

If ScriptType is Evict, the returned script contains:

- Removal of VdaUpdateService service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix VdaUpdateService Service and copies it to a file called "C:\VdaUpdateServiceSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a VdaUpdateService service schema.

```
Get-VusDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\VdaUpdateServiceSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the VdaUpdateService service. This can be used when configuring a mirror server for use.

```
Get-VusDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    VdaUpdateServiceLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new VdaUpdateService service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the VdaUpdateService services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix VdaUpdateService Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a VdaUpdateService Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Evict

  Removes a VdaUpdateService Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

  Adds a logon for the VdaUpdateService Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for VdaUpdateService services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the VdaUpdateService Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-VusDBVersionChangeScript

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets an SQL service schema update script for the Citrix VdaUpdateService Service.

Syntax

```
Get-VusDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Gets an SQL script that can be used to update the current Citrix VdaUpdateService Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix VdaUpdateService Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix VdaUpdateService Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix VdaUpdateService Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix VdaUpdateService Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-VusServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-VusDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-DatabaseName

The name of the database containing the Citrix VdaUpdateService Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-VusDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix VdaUpdateService Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any VdaUpdateService services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-VusServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-VusEntityUnit

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets Entity related persistent data.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-VusEntityUnit
    [[-Uid] <Guid>]
    [-DNSName <String>]
    [-EntityName <String>]
    [-EntitySID <String>]
    [-EntityType <EntityType>]
    [-EntityUid <Int32>]
    [-EntityUUID <Guid>]
    [-InstalledComponentsTypes <String>]
    [-LastUpgradeCheck <DateTime>]
    [-ParentUUID <Guid>]
    [-ProvisioningType <ProvisioningType>]
    [-RecentSchedule <Guid>]
    [-SessionSupport <SessionSupport>]
    [-UpgradeState <UpgradeState>]
    [-UpgradeType <UpgradeType>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The VDA Update Service maintains a list of Entities and corresponding information such as Upgrade-Type, Name, UUID etc.

Examples

EXAMPLE 1

Retrieves the upgrade type,Display name etc. for the Entity

```
Get-VusEntityUnit -EntityUUID "26C82B4E-A8E7-4013-8055-9110FD9FFDC9"
```

EXAMPLE 2

Retrieve the list of entities

```
Get-VusEntityUnit
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-DNSName

DNSName of entity

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EntityName

The name of entity as set through broker

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EntitySID

The SID of entity as provided by broker

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	True

-EntityType

The type of entity Catalog/Machine

Type:	EntityType
Accepted values:	Machine, Catalog
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EntityUid

The Uid of entity as provided by broker

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EntityUUID

The UUID of entity as provided by broker

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InstalledComponentsTypes

CSV list of installed components types

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastUpgradeCheck

The Last Upgrade Check of entity

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ParentUUID

If the entity is machine Uid of the Catalog entity

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

The ProvisioningType of entity

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RecentSchedule

The UUID of most recent schedule

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

The SessionSupport type of entity

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeState

Current state of VDA in Entity UpToDate/Scheduled/UpgradeAvailable

Type:	UpgradeState
Accepted values:	MissingUpgradeType, UpgradeScheduled, UpgradeAvailable, UpToDate, Unknown
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeType

The type of upgrade that happens for this Catalog i.e LTSR/CR/EAR_CR/EAR_LTSR

Type:	UpgradeType
Accepted values:	NotSet, LTSR, CR, EAR_LTSR, EAR_CR
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

A unique identifier for the data record

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Outputs

Citrix.VdaUpdateService.Sdk.EntityUnit

Get-VusInstalledDBVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets a list of all available database schema versions for the VdaUpdateService Service.

Syntax

```
Get-VusInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Gets the current version number of the Citrix VdaUpdateService Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-VusDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix VdaUpdateService Service database schema version number.

```
Get-VusInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the VdaUpdateService Service database schema for which upgrade scripts are supplied.

```
Get-VusInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-VusInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the VdaUpdateService Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-VusMachine

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Retrieves VUS related information for machine

Syntax

```
Get-VusMachine
   [-CatalogName <String>]
   [-DNSName <String>]
   [-EntitySID <String>]
   [-LastUpgradeCheck <DateTime>]
   [-MachineName <String>]
   [-MachineScheduleID <Guid>]
   [-MachineUid <Int32>]
   [-MachineUuid <Guid>]
   [-ProvisioningType <ProvisioningType>]
   [-SessionSupport <SessionSupport>]
   [-StateId <MachineScheduleState>]
   [-UpgradeState <UpgradeState>]
   [-UpgradeType <UpgradeType>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
21      [-FilterScope <Guid>]
22      [<CitrixCommonParameters>]
23      [<CommonParameters>]
```

Description

Retrieves machines matching specified criteria. If no parameters are specified, this cmdlet returns all machines.

The Get-VusMachine cmdlet returns the VUS-related machine information such as UUID, Name, UpgradeType, UpgradeState and information about recent upgrade of a specific machine or all machines.

Examples

EXAMPLE 1

Retrieve the machine info of the machine corresponding to the UUID.

```
1  Get-VusMachine -MachineUuid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9"
```

EXAMPLE 2

Retrieve the machine info of all machines.

```
1  Get-VusMachine
```

EXAMPLE 3

Retrieve the machine info for machines in WS2019Catalog that could be upgraded.

```
1  Get-VusMachine -CatalogName "WS2019Catalog" -UpgradeState
       UpgradeAvailable
```

EXAMPLE 4

Retrieve the machine info of all machines which are in UpgradeAvailable state.

```
1  Get-VusMachine -UpgradeState UpgradeAvailable
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 5

Retrieve the machine info of all machines which satisfy the filters

```
Get-VusMachine -Filter {
  CatalogName -eq 'STCatalog10222021' -and MachineName -notcontains '*S
     *' -and UpgradeState -eq "UpToDate"  }
  -MaxRecordCount 1000
```

Parameters

-CatalogName

Name of the catalog provided by broker service to filter machines

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-DNSName

DNSName of entity

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EntitySID

The SID of entity as provided by broker

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LastUpgradeCheck

The Last Upgrade Check of entity

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Name of the machine or list of machine names provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MachineScheduleID

The Last schedule of entity

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

UID of the machine or list of UIDs for machines provided by broker service

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUuid

UUID of the machine or list of UUIDs for machines provided by broker service

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningType

The ProvisioningType of entity

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ProvisioningType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionSupport

The SessionSupport type of entity

Type:	SessionSupport
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StateId

Filter machines by its MachineScheduleState

Type:	MachineScheduleState
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeState

Filter machines by its UpgradeState

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	UpgradeState
Accepted values:	MissingUpgradeType, UpgradeScheduled, UpgradeAvailable, UpToDate, Unknown
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeType

Filter machines by its UpgradeType i.e CR/LTSR/EAR_CR/EAR_LTSR

Type:	UpgradeType
Accepted values:	NotSet, LTSR, CR, EAR_LTSR, EAR_CR
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Get-VusMachineComponents

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets list of Components Installed, Components Available for Installation and Available features for Machine(s)

Syntax

```
Get-VusMachineComponents
   -MachineName <String[]>
    [-UpgradeVersion <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-VusMachineComponents
   -MachineUid <Int32[]>
   [-UpgradeVersion <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-VusMachineComponents
   -MachineUuid <String[]>
   [-UpgradeVersion <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

For a given Machine, this cmdlet retrieves a list of Components Installed, Components that are available for installation and features that can be enabled on VDAs,. Retrieves the information matching the specified MachineName/MachineUid/MachineUuid. If no paramaters are specified, then no response is returned.

Examples

EXAMPLE 1

Returns the component related information: InstalledComponents, AvailableComponents and AvailableFeatures for Machine with Uid 1.

```
Get-VusMachineComponentsCommand -MachineUid 1
```

Parameters

-MachineUid

UID of the machine(s) provided by broker service

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUuid

UUID of the machine(s) provided by broker service

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Name of the machine(s) provided by broker service

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeVersion

VDA Version of which the components and parameters are to be fetched

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Guid

Outputs

Citrix.VdaUpdateService.Sdk.MachineComponent

Components and feature Information related to Machine

Get-VusMachineSchedule

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets upgrade schedule data related to each machine part of schedule.

Syntax

```
Get-VusMachineSchedule
   [[-Uid] <Guid>]
   [-ComponentType <ComponentType>]
   [-EntityId <Guid>]
   [-ScheduleId <Guid>]
   [-StateId <MachineScheduleState>]
   [-UpgradeVersion <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The VDA Update Service maintains a list of ongoing machine upgrades.

Examples

EXAMPLE 1

Retrieve the information regarding a machine schedule

```
Get-VusMachineSchedule -Uid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9"
```

EXAMPLE 2

Retrieve the list of machines being upgraded as part of different schedules

```
Get-VusMachineSchedule
```

Parameters

-ComponentType

The component being upgraded through this schedule VDA/VUS

Type:	ComponentType
Accepted values:	Unknown, VDA, VUS, AppV, McsIo, Mps, RendezvousV2, SupportabilityTools, Upl, Upm, UpmVdaPlugin
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EntityId

The UUIID of machine being upgraded

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduleId

The schedule as part of which this machine is being upgraded

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StateId

The current state of machine upgrade

Type:	MachineScheduleState
Accepted values:	Unknown, UpgradeScheduled, UpgradeInUpgradeWindow, UpgradeInProgress, UpgradeCancelled, UpgradeFailed, UpgradeSuccess, UpgradeValidationFailed
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-UpgradeVersion

The version the component is being upgraded to

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

A unique identifier for the data record

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.ComponentType

Outputs

Citrix.VdaUpdateService.Sdk.MachineSchedule

Get-VusRevision

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the current revision of the VDA Update Service configuration data.

Syntax

```
Get-VusRevision
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The VDA Update Service maintains a revision number that is incremented whenever its configuration is changed. This command retrieves the current revision number.

Examples

EXAMPLE 1

Retrieve the current revision number.

```
Get-VusRevision
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Int32

The configuration revision number

Notes

If Int32.MaxValue is reached the value of the revision number will wrap around to Int32.MinValue.

In some cases the value may be incremented by more than one.

Get-VusSchedule

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets upgrade schedule data.

Syntax

```
Get-VusSchedule
    [[-Uid] <Guid>]
    [-ComponentType <ComponentType>]
    [-DurationInHours <Int32>]
    [-EntityList <String>]
    [-EntityType <EntityType>]
    [-ScheduledTime <DateTime>]
    [-StateId <ScheduleState>]
    [-UpgradeVersion <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The VDA Update Service maintains a list of ongoing and past scheduled upgrades.

Examples

EXAMPLE 1

Retrieve the information regarding a schedule

```
Get-VusSchedule -Uid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9"
```

EXAMPLE 2

Retrieve the list of schedules current and past

```
Get-VusSchedule
```

Parameters

-ComponentType

The component being upgraded through this schedule VDA/VUS

Type:	ComponentType
Accepted values:	Unknown, VDA, VUS, AppV, McsIo, Mps, RendezvousV2, SupportabilityTools, Upl, Upm, UpmVdaPlugin
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInHours

Amount of time in hours to complete the upgrade

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EntityList

The list of machines or catalogs schedule in this upgrade

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-EntityType

The type of entities mentioned in the EntityList parameter i.e Catalog/Machine

Type:	EntityType
Accepted values:	Machine, Catalog
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ScheduledTime

The time at which upgrade is supposed to begin

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StateId

The current state of schedule

Type:	ScheduleState
Accepted values:	NotScheduled, UpgradeScheduled, UpgradeInProgress, UpgradeCancelled, UpgradeFailed, UpgradeSuccessful
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeVersion

The version the component is being upgraded to

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

A unique identifier for the data record

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.ComponentType

Outputs

Citrix.VdaUpdateService.Sdk.Schedule

Get-VusService

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the service record entries for the VdaUpdateService Service.

Syntax

```
Get-VusService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the VdaUpdateService Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the VdaUpdateService Service running in the current service group.

```
Get-VusService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Vus_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Vus_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.VdaUpdateService.Sdk.Service

The Get-VusServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- about_VusVdaUpdateServiceSnapin

Get-VusServiceAddedCapability

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets any added capabilities for the VdaUpdateService Service on the controller.

Syntax

```
Get-VusServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Enables updates to the VdaUpdateService Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the VdaUpdateService Service.

```
1  Get-VusServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- about_VusVdaUpdateServiceSnapin

Get-VusServiceInstance

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the service instance entries for the VdaUpdateService Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-VusServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the VdaUpdateService Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the VdaUpdateService Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-VusServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.VdaUpdateService.Sdk.ServiceInstance

The Get-VusServiceInstance command returns an object containing the following properties.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.VdaUpdateService.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- Get-VusServiceStatus
- Reset-VusServiceGroupMembership

Get-VusServiceStatus

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the current status of the VdaUpdateService Service on the controller.

Syntax

```
Get-VusServiceStatus
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables the status of the VdaUpdateService Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the current status of the VdaUpdateService Service.

```
Get-VusServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-VusServiceStatus cmdlet returns an object containing the status of the VdaUpdateService Service together with extra diagnostics information.

- DBUnconfigured

  The VdaUpdateService Service does not have a database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBRejectedConnection

  The database rejected the logon attempt from the VdaUpdateService Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the VdaUpdateService Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The VdaUpdateService is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The VdaUpdateService is connected to a database that is valid, but it does not have the full functionality required so the VdaUpdateService cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the VdaUpdateService Service currently in use is incompatible with the version of the VdaUpdateService Service schema on the database. Upgrade the VdaUpdateService Service to a more recent version.

- DBOlderVersionThanService

  The version of the VdaUpdateService Service schema on the database is incompatible with the version of the VdaUpdateService Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The VdaUpdateService Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the VdaUpdateService Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Failed

  Connectivity between the VdaUpdateService and the database has been lost for an extended period of time, or has failed due to a configuration problem. The VdaUpdateService service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-VusSite

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Gets VDA Upgrade Service site.

Syntax

```
Get-VusSite
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Examples

EXAMPLE 1

Gets the VDA Upgrade Service site.

```
Get-VusSite
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

This functionality is only available in On-Prem deployments.

Import-VusVdaReleasesMetadata

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Sets the VDA releases metadata.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Import-VusVdaReleasesMetadata
       -Content <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Import-VusVdaReleasesMetadata
       [-Path] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Examples

EXAMPLE 1

Imports VDA releases metadata by specifying the path to an XML file containing the metadata.

```
Import-VusVdaReleasesMetadata -Path "XML_VDA_Metadata_Path\
   VusVdaReleasesMetadata.xml"
```

Parameters

-Content

Metadata content.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Path

The path to the file containing the metadata.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Aliases:	PSPath
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The New-VusCatalogSchedule cmdlet creates a new upgrade schedule for all machines in the catalog.

The service internally gets a list of VDAs that are part of this catalog and schedules an upgrade for each machine. Any machine newly added to catalog after the expansion is not scheduled.

Examples

EXAMPLE 1

Schedule upgrade for a catalog on specified date for specified hours.

```
New-VusCatalogSchedule -CatalogName "Workstation catalog" -
    ScheduledTimeInUtc ([System.DateTime]::ParseExact("10/23/2021 07:00
    PM", 'MM/dd/yyyy hh:mm tt', $null)) -DurationInHours 4
```

EXAMPLE 2

Schedule upgrade for a catalog to start right away for specified hours.

```
New-VusCatalogSchedule -CatalogName "Workstation catalog" -UpgradeNow -
    DurationInHours 4
```

EXAMPLE 3

SCList represents the Selected Components List comprising of ComponentA and ComponentB with Component ID's indicated below, which were previously not installed on VDAs of catalog but needs to be installed/included during the VDA Upgrade. $ComponentA = [PSCustomObject]@{ ComponentId = [System.guid]::new('396394b3-53f0-48e0-8d8c-61dad39e3f17') Parameters = $EmptyParamList }

© 1997–2025 Citrix Systems, Inc. All rights reserved.

$ComponentB = [PSCustomObject]@{ ComponentId = [System.guid]::new('3ce3c043-5f32-497c-9099-0e1a6dc06647') Parameters = $EmptyParamList } $SCList = @($ComponentA, $ComponentB)

$ComponentC Represent a Component installed on all VDAs of a Catalog but needs to be excluded during the VDA Upgrade. $ComponentC = [PSCustomObject]@{ ComponentId = [System.guid]::new('bddec677-9afb-49f0-9908-59a64f0f54f8') Parameters = $EmptyParamList }

$FeatureA represents a feature that needs to be enabled on the VDAs of the catalog during the Upgrade. $FeatureA = [PSCustomObject]@{ ParameterId = [System.guid]::new('D9167E2C-2088-4301-BFA1-698F934B4E6B') }

The above input parameters instruct the cmdlet to check if the ComponentA and ComponentB can be installed/Included for installation and ComponentC can be excluded from installation and FeatureA can be enabled on the VDAs of the Catalog with Uid 1 during the next Catalog Upgrade scheduled from VDA Upgrade Service. If this a valid selection then VUS Schedules an upgrade for catalog with Uid 1 to start right away for specified hours.

```
New-VusCatalogSchedule -CatalogUid 1 -UpgradeNow -DurationInHours 2 -
    IncludeAdditionalComponents SCList -ExcludeComponents $ComponentC -
    Features $EnableA
```

EXAMPLE 4

The XML Schema Definition (xsd) with which the xml string provided for parameters: IncludeAdditionalComponentsXml and ExcludeComponentsXml is validated is as given below: The ComponentId, ParamterId, FeatureId needed can be obtained from the output of Get-VusComponents.

SCXml represents a ComponentList in XML String format comprising of Component with Component ID(f515acf6-a309-4fe1-8ec6-5023cd0073f4) which has a Paramter with ParameterId(9c365ddc-6e25-48a0-9390-e58c03137d8a) and ParameterValue(testval) that was previously not installed on VDAs of catalog but needs to be installed/included during the VDA Upgrade.

$ScXml = ""

$EcXml represents 2 Components in XML String format with ComponentIDs:(396394b3-53f0-48e0-8d8c-61dad39e3f17, 3ce3c043-5f32-497c-9099-0e1a6dc06647) that is installed on all VDAs of a Catalog but needs to be excluded during the VDA Upgrade.

$EcXml = ""

Features represents the List of strings (feature ID Guids) that needs to be enabled on the VDAs of the catalog during the Upgrade.

$FeatureA and FeatureB represents features that needs to be enabled on the VDAs of the catalog during the Upgrade.

$FeatureA = '44FF6E61-E3CC-45D0-BE9B-F52B5AB72A08'

© 1997–2025 Citrix Systems, Inc. All rights reserved.

$FeatureB = ‘D9167E2C-2088-4301-BFA1-698F934B4E6B’

$FeaturesList = @($FeatureA,$FeatureB)

The above input parameters instruct the cmdlet to check if the components represented by ScXml can be installed/Included for installation and Component represented by EcXml can be excluded from installation and FeatureList can be enabled on the VDAs of the Catalog during the next Catalog Upgrade scheduled from VDA Upgrade Service.

If this a valid selection then VUS Schedules an upgrade for catalog with Uid 1 to start right away for specified hours.

```
New-VusCatalogSchedule -CatalogUid 1 -UpgradeNow -DurationInHours 2 -
    XmlInput -IncludeAdditionalComponentsXml $ScXml -
    ExcludeComponentsXml $EcXml -Features $Featureslist
```

EXAMPLE 5

Schedule upgrade that will use a custom location to download the installer package from.

```
New-VusCatalogSchedule -CatalogName "Workstation catalog" -UpgradeNow -
    DurationInHours 4 -VdaWorkstationPackageUri "\\hostname\VDA-Packages
    \VDAWorkstationSetup_2308.exe"
```

Parameters

-CatalogUid

UID of the catalog

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledTimeInUtc

Scheduled time in UTC for catalog schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInHours

Hours available to upgrade

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeNow

Switch to start upgrade at current time in UTC

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-IncludeAdditionalComponentsXml

List of New Components(in XML format) that are to be included/added in the Upgrade. The XML Scehma definition(xsd) is provided in the examples section.ComponentId, ParameterId can be obtianed from the Get-VusComponents cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludeComponentsXml

List of Installed Components that are to be excluded/omitted in the Upgrade.This parameter accepts XML string. The XML Scehma definition(xsd) is provided in the examples section. ComponentId, ParameterId can be obtianed from the Get-VusComponents cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUuid

UUID of the catalog

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Name of the catalog

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeAdditionalComponents

List of New Components that are to be included/added in the Upgrade. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the Get-VusComponents cmdlet.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludeComponents

List of Installed Components that are to be excluded/omitted in the Upgrade. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the Get-VusComponents cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Features

List of string (FeatureId GUIDs) to be enabled on VDA. FeatureId can be obtained from the Get-VusComponents cmdlet

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ConcurrencyLevel

limits the Concurrent upgrades that can happen at any time in Upgrade Window.

- Must be a positive number less than or equal to total number of machines in the catalog which are in UpgradeAvailable state.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FailureThreshold

limits the number of failures that can take place during a scheduled upgrade.

- Must be a positive number less than or equal to total number of machines in the catalog which are in UpgradeAvailable state.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VdaWorkstationPackageUri

Custom location to download the VDA Workstation package from. Currently, only network shares (specified using a UNC path) are supported.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VdaServerPackageUri

Custom location to download the VDA Server package from. Currently, only network shares (specified using a UNC path) are supported.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeVersion

Upgrade Version to which the VDA needs to be Upgraded to.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LogoffOption

LogoffOption for VDAs in catalog

Type:	LogoffOption
Accepted values:	DoNotLogoff, ActiveSessionsOnly, DisconnectedSessionsOnly, ActiveAndDisconnectedSessions
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InstallOrUpgradeCWA

Switch to specify whether to Install or Upgrade CWA along with VDA Upgrades

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Reboot

Switch parameter to specify VDA needs to be rebooted before upgrade

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

DateTime

Citrix.VdaUpdateService.Sdk.ComponentSelection

Component Information for the Selected/Excluded Component

Citrix.VdaUpdateService.Sdk.ComponentParameter

Feature/Parameter information for the selected feature/parameter

Citrix.VdaUpdateService.Sdk.LogoffOption

LogoffOption i.e, DoNotLogoff/ActiveSessionsOnly/DisconnectedSessionsOnly/ActiveAndDisconnectedSessions

Outputs

Citrix.VdaUpdateService.Sdk.CatalogUpgrade

Upgrade information for catalog schedule being updated

New-VusMachineUpgrade

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Creates a new schedule for a machine or list of machines

Syntax

```
New-VusMachineUpgrade
   -ScheduledTimeInUtc <DateTime>
   -DurationInHours <Int32>
   [-IncludeAdditionalComponents <ComponentSelection[]>]
   [-ExcludeComponents <ComponentSelection[]>]
   [-Features <String[]>]
   [-VdaWorkstationPackageUri <String>]
   [-VdaServerPackageUri <String>]
   [-UpgradeVersion <String>]
   [-LogoffOption <LogoffOption>]
   [-InstallOrUpgradeCWA]
   [-Reboot]
   [-LoggingId <Guid>]
   -MachineName <String[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-VusMachineUpgrade
   -ScheduledTimeInUtc <DateTime>
   -DurationInHours <Int32>
   [-Features <String[]>]
   -ExcludeComponentsXml <String>
   [-VdaWorkstationPackageUri <String>]
   [-VdaServerPackageUri <String>]
   [-UpgradeVersion <String>]
   [-LogoffOption <LogoffOption>]
   [-InstallOrUpgradeCWA]
   [-Reboot]
   [-LoggingId <Guid>]
   -MachineName <String[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-VusMachineUpgrade
   -ScheduledTimeInUtc <DateTime>
   -DurationInHours <Int32>
   [-Features <String[]>]
   -IncludeAdditionalComponentsXml <String>
   [-VdaWorkstationPackageUri <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-VdaServerPackageUri <String>]
    [-UpgradeVersion <String>]
    [-LogoffOption <LogoffOption>]
    [-InstallOrUpgradeCWA]
    [-Reboot]
    [-LoggingId <Guid>]
    -MachineName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
New-VusMachineUpgrade

```

Description

The New-VusMachineUpgrade cmdlet creates a new schedule for a machine or list of machines.

The cmdlet syncs with broker service to determine if the machine actually is added to broker service and only then schedules the upgrade for it.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Create a new upgrade for the machine matching the given UUID.

```
NewVusMachineUpgrade -MachineUuid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9
    " -ScheduledTimeInUtc ([System.DateTime]::ParseExact("10/23/2021
    07:00 PM", 'MM/dd/yyyy hh:mm tt', $null)) -DurationInHours 4
```

EXAMPLE 2

Create a new upgrade for the machine matching the given UUID.

```
NewVusMachineUpgrade -MachineUuid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9
    " -UpgradeNow -DurationInHours 4
```

EXAMPLE 3

Create a new upgrade for a list of machines matching the given list of UUIDs.

```
NewVusMachineUpgrade -MachineUuid @("26C82B4E-A8E7-4013-8055-9110
    FD9FFDC9","48C6D5FC-8547-449D-A779-124C7AAE3AC8") -UpgradeNow -
    DurationInHours 4
```

EXAMPLE 4

Create a new upgrade that will use a custom location to download the installer package from.

```
NewVusMachineUpgrade -MachineUuid "26C82B4E-A8E7-4013-8055-9110FD9FFDC9
    " -UpgradeNow -DurationInHours 4 -VdaWorkstationPackageUri "\\
    hostname\VDA-Packages\VDAWorkstationSetup_2308.exe"
```

EXAMPLE 5

Create a new upgrade using a custom download location for a list of machines containing a mix of workstation and server OSes.

```
NewVusMachineUpgrade -MachineUuid @("26C82B4E-A8E7-4013-8055-9110
    FD9FFDC9","48C6D5FC-8547-449D-A779-124C7AAE3AC8") -UpgradeNow -
    DurationInHours 4 -VdaWorkstationPackageUri "\\hostname\VDA-Packages
    \VDAWorkstationSetup_2308.exe" -VdaServerPackageUri "\\hostname\VDA-
    Packages\VDAServerSetup_2308.exe"
```

Parameters

-ScheduledTimeInUtc

Scheduled time in UTC when machine upgrade occurs

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInHours

Hours available for upgrade

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeAdditionalComponentsXml

List of New Components(in XML format) that are to be included/added in the Upgrade for a single machine only. The XML Scehma definition(xsd) is provided in the examples section.ComponentId, ParameterId can be obtianed from the GetVusMachineAdditionalComponents cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludeComponentsXml

List of Installed Components that are to be excluded/omitted in the Upgrade for a single machine only.This parameter accepts XML string. The XML Scehma definition(xsd) is provided in the examples section. ComponentId, ParameterId can be obtianed from the GetVusMachineAdditionalComponents cmdlet.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeNow

Switch to start upgrade at current time in UTC

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IncludeAdditionalComponents

List of New Components that are to be included/added in the Upgrade for a single machine only. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the GetVusMachineAdditionalComponents cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludeComponents

List of Installed Components that are to be excluded/omitted in the Upgrade for a single machine only. This parameter accepts a List of Component PS Object. ComponentId and ParameterId can be obtianed from the GetVusMachineAdditionalComponents cmdlet.

Type:	ComponentSelection[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Features

List of string (FeatureId GUIDs) to be enabled on VDA. FeatureId can be obtained from the GetVusMachineAdditionalComponents cmdlet

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-VdaWorkstationPackageUri

Custom location to download the VDA Workstation package from. Currently, only network shares (specified using a UNC path) are supported.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VdaServerPackageUri

Custom location to download the VDA Server package from. Currently, only network shares (specified using a UNC path) are supported.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeVersion

Upgrade Version to which the VDA needs to be Upgraded to.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LogoffOption

LogoffOption for a VDAs in Machine list

Type:	LogoffOption
Accepted values:	DoNotLogoff, ActiveSessionsOnly, DisconnectedSessionsOnly, ActiveAndDisconnectedSessions
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InstallOrUpgradeCWA

Switch to specify whether to Install or Upgrade CWA along with VDA Upgrades

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Reboot

Switch parameter to specify VDA needs to be rebooted before upgrade

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

-MachineName

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MachineUid

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

-MachineUuid

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Guid

Citrix.VdaUpdateService.Sdk.LogoffOption

LogoffOption i.e, DoNotLogoff/ActiveSessionsOnly/DisconnectedSessionsOnly/ActiveAndDisconnectedSessions

Outputs

Citrix.VdaUpdateService.Sdk.MachineScheduleObject

Upgrade information for most recent machine schedule

Remove-VusCatalogUpgrade

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Removes existing catalog upgrade schedule

Syntax

```
Remove-VusCatalogUpgrade
      -CatalogName <String>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-VusCatalogUpgrade
      -CatalogUid <Int32>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-VusCatalogUpgrade
      -CatalogUuid <String>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-VusCatalogUpgrade cmdlet removes the existing catalog schedule. The schedule is cancelled if it has not moved to the UpgradeInProgress state. To cancel a schedule in UpgradeInProgress state, use the Force switch, which cancels schedules for VDAs that have not yet started to upgrade.

Examples

EXAMPLE 1

Force cancel upgrades for machine not yet started.

```
Remove-VusCatalogUpgrade -CatalogName "Workstation catalog" -Force
```

Parameters

-CatalogUid

UID of the catalog

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUuid

UUID of the catalog

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Name of the catalog

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Removes machines that have not yet started the upgrade. Without Force, catalog is removed only if not in upgrade window.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Outputs

None

By default, this cmdlet returns no output.

Remove-VusMachineUpgrade

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Deletes a scheduled upgrade for a specific machine/list of machines

Syntax

```
Remove-VusMachineUpgrade
      -MachineName <String[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-VusMachineUpgrade
      -MachineUid <Int32[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-VusMachineUpgrade
      -MachineUuid <String[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-VusMachineUpgrade cmdlet deletes the scheduled upgrade for a specific machine or list of machines.

To cancel machines within scheduled duration, use the Force switch.

Examples

EXAMPLE 1

Delete a scheduled upgrade for a specific machine specified by UUID.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-VusMachineUpgrade -MachineUuid "26C82B4E-A8E7-4013-8055-9110
    FD9FFDC9"
```

EXAMPLE 2

Delete a scheduled upgrade for the machine with the name specified by MachineName.

```
Remove-VusMachineUpgrade -MachineName "TestMachine1"
```

Parameters

-MachineUuid

UUID of the machine or list of machines

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineName

Name of the machine or list of machines

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MachineUid

UID of the machine or list of machines

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Removes machine schedules in upgrade window

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Outputs

None

By default, this cmdlet returns no output.

Remove-VusServiceMetadata

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Removes metadata from the given Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-VusServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-VusServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-VusServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-VusServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given VdaUpdateService Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-VusService | % {
  Remove-VusServiceMetadata -Map $_.MetadataMap  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the VdaUpdateService Service

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

VdaUpdateService service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Reset-VusEnabledFeatureList

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Refreshes the VdaUpdateService service's list of enabled features.

Syntax

```
Reset-VusEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Synchronizes the currently selected Citrix VdaUpdateService Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a VdaUpdateService SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected VdaUpdateService service instance's list of enabled features.

```
1  Reset-VusEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-VusServiceGroupMembership

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Reloads the access permissions and configuration service locations for the VdaUpdateService Service.

Syntax

```
Reset-VusServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the VdaUpdateService Service.

The Reset-VusServiceGroupMembership cmdlet must be run on at least one instance of the service type (Vus) after installation and registration with the configuration service. Without this operation, the VdaUpdateService services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-VusServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    VusServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-VusServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.VdaUpdateService.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-VusServiceGroupMembership command.

Outputs

Citrix.VdaUpdateService.Sdk.ServiceInstance

Reset-VusServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the VdaUpdateService Service instance.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-VusCatalogUpgrade

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Sets upgrade schedule time and duration for existing catalog schedule

Syntax

```
Set-VusCatalogUpgrade
   -CatalogName <String>
   [-ScheduledTimeInUtc <DateTime>]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgrade
   -CatalogName <String>
   [-UpgradeNow]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgrade
   -CatalogUid <Int32>
   [-ScheduledTimeInUtc <DateTime>]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgrade
   -CatalogUid <Int32>
   [-UpgradeNow]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgrade
   -CatalogUuid <String>
   [-ScheduledTimeInUtc <DateTime>]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgrade
   -CatalogUuid <String>
   [-UpgradeNow]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-VusCatalogUpgrade cmdlet allows admin to set the schedule time and/or duration for existing catalog schedule.

In case the schedule is already in UpgradeInProgress state, only the VDAs that have not yet picked up the upgrade are affected. VDAs that have started to upgrade cannot be rescheduled.

Examples

EXAMPLE 1

Set upgrade time for provided catalog.

```
Set-VusCatalogUpgrade -CatalogName "Workstation catalog" -
    DurationInHours 4
```

EXAMPLE 2

Set upgrade time for provided catalog.

```
Set-VusCatalogUpgrade -CatalogName "Workstation catalog" -
    ScheduledTimeInUtc ([System.DateTime]::ParseExact("10/23/2021 07:00
    PM", 'MM/dd/yyyy hh:mm tt', $null))
```

EXAMPLE 3

Change the schedule for provided catalog to start at right now.

```
Set-VusCatalogUpgrade -CatalogName "Workstation catalog" -UpgradeNow
```

Parameters

-CatalogUid

UID of the catalog provided by broker service

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogUuid

UUID of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Name of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledTimeInUtc

Scheduled time in UTC for catalog schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInHours

Hours available to upgrade

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeNow

Switch to start upgrade at current time in UTC

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

DateTime

Outputs

Citrix.VdaUpdateService.Sdk.CatalogUpgrade

The upgrade information for catalog schedule being updated

Related Links

Set-VusCatalogUpgradeType

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Set upgrade type LTSR/CR/EAR_CR/EAR_LTSR for a catalog.

Syntax

```
Set-VusCatalogUpgradeType
   -CatalogName <String>
   -UpgradeType <UpgradeType>
   [-LoggingId <Guid>]
   [-WhatIf]
   [-Confirm]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgradeType
   -CatalogUid <Int32>
   -UpgradeType <UpgradeType>
   [-LoggingId <Guid>]
   [-WhatIf]
   [-Confirm]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusCatalogUpgradeType
   -CatalogUuid <String>
   -UpgradeType <UpgradeType>
   [-LoggingId <Guid>]
   [-WhatIf]
   [-Confirm]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-VusCatalogUpgradeType cmdlet sets the upgrade type for a catalog.

All machines/VDAs inherit the property from the catalog.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Set upgrade type for provided catalog to LTSR.

```
Set-VusCatalogUpgradeType -CatalogName "Workstation catalog" -
    UpgradeType LTSR
```

Parameters

-CatalogUid

UID of the catalog provided by broker service

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeType

Upgrade type for a catalog

Type:	UpgradeType
Accepted values:	NotSet, LTSR, CR, EAR_LTSR, EAR_CR
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-CatalogUuid

UUID of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CatalogName

Name of the catalog provided by broker service

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-WhatIf

Displays the confirmation message displayed for selected Upgrade type

Type:	SwitchParameter
Aliases:	wi
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Confirm

Confirms that user understands Early access release builds are available for customers to test in their non-production or limited production environments, and share feedback. It is advised not to deploy early access release builds in production environments.

Type:	SwitchParameter
Aliases:	cf
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.VdaUpdateService.Sdk.UpgradeType

Upgrade Type i.e, LTSR/CR/EAR_CR/EAR_LTSR

Outputs

None

By default, this cmdlet returns no output.

Set-VusDBConnection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Configures a database connection for the VdaUpdateService Service.

Syntax

```
Set-VusDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Specifies the database connection string for use by the currently selected Citrix VdaUpdateService Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a VdaUpdateService SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Set-VusDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
1  Set-VusDBConnection -DBConnection $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-DBConnection

Specifies the database connection string to be used by the VdaUpdateService Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-VusDBConnection cmdlet returns an object describing the status of the VdaUpdateService Service together with extra diagnostics information. Possible values are:

- OK

  The VdaUpdateService Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the VdaUpdateService Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBRejectedConnection

  The database rejected the logon attempt from the VdaUpdateService Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the VdaUpdateService Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the VdaUpdateService Service currently in use is newer than, and incompatible with, the version of the VdaUpdateService Service schema on the database. Upgrade the VdaUpdateService Service to a more recent version.

- DBOlderVersionThanService

  The version of the VdaUpdateService Service schema on the database is newer than, and incompatible with, the version of the VdaUpdateService Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the VdaUpdateService Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the VdaUpdateService Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the VdaUpdateService Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-VusDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Configures the database server SQL credentials for the VdaUpdateService Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-VusDBCredentials
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-VusDBCredentials
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix VdaUpdateService Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional VdaUpdateService Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a VdaUpdateService SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-VusDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$sqlCred = Get-Credential
Set-VusDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-VusDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-VusDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-VusMachineUpgrade

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Sets scheduled time and duration for existing machine schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-VusMachineUpgrade
   -MachineName <String[]>
   [-ScheduledTimeInUtc <DateTime>]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusMachineUpgrade
   -MachineName <String[]>
   [-UpgradeNow]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusMachineUpgrade
   -MachineUid <Int32[]>
   [-ScheduledTimeInUtc <DateTime>]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusMachineUpgrade
   -MachineUid <Int32[]>
   [-UpgradeNow]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusMachineUpgrade
   -MachineUuid <String[]>
   [-ScheduledTimeInUtc <DateTime>]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusMachineUpgrade
   -MachineUuid <String[]>
   [-UpgradeNow]
   [-DurationInHours <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The Set-VusMachineUpgrade cmdlet sets the scheduled time and duration for upgrade for a machine or list of machines. This affects only machines that are not in the state UpgradeInUpgradeWindow.

Examples

EXAMPLE 1

Set scheduled time and duration for existing machine schedule for machine matching the given UUID.

```
Set-VusMachineUpgrade -MachineUuid "26C82B4E-A8E7-4013-8055-9110
    FD9FFDC9" -DurationInHours 6 -ScheduledTimeInUtc ([System.DateTime
    ]::ParseExact("10/23/2021 07:00 PM", 'MM/dd/yyyy hh:mm tt', $null))
```

EXAMPLE 2

Set duration for existing machine schedule for machine matching the given name.

```
Set-VusMachineUpgrade -MachineName "TestMachine1" -DurationInHours 6
```

EXAMPLE 3

Set start time as current time for existing machine schedule for machine matching the given name.

```
Set-VusMachineUpgrade -MachineName "TestMachine1" -UpgradeNow
```

Parameters

-MachineUuid

UUID of the machine or list of machines

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-MachineName

Name of the machine or list of machines

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineUid

UID of the machine or list of machines

Type:	Int32[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledTimeInUtc

Scheduled time in UTC when machine upgrade will be performed

Type:	DateTime
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInHours

Hours available for upgrade

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UpgradeNow

Switch to start upgrade at current time in UTC

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2507

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

Outputs

Citrix.VdaUpdateService.Sdk.MachineUpgradeObject

The upgrade information for most recent machine schedule

Set-VusServiceMetadata

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Adds or updates metadata on the given Service.

Syntax

```
Set-VusServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-VusServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given VdaUpdateService Service objects.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-VusServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

VdaUpdateService service objects to which metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-VusServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-VusSite

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Sets VDA Upgrade Service site.

Syntax

```
Set-VusSite
   [-Enabled <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Examples

EXAMPLE 1

Enables the VDA Upgrade Service feature.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-VusSite -Enabled $true
```

Parameters

-Enabled

This enables or disables the VDA Upgrade Service functionality.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

This functionality is only available in On-Prem deployments.

Test-VusDBConnection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Tests whether a database is suitable for use by the Citrix VdaUpdateService Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Test-VusDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-VusDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-VusDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix VdaUpdateService Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a VdaUpdateService SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-VusDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix VdaUpdateService Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-VusDBConnection cmdlet returns an object describing the status of the selected VdaUpdateService Service instance that would result if the connection string were used with the Set-VusDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-VusDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the VdaUpdateService Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the VdaUpdateService Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the VdaUpdateService Service instance, or the service's schema within the database is invalid.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the VdaUpdateService Service currently in use is newer than, and incompatible with, the version of the VdaUpdateService Service schema on the database. Upgrade the VdaUpdateService Service to a more recent version.

- DBOlderVersionThanService

  The version of the VdaUpdateService Service schema on the database is newer than, and incompatible with, the version of the VdaUpdateService Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the VdaUpdateService Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the VdaUpdateService Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the VdaUpdateService Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
   PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Topic

about_XenDesktopModule

Short Description

The XenDesktop PowerShell module provides high level administrative functions for the Citrix XenDesktop.

Command Prefix

All commands in this module have the noun prefixed with ‘XD’.

Long Description

The XenDesktop PowerShell module enables both local and remote administration for Citrix XenDesktop. It provides facilities to configure and administer a XenDesktop site.

XenDesktop PowerShell Module - Site Configuration

Short Description

Describes how to do the initial configuration of a Site using the XenDesktop PowerShell Module.

Command Prefix

All commands in this module have 'XD'in their name.

Long Description

After installing XenDesktop for the first time, the Site must be configured. Site configuration involves:

- Creating the databases that will be used by the Site.
- Instructing the various XenDesktop services to use the databases and making those services aware of each other.
- Licensing the Site and specifying which edition of XenDesktop to use.

Additional Delivery Controllers may be added to the Site once the initial configuration is complete.

Database Creation

There is one main database, namely the Site Configuration Database, and two secondary databases, namely the Configuration Logging Database and the

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Monitoring Database. These databases may be hosted on the same SQL Server or on dedicated SQL Servers.

The method used to create the databases depends on the SQL Server permissions held by the person configuring the Site, whether or not the databases use default names, and whether or not the databases are hosted on the same SQL Server.

If the person configuring the Site does not have sufficient privilege to create databases and add database logons in the SQL Server, then database creation is a two-stage process:

- Use the Get-XDDatabaseSchema cmdlet to generate one or more SQL scripts that contain commands to create the databases and configure SQL logons.
- The scripts must be executed by a database administrator with suitable privileges on the target SQL Server(s).

If the person configuring the Site has sufficient privilege, database creation is a single-stage process in which the New-XDDatabase cmdlet is used to create the databases and configure SQL logons.

When non-default database names are to be used, or the databases are to be hosted on individual SQL Servers, you must run either Get-XDDatabaseSchema or New-XDDatabase cmdlets once for each database.

Database Mirroring

There are two variations of the New-XDDatabase cmdlet:

- One that is intended for Proof of concept and basic deployments. This variation is defined by the -AllDefaultDatabases switch parameter.
- The other is used to configure a database for each data store (Site, Logging, and Monitoring) individually. Each data store can be configured on different database server with different levels of access (user credentials). It is on these environments that mirroring is expected to be configured because mirroring can be targeted at a specific datastore. For instance; it may be considered that mirroring is not important for the monitoring data store.

When New-XDDatabase is to be used to configure each data store separately an empty database should be created on the database server with mirroring

© 1997–2025 Citrix Systems, Inc. All rights reserved.

enabled before running New-XDDatabase. The empty database must have a collation which ends with "_CI_AS_KS". In general, it is best to use a collation which ends with "_100_CI_AS_KS ". Once the databases have been configured for mirroring call New-XDDatabase for each data store (See the -DataStore parameter) and supply the principle database server address, the database credentials and the database name. New-XDDatabase will just populate the empty database if it sees that it is there. The mirror server address will be detected automaticallyand login scripts uploaded to the mirror server to allow the XenDesktop services access to the mirror database upon failover.

If using the "-AllDefaultDatabases"parameter set of these cmdlets the database names will not be known to the user upfront. Mirroring will need to be configured on the databases after they have been created using New-XDDatabase. New-XDDatabase will return information about the database names once it has completed. To configure mirroring on the databases; go to the SQL server and configure mirroring on the databases in the usual way. The mirror server will also need updating to allow XenDesktop access upon failover. To do this call:

"Get-XDDatabaseSchema -ScriptType AddDatabaseLogOn -DataStore …"

for each datastore. Append the returned scripts together and upload the scripts to the mirror server. If this step is not performed XenDesktop will not be able to connect to the mirror server. The mirror server address can then be supplied to New-XDSite.

The databases can be created entirely via a manual process too. In which case New-XDDatabase will not be used. Instead call:

"Get-XDDatabaseSchema -ScriptType FullDatabase -DataStore …"

for each data store and upload the resultant script to the database on the principle database server. Configure mirroring on the database if required and call:

"Get-XDDatabaseSchema -ScriptType AddDatabaseLogOn -DataStore …"

and upload the resultant script to the mirror server. This will allow XenDesktop access to the server upon failover.

Once the databases have been created and populated call New-XDSite and supply the full information (Database Name, Database Server Address, and Database Mirror Server Address) for each data store.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Service Initialization

During service initialization the XenDesktop services are instructed to use the databases, Configuration Logging is started and a temporary license is automatically enabled using the New-XDSite cmdlet. If SQL Mirroring is enabled for the databases, the services are also made aware of the SQL Mirror Servers.

The site will run in a license caching mode until Set-XDLicensing is used to configure licensing.

There are three variations of the New-XDSite cmdlet to handle the following scenarios:

- The databases were created with default names on a single SQL Server.
- The databases were created with non-default names on a single SQL Server.
- The databases were created on individual SQL Servers.

Licensing

The product edition and licensing model of the Site must be set, and details of a Citrix License Server from which licenses can be obtained must be provided. Licensing must be set after running New-XDSite. Use the Set-XDLicensing cmdlet.

Adding Controllers

The method used to add a Controller to an existing Site depends on the SQL Server permissions held by the person adding the Controller.

If the person adding the Controller does not have sufficient privilege to alter content of the databases and add database logons, then Controller addition is a three-stage process:

- The Get-XDDatabaseSchema cmdlet is used to generate one or more SQL scripts that contain commands to alter database content and configure SQL logons.
- The scripts must be executed by a database administrator with suitable privileges on the target SQL Server(s).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- After the scripts have been executed, the Add-XDController cmdlet is used with the DoNotUpdateDatabaseServer switch to configure the XenDesktop services on the new Controller.

If the person adding the Controller has sufficient privilege, the Add-XDController cmdlet is used without the DoNotUpdateDatabaseServer switch to alter database content, configure SQL logons and configure the XenDesktop services on the new Controller.

Removing Controllers

The method used to remove a Controller from a Site depends on the SQL Server permissions held by the person removing the Controller.

If the person removing the Controller does not have sufficient privilege to alter content of the databases and remove database logons, then Controller removal is a three-stage process:

- Use the Remove-XDController cmdlet with the DoNotUpdateDatabaseServer switch to decommission the XenDesktop services on the Controller that is to be removed.
- Use the Get-XDDatabaseSchema cmdlet to generate one or more SQL scripts that contain commands to alter database content and remove SQL logons.
- Execute the scripts on the target SQL Server(s). This must be done by a database administrator with suitable privileges.

If the person removing the Controller has sufficient privilege, the Remove-XDController cmdlet is used without the DoNotUpdateDatabaseServer switch to decommission the XenDesktop services on the new Controller, alter database content and remove SQL logons.

Once a Controller has been removed from a Site, that Controller may be retired or added to another Site.

Changing Secondary Databases

This may be required when, for example, the data contained in the

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Monitoring Database Has Grown To Such An Extent That A Dedicated Sql Server Is Needed. The Method Required To Change The Name Of One Of The Secondary Databases That Supports Configuration Logging

and Monitoring, or the SQL Server hosting one of those databases, depends on the SQL Server permissions held by the person changing the database.

If the person changing a secondary database does not have sufficient privilege to create databases in the SQL Server hosting the new secondary databases and add database logons, then modification is a three-stage process:

- Use the Get-XDDatabaseSchema cmdlet to generate an SQL script that contains commands to create the secondary database and configure SQL logons.
- Execute the script on the target SQL Server. This must be done by a database administrator with suitable privileges.
- After executing the script, use the Set-XDLogging and/or Set-XDMonitor cmdlets to configure the XenDesktop services in the Site to use the new secondary databases.

If the person changing a secondary database has sufficient privilege to create databases in the SQL Server hosting the new secondary databases and add database logons, then:

- Use the New-XDDatabase cmdlet to create the secondary databases and configure SQL logons.
- Use the Set-XDLogging and/or Set-XDMonitor cmdlets to configure the XenDesktop services in the Site to use the new secondary databases.

Examples

Single Sql Server With Default Database Names, Sql Admin Access And No Sql Mirroring

You have full administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1'and associate it with

© 1997–2025 Citrix Systems, Inc. All rights reserved.

the Controller at ‘Controller1’. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer.

```
# Create the databases
 New-XDDatabase -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -AllDefaultDatabases -SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -AllDefaultDatabases -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer
```

Create A Site Using A Single Sql Server With Default Database Names, Sql Admin Access And Sql Mirroring

You have full administrative rights on the SQL Server ‘SqlServer1’with instance ‘Instance1’and want to create a Site called ‘Site1’and associate it with the Controller at ‘Controller1’. You want to configure the databases for SQL Server Mirroring using ‘SqlMirror1’with ‘Instance1’. Your Citrix License Server is listening on the non default port 27001 of server CitrixLicenseServer.

```
# Create the databases
 New-XDDatabase -AdminAddress Controller1 -DatabaseServer
SqlServer1\Instance1 -AllDefaultDatabases -SiteName Site1
```

```
#
# Configure your SQL Server Mirror in the normal manner to mirror the
   three
# default databases
#
```

```
# Create the Site and provide the mirror information
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\Instance1 -DatabaseMirrorServer SqlMirror1\Instance1
-AllDefaultDatabases -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -LicenseServerPort 27001
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Create A Site Using A Single Sql Server With Default Database Names, Sql Admin Access Under Separate Username And No Sql Mirroring

You have a separate user account with full administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1'and associate it with the Controller at 'Controller1'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
# Construct a Credential object for your SQL Administrator
 $cred = Get-Credential
```

```
# Create the databases
 New-XDDatabase -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -DatabaseCredentials $cred -AllDefaultDatabases
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -AllDefaultDatabases -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition PLT
```

Create A Site Using A Single Sql Server With Non-Default Database Names, Sql Admin Access And No Sql Mirroring

You have full administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1', associate it with the Controller at 'Controller1'and use database names of 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have an Enterprise license.

```
# Create the Site Database
New-XDDatabase -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb
-SiteName Site1
```

```
# Create the Logging Database
New-XDDatabase -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
-SiteName Site1
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
# Create the Monitor Database
New-XDDatabase -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
SqlServer1\SQLEXPRESS -SiteDatabaseName CitrixSiteDb -
    LoggingDatabaseName
CitrixLoggingDb -MonitorDatabaseName CitrixMonitorDb -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition ENT
```

Create A Site Using One Sql Server Per Database With Non-Default Database

Names, Sql Admin Access And No Sql Mirroring

You have full administrative rights on the SQL Servers 'SqlServerSite', 'SqlServerLogging'and 'SqlServerMonitor'with instance 'SQLEXPRESS'on each SQL Server. You want to create a Site called 'Site1', associate it with the Controller at 'Controller1'and use database names of 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
# Create the Site Database
New-XDDatabase -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServerSite\SQLEXPRESS -DatabaseName CitrixSiteDb
-SiteName Site1
```

```
# Create the Logging Database
New-XDDatabase -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServerLogging\SQLEXPRESS -DatabaseName
    CitrixLoggingDb
-SiteName Site1
```

```
# Create the Monitor Database
New-XDDatabase -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServerMonitor\SQLEXPRESS -DatabaseName
    CitrixMonitorDb
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -SiteDatabaseServer
SqlServerSite\SQLEXPRESS -SiteDatabaseName CitrixSiteDb
```

```

Create A Site Using One Sql Server Per Database With Non-Default Database Names, Sql Admin Access And Sql Mirroring

You have full administrative rights on the SQL Servers 'SqlServerSite', 'SqlServerLogging'and 'SqlServerMonitor'with instance 'Instance1'on each SQL Server. You want to create a Site called 'Site1', associate it with the Controller at 'Controller1'and use database names of 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. You also want to configure the databases for SQL Server Mirroring using 'SqlMirrorSite', 'SqlMirrorLogging'and 'SqlMirrorMonitor'with instance 'Instance1'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
#
# Create the empty databases for each data store and configure
   mirroring
# on those databases.
#
```

```
# Populate the Site Database
New-XDDatabase -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServerSite\Instance1 -DatabaseName CitrixSiteDb
-SiteName Site1
```

```
# Populate the Logging Database
New-XDDatabase -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServerLogging\Instance1 -DatabaseName
   CitrixLoggingDb
-SiteName Site1
```

```
# Populate the Monitor Database
New-XDDatabase -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServerMonitor\Instance1 -DatabaseName
   CitrixMonitorDb
-SiteName Site1
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -SiteDatabaseServer
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```

Create A Site Using A Single Sql Server With Non-Default Database Names, No Sql Admin Access And No Sql Mirroring

You have no administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'and want to create a Site called 'Site1', associate it with the Controller at 'Controller1'and use database names of 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. Your Citrix License Server is listening on the default port (27000) of server CitrixLicenseServer and you have a Platinum license.

```
# Get the SQL script to create the Site Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb -
    SiteName
Site1 -ScriptType FullDatabase > C:\siteScript.sql
```

```
# Get the SQL script to create the Logging Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
-SiteName Site1 -ScriptType FullDatabase > C:\LoggingScript.sql
```

```
# Get the SQL script to create the Monitor Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1 -ScriptType FullDatabase > C:\monitorScript.sql
```

```
#
# Get an individual with suitable privileges to execute the SQL scripts
# 'siteScript.sql', 'loggingScript.sql' and 'monitorScript.sql'on
# 'SqlServer1'
#
```

```
# Create the Site
New-XDSite -AdminAddress Controller1 -DatabaseServer
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
SqlServer1\SQLEXPRESS -SiteDatabaseName CitrixSiteDb -
    LoggingDatabaseName
CitrixLoggingDb -MonitorDatabaseName CitrixMonitorDb -SiteName Site1
```

```
# Set licensing
Set-XDLicensing -AdminAddress Controller1 -LicenseServerAddress
CitrixLicenseServer -ProductEdition PLT
```

Determine Applicable Licensing Models And Product Editions

You want to determine the license models and product editions that are applicable to your XenDesktop installation.

```
# Determine your product code
$site = Get-XDSite
$productCode = $site.LicenseInformation.ProductCode
```

```
# Load the Citrix.Configuration.Admin.V2 snapin, as this exposes
    cmdlets to
# retrieve the licensing models and product editions
Add-PSSnapin Citrix.Configuration.Admin.V2
```

```
# Get the applicable licensing models
Get-ConfigLicensingModel -ProductCode $productCode
```

```
# Get the applicable product editions
Get-ConfigProductEdition -ProductCode $productCode
```

Change The Configuration Logging Database

You have full administrative rights on the SQL Server 'SqlServer2'with instance 'INSTANCE1'and want to change Configuration Logging for site 'Site1'to use a new database called 'CitrixLoggingDb_New'on that server.

```
# Create the Configuration Logging Database on the new SQL Server
New-XDDatabase -Datastore Logging -SiteName Site1 -DatabaseServer
SqlServer2\INSTANCE1 -DatabaseName CitrixLoggingDb_New
```

```
# Change Configuration Logging to use the new database
Set-XDLogging -DatabaseServer SqlServer2\INSTANCE1 -DatabaseName
CitrixLoggingDb_New
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Change The Monitoring Database

You have full administrative rights on the SQL Server 'SqlServer2'with instance 'INSTANCE1'and want to change Monitoring for site 'Site1'to use a new database called 'CitrixMonitorDb_New'on that server.

```
# Create the Monitoring Database on the new SQL Server
New-XDDatabase -Datastore Monitor -SiteName Site1 -DatabaseServer
SqlServer2\INSTANCE1 -DatabaseName CitrixMonitorDb_New
```

```
# Change Monitoring to use the new database
Set-XDMonitor -DatabaseServer SqlServer2\INSTANCE -DatabaseName
CitrixMonitorDb_New
```

Add A Controller To A Site For Which You Have Full Db Admin

You have full administrative rights on the SQL Server that underlies a Site called 'Site1'. An existing Controller in the Site is 'Controller1'and you want to add Controller 'AdditionalController'to the Site.

```
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1
```

Add A Controller To A Site For Which You Have Full Db Admin Under Separate

Username

You have a separate user account with full administrative rights on the SQL Server that underlies a Site called 'Site1'. An existing Controller in the Site is 'Controller1'and you want to add Controller 'AdditionalController'to the Site.

```
# Construct a Credential object for your SQL Administrator
 $cred = Get-Credential
```

```
# Add the Controller
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1 -DatabaseCredentials $cred
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Add A Controller To A Site For Which You Have Full Db Admin Under Separate

Usernames

You have separate user accounts with full administrative rights on the three SQL Servers that underlie a Site called 'Site1'. An existing Controller in the Site is 'Controller1'and you want to add Controller 'AdditionalController' to the Site.

```
# Construct a Credential object for your Site Database SQL
    Administrator
 $credSite = Get-Credential
```

```
# Construct a Credential object for your Logging Database SQL
    Administrator
 $credLogging = Get-Credential
```

```
# Construct a Credential object for your Monitor Database SQL
    Administrator
 $credMonitor = Get-Credential
```

```
# Add the Controller
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1 -SiteDatabaseCredentials $credSite
-LoggingDatabaseCredentials $credLogging -MonitorDatabaseCredentials
$credMonitor
```

Add A Controller To A Site For Which You Have No Db Admin Access

You have no administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'that underlies a Site called 'Site1'. The Site's databases are called 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. An existing Controller in the Site is 'Controller1'and you want to add Controller 'AdditionalController'to the Site.

```
# Get the SQL script that may be used to add permissions for
# 'AdditionalController' to the Site Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Site
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixSiteDb -
    SiteName
Site1 -ScriptType AddController > C:\siteScript.sql
```

```
# Get the SQL scripts that may be used to add permissions for '
# AdditionalController' to the Logging Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Logging
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixLoggingDb
-SiteName Site1-ScriptType AddController > C:\loggingScript.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
# Get the SQL script that may be used to add permissions for
# 'AdditionalController' to the Monitor Database
Get-XDDatabaseSchema -AdminAddress Controller1 -DataStore Monitor
-DatabaseServer SqlServer1\SQLEXPRESS -DatabaseName CitrixMonitorDb
-SiteName Site1-ScriptType AddController > C:\monitorScript.sql
```

```
#
# Get an individual with suitable privileges to execute the SQL scripts
# 'siteScript.sql', 'loggingScript.sql' and 'monitorScript.sql'on
# 'SqlServer1'
#
```

```
# Add the Controller
Add-XDController -AdminAddress AdditionalController
-SiteControllerAddress Controller1 -DoNotUpdateDatabaseServer
```

Remove A Controller From A Site For Which You Have Full Db Admin Access

You have full administrative rights on the SQL Server that underlies a Site called 'Site1'. The Site currently has two Controllers, namely 'Controller1'and 'RedundantController'. You want to remove 'RedundantController'from the Site.

```
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController
```

Remove A Controller From A Site For Which You Have Full Db Admin Under

Separate Username

You have a separate user account with full administrative rights on the SQL Server that underlies a Site called 'Site1'. The Site currently has two Controllers, namely 'Controller1'and 'RedundantController'. You want to remove 'RedundantController'from the Site.

```
# Construct a Credential object for your SQL Administrator
 $cred = Get-Credential
```

```
# Remove the Controller
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController -DatabaseCredentials $cred
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Remove A Controller From A Site For Which You Have Full Db Admin Under

Separate Usernames

You have separate user accounts with full administrative rights on the three SQL Servers that underlie a Site called 'Site1'. The Site currently has two Controllers, namely 'Controller1'and 'RedundantController'. You want to remove 'RedundantController'from the Site.

```
# Construct a Credential object for your Site Database SQL
    Administrator
 $credSite = Get-Credential
```

```
# Construct a Credential object for your Logging Database SQL
    Administrator
 $credLogging = Get-Credential
```

```
# Construct a Credential object for your Monitor Database SQL
    Administrator
 $credMonitor = Get-Credential
```

```
# Remove the Controller
Remove-XDController -AdminAddress Controller1 -ControllerName
RedundantController -SiteDatabaseCredentials $credSite
-LoggingDatabaseCredentials $credLogging -MonitorDatabaseCredentials
$credMonitor
```

Remove A Controller From A Site For Which You Have No Db Admin Access

You have no administrative rights on the SQL Server 'SqlServer1'with instance 'SQLEXPRESS'that underlies a Site called 'Site1'. The Site's databases are called 'CitrixSiteDb', 'CitrixLoggingDb'and 'CitrixMonitorDb'. The Site currently has two Controllers, namely 'Controller1'and 'RedundantController'. You want to remove 'RedundantController'from the Site. 'RedundantController'is in the 'ACME'domain.

```
# Determine the SID of the Controller that is to be removed.
$site = Get-XDSite
$redundantController = $site.Controllers  | Where-Object
{
 $_.MachineName -eq ' ACME\RedundantController ' }

$redundantControllerSid = $redundantController.Sid
```

```
# Remove the Controller
Remove-XDController -AdminAddress Controller1 -ControllerName

Add-XDController

August 14, 2025

Adds a Delivery Controller to an existing Site.

Syntax

```
Add-XDController
   -SiteControllerAddress <String>
   [-DoNotUpdateDatabaseServer]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
Add-XDController
   -SiteControllerAddress <String>
   [-DoNotUpdateDatabaseServer]
   [-AdminDatabaseCredentials <PSCredential>]
   -ServiceDatabaseCredentials <PSCredential>
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
Add-XDController
   -SiteControllerAddress <String>
   [-DoNotUpdateDatabaseServer]
   -SiteAdminDatabaseCredentials <PSCredential>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -LoggingAdminDatabaseCredentials <PSCredential>
    -MonitorAdminDatabaseCredentials <PSCredential>
    [-AdminAddress <String>]
    [<CommonParameters>]
```

```
Add-XDController
    -SiteControllerAddress <String>
    [-DoNotUpdateDatabaseServer]
    [-SiteAdminDatabaseCredentials <PSCredential>]
    -SiteServiceDatabaseCredentials <PSCredential>
    [-LoggingAdminDatabaseCredentials <PSCredential>]
    -LoggingServiceDatabaseCredentials <PSCredential>
    [-MonitorAdminDatabaseCredentials <PSCredential>]
    -MonitorServiceDatabaseCredentials <PSCredential>
    [-AdminAddress <String>]
    [<CommonParameters>]
```

```
Add-XDController
    -SiteControllerAddress <String>
    -DatabaseCredentials <PSCredential>
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Adds a Controller to an existing Site.

If no credentials are provided and DoNotUpdateDatabaseServer has not been specified, then all database update operations are attempted using the credentials of the user running the cmdlet.

If DatabaseCredentials is provided, then all database operations are attempted using those credentials.

If one or more of SiteDatabaseCredentials, LoggingDatabaseCredentials or MonitorDatabaseCredentials are provided, then all three must be provided. All operations are then attempted using the credentials appropriate to each Database.

Examples

EXAMPLE 1

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined. The permissions for 'MyNewController'will be added automatically to the Database using the implicit credentials of the user running the cmdlet.

```
Add-XDController -AdminAddress MyNewController -SiteControllerAddress
    MyExistingController
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined.

The permissions for 'MyNewController'will not be added to the Database. Instead the Get-XDDatabaseSchema cmdlet is used to generate a SQL script that must be given to the database administrator of 'MySQLServer'. The SQL script must be used to add the necessary permissions for 'MyNewController'before Add-XDController is run.

```
Get-XDDatabaseSchema -AdminAddress MyNewController -SiteName MySite -
    DatabaseServer MySQLServer -ScriptType AddController > C:\
    addController.sql
# Get a database administrator to run addController.sql
Add-XDController -AdminAddress MyNewController -SiteControllerAddress
    MyExistingController -DoNotUpdateDatabaseServer
```

EXAMPLE 3

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined.

The credentials contained within '$credential'will be used to add the necessary permissions for 'MyNewController'to the Database.

```
$credential = Get-Credential
Add-XDController -AdminAddress MyNewController -SiteControllerAddress
    MyExistingController -DatabaseCredentials $credential
```

EXAMPLE 4

Adds the Controller 'MyNewController'to the Site to which 'MyExistingController'is already joined.

The credentials contained within '$credentialSite'will be used to add the necessary permissions for 'MyNewController'to the Site Configuration Database. The credentials contained within '$credential-Logging'will be used to add the necessary permissions for 'MyNewController'to the Configuration Logging Database. The credentials contained within '$credentialMonitor'will be used to add the necessary permissions for 'MyNewController'to the Monitoring Database.

```
$credentialSite = Get-Credential
$credentialLogging = Get-Credential
$credentialMonitor = Get-Credential
Add-XDController -AdminAddress MyNewController -SiteControllerAddress
    MyExistingController -SiteDatabaseCredentials $credentialSite -
    LoggingDatabaseCredentials $credentialLogging -
    MonitorDatabaseCredentials $credentialMonitor
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-SiteControllerAddress

The address of a Controller in the Site to which this Controller is to be joined.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for services to connect to the SQL servers associated with the Site, Logging and Monitor databases when the SQLServer authentication mode was configured for this site.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SiteAdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL server associated with the Site database.

Type:	PSCredential
Aliases:	SiteDatabaseCredentials

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

Type:	PSCredential
Aliases:	SiteDatabaseCredentials
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingAdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL server associated with the Logging database.

Type:	PSCredential
Aliases:	LoggingDatabaseCredentials
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSCredential
Aliases:	LoggingDatabaseCredentials
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-MonitorAdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL server associated with the Monitor database.

Type:	PSCredential
Aliases:	MonitorDatabaseCredentials
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

Type:	PSCredential
Aliases:	MonitorDatabaseCredentials
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SiteServiceDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for services to connect to the SQL server associated with the Site database when the SQLServer authentication mode was configured for this site.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingServiceDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for services to connect to the SQL server associated with the Logging database when the SQLServer authentication mode was configured for this site.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MonitorServiceDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for services to connect to the SQL server associated with the Monitor database when the SQLServer authentication mode was configured for this site.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-DatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL servers associated with the Site, Logging and Monitor databases.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotUpdateDatabaseServer

Results in the permissions associated with the Controller not being automatically added to the database.

This switch may be useful when the person running the cmdlet does not have sufficient database privilege. The database permissions for the Controller that is to be added must have been applied manually prior to running this cmdlet, otherwise the Controller is not added and an error is returned.

Get-XDDatabaseSchema may be used to generate the SQL script which in turn may be used to add the necessary permissions to the Database.

This parameter results in all supplied credentials being ignored.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL servers associated with the Site, Logging and Monitor databases.

Type:	PSCredential
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In general, the AdminAddress specifies the Controller to which the PowerShell module will connect. However, in this cmdlet, not only is this the address of the Controller to connect to, it is also the Controller that is to be added to this Site.

If the user running this cmdlet does not have privilege to add users to the Database, then use either the DoNotudpateDatabaseServer switch or supply alternative credentials using one or more of the Credential arguments.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The command can fail for the following reasons:

- The Controller is already a member of a Site.
- The DoNotUpdateDatabaseServer parameter was specified, but the permissions for the Controller are not already in the Database. Either add the permissions using Get-XDDatabaseSchema or allow this cmdlet to add the permissions automatically.
- The person running the cmdlet, or the supplied credentials, do not have sufficient privilege to update the Database. Either run this cmdlet as a user that has administrator privilege to the Database, or supply an account with suitable privileges using the PSCredential parameter(s).

Get-XDDatabaseSchema

August 14, 2025

Gets the SQL scripts used to create and manage the Database.

Syntax

```
Get-XDDatabaseSchema
   -SiteName <String>
   -DataStore <DataStore>
   [-DatabaseName <String>]
   -DatabaseServer <String>
   [-ServiceDatabaseCredentials <PSCredential>]
   [-ScriptType <DatabaseScriptType>]
   [-DatabaseEdition <DatabaseServerEdition>]
   [-AuthenticationMode <DatabaseAuthenticationMode>]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Generates SQL scripts that can be given to a database administrator for execution. Scripts are written to standard output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

A script of type FullDatabase is used to manually create the Database with write access permissions for the Delivery Controller identified by AdminAddress. This script must be generated and executed for each datastore type supported by the Site.

Once the database administrator has executed all scripts of type FullDatabase, run New-XDSite to configure the databases for first use.

Examples

EXAMPLE 1

Gets the script for creating the Site Configuration Database and writes the content to the file "c:\script.sql". This script may be executed on a database server "MyDBServer"for an existing and empty database with name "MySiteDB".

```
Get-XDDatabaseSchema -SiteName MySiteServiceGroup -DataStore Site -
    DatabaseName MySiteDB -DatabaseServer MyDBServer -ScriptType
    FullDatabase > c:\script.sql
```

EXAMPLE 2

Gets the script used to write the access permissions for 'MyNewController'to the Configuration Logging Database. The contents of the script are written to the file "c:\script.sql". This script may be executed on a database server "MyDBServer"for an existing database with name "MyLoggingDB". The Controller can then only be added to the Site by running Add-XDController.

```
Get-XDDatabaseSchema -AdminAddress MyNewController -SiteName
    MySiteServiceGroup -DataStore Logging -DatabaseName MyLoggingDB -
    DatabaseServer MyDBServer -ScriptType AddController > c:\script.sql
```

EXAMPLE 3

Gets the script used to remove the access permissions for a Controller with SID 'S-1-5-21-1234567890-123456789-123456789-1234'from the Monitoring Database. The contents of the script are written to the file "c:\script.sql". This script can be executed only after the Controller has been removed from the Site with Remove-XDController. It may be executed on a database server "MyDBServer"for an existing database with name "MyLoggingDB".

```
Get-XDDatabaseSchema -SiteName MySiteServiceGroup -DataStore Monitor -
    DatabaseName MyMonitorDB -DatabaseServer MyDBServer -ScriptType
    RemoveController -ControllerToRemoveSid S
    -1-5-21-1234567890-123456789-123456789-1234 > c:\script.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 4

Gets the script used to add a logon for 'MyExistingController'to the Site Configuration Database for the database mirror server "MyMirrorDBServer". The contents of the script are written to the file "c:\script.sql".

```
1  Get-XDDatabaseSchema -AdminAddress MyExistingController -SiteName
       MySiteServiceGroup -DataStore Site -DatabaseName MySiteDB -
       DatabaseServer MyMirrorDBServer -ScriptType AddDatabaseLogOn > c:\
       script.sql
```

Parameters

-SiteName

The name of the Site for which the SQL script is to be generated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-DataStore

The datastore type of the script to be generated. There is no default value. Valid values are:

- Site

This corresponds to the Site Configuration Database.

- Logging

This corresponds to the Configuration Logging Database.

- Monitor

This corresponds to the Monitor Database.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	DataStore
Accepted values:	Unknown, Site, Logging, Monitor
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The address of the SQL server on which the generated script will be run.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-DatabaseName

The name for the database of the selected datastore. There is a default name for each database. The default names are listed with their corresponding dataStore types as follows:

- Site

The Site Configuration Database. The default name of this database is Citrix<SiteName>.

- Logging

The Configuration Logging Database. The default name of this database is CitrixConfigLogging<SiteName>.

- Monitor

The Monitoring Database. The default name of this database is CitrixMonitor<SiteName>.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ServiceDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for services to connect to the SQL Server specified by the DatabaseServer parameter when the SQLServer authentication mode selected.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ScriptType

The type of SQL script to be generated. By default, a script of type FullDatabase is generated. Valid types are:

- AddController

This script is used to add a Controller specified by AdminAddress. It updates the specified database with all the access permissions needed by the Controller.

- AddDatabaseLogOn

This script is used to add a logon for a Controller to the specified database server. It is used specifically for configuring SQL Server mirroring, in which the mirror database server must have appropriate logons created for all Controllers in the site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- FullDatabase

This script is used to create a database corresponding to the specified DataStore parameter. It also updates the database with all the access permissions needed for the Controller.

- RemoveController

This script is used to remove a Controller specified by the ControllerToRemoveSid parameter. It removes the database access permissions previously required by the Controller.

Type:	DatabaseScriptType
Accepted values:	FullDatabase, AddController, RemoveController, AddDatabaseLogOn
Position:	Named
Default value:	FullDatabase
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseEdition

The edition of the SQL server on which the generated script will be run. Valid values are:

- OnPrem

The On-premises Microsoft SQL Server.

- Azure

The Microsoft Azure SQL Database.

Type:	DatabaseServerEdition
Accepted values:	Azure, OnPrem
Position:	Named
Default value:	OnPrem
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AuthenticationMode

The authentication mode of the SQL server on which the generated script will be run. Valid values are:

- Windows

The Integrated Windows Authentication mode.

- SQLServer

The SQL Server Authentication mode.

Type:	DatabaseAuthenticationMode
Accepted values:	Windows, SQLServer
Position:	Named
Default value:	Windows
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the content of the generated SQL script.

Notes

When the ScriptType is set to RemoveController, you must specify the dynamic parameter "ControllerToRemoveSid". This specifies the SID of the Controller that is to be removed from the Site. The resultant database script removes the controller's permissions to change the Database data.

If a script of type FullDatabase is generated for a configured Site, the resulting script adds database access permissions for all known Controllers to the database to be created.

If the cmdlet fails, the following error codes can result:

- The datastore was not recognized.
- The database server name could not be resolved.

Get-XDLicensing

August 14, 2025

Get the licensing attributes for a site.

Syntax

```
Get-XDLicensing
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Get the licensing attributes for the site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

Get the licensing attributes of the Site which has a Controller identified by MyController.

```
Get-XDLicensing -AdminAddress MyController
```

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation

A Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation object containing the relevant attributes.

Get-XDLogging

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Gets the Configuration Logging Database attributes of a Site.

Syntax

```
Get-XDLogging
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Gets the Configuration Logging Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Logging

This includes whether Logging is enabled or not, whether configuration operations may proceed or not, even if the Configuration Logging Database is not available, the language used for Configuration Logging entries, the name of the Configuration Logging Database, the database server for the Configuration Logging Database, the mirror database server for the Configuration Logging Database and whether Integrated Security is enabled or not for the Configuration Logging Database.

Get-XDLogServer

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2507

Get the site's centralized log configuration.

Syntax

```
Get-XDLogServer
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Get the site's centralized log configuration.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

```
Get-XDLogServer
```

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.AotLogConfiguration

Get-XDMonitor

August 14, 2025

Gets the Monitoring Database attributes of a Site.

Syntax

```
Get-XDMonitor
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Gets the Monitoring Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Monitor

This includes the name of the Monitoring Database, the database server for the Monitoring Database, the mirror database server for the Monitoring Database and whether Integrated Security is enabled or not for the Monitoring Database.

Get-XDSite

August 14, 2025

Gets the attributes of a Site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-XDSite
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Gets the attributes of the Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

Gets the attributes of the Site which has a Controller identified by MySiteController.

```
Get-XDSite -AdminAddress MySiteController
```

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site

This includes the name of the Site, the Controllers in Site, the Databases supporting the Site, the licensing configuration of the Site and the default Icon for the Site.

New-XDDatabase

August 14, 2025

Creates the specified Database or all Databases.

Syntax

```
New-XDDatabase
   [-AllDefaultDatabases]
   -SiteName <String>
   [-DatabaseNamePrefix <String>]
   -DatabaseServer <String>
   [-AdminDatabaseCredentials <PSCredential>]
   [-ServiceDatabaseCredentials <PSCredential>]
   [-DatabaseEdition <DatabaseServerEdition>]
   [-AuthenticationMode <DatabaseAuthenticationMode>]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

```
New-XDDatabase
   -SiteName <String>
   -DataStore <DataStore>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-DatabaseName <String>]
    -DatabaseServer <String>
    [-AdminDatabaseCredentials <PSCredential>]
    [-ServiceDatabaseCredentials <PSCredential>]
    [-DatabaseEdition <DatabaseServerEdition>]
    [-AuthenticationMode <DatabaseAuthenticationMode>]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

If AllDefaultDatabases is specified, this cmdlet creates all databases using their default names on the specified SQL server. When used in this manner, the cmdlet need only be called once.

If DataStore is specified, this cmdlet creates the specified database on the specified SQL Server. When used in this manner, the cmdlet should be called once per datastore.

This cmdlet creates, but does not configure, the Database. Run New-XDSite to configure the Site to use the Database.

For database mirroring please refer to "about_XenDesktopModule_SiteConfiguration".

Examples

EXAMPLE 1

Creates a Site Configuration Database called 'MySiteDatabase'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    Datastore Site -DatabaseServer MySqlServer\Instance_1 -DatabaseName
    MySiteDatabase
```

EXAMPLE 2

Creates a Configuration Logging Database called 'MyLoggingDatabase'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    Datastore Logging -DatabaseServer MySqlServer\Instance_1 -
    DatabaseName MyLoggingDatabase
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 3

Creates a Monitoring Database called 'MyMonitorDatabase'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    Datastore Monitor -DatabaseServer MySqlServer\Instance_1 -
    DatabaseName MyMonitorDatabase
```

EXAMPLE 4

Creates Site Configuration, Configuration Logging and Monitoring Databases called 'MyPrefix-CitrixMySite', 'MyPrefix-CitrixConfigLoggingMySite'and 'MyPrefix-CitrixMonitorMySite'for the Site named 'MySite'on 'Instance_1'of the SQL Server 'MySqlServer'.

```
New-XDDatabase -AdminAddress MySiteController -SiteName MySite -
    AllDefaultDatabases -DatabaseServer MySqlServer\Instance_1 -
    DatabaseNamePrefix  MyPrefix-
```

Parameters

-AllDefaultDatabases

All databases are created with their default names. The default names are listed with their corresponding dataStore types as follows:

- Site

The Site Configuration Database. The default name of this database is Citrix<SiteName>.

- Logging

The Configuration Logging Database. The default name of this database is CitrixConfigLogging<SiteName>.

- Monitor

The Monitoring Database. The default name of this database is CitrixMonitor<SiteName>.

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteName

The name of the Site for which the specified database is to be created.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The address of the SQL Server in which the database is to be created. This must include the SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

The datastore type that is to be created. Valid values are Site, Logging and Monitor.

Type:	DataStore

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accepted values:	Unknown, Site, Logging, Monitor
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseNamePrefix

The prefix to be added to the default database names when AllDefaultDatabases is specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL Server specified by the DatabaseServer parameter. If this parameter is not provided, then the implicit credentials of the user running the cmdlet are used to connect to the SQL Server.

Type:	PSCredential
Aliases:	DatabaseCredentials
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ServiceDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for services to connect to the SQL Server specified by the DatabaseServer parameter when the SQLServer authentication mode selected.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-DatabaseEdition

The edition of the SQL server in which the database is to be created. Valid values are:

- OnPrem

The On-premises Microsoft SQL Server.

- Azure

The Microsoft Azure SQL Database.

Type:	DatabaseServerEdition
Accepted values:	Azure, OnPrem
Position:	Named
Default value:	OnPrem
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AuthenticationMode

The authentication mode of the SQL server in which the database is to be created. Valid values are:

- Windows

The Integrated Windows Authentication mode.

- SQLServer

The SQL Server Authentication mode.

Type:	DatabaseAuthenticationMode
Accepted values:	Windows, SQLServer
Position:	Named
Default value:	Windows
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-DatabaseName

The name that should be used for the database of the specified datastore type.

Type:	String
Position:	Named
Default value:	Site = Citrix, Logging = CitrixConfigLogging and Monitor = CitrixMonitor
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Database

One Database object is returned for each datastore type that is created. Each Database object includes the database name, datastore type and SQL Server address.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the user running this cmdlet does not have privilege to create databases on the specified SQL Server, then alternative credentials may be provided using the DatabaseCredentials parameter.

The command can fail for the following reasons:

- A connection could not be established with the specified SQL Server.
- The person running the cmdlet, or the supplied credentials, do not have sufficient privilege to create databases on the specified SQL Server. In this situation, use Get-XDDatabaseSchema, instead of New-XDDatabase, to generate SQL database creation scripts that may be given to a database administrator for execution on the SQL Server.

New-XDSite

August 14, 2025

Configures the databases for use with a new Site and initializes all of the associated Site services.

Syntax

```
New-XDSite
   [-AllDefaultDatabases]
   -SiteName <String>
   [-DatabaseNamePrefix <String>]
   -DatabaseServer <String>
   [-DatabaseMirrorServer <String>]
   [-ServiceDatabaseCredentials <PSCredential>]
   [-DatabaseEdition <DatabaseServerEdition>]
   [-AuthenticationMode <DatabaseAuthenticationMode>]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
New-XDSite
    -SiteName <String>
    -SiteDatabaseName <String>
    -SiteDatabaseServer <String>
    [-SiteDatabaseMirrorServer <String>]
    [-SiteServiceDatabaseCredentials <PSCredential>]
    -LoggingDatabaseName <String>
    -LoggingDatabaseServer <String>
    [-LoggingDatabaseMirrorServer <String>]
    [-LoggingServiceDatabaseCredentials <PSCredential>]
    -MonitorDatabaseName <String>
    -MonitorDatabaseServer <String>
    [-MonitorDatabaseMirrorServer <String>]
    [-MonitorServiceDatabaseCredentials <PSCredential>]
    [-DatabaseEdition <DatabaseServerEdition>]
    [-AuthenticationMode <DatabaseAuthenticationMode>]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

```
New-XDSite
    -SiteName <String>
    -DatabaseServer <String>
    [-DatabaseMirrorServer <String>]
    [-ServiceDatabaseCredentials <PSCredential>]
    -SiteDatabaseName <String>
    -LoggingDatabaseName <String>
    -MonitorDatabaseName <String>
    [-DatabaseEdition <DatabaseServerEdition>]
    [-AuthenticationMode <DatabaseAuthenticationMode>]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Configures the Site for first use. This must be run after the databases have been created. The databases may have been created manually using the scripts generated from Get-XDDatabaseSchema or automatically using New-XDDatabase.

The site will run in a license caching mode until Set-XDLicensing is used to configure licensing.

For database mirroring please refer to "about_XenDesktopModule_SiteConfiguration".

Examples

EXAMPLE 1

Configures a site called 'MySite'for the Controller 'MyController'. All previously created databases have default names and are hosted on the SQL Server 'MySqlServer\Instance_1'.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
New-XDSite -AdminAddress MyController -AllDefaultDatabases -
    DatabaseServer MySqlServer\Instance_1 -SiteName MySite
```

EXAMPLE 2

Configures a site called 'MySite'for the Controller 'MyController'. All previously created databases have default names, are hosted on the SQL Server 'MySqlServer'and mirrored on the SQL Server 'MySqlMirror'.

```
New-XDSite -AdminAddress MyController -AllDefaultDatabases -
    DatabaseServer MySqlServer -DatabaseMirrorServer MySqlMirror -
    SiteName MySite
```

EXAMPLE 3

Configures a site called 'MySite'for the Controller 'MyController'. All previously created databases have default names with a prefix of 'MyPrefix-'and are hosted on the SQL Server 'MySqlServer'.

```
New-XDSite -AdminAddress MyController -AllDefaultDatabases -
    DatabaseServer MySqlServer -SiteName MySite -DatabaseNamePrefix
    MyPrefix-
```

EXAMPLE 4

Configures a site called 'MySite'for the Controller 'MyController'. The previously created databases have non-default names of 'LoggingDb'for the Configuration Logging Database, 'MonitorDb'for Monitoring Database and 'SiteDb'for the Site Configuration Database. All databases are hosted on the SQL Server 'MySqlServer'.

```
New-XDSite -AdminAddress MyController -DatabaseServer MySqlServer -
    LoggingDatabaseName LoggingDb -MonitorDatabaseName MonitorDb -
    SiteDatabaseName SiteDb -SiteName MySite
```

EXAMPLE 5

Configures a site called 'MySite'for the Controller 'MyController'.

The previously created databases have non-default names and are hosted on individual SQL Servers. 'LoggingDb'and 'LoggingSqlServer 'for the Configuration Logging Database. 'MonitorDb'and 'MonitorSqlServer'for Monitoring Database. 'SiteDb'and 'SiteSqlServer'for the Site Configuration Database.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
New-XDSite -AdminAddress MyController -LoggingDatabaseName LoggingDb -
    LoggingDatabaseServer LoggingSqlServer -MonitorDatabaseName
    MonitorDb -MonitorDatabaseServer MonitorSqlServer -SiteDatabaseName
    SiteDb -SiteDatabaseServer SiteSqlServer -SiteName MySite
```

Parameters

-AllDefaultDatabases

Indicates that all the databases that are to be used in this Site were created with their default names.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteName

The name of the Site that is to be created.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

If all databases were created within a single SQL Server, this is the address of that server. This must include the SQL Instance name.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseName

If databases were not created using their default names, this is the name of the Site Configuration Database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseName

If databases were not created using their default names, this is the name of the Configuration Logging Database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MonitorDatabaseName

If databases were not created using their default names, this is the name of the Monitoring Database.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteDatabaseServer

If each database was created on a separate SQL Server, this is the name of the SQL Server hosting the Site Configuration Database. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingDatabaseServer

If each database was created on a separate SQL Server, this is the name of the SQL Server hosting the Configuration Logging Database. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorDatabaseServer

If each database was created on a separate SQL Server, this is the name of the SQL Server hosting the Monitoring Database. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseNamePrefix

If a name prefix was applied to the default database names during the original creation of the databases, this specifies that name prefix.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseMirrorServer

If all databases were created within a single SQL Server and SQL Mirroring has been enabled for those databases, this is the address of the SQL Server that is acting as the Mirror. This must include the SQL Instance name.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceDatabaseCredentials

If all databases were created within a single SQL Server with the SQL Server Authentication mode, this is the credentials of those databases. The credentials are used by Controller Services.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-DatabaseEdition

The edition of the SQL server in which databases created for the site. Valid values are:

- OnPrem

The On-premises Microsoft SQL Server.

- Azure

The Microsoft Azure SQL Database.

Type:	DatabaseServerEdition
Accepted values:	Azure, OnPrem

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	OnPrem
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AuthenticationMode

The authentication mode of the SQL server in which databases created for the site. Valid values are:

- Windows

The Integrated Windows Authentication mode.

- SQLServer

The SQL Server Authentication mode.

Type:	DatabaseAuthenticationMode
Accepted values:	Windows, SQLServer
Position:	Named
Default value:	Windows
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SiteDatabaseMirrorServer

If each database was created on a separate SQL Server and SQL Mirroring has been enabled for the Site Configuration Database, this is the address of the SQL Server that is acting as the mirror. This must include any applicable SQL Instance name.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	If this parameter is not provided, the mirror server is determined by querying the SQL Server that is hosting the Site Configuration Database.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SiteServiceDatabaseCredentials

If each database was created on a separate SQL Server with the SQL Server Authentication mode, this is the credentials of the Site Configuration Database. The credentials are used by Controller Services.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingDatabaseMirrorServer

If each database was created on a separate SQL Server and SQL Mirroring has been enabled for the Configuration Logging Database, this is the address of the SQL Server that is acting as the mirror. This must include any applicable SQL Instance name.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	If this parameter is not provided, the mirror server is determined by querying the SQL Server hosting the Configuration Logging Database.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingServiceDatabaseCredentials

If each database was created on a separate SQL Server with the SQL Server Authentication mode, this is the credentials of the Configuration Logging Database. The credentials are used by Controller Services.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-MonitorDatabaseMirrorServer

If each database was created on a separate SQL Server and SQL Mirroring has been enabled for the Monitoring Database, this is the address of the SQL Server that is acting as the mirror. This must include any applicable SQL Instance name.

Type:	String
Position:	Named
Default value:	If this parameter is not provided, the mirror server is determined by querying the SQL Server that is hosting the Monitoring Database.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MonitorServiceDatabaseCredentials

If each database was created on a separate SQL Server with the SQL Server Authentication mode, this is the credentials of the Monitoring Database. The credentials are used by Controller Services.

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site

This includes the name of the Site, the Delivery Controllers in Site, the Databases supporting the Site, the metadata associated with the Site, the licensing configuration of the Site, and the default Icon for the Site.

Notes

The parameter set used with this cmdlet is dependent on the manner in which the databases were previously created.

If the databases were created with default names on a single SQL Server, use the following parameter set:

New-XDSite -AllDefaultDatabases -DatabaseServer <String> -SiteName <String> [-DatabaseMirrorServer <String>] [-DatabaseNamePrefix <String>] [-AdminAddress <String>]

If the databases were created with non-default names on a single SQL Server, use the following parameter set:

New-XDSite -DatabaseServer <String> -LoggingDatabaseName <String> -MonitorDatabaseName <String> -SiteDatabaseName <String> -SiteName <String> [-DatabaseMirrorServer <String>] [-AdminAddress <String>]

If the databases were created on seperate SQL Servers, use the following parameter set:

New-XDSite -LoggingDatabaseName <String> -LoggingDatabaseServer <String> -MonitorDatabaseName <String> -MonitorDatabaseServer <String> -SiteDatabaseName <String> -SiteDatabaseServer <String> -SiteName <String> [-LoggingDatabaseMirrorServer <String>] [-MonitorDatabaseMirrorServer <String>] [-SiteDatabaseMirrorServer <String>] [-AdminAddress <String>]

The command can fail for the following reasons:

- The Site associated with the Controller at AdminAddress is already configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- One or more of the specified databases could not be found.
- One or more of the specified databases does not have the necessary permissions for the Controller at AdminAddress.

Remove-XDController

August 14, 2025

Removes a Delivery Controller from an existing Site

Syntax

```
Remove-XDController
      -ControllerName <String>
      [-DoNotUpdateDatabaseServer]
      [-AdminAddress <String>]
      [<CommonParameters>]
```

```
Remove-XDController
      -ControllerName <String>
      -AdminDatabaseCredentials <PSCredential>
      [-AdminAddress <String>]
      [<CommonParameters>]
```

```
Remove-XDController
      -ControllerName <String>
      -SiteAdminDatabaseCredentials <PSCredential>
      -LoggingAdminDatabaseCredentials <PSCredential>
      -MonitorAdminDatabaseCredentials <PSCredential>
      [-AdminAddress <String>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Removes a Controller from an existing Site that currently has more than one Controller.

If no credentials are provided and DoNotUpdateDatabaseServer has not been specified, then all database update operations are attempted using the credentials of the user running the cmdlet.

If DatabaseCredentials is provided, then all database operations are attempted using the credentials.

If one or more of SiteDatabaseCredentials, LoggingDatabaseCredentials or MonitorDatabaseCredentials are provided, then all three must be provided. All operations are then attempted using the credentials appropriate to each Database.

Examples

EXAMPLE 1

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined. The permissions associated with 'MyControllerToRemove'will be automatically removed from the Database using the implicit credentials of the user running the cmdlet.

```
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove
```

EXAMPLE 2

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined.

The permissions for 'MyNewController'will not be removed from the Database. Instead the Get-XDDatabaseSchema cmdlet is used to generate a SQL script that may be given to the database administrator of 'MySQLServer'. The SQL script may be used to remove the permissions that previously allowed 'MyControllerToRemove'to manipulate data within the Database.

```
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove -DoNotUpdateDatabaseServer
Get-XDDatabaseSchema -AdminAddress MyExistingController -SiteName
    MySite -DatabaseServer MySQLServer -ScriptType RemoveController -
    ControllerToRemoveSid MyControllerToRemove_SID > C:\removeController
    .sql
# Although not necessary, Citrix recommends you get a database
    administrator to run removeController.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 3

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined.

The credentials contained within '$credential'will be used to remove the permissions associated with 'MyControllerToRemove'from the Database.

```
$credential = Get-Credential
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove -DatabaseCredentials $credential
```

EXAMPLE 4

Removes the Controller 'MyControllerToRemove'from the Site to which 'MyExistingController'is joined.

The credentials contained within '$credentialSite'will be used to remove the permissions associated with 'MyControllerToRemove'from the Site Configuration Database. The credentials contained within '$credentialLogging'will be used to remove the permissions associated with 'MyControllerToRemove' from the Configuration Logging Database. The credentials contained within '$credentialMonitor'will be used to remove the permissions associated with 'MyControllerToRemove'from the Monitoring Database.

```
$credentialSite = Get-Credential
$credentialLogging = Get-Credential
$credentialMonitor = Get-Credential
Remove-XDController -AdminAddress MyExistingController -ControllerName
    MyControllerToRemove -SiteDatabaseCredentials $credentialSite -
    LoggingDatabaseCredentials $credentialLogging -
    MonitorDatabaseCredentials $credentialMonitor
```

Parameters

-ControllerName

The name of the Controller that is to be removed. This may be in SID, DNS or SAM name form. This cannot be the same as the Controller identified by AdminAddress.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL servers associated with the Site, Logging and Monitor databases.

Type:	PSCredential
Aliases:	DatabaseCredentials
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SiteAdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL server associated with the Site database.

Type:	PSCredential
Aliases:	SiteDatabaseCredentials
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingAdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL server associated with the Logging database.

Type:	PSCredential
Aliases:	LoggingDatabaseCredentials
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-MonitorAdminDatabaseCredentials

The security credentials, in the form of a PSCredential object, that will be used for administrator to connect to the SQL server associated with the Monitor database.

Type:	PSCredential
Aliases:	MonitorDatabaseCredentials
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotUpdateDatabaseServer

Results in the permissions associated with the Controller not being automatically removed from the database.

This switch may be useful when the person running the cmdlet has insufficient database privilege. The database permissions for the Controller must be removed manually after running this cmdlet.

Get-XDDatabaseSchema may be used to generate the SQL script which in turn may be used to remove the associated permissions from the Database.

This parameter results in all supplied credentials being ignored.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the user running this cmdlet does not have privilege to remove users from the Database, then either use the DoNotudpateDatabaseServer switch or supply alternative credentials using one or more of the Credentials arguments.

This cmdlet cannot be used to remove the last Controller from a Site; use the Remove-XDSite cmdlet instead.

The command can fail for the following reasons:

- The Site has only one Controller. A Site must have multiple Controllers before a Controller can be removed.
- The Controller that is to be removed is not a member of the Site.
- The person running the cmdlet, or the supplied credentials, does not have sufficient privilege to update the Database. Either run this cmdlet as a user that has administrator privilege to the Database, or supply an account with suitable privileges using the PSCredential parameter(s).

Remove-XDSite

August 14, 2025

Removes the XenDesktop Site.

Syntax

```
Remove-XDSite
       [-AdminAddress <String>]
       [<CommonParameters>]
```

Description

This cmdlet can be executed only when there is one remaining Controller in the Site. It removes the Site by removing the last Controller from the Site.

The person running this command must be a the local administrator on the last Controller in this Site.

Examples

Parameters

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-XDLicensing

August 14, 2025

Changes one or more of the licensing attributes of a Site

Syntax

```
Set-XDLicensing
   [-Force]
   [-LicenseServerAddress <String>]
   [-LicenseServerPort <String>]
   [-LicensingModel <String>]
   [-PassThru]
   [-ProductCode <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-ProductEdition <String>]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Changes one or more of the licensing attributes of the Site which has a Controller identified by AdminAddress. When the Citrix License Server address and/or port are specified and Force is not, the new server:port combination will be validated before being changed. Otherwise, no validation is performed.

Examples

EXAMPLE 1

For the Site managed by MyController, changes the License Server to MyLicenseServer:27001.

```
Set-XDLicensing -AdminAddress MyController -LicenseServerAddress
    MyLicenseServer -LicenseServerPort 27001
```

Parameters

-Force

Force the setting of the License Server address and/or port, i.e. do not check that the new server:port combination is valid. This can be used, for example, when the License Server needs to be set but is temporarily unavailable.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LicenseServerAddress

The address of the License Server for this Site. If this parameter is not provided then the License Server address will not be altered.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicenseServerPort

The port on which the License Server for this Site is listening. If this parameter is not provided then the License Server port will not be altered.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LicensingModel

The licensing model for this Site. If this parameter is not provided then the licensing model will not be altered. Use the ProductCode returned from Get-XDSite as input to Get-ConfigLicensingModel to determine the list of valid licensing models.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductCode

The product code for this Site. If this parameter is not provided then the product code will not be altered. Find valid product codes by running Get-ConfigProduct.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProductEdition

The product edition for this Site. If this parameter is not provided then the product edition will not be altered. Use the ProductCode returned from Get-XDSite as input to Get-ConfigProductEdition to determine the list of valid product editions.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None or
Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.LicenseInformation object.

Notes

The command can fail for the following reasons:

- The supplied License Server does not support the requested product edition.
- A License Server was not found at the supplied address.

Set-XDLogging

August 14, 2025

Sets the Configuration Logging Database attributes of a Site.

Syntax

```
Set-XDLogging
   [-DatabaseName <String>]
   [-DatabaseServer <String>]
   [-DatabaseMirrorServer <String>]
   [-Enabled <Boolean>]
   [-Locale <String>]
   [-PassThru]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Sets the Configuration Logging Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

For the Site managed by MyController, enables Configuration Logging.

```
Set-XDLogging -AdminAddress MyController -Enabled $true
```

EXAMPLE 2

For the Site managed by MyController, enables Configuration Logging and allows configuration operations to succeed even if the Configuration Logging Database is unavailable. Note that Configuration Logging must be enabled before AllowDisconnectedDatabase can be set to $true.

```
Set-XDLogging -AdminAddress MyController -Enabled $true -
    AllowDisconnectedDatabase $true
```

EXAMPLE 3

For the Site managed by MyController, sets the mirror for the Configuration Logging Database to MySQLMirror.

```
Set-XDLogging -AdminAddress MyController -DatabaseMirrorServer
    MySQLMirror
```

EXAMPLE 4

For the Site managed by MyController, sets the SQL Server for the Configuration Logging Database to MySQLServer and the database name to MyConfigLoggingDatabase.

```
Set-XDLogging -AdminAddress MyController -DatabaseServer MySQLServer -
    DatabaseName MyConfigLoggingDatabase
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-DatabaseName

The name of the Configuration Logging Database. If this is omitted, the name is assumed to be the existing Configuration Logging Database name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The database server for the Configuration Logging Database. If not provided, the server is assumed to be the SQL Server that is hosting the existing Configuration Logging Database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseMirrorServer

The mirror database server for the Configuration Logging Database. If this parameter is not provided, the mirror server is determined by querying the SQL Server hosting the Configuration Logging Database.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Determines if Configuration Logging is enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Locale

The language used for Configuration Logging entries. Supported locales are English, Japanese and Chinese.

Type:	String
Accepted values:	en, de, es, fr, ja, zh-CN
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Logging

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Logging object.

Notes

When Configuration Logging is enabled, the dynamic parameter "AllowDisconnectedDatabase"may be used to permit Configuration operations to proceed even if the Configuration Logging Database is not available.

The command can fail for the following reasons:

- The Configuration Logging Database name and/or database server have not been provided, yet there is no existing database name and/or database server to use as default settings.
- The Controller identfied by AdminAddress does not have the necessary permissions to access the new Configuration Loggging Database or mirror database on the database server.
- The new Configuration Loggging Database or mirror database on the database server is not configured for the Site that is associated with the Controller identified by AdminAddress.

Set-XDLogServer

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2507

Set the site's centralized log configuration.

Syntax

```
Set-XDLogServer
   [-Enabled <Boolean>]
   [-Endpoint <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-DesktopGroups <String[]>]
    [-ExcludedDesktopGroups <String[]>]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Set the site's centralized log configuration.

Examples

EXAMPLE 1

```
Set-XDLogServer -Enable $True -Endpoint fqdn:5000
```

EXAMPLE 2

```
Set-XDLogServer -DesktopGroups DesktopGroup1,DesktopGroup2
```

EXAMPLE 3

```
Set-XDLogServer -DesktopGroups *
```

EXAMPLE 4

```
Set-XDLogServer -ExcludedDesktopGroups DesktopGroup1,DesktopGroup2
```

EXAMPLE 5

```
Set-XDLogServer -Enable $True -Endpoint fqdn:8080 -DesktopGroups * -
    ExcludedDesktopGroups DesktopGroup1,DesktopGroup2
```

Parameters

-Enabled

FIXME

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Endpoint

Specifies the fully-qualified domain name and port number of the log server, such as "logserver.mysite.com:5000" .

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DesktopGroups

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ExcludedDesktopGroups

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Set-XDMonitor

August 14, 2025

Sets the Monitoring Database attributes of a Site.

Syntax

```
Set-XDMonitor
    [-DatabaseName <String>]
    [-DatabaseServer <String>]
    [-DatabaseMirrorServer <String>]
    [-PassThru]
    [-AdminAddress <String>]
    [<CommonParameters>]
```

Description

Sets the Monitoring Database attributes of the Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

For the Site managed by MyController, sets the mirror for the Monitoring Database to MySQLMirror.

```
Set-XDMonitor -AdminAddress MyController -DatabaseMirrorServer
    MySQLMirror
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

For the Site managed by MyController, sets the SQL Server for the Monitoring Database to MySQLServer and the database name to MyMonitorDatabase.

```
Set-XDMonitor -AdminAddress MyController -DatabaseServer MySQLServer -
    DatabaseName MyMonitorDatabase
```

Parameters

-DatabaseName

The name of the Monitoring Database. If this is omitted, the name is assumed to be the existing Monitoring Database name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseServer

The database server for the Monitoring Database. If not provided, the server is assumed to be the SQL Server that is hosting the existing Monitoring Database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-DatabaseMirrorServer

The mirror database server for the Monitoring Database. If this parameter is not provided, the mirror server is determined by querying the SQL Server hosting the Monitoring Database.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named
Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input to this cmdlet.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Monitor

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Monitor object.

Notes

The command can fail for the following reasons:

- The Monitoring Database name and/or database server have not been provided, yet there is no existing database name and/or database server to use as default settings.
- The Controller identfied by AdminAddress does not have the necessary permissions to access the new Monitoring Database or mirror database on the database server.
- The new Monitoring Database or mirror database on the database server is not configured for the Site that is associated with the Controller identified by AdminAddress.

Set-XDSiteMetadata

August 14, 2025

Creates or updates metadata key-value pairs for a Site

Syntax

```
Set-XDSiteMetadata
   -DataName <String>
   -DataValue <String>
   [-PassThru]
   [-AdminAddress <String>]
   [<CommonParameters>]
```

Description

Creates or updates metadata key-value pairs for a Site which has a Controller identified by AdminAddress.

Examples

EXAMPLE 1

Creates, or if it already exists, updates the metadata key “MyMetadataName”with the value “1234”.

```
Set-XDSiteMetadata -DataName "MyMetadataName" -DataValue "1234"
```

Parameters

-DataName

The name of the metadata member that is to be created/updated.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-DataValue

The value of the metadata member that is to be created/updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminAddress

Specifies the address of the Delivery Controller to which the PowerShell module will connect. This can be provided as a host name or an IP address.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

The DataName and DataValue parameters may be piped into this cmdlet by property name.

Outputs

None or Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.XenDesktopPowerShellSdk.ServiceInterfaces.Configuration.Site object.
