Start-LogHighLevelOperation returns a HighLevelOperation object which contains information about the started high level operation. The "Id"property of the returned HighLevelOperation uniquely identifies the started high level operation. This can be supplied into the "-LoggingId"parameter which is implemented in all service SDK cmdlets which execute loggable configuration changes.

High level operation logs are automatically created by the XenDesktop consoles when:

- Initiating an operation which performs configuration changes.
- Initiating an operation which performs an administration activity.

Configuration Change and Administrator Activity

A configuration change is an operation which alters the configuration of the XenDesktop site. Examples of a configuration changes include:

- Creating or editing a host.
- Creating or editing a catalog.
- Adding a user to a delivery group.
- Deleting a machine.

An administrator activity operation doesn't directly alter site configuration, but it could be an operation carried out by an administrator as part of site management or helpdesk support. Examples of administrator activities include:

- Shutdown/start/restart of a user desktop.
- Studio or Director sending a message to a user.
- Rebooting a user's desktop.

Once the change being logged has completed (whether successfully or not) the Stop-LogHighLevelOperation cmdlet should be called to log the completion of a started high level operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId"parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.

```
$succeeded = $false #indicates if high level operation succeeded.
# Log high level operation start.
$highLevelOp = Start-LogHighLevelOperation -Text "Create catalog" -
    Source "My Custom Script"

try
{

  # Create catalog object
  $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType
     Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -
     LoggingId $highLevelOp.Id

  # Add a machine to the catalog
  $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "
     DOMAIN\Machine" -LoggingId $highLevelOp.Id
  $succeeded = $true
 }

catch{
  "Error encountered"  }

finally{

  # Log high level operation stop, and indicate its success
  Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -
     IsSuccessful $succeeded
 }
```

Parameters

-Text

Specifies text to describe the high level operation.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Source

Specifies the source of the high level operation.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTime

Specifies the start time of the high level operation.

Type:	DateTime
Position:	Named
Default value:	DateTime.UtcNow
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationType

Specifies the type of operation being logged. Values can be:

- AdminActivity - If the operation being logged performs an administration activity.
- ConfigurationChange - If the operation being logged performs a configuration change.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	OperationType
Position:	Named
Default value:	ConfigurationChange
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetTypes

Specifies the names of the object types that will be affected

by the operation being logged.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Parameters

Specifies the names and values of parameters that are supplied to the operation being logged.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.ConfigurationLogging.Sdk.HighLevelOperation

The newly logged high level operation start.

Stop-LogHighLevelOperation

August 14, 2025

Logs the completion of a previously started high level operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Stop-LogHighLevelOperation
    -HighLevelOperationId <String>
    [-EndTime <DateTime>]
    -IsSuccessful <Boolean>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Stop-LogHighLevelOperation logs the completion of a started high level operation.

Examples

EXAMPLE 1

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId"parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.

```
$succeeded = $false #indicates if high level operation succeeded.
# Log high level operation start.
$highLevelOp = Start-LogHighLevelOperation -Text "Create unmanaged
    catalog" -Source "My Custom Script"

try
{

  # Create catalog object
  $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType
      Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -
      LoggingId $highLevelOp.Id

  # Add a machine to the catalog
  $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "
      DOMAIN\Machine" -LoggingId $highLevelOp.Id
  $succeeded = $true
 }

catch{
  "Error encountered"  }

finally{

  # Log high level operation stop, and indicate its success
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
23    Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -
          IsSuccessful $succeeded
24    }
```

Parameters

-HighLevelOperationId

Specifies the identifier of the high level operation being completed.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSuccessful

Specifies if the started high level operation completed sucessfully.

Type:	Boolean
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-EndTime

Specifies the end time of the high level operation being completed.

Type:	DateTime
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	DateTime.UtcNow.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Test-LogDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix ConfigurationLogging Service.

Syntax

```
Test-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-LogDBConnection
    [[-DataStore] <String>]
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix ConfigurationLogging Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a ConfigurationLogging SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-LogDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix ConfigurationLogging Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site'or the logical name of the secondary data store.

Type:	String
Position:	3
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-LogDBConnection cmdlet returns an object describing the status of the selected ConfigurationLogging Service instance that would result if the connection string were used with the Set-LogDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-LogDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the ConfigurationLogging Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the ConfigurationLogging Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the ConfigurationLogging Service currently in use is newer than, and incompatible with, the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBOlderVersionThanService

  The version of the ConfigurationLogging Service schema on the database is newer than, and incompatible with, the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the ConfigurationLogging Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the ConfigurationLogging Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the ConfigurationLogging Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

about_AdminDelegatedAdminSnapIn

August 14, 2025

Topic

about_AdminDelegatedAdminSnapin

Short Description

The Delegated Administration Service PowerShell snap-in provides administrative functions for the Delegated Administration Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Admin'.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Long Description

The Delegated Administration Service PowerShell snap-in enables both local and remote administration of the Delegated Administration Service.

The Delegated Administration Service (or DAS for short) stores information about Citrix administrators and the rights they have. Services in the XenDesktop deployment use the DAS to determine whether a particular user has the privilege to perform an operation or not.

The snap-in provides storage and configuration of these entities:

Administrators

Each administrator object represents an individual person or a group of people identified by their Active Directory account. Administrators can be enabled and disabled.

The effective rights that a user has is the union of any rights that they have by looking at their Active Directory group membership. Disabled administrator entries are ignored for this calculation.

Once a site is setup, there must always be a full administrator and the Delegated Administration snap-in rejects requests to remove or disable the last full administrator.

Roles

A role represents a job function. That is, anyone with a given role is expected to be able to use or perform the tasks, wizards, and actions associated with that role. Administrators may have multiple roles for a particular site.

Some roles are built-in, and some editions of the product allow custom roles to be created with different combinations of permissions.

Scopes

Scopes represent a collection of objects, and are used to group objects for administrative purposes in a way that is relevant to the organisation. They can be used to represent both hierarchical and non-hierarchical relationships.

Objects can exist in multiple scopes at once. You may find it easier to think of scopes as labels, or a non-exclusive grouping such as a play-list.

All objects are implicitly in the built-in ‘All’scope.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Some objects are not scoped, and access to them is through either the 'All' scope or indirectly through a scoped object. For example sessions are not directly scoped but can be accessed using the scope of the desktop group.

The DAS stores information about scopes, but the mapping between scopes and objects is stored and updated using the PowerShell snap-ins of each corresponding service. For example, Delivery Group scopes are managed using the Broker PowerShell snap-in.

Rights

Rights determine what an administrator can do and where they can do it. They are expressed as a number of <role, scope> pairs associated with each administrator.

To gain access to any particular object, a person must match an administrator object that has an appropriate right that allows the required operation in a scope that the object is a member of.

Permissions

Each task, wizard or action in the Citrix Studio or Director consoles represents a unit of functionality that an administrator can perform. Permissions are expressed at a high level and generally correspond directly to the labels in the consoles. For example: "Edit catalog", or "Create delivery group".

Permission groups:

Permissions are grouped into related functionality when displayed by the console.

Operations

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets. Internally, each permission requires a number of operations to be performed, possibly by different services.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
          # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for

© 1997–2025 Citrix Systems, Inc. All rights reserved.

objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings

© 1997–2025 Citrix Systems, Inc. All rights reserved.

formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-AdminPermission

August 14, 2025

Add permissions to the set of permissions of a role.

Syntax

```
Add-AdminPermission
   -Role <String>
   [-Permission] <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-AdminPermission
   -Role <String>
   [-InputObject] <Permission[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Add extra permissions to the set of permissions that a role maps to.

Any administrator with a right including that role immediately gains the ability to use the operations of the new permissions.

Duplicate permissions do not produce an error, and permissions are skipped if the role already contains the permission (without error).

You cannot modify the permissions of built-in roles.

You are not permitted to add permissions that you yourself don't have rights to.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add a couple of specific permissions to the 'MyRole'role.

```
Add-AdminPermission -Role MyRole -Permission Global_Read,Logging_Read
```

EXAMPLE 2

Add all of the permissions of the Delivery Administrator role to MyRole.

```
$list = Get-AdminRole "Delivery Administrator" | Select -Expand
    Permissions
Add-AdminPermission -Role MyRole -Permission $list
```

Parameters

-Role

Role name or identifier of the role to update.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the permissions to add.

Type:	Permission[]
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Permission

Specifies the list of permissions to add (by identifier).

Type:	String[]
Aliases:	Id
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Permission

You can pipe a list of permissions to be added into this command.

Outputs

None

By default, this cmdlet returns no output.

Add-AdminRight

August 14, 2025

Grants a given right to the specified administrator.

Syntax

```
Add-AdminRight
   -Role <String>
   -Administrator <String>
   [-All]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-AdminRight
    [-InputObject] <Right[]>
    -Administrator <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-AdminRight
    -Scope <String>
    -Role <String>
    -Administrator <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use the Add-AdminRight cmdlet to add rights (role and scope pairs) to an administrator.

For convenience, you can use the -All parameter to specify the 'All'scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

This cmdlet cannot be used in case of DaaS customers.

Examples

EXAMPLE 1

Assigns the 'Help Desk Administrator'role and 'London'scope to the 'Admin1'administrator.

```
Add-AdminRight -Role 'Help Desk Administrator' -Scope London -
    Administrator DOMAIN\Admin1
```

EXAMPLE 2

Assigns the 'Full Administrator'role and 'All'scope to the 'Admin1'administrator.

```
Add-AdminRight -Role 'Full Administrator' -All -Administrator DOMAIN\
    Admin1
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 3

Copies the administrator rights from ‘ExistingAdmin’to ‘NewAdmin’.

```
$admin = Get-AdminAdministrator -Name DOMAIN\ExistingAdmin
Add-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\
    NewAdmin
```

Parameters

-Scope

Specifies the scope name or scope identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Role

Specifies the role name or role identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Administrator

Specifies the name or ID of the administrator.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the rights to add from Right objects.

Type:	Right[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-All

Specifies the 'All'scope. This parameter avoids localization issues or having to type the identifier of the 'All'scope.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Right

You can pipe the rights to be added into this command.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-AdminAdministrator

August 14, 2025

Gets administrators configured for this site.

Syntax

```
Get-AdminAdministrator
    [-Sid <String>]
    [[-Name] <String>]
    [-AdministratorType <AdministratorType>]
    [-BuiltIn <Boolean>]
    [-Enabled <Boolean>]
    [-IsCloudGroup <Boolean>]
    [-Metadata <String>]
    [-UserIdentity <String>]
    [-UserIdentityType <UserIdentityType>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves administrators matching the specified criteria. If no parameters are specified this cmdlet enumerates all administrators.

See about_Admin_Filtering for information about advanced filtering options.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Finds the administrator object (if one exists) for user "DOMAIN\TestUser".

```
Get-AdminAdministrator -Name DOMAIN\TestUser
```

EXAMPLE 2

Finds all disabled administrator objects.

```
Get-AdminAdministrator -Enabled $false
```

Parameters

-Sid

Gets administrators with the specified SID (security identifier).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-AdministratorType

Gets administrators with the specified Administrator Type(Individual Administrator or Administrator Group or ServicePrincipal). This property only applies for Cloud(DaaS) and not for on-prem.

Type:	AdministratorType
Accepted values:	Unknown, Administrator, AdministratorGroup, ServicePrincipal
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-BuiltIn

Gets administrators that are builtin

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2006

-Enabled

Gets administrators with the specified value of Enabled.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsCloudGroup

Gets administrators with the specified cloud group state

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2112

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserIdentity

Gets administrators with the specified UserIdentity (Windows security identifier or Citrix Cloud Identity). If the UserIdentityType is a Sid this will be the same as the Sid property. For Cloud administrators this will show cloud identity and the the Sid property will be null.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	True

-UserIdentityType

Gets administrators with the specified UserIdentityType (Windows security identifier or Citrix Cloud Identity).

Type:	UserIdentityType
Accepted values:	Sid, CitrixCloudIdentity, CitrixMultiTenantServiceIdentity, CitrixSingleTenantServiceIdentity
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-Name

Gets administrators with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Administrator

Get-AdminAdministrator returns an object for each matching administrator.

Get-AdminDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the DelegatedAdmin Service.

Syntax

```
Get-AdminDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected DelegatedAdmin Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the DelegatedAdmin Service instance running on controller "controller1.mydomain.net".

```
Get-AdminDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
   Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current DelegatedAdmin Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the DelegatedAdminService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-AdminDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix DelegatedAdmin Service.

Syntax

```
Get-AdminDBSchema
   [-DatabaseName <String>]
   [-ServiceGroupName <String>]
   [-ScriptType <ScriptTypes>]
   [-LocalDatabase]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix DelegatedAdmin Service database schema, add a new DelegatedAdmin service to an existing site, remove a DelegatedAdmin service from a site, or create a database server logon for a DelegatedAdmin service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected DelegatedAdmin service instance, otherwise the scripts relate to DelegatedAdmin service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to DelegatedAdmin service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to DelegatedAdmin service roles

If ScriptType is Evict, the returned script contains:

- Removal of DelegatedAdmin service instance from database
- Removal of database user

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix DelegatedAdmin Service and copies it to a file called "C:\DelegatedAdminSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a DelegatedAdmin service schema.

```
Get-AdminDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\DelegatedAdminSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the DelegatedAdmin service. This can be used when configuring a mirror server for use.

```
Get-AdminDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    DelegatedAdminLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new DelegatedAdmin service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the DelegatedAdmin services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix DelegatedAdmin Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a DelegatedAdmin Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Evict

  Removes a DelegatedAdmin Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

  Adds a logon for the DelegatedAdmin Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for DelegatedAdmin services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the DelegatedAdmin Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix DelegatedAdmin Service.

Syntax

```
Get-AdminDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Gets an SQL script that can be used to update the current Citrix DelegatedAdmin Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix DelegatedAdmin Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix DelegatedAdmin Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix DelegatedAdmin Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix DelegatedAdmin Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-AdminServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-AdminDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-DatabaseName

The name of the database containing the Citrix DelegatedAdmin Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-AdminDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix DelegatedAdmin Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the

© 1997–2025 Citrix Systems, Inc. All rights reserved.

current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any DelegatedAdmin services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AdminServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-AdminEffectiveAdministrator

August 14, 2025

Retrieve the effective administrator objects for a user.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-AdminEffectiveAdministrator
    [-Name] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This command determines what groups the specified user belongs to and retrieves the matching administrator records. It includes the set of rights that would be granted to the user if he or she used the system.

As this command uses Active Directory to determine what groups the user has, the caller must have the ability to read this information from Active Directory.

Only enabled administrator records are returned.

Examples

EXAMPLE 1

Retrieve the administrator records matching user 'testuser'.

```
Get-AdminEffectiveAdministrator MYDOMAIN\testuser
```

Parameters

-Name

User name or ID of user to query

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

User name or ID of user to query

Outputs

Citrix.DelegatedAdmin.Sdk.Administrator

Administrator records matching the specified user

Related Links

- about_AdminDelegatedAdminSnapin

Get-AdminEffectiveRight

August 14, 2025

Gets the set of Right objects associated with the current user.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-AdminEffectiveRight
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Get-AdminEffectiveRight cmdlet returns the effective rights of the current user. This is the union of all rights of the enabled administrators that the current user matches, taking into account Active Directory group membership.

Examples

EXAMPLE 1

Return the effective rights for the current user.

```
Get-AdminEffectiveRight
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.DelegatedAdmin.Sdk.Right

The Rights associated with the current user

Related Links

- Get-AdminAdministrator
- Add-AdminRight
- Remove-AdminRight

Get-AdminInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the DelegatedAdmin Service.

Syntax

```
Get-AdminInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix DelegatedAdmin Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-AdminDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix DelegatedAdmin Service database schema version number.

```
Get-AdminInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the DelegatedAdmin Service database schema for which upgrade scripts are supplied.

```
Get-AdminInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-AdminInstalledDBVersion returns database schema version numbers as requested.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the DelegatedAdmin Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-AdminPermission

August 14, 2025

Gets permissions configured for the site.

Syntax

```
Get-AdminPermission
    [-Id <String>]
    [[-Name] <String>]
    [-Description <String>]
    [-GroupId <String>]
    [-GroupName <String>]
    [-IsHidden <Boolean>]
    [-Metadata <String>]
    [-Operation <String>]
    [-ReadOnly <Boolean>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves permission matching the specified criteria. If no parameters are specified this cmdlet enumerates all permissions.

Permissions are configured using the Import-AdminRoleConfiguration command, and are used to represent collections of operations that are needed to perform a particular task. These permissions are presented in Citrix Studio when configuring roles.

Permissions can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Finds all permissions with 'Edit'in their names.

```
Get-AdminPermission -Name *Edit*
```

EXAMPLE 2

Finds permissions that contain specific operations, with the -Filter form needed to match multiple values.

```
Get-AdminPermission -Operation "Broker:SetCatalog"
Get-AdminPermission -Filter {
  Operations -contains "Broker:SetCatalog" -or Operations -contains "
     Broker:NewCatalog"  }
```

Parameters

-Id

Gets permissions with the specified identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Gets permissions with the specified description.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-GroupId

Gets permissions that are a member of the specified permission group (by group id).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-GroupName

Gets permissions that are a member of the specified permission group (by group name).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-IsHidden

Gets permissions with the specified value for the IsHidden flag.

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2305

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Operation

Gets permissions that contain a specific operation.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReadOnly

Gets permissions with the specified value for the ReadOnly flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Name

Gets permissions with the specified name (localized)

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Permission

Get-AdminPermission returns an object for each matching permission.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-AdminPermissionGroup

August 14, 2025

Gets permission groups configured for the site.

Syntax

```
Get-AdminPermissionGroup
    [-Id <String>]
    [[-Name] <String>]
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves permission groups matching the specified criteria. If no parameters are specified this cmdlet enumerates all permission groups.

Permission groups are configured using the Import-AdminRoleConfiguration command, and are primarily used to store the localized name for a group of permissions. Permission groups can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Finds all permission groups that end with the letter 's'.

```
Get-AdminPermissionGroup -Name *s
```

EXAMPLE 2

Retrieve two specific permission group objects with the matching identifiers.

```
$list = @("Hosts","Other")
Get-AdminPermissionGroup -Filter {
  Id -in $list  }
  -SortBy Name
```

Parameters

-Id

Gets permission groups with the given identifier. This is the non-localized identifier used to associate permissions with permission groups.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-Name

Gets permission groups matching the given name. This is the localized name of the group.

Type:	String
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.PermissionGroup

Get-AdminPermissionGroup returns an object for each matching permission group.

Get-AdminRevision

August 14, 2025

Gets the current revision of the delegated administration configuration data.

Syntax

```
Get-AdminRevision
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Delegated Administration Service maintains a revision number that is incremented whenever its configuration is changed. This command retrieves the current revision number.

Examples

EXAMPLE 1

Retrieve the current revision number.

```
Get-AdminRevision
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Int32

The configuration revision number

Notes

If Int32.MaxValue is reached the value of the revision number will wrap around to Int32.MinValue.

In some cases the value may be incremented by more than one.

Get-AdminRole

August 14, 2025

Gets roles configured for this site.

Syntax

```
Get-AdminRole
    [-Id <Guid>]
    [[-Name] <String>]
    [-BuiltIn <Boolean>]
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-ExclusivePermission <String>]
    [-Metadata <String>]
    [-Permission <String>]
    [-Property <String[]>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves roles matching the specified criteria. If no parameters are specified, this cmdlet enumerates all roles.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

Gets the details of the role with the specific id.

```
Get-AdminRole -Id 20852cdf-f527-4953-ba6e-e7545217122d
```

EXAMPLE 2

List all custom roles.

```
Get-AdminRole -BuiltIn $false
```

Parameters

-Id

Gets the role with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-BuiltIn

Gets roles with the specified value of the BuiltIn flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CanLaunchManage

Gets roles with the specified value of the CanLaunchManage flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-CanLaunchMonitor

Gets roles with the specified value of the CanLaunchMonitor flag.

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-Description

Gets roles with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ExclusivePermission

Gets roles that contain a specific exclusive permission.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Permission

Gets roles that contain a specific permission.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-Name

Gets roles with the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Role

Get-AdminRole returns an object for each matching role.

Get-AdminRoleConfiguration

August 14, 2025

Gets role configurations for this site.

Syntax

```
Get-AdminRoleConfiguration
   [-Id <Guid>]
   [[-Name] <String>]
   [-Locale <String>]
   [-Priority <Int32>]
   [-Version <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves role configurations matching the specified criteria. If no parameters are specified, this cmdlet enumerates and returns all role configurations.

Role configurations are part of the product configuration and define what permissions, permission groups, and built-in roles the product has. This cmdlet also provides the mapping of permissions to operations.

Examples

EXAMPLE 1

Retrieve the role configuration for the Citrix Director component.

```
Get-AdminRoleConfiguration -Name Director
```

Parameters

-Id

Gets role configurations with the specified id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Locale

Gets role configurations with the specified locale. Role configurations usually have a consistent locale.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Priority

Gets role configurations with the specified priority.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Version

Gets role configurations with the matching version number.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-Name

Gets role configurations matching the specified name.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.RoleConfiguration

Get-AdminRoleConfiguration returns an object for each matching role configuration.

Notes

This command is supplied for infrastructure purposes only and is not intended for public use.

Get-AdminScope

August 14, 2025

Gets scopes configured for this site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-AdminScope
    [-Id <Guid>]
    [[-Name] <String>]
    [-BuiltIn <Boolean>]
    [-Description <String>]
    [-Metadata <String>]
    [-TenantId <String>]
    [-TenantName <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves scopes matching the specified criteria. If no parameters are specified this cmdlet enumerates all scopes.

There is one special built-in scope, the 'All'scope.

To determine what objects are currently in a scope, use the Get-<Prefix>ScopedObject from each of the relevant PowerShell snap-ins.

See about_Admin_Filtering for information about advanced filtering options.

Examples

EXAMPLE 1

List all scopes that contain the word 'Sales'.

```
Get-AdminScope -Name *Sales*
```

EXAMPLE 2

Gets the details of the scope with the specific id.

```
Get-AdminScope -Id 21862daf-e529-4553-ba6e-f7543217111e
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Id

Gets the scope with the specified identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-BuiltIn

Gets scopes with the specified value of the BuiltIn flag.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Gets scopes with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	True

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenantId

Gets scopes with the specified tenant customer identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-TenantName

Gets scopes with the specified tenant customer name.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-Name

Gets scopes with the specified name.

Type:	String
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Scope

Get-AdminScope returns an object for each matching scope.

Get-AdminService

August 14, 2025

Gets the service record entries for the DelegatedAdmin Service.

Syntax

```
Get-AdminService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the DelegatedAdmin Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the DelegatedAdmin Service running in the current service group.

```
Get-AdminService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Service

The Get-AdminServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-AdminServiceAddedCapability

August 14, 2025

Gets any added capabilities for the DelegatedAdmin Service on the controller.

Syntax

```
Get-AdminServiceAddedCapability
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables updates to the DelegatedAdmin Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the DelegatedAdmin Service.

```
Get-AdminServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- about_AdminDelegatedAdminSnapin

Get-AdminServiceInstance

August 14, 2025

Gets the service instance entries for the DelegatedAdmin Service.

Syntax

```
Get-AdminServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the DelegatedAdmin Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the DelegatedAdmin Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-AdminServiceInstance
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.ServiceInstance

The Get-AdminServiceInstance command returns an object containing the following properties.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.DelegatedAdmin.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-AdminServiceStatus

August 14, 2025

Gets the current status of the DelegatedAdmin Service on the controller.

Syntax

```
Get-AdminServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Enables the status of the DelegatedAdmin Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

Examples

EXAMPLE 1

Get the current status of the DelegatedAdmin Service.

```
Get-AdminServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-AdminServiceStatus cmdlet returns an object containing the status of the DelegatedAdmin Service together with extra diagnostics information.

- DBUnconfigured

  The DelegatedAdmin Service does not have a database connection configured.

- DBRejectedConnection

  The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The DelegatedAdmin is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The DelegatedAdmin is connected to a database that is valid, but it does not have the full functionality required so the DelegatedAdmin cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

- DBOlderVersionThanService

  The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- OK

  The DelegatedAdmin Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the DelegatedAdmin Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the DelegatedAdmin and the database has been lost for an extended period of time, or has failed due to a configuration problem. The DelegatedAdmin service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-AdminSite

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Gets the site level data for the admin service

Syntax

```
Get-AdminSite
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieves the site level data such as when the most recent admin sync happened and the current database revision

Examples

EXAMPLE 1

Retrieves the site level data for the admin service such as when the recent admin sync happened and the current database revision

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-AdminSite
```

Parameters

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Site

Get-AdminSite returns the site level data such as when the most

recent admin sync happened and the current database revision

- Get-AdminSite

Import-AdminRoleConfiguration

August 14, 2025

Imports role configuration data into the Delegated Administration Service.

Syntax

```
Import-AdminRoleConfiguration
      -Content <String>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Import-AdminRoleConfiguration
      [-Path] <String>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

This command is intended for use by Citrix Studio to import definitions, roles, permissions, and their mappings to operations.

The supplied configuration requires a digital signature; this is used to validate the integrity of the configuration.

Examples

EXAMPLE 1

Imports the contents of 'C:\MyAdminConfig.xml'to the Delegated Administration Service.

```
1  Import-AdminRoleConfiguration -Path 'C:\MyAdminConfig.xml'
```

Parameters

-Content

The content of the role configuration data.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Path

The path to the file containing the role configuration data.

Type:	String
Aliases:	PSPath
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Allows older versions of role configuration to replace newer versions.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

This command is supplied for infrastructure purposes only and is not intended for public use.

- about_AdminDelegatedAdminSnapin
- Get-AdminRoleConfiguration

New-AdminAdministrator

August 14, 2025

Adds a new administrator to the site.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
New-AdminAdministrator
   [-Enabled <Boolean>]
   [-IsHidden <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AdminAdministrator
   [-Enabled <Boolean>]
   [-IsHidden <Boolean>]
   [-Name] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-AdminAdministrator
   [-Enabled <Boolean>]
   [-IsHidden <Boolean>]
   -Sid <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

New-AdminAdministrator creates a new administrator object in the site. Once a new administrator has been created you can assign rights (role and scope pairs) to the administrator.

Administrator objects are used to determine what rights, and therefore what permissions a particular Active Directory user has through the various SDKs and consoles of the site.

When the Enabled flag of an administrator is set to false, any rights of the administrator are ignored by the system when performing permission checks.

This cmdlet cannot be used in case of DaaS customers.

Examples

EXAMPLE 1

Creates a new administrator object for user “DOMAIN\TestUser”. It defaults to enabled.

```
New-AdminAdministrator -Name DOMAIN\TestUser
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Creates a new administrator object for user with SID "S-1-2-34-1234567890-1234567890-1234567890-123". It defaults to enabled.

```
New-AdminAdministrator -Sid S
    -1-2-34-1234567890-1234567890-1234567890-123
```

Parameters

-Sid

Specifies the SID (security identifier) of the user in Active Directory that this administrator corresponds to.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Name

Specifies the user or group name in Active Directory that this administrator corresponds to.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Enabled

Specifies whether the new administrator starts off enabled or not.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IsHidden

Specifies whether the administrator is hidden or not.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2303

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Administrator

The newly created administrator.

New-AdminRole

August 14, 2025

Adds a new custom role to the site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
New-AdminRole
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-Name] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

New-AdminRole adds a new custom role object to the site. Once a new role has been created, you can add permissions to the role which define what operations the role conveys.

Roles represent a job function, such as 'help desk administrator', and contain a list of permissions that are required to perform that job function.

To assign a role to an administrator, you combine it with a scope which indicates what objects the role can operate on. This pair (also known as a 'right') can then be assigned to an administrator. See Add-AdminRight for further details.

The identifier of the new role is chosen automatically, and custom roles created with this cmdlet always have their BuiltIn flag set to false.

You cannot modify built-in roles.

The following license editions are supported for custom roles:

- Citrix DaaS supports custom roles in all editions.
- Citrix Virtual Apps and Desktops supports custom roles in Premium and Advanced editions.
- Citrix Virtual Apps supports custom roles in Premium and Advanced editions.

Examples

EXAMPLE 1

Creates a new role called 'Supervisor', and then copies the permissions from the help desk role and adds some extras. Then gives this role (with the all scope) to user 'TestUser'.

```
New-AdminRole -Name Supervisor -Description "My custom supervisor role"
$list = Get-AdminRole 'Help Desk Administrator' | Select -Expand
    Permissions
Add-AdminPermission -Role Supervisor -Permission $list
Add-AdminPermission -Role Supervisor -Permission $extras
Add-AdminRight -Administrator DOMAIN\TestUser -Role Supervisor -All
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the name of the role. Each role in a site must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-CanLaunchManage

Optionally Specifies whether the role has access to the Manage tab in Citrix Cloud.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-CanLaunchMonitor

Optionally Specifies whether the role has access to the Monitor tab in Citrix Cloud.

Type:	Boolean
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-Description

Specifies the description of the role.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	0 to 256

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Role

The newly created role.

Notes

Roles are created without any permissions. Use the Add-AdminPermission to add permissions.

New-AdminScope

August 14, 2025

Adds a new scope to the site.

Syntax

```
New-AdminScope
    [-Description <String>]
    [-Name] <String>
    [-TenantId <String>]
    [-TenantName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

New-AdminScope adds a new scope object to the site.

A scope represents a collection of objects. Scopes are used to group objects in a way that is relevant to the organization; for example, the set of delivery groups used by the Sales team.

You can create objects in particular scopes by specifying the -Scope parameter of a New- cmdlet for an object that can be scoped. You can then modify the contents of a scope with Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the correpsonding PowerShell snap-ins.

To assign a scope to an administrator, combine it with a role and then assign this pair (also known as a 'right') to an administrator. See Add-AdminRight for further details.

The identifier of the new scope is chosen automatically.

Examples

EXAMPLE 1

Creates a new scope called 'Sales', adds a hypervisor connection object to the scope, and then assigns the right to use the hosting role on the Sales scope to the 'TestUser'administrator.

```
New-AdminScope -Name Sales -Description "Sales department scope"
Add-HypHypervisorConnectionScope -HypervisorConnectionName XenServer2 -
    Scope Sales
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
3  Add-AdminRight -Administrator DOMAIN\TestUser -Role Hosting -Scope
       Sales
```

Parameters

-Name

Specifies the name of the scope. Each scope in a site must have a unique name.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Description

Specifies the description of the scope.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	0 to 256

-TenantId

Specifies the tenant customer identifier of the scope.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-TenantName

Specifies the new tenant name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	1 to 128
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.Scope

The newly created scope.

Redo-AdminSync

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Performs admin sync

Syntax

```
Redo-AdminSync
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This command performs admin sync and updates the database

Examples

EXAMPLE 1

Updates the admin details in the database

```
Redo-AdminSync
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminAdministrator

August 14, 2025

Removes administrators from the site.

Syntax

```
Remove-AdminAdministrator
      [-InputObject] <Administrator[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministrator
      -Sid <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministrator
      [-Name] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-AdminAdministrator cmdlet deletes administrators from the site. This cmdlet cannot be used in case of DaaS customers.

Examples

EXAMPLE 1

Remove the administrator called “DOMAIN\TestUser”.

```
Remove-AdminAdministrator DOMAIN\TestUser
```

EXAMPLE 2

Remove all disabled administrators.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-AdminAdministrator -Enabled $false | Remove-AdminAdministrator
```

Parameters

-Sid

Specifies the SID of the administrator to delete.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-InputObject

Specifies the administrators to delete.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the name of the administrator to delete.

Type:	String[]
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Administrator

You can pipe the adminstrators to be deleted into this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminAdministratorMetadata

August 14, 2025

Removes metadata from the given Administrator.

Syntax

```
Remove-AdminAdministratorMetadata
       -AdministratorSid <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
       -AdministratorSid <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
       [-InputObject] <Administrator[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-AdminAdministratorMetadata
      [-InputObject] <Administrator[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
      [-AdministratorName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminAdministratorMetadata
      [-AdministratorName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Administrator.

Examples

EXAMPLE 1

Remove all metadata from all Administrator objects.

```
Get-AdminAdministrator | % {
  Remove-AdminAdministratorMetadata -Map $_.MetadataMap  }
```

Parameters

-AdministratorSid

Sid of the Administrator

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AdministratorName

Name of the Administrator

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

© 1997–2025 Citrix Systems, Inc. All rights reserved.

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AdminPermission

August 14, 2025

Remove permissions from the set of permissions of a role.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-AdminPermission
      -Role <String>
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminPermission
      -Role <String>
      [-Permission] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminPermission
      -Role <String>
      [-InputObject] <Permission[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove permissions from the set of permissions that a role maps to.

Any administrator with a right including that role immediately loses the ability to use the operations of the removed permissions.

Duplicate permissions do not produce an error, and permissions that the roles does not already have are skipped (without error).

You cannot modify the permissions of built-in roles.

Examples

EXAMPLE 1

Remove a couple of specific permissions from the 'MyRole'role.

```
Remove-AdminPermission -Role MyRole -Permission Global_Read,
   Logging_Read
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Remove all permissions from the 'MyRole'role.

```
Remove-AdminPermission -Role MyRole -All
```

Parameters

-Role

Role name or identifier of the role to update.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-All

Remove all permissions.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the permissions to remove.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Permission[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Permission

Specifies the list of permissions to remove (by identifier).

Type:	String[]
Aliases:	Id
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Permission

You can pipe a list of permissions to be removed into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminRight

August 14, 2025

Removes rights from an administrator.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-AdminRight
      -Role <String>
      -Administrator <String>
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRight
      [-InputObject] <Right[]>
      -Administrator <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRight
      -Scope <String>
      -Role <String>
      -Administrator <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This command removes rights from the specified administrator.

For convenience, you can use the -All parameter to specify the 'All'scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

This cmdlet cannot be used in case of DaaS customers.

Examples

EXAMPLE 1

Removes the 'Help Desk Administrator'role and 'London'scope from user 'Admin1'

```
RemoveAdminRight -Role 'Help Desk Administrator' -Scope London -
   Administrator DOMAIN\Admin1
```

EXAMPLE 2

Removes all rights from administrator 'Admin'.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$admin = Get-AdminAdministrator -Name DOMAIN\Admin
Remove-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\
    Admin
```

Parameters

-Scope

Specifies the scope name or scope identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Role

Specifies the role name or role identifier.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Administrator

Specifies the name or ID of the administrator.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

Specifies the rights to remove.

Type:	Right[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-All

Specifies the 'All'scope. This parameter avoids localization issues or having to type the identifier of the 'All'scope.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Right

You can pipe the rights to be removed into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminRole

August 14, 2025

Removes a role from the site.

Syntax

```
Remove-AdminRole
       [-InputObject] <Role[]>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRole
       [-Id] <Guid[]>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminRole
       [-Name] <String[]>
       [-Force]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The Remove-AdminRole cmdlet deletes roles from the site.

You cannot remove built-in roles.

An error will be produced if the role being removed is currently assigned to an administrator unless you specify the -Force option. When -Force is specified, any rights that reference the role are also removed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Remove the Supervisor role.

```
Remove-AdminRole -Name Supervisor
```

EXAMPLE 2

Attempt to remove all custom roles. This fails if one of the roles is assigned to an administrator.

```
Get-AdminRole -BuiltIn $false | Remove-AdminRole
```

Parameters

-InputObject

Specifies the roles to remove (by role object).

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the roles to remove (by role id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Name

Specifies the roles to remove (by role name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Force

Allow removal of roles that are still in use.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Role

You can pipe the roles to be deleted into this command.

Outputs

None

By default, this cmdlet returns no output.

Remove-AdminRoleMetadata

August 14, 2025

Removes metadata from the given Role.

Syntax

```
Remove-AdminRoleMetadata
      [-RoleId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
      [-RoleId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
      [-InputObject] <Role[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
      [-InputObject] <Role[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
      [-RoleName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminRoleMetadata
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [-RoleName] <String>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Role.

Examples

EXAMPLE 1

Remove all metadata from all Role objects.

```
Get-AdminRole | % {
  Remove-AdminRoleMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “Sys-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tem.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-RoleId

Id of the Role

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RoleName

Name of the Role

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-InputObject

Objects to which the metadata is to be added.

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AdminScope

August 14, 2025

Removes a scope from the site.

Syntax

```
Remove-AdminScope
      [-InputObject] <Scope[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminScope
      [-Id] <Guid[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-AdminScope
      [-Name] <String[]>
      [-Force]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The Remove-AdminScope cmdlet deletes scopes from the site.

You cannot remove the built-in 'All'scope.

An error will be produced if the scope being removed is currently assigned to an administrator unless you specify the -Force option. When -Force is specified, any rights that reference the scope are also removed.

Examples

EXAMPLE 1

Remove the Sales scope.

```
1  Remove-AdminScope -Name Sales
```

EXAMPLE 2

Attempt to remove all scopes (excluding the built-in 'All'scope). This fails if one of the scopes is assigned to an administrator.

```
1  Get-AdminScope -BuiltIn $false | Remove-AdminScope
```

Parameters

-InputObject

Specifies the scopes to remove (by scope object).

Type:	Scope[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Id

Specifies the scopes to remove (by scope id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the scopes to remove (by scope name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Force

Allow removal of scopes that are still in use.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Scope

You can pipe the scopes to be deleted into this command.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Remove-AdminScopeMetadata

August 14, 2025

Removes metadata from the given Scope.

Syntax

```
Remove-AdminScopeMetadata
       [-ScopeId] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-ScopeId] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-InputObject] <Scope[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-InputObject] <Scope[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-AdminScopeMetadata
       [-ScopeName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-AdminScopeMetadata
       [-ScopeName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Scope.

Examples

EXAMPLE 1

Remove all metadata from all Scope objects.

```
Get-AdminScope | % {
  Remove-AdminScopeMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ScopeId

Id of the Scope

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ScopeName

Name of the Scope

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Scope[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-AdminServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-AdminServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AdminServiceMetadata
        [-ServiceHostId] <Guid>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AdminServiceMetadata
        [-InputObject] <Service[]>
        -Name <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-AdminServiceMetadata
        [-InputObject] <Service[]>
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given DelegatedAdmin Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-AdminService | % {
  Remove-AdminServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type: String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the DelegatedAdmin Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-InputObject

DelegatedAdmin service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Rename-AdminRole

August 14, 2025

Rename a role

Syntax

```
Rename-AdminRole
       [-InputObject] <Role>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminRole
       [-Id] <Guid>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminRole
       [-Name] <String>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The Rename-AdminRole cmdlet changes the name of a role.

Role names must be unique, and you cannot modify the name of built-in roles.

Examples

EXAMPLE 1

Renames the 'Supervisor'role to 'HelpDeskLead'.

```
Rename-AdminRole -Name Supervisor -NewName HelpDeskLead
```

Parameters

-InputObject

Specifies the role to rename (by object).

Type:	Role
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the role to rename (by id).

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Name

Specifies the role to rename (by name).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the role.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Role

You can pipe the role to be renamed into this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Rename-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Rename-AdminScope

August 14, 2025

Rename a scope

Syntax

```
Rename-AdminScope
       [-InputObject] <Scope>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminScope
       [-Id] <Guid>
       [-NewName] <String>
       [-PassThru]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Rename-AdminScope
       [-Name] <String>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [-NewName] <String>
        [-PassThru]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

The Rename-AdminScope cmdlet changes the name of a scope.

Scope names must be unique, and you cannot modify the name of the built-in 'All'scope.

Examples

EXAMPLE 1

Renames the 'Sales'scope to 'SalesDesktops'.

```
Rename-AdminScope -Name Sales -NewName SalesDesktops
```

Parameters

-InputObject

Specifies the scope to rename (by object).

Type:	Scope
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the scope to rename (by id).

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the scope to rename (by name).

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-NewName

Specifies the new name of the scope.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.DelegatedAdmin.Sdk.Scope

You can pipe the scope to be renamed into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Rename-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

Reset-AdminEnabledFeatureList

August 14, 2025

Refreshes the DelegatedAdmin service's list of enabled features.

Syntax

```
Reset-AdminEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix DelegatedAdmin Service instance's list of enabled features with that held by the Central Configuration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected DelegatedAdmin service instance's list of enabled features.

```
1  Reset-AdminEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Reset-AdminServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the DelegatedAdmin Service.

Syntax

```
Reset-AdminServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the DelegatedAdmin Service.

The Reset-AdminServiceGroupMembership cmdlet must be run on at least one instance of the service type (Admin) after installation and registration with the configuration service. Without this operation, the DelegatedAdmin services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AdminServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    AdminServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-AdminServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-AdminServiceGroupMembership command.

Outputs

Citrix.DelegatedAdmin.Sdk.ServiceInstance

Reset-AdminServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the DelegatedAdmin Service instance.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-AdminAdministrator

August 14, 2025

Sets the properties of an administrator.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-AdminAdministrator
   [-InputObject] <Administrator[]>
   [-Enabled <Boolean>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministrator
   -Sid <String[]>
   [-Enabled <Boolean>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministrator
   [-Name] <String[]>
   [-Enabled <Boolean>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Set-AdminAdministrator cmdlet is used to enable or disable an existing administrator.

You can specify the administrators to modify in a number of ways, by piping in existing objects, by passing existing objects with the InputObject parameter, or by specifying the names or SIDs explicitly.

Examples

EXAMPLE 1

Enable all administrators that are currently disabled.

```
Get-AdminAdministrator -Enabled $false | Set-AdminAdministrator -
   Enabled $true
```

EXAMPLE 2

Enable two specific users specified by name (TestUser1 and TestUser2).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-AdminAdministrator -Name DOMAIN\TestUser1,DOMAIN\TestUser2 -Enabled
    $true
```

Parameters

-Sid

Specifies the SIDs of the administrators to modify.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-InputObject

Specifies the administrators to modify.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Name

Specifies the names of the administrators to modify.

Type:	String[]
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Enabled

Specifies the new value for the Enabled property.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Administrator

You can pipe the adminstrators to be modified into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Administrator

When you use the PassThru parameter, Set-AdminAdministrator generates a Citrix.DelegatedAdmin.Sdk.Administra object. Otherwise, this cmdlet does not generate any output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Set-AdminAdministratorMetadata

August 14, 2025

Adds or updates metadata on the given Administrator.

Syntax

```
Set-AdminAdministratorMetadata
   -AdministratorSid <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   -AdministratorSid <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-InputObject] <Administrator[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-InputObject] <Administrator[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-AdminAdministratorMetadata
   [-AdministratorName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminAdministratorMetadata
   [-AdministratorName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Administrator objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Administrator with the identifier ‘S-1-5-21-1505241163-3345470479-1241728991-1000’.

```
Set-AdminAdministratorMetadata -AdministratorSid S
   -1-5-21-1505241163-3345470479-1241728991-1000 -Name property -Value
   value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-AdministratorSid

Sid of the Administrator

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Administrator specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-AdministratorName

Name of the Administrator

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Administrator[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminAdministratorMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminDBConnection

August 14, 2025

Configures a database connection for the DelegatedAdmin Service.

Syntax

```
Set-AdminDBConnection
    [-DBConnection] <String>
    [-Force]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix DelegatedAdmin Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-AdminDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-AdminDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the DelegatedAdmin Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-AdminDBConnection cmdlet returns an object describing the status of the DelegatedAdmin Service together with extra diagnostics information. Possible values are:

- OK

  The DelegatedAdmin Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the DelegatedAdmin Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the DelegatedAdmin Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the DelegatedAdmin Service currently in use is newer than, and incompatible with, the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBOlderVersionThanService

  The version of the DelegatedAdmin Service schema on the database is newer than, and incompatible with, the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the DelegatedAdmin Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the DelegatedAdmin Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the DelegatedAdmin Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-AdminDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the DelegatedAdmin Service.

Syntax

```
Set-AdminDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix DelegatedAdmin Service instance to authenticate with the database server. By default Windows authentication is used and no SQL cre-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

dentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional DelegatedAdmin Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-AdminDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-AdminDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-AdminDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-AdminDBCredentials $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Related Links

- Get-AdminDBSchema

- Get-Credential

Set-AdminRole

August 14, 2025

Set the properties of a role.

Syntax

```
Set-AdminRole
    [-InputObject] <Role[]>
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminRole
    [-Id] <Guid[]>
    [-CanLaunchManage <Boolean>]
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminRole
    [-Name] <String[]>
    [-CanLaunchManage <Boolean>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-CanLaunchMonitor <Boolean>]
    [-Description <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-AdminRole command allows the description of custom roles to be updated. You cannot modify built-in roles.

To modify the permissions of a role, use the Add-AdminPermission and Remove-AdminPermission cmdlets.

To update the metadata associated with a role, use the Set-AdminRoleMetadata and Remove-AdminRoleMetadata cmdlets.

Examples

EXAMPLE 1

Change the description of the 'Supervisor'role.

```
Set-AdminRole -Name Supervisor -Description "Helpdesk supervisor role"
```

Parameters

-InputObject

Specifies the roles to update (by object).

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Id

Specifies the roles to update (by id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the roles to update (by name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-CanLaunchManage

Supplies the new CanLaunchManage value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-CanLaunchMonitor

Supplies the new CanLaunchMonitor value.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-Description

Supplies the new description value.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	0 to 256

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Role

You can pipe the roles to be updated into this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Set-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Set-AdminRoleMetadata

August 14, 2025

Adds or updates metadata on the given Role.

Syntax

```
Set-AdminRoleMetadata
   [-RoleId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-RoleId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-AdminRoleMetadata
   [-InputObject] <Role[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-InputObject] <Role[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-RoleName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminRoleMetadata
   [-RoleName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Role objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Role with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-AdminRoleMetadata -RoleId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -
   Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Role specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-RoleId

Id of the Role

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RoleName

Name of the Role

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Role[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminRoleMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminScope

August 14, 2025

Set the properties of a scope.

Syntax

```
Set-AdminScope
   [-InputObject] <Scope[]>
   [-Description <String>]
   [-TenantName <String>]
   [-PassThru]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScope
   [-Id] <Guid[]>
   [-Description <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-TenantName <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminScope
    [-Name] <String[]>
    [-Description <String>]
    [-TenantName <String>]
    [-PassThru]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The Set-AdminScope command allows the description of scopes and the tenant name to be updated. You cannot modify the built-in 'All'scope.

To change the contents of a scope, use the Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the corresponding PowerShell snap-in.

To update the metadata associated with a scope, use the Set-AdminScopeMetadata and Remove-AdminScopeMetadata cmdlets.

Examples

EXAMPLE 1

Change the description of the 'Sales'scope.

```
Set-AdminScope -Name Sales -Description "Sales department desktops"
```

Parameters

-InputObject

Specifies the scopes to update (by object).

Type:	Scope[]
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Id

Specifies the scopes to update (by id).

Type:	Guid[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Name

Specifies the scopes to update (by name).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Description

Supplies the new description value.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	0 to 256

-TenantName

Specifies the new tenant name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Scope

You can pipe the scopes to be updated into this command.

Outputs

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Set-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Set-AdminScopeMetadata

August 14, 2025

Adds or updates metadata on the given Scope.

Syntax

```
Set-AdminScopeMetadata
   [-ScopeId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-ScopeId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-InputObject] <Scope[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminScopeMetadata
   [-InputObject] <Scope[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminScopeMetadata
    [-ScopeName] <String>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-AdminScopeMetadata
    [-ScopeName] <String>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given Scope objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Scope with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AdminScopeMetadata -ScopeId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -
    Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Scope specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ScopeId

Id of the Scope

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ScopeName

Name of the Scope

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	Scope[]
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminScopeMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-AdminServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

```
Set-AdminServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-AdminServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CommonParameters>]
```

```
Set-AdminServiceMetadata
    [-InputObject] <Service[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to store additional custom data against given DelegatedAdmin Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-AdminServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

DelegatedAdmin service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-AdminServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Test-AdminAccess

August 14, 2025

Retrieves the scopes where the specified operation is permitted.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Test-AdminAccess
    [-Operation] <String[]>
    [-Annotate]
    [-RejectedScopes]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet evaluates what rights the current user has, and from these determines the scopes where the specified operation is permitted.

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets.

If you specify the -Annotate option or specify multiple operations to check, the resulting object is annotated with the operation the result relates to.

Examples

EXAMPLE 1

Queries the scopes where 'Broker:GetCatalog'is permitted.

```
Test-AdminAccess -Operation 'Broker:GetCatalog'
```

EXAMPLE 2

Queries the scopes where 'Broker:GetCatalog'or 'Broker:GetMachine'are permitted.

```
Test-AdminAccess -Operation 'Broker:GetCatalog','Broker:GetMachine'
```

Parameters

-Operation

The operation to query.

Type: String[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Annotate

Annotates each result with the operation it relates to.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RejectedScopes

Gets the scopes where operations are not allowed as well as the scopes where an operation is allowed

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.DelegatedAdmin.Sdk.ScopeReference

The list of permissible scopes for the specified single operation.

PSObject

The list of permissible scopes for each operation. This type of object is returned when the -Annotate option or multiple operations are specified.

Notes

If the specified operation has unrestricted access a single object is returned representing the 'All' scope with a ScopeId of Guid.Empty (00000000-0000-0000-0000-000000000000).

Test-AdminDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix DelegatedAdmin Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Test-AdminDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AdminDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-AdminDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix DelegatedAdmin Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a DelegatedAdmin SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-AdminDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix DelegatedAdmin Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-AdminDBConnection cmdlet returns an object describing the status of the selected DelegatedAdmin Service instance that would result if the connection string were used with the Set-AdminDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-AdminDBConnection command would succeed if it were executed with the supplied connection string.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBUnconfigured

  No database connection string is set for the DelegatedAdmin Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the DelegatedAdmin Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the DelegatedAdmin Service currently in use is newer than, and incompatible with, the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

- DBOlderVersionThanService

  The version of the DelegatedAdmin Service schema on the database is newer than, and incompatible with, the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the DelegatedAdmin Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the DelegatedAdmin Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the DelegatedAdmin Service cannot be determined.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Update-AdminNameCache

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

Updates admin name cache

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Update-AdminNameCache
      [[-Name] <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This command marks the admin names that need to be resynced during the admin sync site service by setting their CloudNameExpiryTime

Examples

EXAMPLE 1

Marks the admin names ending with the letter s

```
Update-AdminNameCache -Name *s
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Name

Specifies the wild card entry for admin names to be invalidated

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.DelegatedAdmin.Sdk.Name

Takes wild card entry of admin names as input

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get-cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
          # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
       # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Get-EnvTestConfiguration

August 14, 2025

Gets the Environment Test Service's configuation options

Syntax

```
Get-EnvTestConfiguration
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the Environment Test Service's configuation options and returns them as key/value pairs.

Examples

EXAMPLE 1

Gets all configuration options

```
Get-EnvTestConfiguration
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Dictionary<string, object>

All configuration settings

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Related Links

Get-EnvTestDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the EnvTest Service.

Syntax

```
Get-EnvTestDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected EnvTest Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the EnvTest Service instance running on controller "controller1.mydomain.net".

```
Get-EnvTestDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
    Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current EnvTest Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the EnvTestService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-EnvTestDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix EnvTest Service.

Syntax

```
Get-EnvTestDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix EnvTest Service database schema, add a new EnvTest service to an existing site, remove a EnvTest service from a site, or create a database server logon for a EnvTest service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected EnvTest service instance, otherwise the scripts relate to EnvTest service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to EnvTest service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to EnvTest service roles

If ScriptType is Evict, the returned script contains:

- Removal of EnvTest service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix EnvTest Service and copies it to a file called "C:\EnvTestSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a EnvTest service schema.

```
Get-EnvTestDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\EnvTestSchema.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Gets a script to create the appropriate database server logon for the EnvTest service. This can be used when configuring a mirror server for use.

```
1  Get-EnvTestDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
       EnvTestLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new EnvTest service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the EnvTest services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix EnvTest Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a EnvTest Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a EnvTest Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

  Adds a logon for the EnvTest Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for EnvTest services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the EnvTest Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-EnvTestDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix EnvTest Service.

Syntax

```
Get-EnvTestDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix EnvTest Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix EnvTest Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix EnvTest Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix EnvTest Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix EnvTest Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-EnvTestServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-EnvTestDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix EnvTest Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-EnvTestDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix EnvTest Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any EnvTest services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-EnvTestServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-EnvTestDefinition

August 14, 2025

Gets the one or more test definitions

Syntax

```
Get-EnvTestDefinition
    [-TestId <String[]>]
    [-CultureName <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list of test definitions that are available from currently running components.

Examples

EXAMPLE 1

Retrieve all tests.

```
$allTestDefinitions = Get-EnvTestDefinition
```

EXAMPLE 2

Retrieve all tests with localized properties returned in Spanish.

```
$allTestDefinitionsTranslatedIntoSpanish = Get-EnvTestDefinition -
    CultureName es-ES
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 3

Retrieve the definition of the 'Monitor_RegisteredWithConfigurationService'test.

```
$monitorConfigServiceRegistrationDefinition = Get-EnvTestDefinition -
    TestId Monitor_RegisteredWithConfigurationService
```

Parameters

-TestId

The id of one or more tests.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CultureName

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

A test id.

String[]

An array of test ids.

Outputs

Citrix.EnvTest.Sdk.EnvTestDefinition

One or more test definitions.

Get-EnvTestInstalledDBVersion

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Gets a list of all available database schema versions for the EnvTest Service.

Syntax

```
Get-EnvTestInstalledDBVersion
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix EnvTest Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-EnvTestDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix EnvTest Service database schema version number.

```
Get-EnvTestInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the EnvTest Service database schema for which upgrade scripts are supplied.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-EnvTestInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-EnvTestInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the EnvTest Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-EnvTestService

August 14, 2025

Gets the service record entries for the EnvTest Service.

Syntax

```
Get-EnvTestService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Returns instances of the EnvTest Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the EnvTest Service running in the current service group.

```
Get-EnvTestService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_EnvTest_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_EnvTest_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.Service

The Get-EnvTestServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-EnvTestServiceAddedCapability

August 14, 2025

Gets any added capabilities for the EnvTest Service on the controller.

Syntax

```
Get-EnvTestServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the EnvTest Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the EnvTest Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-EnvTestServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

- about_EnvTestEnvTestSnapin

Get-EnvTestServiceInstance

August 14, 2025

Gets the service instance entries for the EnvTest Service.

Syntax

```
Get-EnvTestServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the EnvTest Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented

© 1997–2025 Citrix Systems, Inc. All rights reserved.

as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the EnvTest Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
1  Get-EnvTestServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.ServiceInstance

The Get-EnvTestServiceInstance command returns an object containing the following properties.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.EnvTest.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-EnvTestServiceStatus

August 14, 2025

Gets the current status of the EnvTest Service on the controller.

Syntax

```
Get-EnvTestServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the EnvTest Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

Examples

EXAMPLE 1

Get the current status of the EnvTest Service.

```
Get-EnvTestServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-EnvTestServiceStatus cmdlet returns an object containing the status of the EnvTest Service together with extra diagnostics information.

- DBUnconfigured

  The EnvTest Service does not have a database connection configured.

- DBRejectedConnection

  The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The EnvTest is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The EnvTest is connected to a database that is valid, but it does not have the full functionality required so the EnvTest cannot function. Upgrading the database is required.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNewerVersionThanService

  The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

- DBOlderVersionThanService

  The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The EnvTest Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the EnvTest Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the EnvTest and the database has been lost for an extended period of time, or has failed due to a configuration problem. The EnvTest service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-EnvTestSuiteDefinition

August 14, 2025

Gets one or more test suite definitions.

Syntax

```
Get-EnvTestSuiteDefinition
   [-TestSuiteId <String[]>]
   [-CultureName <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of test suite definitions that are available from currently running components.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Retrieve all test suites.

```
$allTestSuiteDefinitions = Get-EnvTestSuiteDefinition
```

EXAMPLE 2

Retrieve all test suites with localized properties returned in Spanish.

```
$allTestSuiteDefinitionsTranslatedIntoSpanish = Get-
    EnvTestSuiteDefinition -CultureName es-ES
```

EXAMPLE 3

Retrieve the definition of the 'Infrastructure'test suite.

```
$infrastructureSuiteDefinition = Get-EnvTestSuiteDefinition -
    TestSuiteId Infrastructure
```

Parameters

-TestSuiteId

The id of one or more test suites.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CultureName

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

A test suite id.

String[]

An array of test suite ids.

Outputs

Citrix.EnvTest.Sdk.EnvTestSuiteDefinition

The definition of a test suite

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-EnvTestTask

August 14, 2025

Gets one or more EnvTestTask(s)

Syntax

```
Get-EnvTestTask
   [-TaskId <Guid>]
   [-List]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns either the current task, a specified task, or list of tasks that are currently known to the EnvTest Service.

Examples

EXAMPLE 1

Retrieve the current task. The current task is the most recently created task unless Switch-EnvTestTask explicitly changes it.

```
$currentTask = Get-EnvTestTask
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Retrieve a fresh copy of a task object based on a known task id, which is always a Guid. This id can be retrieved from an existing task object via its $task.TaskId property.

```
$taskOfSpecificId = Get-EnvTestTask -TaskId 36C0EC52-2039-4D6E-B690-9
    F02F8CEFFCC
```

EXAMPLE 3

Retrieve the list of current tasks. This list includes any task started by the Start-EnvTestTask cmdlet since the service started that has not later been removed via Remove-EnvTestTask.

```
$allKnownTasks = Get-EnvTestTask -List
```

Parameters

-TaskId

Specifies the task identifier to be returned. This value can be retrieved from an existing task's $task.TaskId property.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-List

List all running tasks, including the current one.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.EnvTestTask

A description of a previously started task.

New-EnvTestDiscoveryTargetDefinition

August 14, 2025

Creates a new EnvTestDiscoveryTargetDefinition object

Syntax

```
New-EnvTestDiscoveryTargetDefinition
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-EnvTestDiscoveryTargetDefinition
   -TestId <String>
   [-TargetIdType <String>]
   [-TargetId <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-EnvTestDiscoveryTargetDefinition
   -TestSuiteId <String>
   [-TargetIdType <String>]
   [-TargetId <String>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Creates a new EnvTestDiscoveryTargetDefinition object that can be piped into Start-EnvTestTask to define one or more targets of execution, optionally including root objects for discovery.

Examples

EXAMPLE 1

Create a discovery target definition with a single test and no target object, then start a task based on it.

```
$singleSimpleTestTaskTarget = New-EnvTestDiscoveryTargetDefinition -
   TestId Monitor_RegisteredWithConfigurationService
$singleSimpleTestTaskTarget | Start-EnvTestTask
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Create a discovery target definition with a single test suite and no target object, then start a task based on it.

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition
    -TestSuiteId Infrastructure
$singleSimpleTestSuiteTaskTarget | Start-EnvTestTask
```

EXAMPLE 3

Create a discovery target definition with a single test suite and a catalog target object, then start a task based on it.

```
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -
    TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-
    BrokerCatalog).Uuid
$singleTestSuiteTaskTarget | Start-EnvTestTask
```

EXAMPLE 4

Create two different discovery target definitions, put them in an array, then start a task based on both.

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition
    -TestSuiteId Infrastructure
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -
    TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-
    BrokerCatalog).Uuid
@($singleSimpleTestSuiteTaskTarget, $singleTestSuiteTaskTarget) | Start
    -EnvTestTask
```

Parameters

-TestId

Test identifiers. If specified, do not specify -TestSuiteId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-TestSuiteId

Test suite identifiers. If specified, do not specify -TestId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetIdType

Describes the type of corresponding object passed with -TargetId

Type:	String
Position:	Named
Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetId

The Ids that object tests or test suites will target. By default, other components are queried for objects related to these.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition

Defines a target of a task

Remove-EnvTestServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-EnvTestServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given EnvTest Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-EnvTestService | % {
  Remove-EnvTestServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ServiceHostId

Id of the EnvTest Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

EnvTest service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-EnvTestTask

August 14, 2025

Removes from the database completed tasks for the EnvTest Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-EnvTestTask
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTask
      [-Task <EnvTestTask>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTask
      [-TaskId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Enables completed tasks that have run within the EnvTest Service to be removed from the database.

Examples

EXAMPLE 1

Removes the current task from the EnvTest service.

```
Remove-EnvTestTask
```

EXAMPLE 2

Removes a task from the EnvTest service via its id, which is available from an existing task's $task.TaskId property.

```
Remove-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

EXAMPLE 3

Removes the second task in the list returned by Get-EnvTestTask -List.

```
$secondTask = $(Get-EnvTestTask -List)[1]
Remove-EnvTestTask -Task $secondTask
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-TaskId

Specifies the identifier of the task to be removed, retrieveable from the $task.TaskId property.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Task

Specifies the task to be removed.

Type:	EnvTestTask
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-EnvTestTaskMetadata

August 14, 2025

Removes metadata from the given Task.

Syntax

```
Remove-EnvTestTaskMetadata
      [-TaskTaskId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-EnvTestTaskMetadata
      [-TaskTaskId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTaskMetadata
      [-InputObject] <EnvTestTask[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-EnvTestTaskMetadata
      [-InputObject] <EnvTestTask[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Task.

Examples

EXAMPLE 1

Remove all metadata from all Task objects.

```
Get-EnvTestTask | % {
  Remove-EnvTestTaskMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskTaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-InputObject

Objects to which the metadata is to be added.

Type:	EnvTestTask[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Reset-EnvTestEnabledFeatureList

August 14, 2025

Refreshes the EnvTest service's list of enabled features.

Syntax

```
Reset-EnvTestEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix EnvTest Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Refreshes the selected EnvTest service instance's list of enabled features.

```
Reset-EnvTestEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-EnvTestServiceGroupMembership

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Reloads the access permissions and configuration service locations for the EnvTest Service.

Syntax

```
Reset-EnvTestServiceGroupMembership
     [-ConfigServiceInstance] <ServiceInstance[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the EnvTest Service.

The Reset-EnvTestServiceGroupMembership cmdlet must be run on at least one instance of the service type (EnvTest) after installation and registration with the configuration service. Without this operation, the EnvTest services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-EnvTestServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    EnvTestServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-EnvTestServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.EnvTest.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-EnvTestServiceGroupMembership command.

Outputs

Citrix.EnvTest.Sdk.ServiceInstance

Reset-EnvTestServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the EnvTest Service instance.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-EnvTestConfiguration

August 14, 2025

Sets the Environment Test Service's configuation options

Syntax

```
Set-EnvTestConfiguration
   [-PerTypeDiscoveredObjectLimit <Int32>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Sets the Environment Test Service's configuation options and broadcasts the changes to other machines in the Site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Set the maximum to 100

```
Set-EnvTestConfiguration -PerTypeDiscoveredObjectLimit 100
```

Parameters

-PerTypeDiscoveredObjectLimit

Sets the maximum number of objects of a particular type to be explored when discovering objects during a test run. Default: 50

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Integer

Must be greater than zero.

Outputs

String

Related Links

Set-EnvTestDBConnection

August 14, 2025

Configures a database connection for the EnvTest Service.

Syntax

```
Set-EnvTestDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Specifies the database connection string for use by the currently selected Citrix EnvTest Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-EnvTestDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-EnvTestDBConnection -DBConnection $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-DBConnection

Specifies the database connection string to be used by the EnvTest Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-EnvTestDBConnection cmdlet returns an object describing the status of the EnvTest Service together with extra diagnostics information. Possible values are:

- OK

  The EnvTest Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the EnvTest Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBRejectedConnection

  The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the EnvTest Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the EnvTest Service currently in use is newer than, and incompatible with, the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

- DBOlderVersionThanService

  The version of the EnvTest Service schema on the database is newer than, and incompatible with, the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the EnvTest Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the EnvTest Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the EnvTest Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-EnvTestDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the EnvTest Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-EnvTestDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix EnvTest Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional EnvTest Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-EnvTestDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$sqlCred = Get-Credential
Set-EnvTestDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-EnvTestDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-EnvTestDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-EnvTestServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-EnvTestServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to store additional custom data against given EnvTest Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-EnvTestServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                     Value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
---                                    -----
property                               value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "Sys-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tem.Collections.Generic.Dictionary[String,String]").

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

EnvTest service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-EnvTestServiceMetadata returns a dictionary containing the new (name, value)-pairs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Set-EnvTestTaskMetadata

August 14, 2025

Adds or updates metadata on the given Task.

Syntax

```
Set-EnvTestTaskMetadata
   [-TaskTaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestTaskMetadata
   [-TaskTaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestTaskMetadata
   [-InputObject] <EnvTestTask[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-EnvTestTaskMetadata
   [-InputObject] <EnvTestTask[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability for additional custom data to be stored against given Task objects.

Examples

EXAMPLE 1

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Set-EnvTestTaskMetadata -TaskTaskId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                    Value
---                                    -----
property                               value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskTaskId

Id of the Task

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-InputObject

Objects to which the metadata is to be added.

Type:	EnvTestTask[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-EnvTestTaskMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Start-EnvTestTask

August 14, 2025

Starts a new test task.

Syntax

```
Start-EnvTestTask
     [-IgnoreRelatedObjects]
     [-RunAsynchronously]
     [-ExcludeNotRunTests]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Start-EnvTestTask
     [-CultureName <String>]
     -InputObject <PSObject[]>
     [-IgnoreRelatedObjects]
     [-RunAsynchronously]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
      [-ExcludeNotRunTests]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Start-EnvTestTask
     -TestId <String>
      [-TargetIdType <String>]
      [-TargetId <String>]
      [-CultureName <String>]
      [-IgnoreRelatedObjects]
      [-RunAsynchronously]
      [-ExcludeNotRunTests]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Start-EnvTestTask
     -TestSuiteId <String>
      [-TargetIdType <String>]
      [-TargetId <String>]
      [-CultureName <String>]
      [-IgnoreRelatedObjects]
      [-RunAsynchronously]
      [-ExcludeNotRunTests]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Starts a new test task based on a set of criteria provided via parameters or piped input and either waits for the tests to run or returns immediately depending on how it is called. When running a test suite and providing a target object for that suite, the service will discover related objects by default, but this behavior may be disabled if desired.

Examples

EXAMPLE 1

Create and start a task with a single test and no target object.

```
$singleSimpleTestTask = Start-EnvTestTask -TestId
    Monitor_RegisteredWithConfigurationService
```

EXAMPLE 2

Create and start a task with a single test and no target object, with localized properties translated into Spanish.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$singleSimpleTestTaskInSpanish = Start-EnvTestTask -TestId
    Monitor_RegisteredWithConfigurationService -CultureName es-ES
```

EXAMPLE 3

Create and start a task with a single test suite and no target object.

```
$singleSimpleTestSuiteTask = Start-EnvTestTask -TestSuiteId
    Infrastructure
```

EXAMPLE 4

Create and start a task with a single test suite and a catalog target object.

```
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -
    TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
```

EXAMPLE 5

Create and start a task with a single test suite and a catalog target object, and return immediately not waiting for the tests to complete.

```
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -
    TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid -
    RunAsynchronously
```

EXAMPLE 6

Create and start a task with a single test, a target object for that test, and no object discovery based on that target.

```
$adAccountPool = Get-AcctIdentityPool
$singleTestTaskWithNoObjectDiscovery = StartEnvTestTask -
    IgnoreRelatedObjects -TestId
    ADIdentity_IdentityPool_ValidatePoolIsUnlocked -TargetIdType
    IdentityPool -TargetId $adAccountPool.IdentityPoolUid
```

EXAMPLE 7

Create two different discovery target definitions, put them in an array, then start a task based on both via -InputObject.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition
    -TestSuiteId Infrastructure
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -
    TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-
    BrokerCatalog).Uuid
$inputObjects = @($singleSimpleTestSuiteTaskTarget,
    $singleTestSuiteTaskTarget)
Start-EnvTestTask -InputObject $inputObjects
```

Parameters

-TestId

Test identifiers. If specified, do not specify -TestSuiteId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TestSuiteId

Test suite identifiers. If specified, do not specify -TestId.

Type:	String
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InputObject

One or more test targets defining the task, see Input Types for details about what kind of objects are permissible. Any valid object passed to this parameter may also be piped into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject[]
Position:	Named
Default value:	Empty
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TargetIdType

Describes the type of corresponding object passed with -TargetId

Type:	String
Position:	Named
Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetId

The Ids that object tests or tests suites will target. By default, other components are queried for objects related to these.

Type:	String
Position:	Named
Default value:	Empty
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-CultureName

The culture name in which to produce results. The culture name is in standard language/region-code format; for example “en-US”.

Type:	String
Position:	Named
Default value:	The current user interface culture
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IgnoreRelatedObjects

Do not ask other components for objects related to a specified target.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Do not wait for the test run to complete, return immediately.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ExcludeNotRunTests

If set, tests that are not run because no object matching their requirements is found are NOT included in test counts and results.

Type:	SwitchParameter
Position:	Named
Default value:	False (include Not Run tests)
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition

A single EnvTestDiscoveryTargetDefinition can be specified to target one test or test suite.

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition[]

An array of EnvTestDiscoveryTargetDefinition(s) can be specified to target any combination of tests and/or test suites.

PSCustomObject

A single PSCustomObject with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target one test or test suite.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PSCustomObject[]

An array of PSCustomObject(s) with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target any combination of tests and/or test suites.

Outputs

Ctrix.EnvTest.Sdk.EnvTestTask

The newly started task.

Stop-EnvTestTask

August 14, 2025

Stops a still running task from completing.

Syntax

```
Stop-EnvTestTask
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Stop-EnvTestTask
    [-Task <EnvTestTask>]
    [<CitrixCommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CommonParameters>]
```

```
Stop-EnvTestTask
    [-TaskId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Stops a still running task from completing. A task may still be retreived via Get-EnvTestTask until it Remove-EnvTestTask is called with its task id.

Examples

EXAMPLE 1

Stops the current task from completing if it is still running.

```
Stop-EnvTestTask
```

EXAMPLE 2

Stops a task from completing via its id, which is available from an existing task's $task.TaskId property.

```
Stop-EnvTestTask -TestId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

EXAMPLE 3

Stops the second task in the list returned by Get-EnvTestTask -List.

```
$secondTask = $(Get-EnvTestTask -List)[1]
Stop-EnvTestTask -Task $secondTask
```

Parameters

-TaskId

The id of the task to stop, retrieveable from the $task.TaskId property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Task

An EnvTestTask representing the task to stop

Type:	EnvTestTask
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Switch-EnvTestTask

August 14, 2025

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Syntax

```
Switch-EnvTestTask
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Switch-EnvTestTask
      [-Task <EnvTestTask>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Switch-EnvTestTask
      [-TaskId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Examples

EXAMPLE 1

Switches the current task to another via its id, which is available from an existing task's $task.TaskId property.

```
Switch-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

EXAMPLE 2

Switches the current task to the second in the list returned by Get-EnvTestTask -List.

```
$secondTask = $(Get-EnvTestTask -List)[1]
Switch-EnvTestTask -Task $switchTask
```

Parameters

-TaskId

Specifies the identifier of the task to be made current.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Task

The task object to be made current, retrieveable from the $task.TaskId property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	EnvTestTask
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-EnvTestTask command.

Outputs

None

By default, this cmdlet returns no output.

Test-EnvTestDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix EnvTest Service.

Syntax

```
Test-EnvTestDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-EnvTestDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-EnvTestDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix EnvTest Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connec-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tion from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a EnvTest SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
1  Test-EnvTestDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
       Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix EnvTest Service instance.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-EnvTestDBConnection cmdlet returns an object describing the status of the selected EnvTest Service instance that would result if the connection string were used with the Set-EnvTestDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-EnvTestDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the EnvTest Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the EnvTest Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the EnvTest Service currently in use is newer than, and incompatible with, the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

- DBOlderVersionThanService

  The version of the EnvTest Service schema on the database is newer than, and incompatible with, the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PendingFailure

  Connectivity between the EnvTest Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the EnvTest Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the EnvTest Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

about_HypHostSnapIn

August 14, 2025

Topic

about_HypHostSnapin

Short Description

The Host Service PowerShell snap-in provides administrative functions for the Host Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Hyp'.

Long Description

The Host Service PowerShell snap-in enables both local and remote administration of the Host Service. It lets you configure XenDesktop deployments to make use of hypervisors, networks, and storage, and enables browsing of their contents using the Host PowerShell provider (Citrix.HypervisorProvider).

The provider creates a default PSDrive with a drive identifier of 'XDHyp'. This drive provides two root folders:

HostingUnits Folder

Contains a list of all the hosting units that have been defined using the New-Item provider command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Hosting units define not only a hypervisor connection, but also reference networks and storage. Hosting units are used by the Machine Creation Service to provide the information required to create and manage virtual machines that can be used by other services. A hosting unit references a root path. This is a specific point in the provider connection tree. The hosting unit is constrained to provide only items below this point in the tree. This restricts the locations that the Machine Creation Service can use to create virtual machines and the networks and storage that can be used.

Connections Folder

Contains a list of all the hosting unit connections that are defined using the New-Item provider command.

Change directory to a specific connection and use the dir/Get-ChildItem command to list all of the infrastructure (such as folders, hypervisors, networks, storage, and virtual machines) that is available in the hosting unit to which the connection refers. The paths to these items are used as the input to commands in the Host Service and Machine Creation Service snap-ins.

The contents of the Hosting Unit and Connection folders reflect the content and structure of the hypervisor to which they refer. The item extensions reflect the object type for each item. Not all item types are appropriate for all hypervisor types. Possible item types are:

Virtual Machine (.vm)
Snapshot (.snapshot)
Cluster (.cluster)
Host (.host)
HostGroup (.hostgroup)
DataCenter (.datacenter)
Folder (.folder)
ResourcePool (.resourcepool)
ComputeResource (.computeresource)

When used with a path that refers to the Host provider (with a default drive of 'XDHyp:'), the Host provider extends the standard New-Item, Get-Item, Get-ChildItem, Remove-Item, Rename-Item, and Set-Item commands as described below. For more information about the basic behavior of these commands, see the help for the command. The Move-Item and Copy-Item commands are not supported for the Host provider.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

New-Item

The following parameters are available when using New-Item in the Connections directory (or a path that refers to the directory). The Credential parameter is not supported.

-Name

Specifies the name of the connection, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the connection name must be specified as part of the Path parameter.

-HypervisorAddress <String[]>

Specifies an array of addresses that can be used to contact the required hypervisor. All the addresses are considered equivalent, that is, all of the addresses provide access to the same virtual machines, snapshots, network, and storage.

-ConnectionType <ConnectionType>

Specifies the type of hypervisor that the connection is for. Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

-PluginId <String>

Specifies the class name for the Citrix Managed Machine library that is used to access the hypervisor. You can obtain this list using the Get-HypHypervisorPlugin command. The PluginId parameter must be specified if the ConnectionType is set to 'Custom'.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. You can specify the password as either Password or SecurePassword, but not both. The UserName parameter, and either Password or SecurePassword, specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as UserName and either Password or SecurePassword, so use of one precludes use of the other.

-Persist

Specifies that the connection details are persistent. If this parameter is not included, the connection is held only for the duration of the current runspace and PSDrive combination. Only persistent connection items are visible to administrators in other runspaces and PSDrives. Hosting units cannot be created from connections that are not persistent.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-Scopes <String[]>

Specifies the list of administrative scopes that the new connection will be a part of. The scopes control which administrators are able to work with the connection.

-ZoneUid <Guid>

Specifies the ZoneUid the connection belongs to. The zone determines which connections are local to the controller.

-IncludeUnavailable <Boolean>

Specifies whether or not to show all hypervisor plug-ins regardless of availability.

The following parameters are available when using New-Item in the HostingUnits directory (or a path that refers to the directory).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-HypervisorConnectionName <String>

Specifies the name of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-HypervisorConnectionUid <Guid>

Specifies the unique identifier of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-RootPath <String>

Specifies the location in a connection that is used as the starting reference for the hosting unit. The path must point to an item in the connection that is marked as a SymLink. The root of a XenServer connection is a special case that is also considered a SymLink. If this parameter is not included, the current location in the provider is used.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-StoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. If the connection is based on cloud infrastructure, storage items are typically not available, in which case this parameter can be omitted.

-PersonalvDiskStoragePath <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates disks for the virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command will communicate with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-GpuGroup

Specifies a path to a GPU Group in a connection that will be used when Machine Creation Services creates VMs. Only a single GPU Group is supported and the value is immutable.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-JobGroup <Guid>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the Uid assocuiated with the HypStorage object created with the New-HypStorage command. This HypStorage object specifies any additional storage details required for the new connection.

The following parameters are available when using New-Item relative to a connection or hosting unit.

-ItemType <String>

Specifies the type of item to create when invoked relative to a connection or hosting unit. Supported ItemType values are:

SecurityGroup (cloud only)

-Description

Specifies a description for the security group.

-VpcId

Specifies a VPC ID for the security group.

Get-Item

Get-ChildItem (alias dir)

Rename-Item

Remove-Item

The following additional parameters are available.

AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

You can specify the Path parameter by name or by using the unique identifier for the connection or hosting unit enclosed in braces. For example:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Path XDHyp:{1233-3213ACDF-12323}

The Filter parameter is not supported. Virtual machines created by the Machine Creation Service are returned only if the -Force parameter is used or if virtual machine tagging was disabled on the hosting unit with the NoVmTagging parameter when the VMs were created.

Set-Item

The following parameters are available when using Set-Item in the Connections directory.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. The password can be given as either Password or SecurePassword, but not both. The UserName parameter and either Password or SecurePassword specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as the UserName parameter and either Password or SecurePassword, so use of one precludes use of the other.

-HypervisorAddress <String[]>

Specifies the addresses of the hypervisor that this connection represents. This replaces all existing addresses.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-MaintenanceMode <Boolean>

Places the connection into maintenance mode which disables all communication between XenDesktop and the Hypervisor. Use this mode when making changes to the hypervisor; for instance, if the password for the access account needs to be changed.

-AdminAddress <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command tries to use a local Host Service.

The Credential parameter is not supported. Addresses can be modified with the Add-HypHypervisorConnectionAddress and Remove-HypHypervisorConnectionAddress commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The following parameters are available when using New-Item in the HostingUnits directory.

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-UseLocalStorageCaching <Boolean>

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Storage can be modified with the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The item types returned when these commands are used in the Host Service provider are defined in the Object Definitions section below.

Examples

To Create a Persistent Hypervisor Connection

```
New-Item -path "xdhyp:\Connections" -Name MyConn -ConnectionType
    XenServer -HypervisorAddress "http:\\address" -UserName user
    -Password password -Persist
PSPath:                   Citrix.HostingUnitService.Admin.V1.0\
                          Citrix.Hypervisor::XDHyp:\Connections\MyConn
PSParentPath:             Citrix.HostingUnitService.Admin.V1.0\
                          Citrix.Hypervisor::XDHyp:\Connections
PSChildName:              MyConn
PSDrive:                  XDHyp
PSProvider:               Citrix.HostingUnitService.Admin.V1.0\
                          Citrix.Hypervisor
PSIsContainer:            True
HypervisorConnectionUid:  04e6daa2-5cbd-4491-b70c-6daf733ee82a
HypervisorConnectionName: MyConn
ConnectionType:           XenServer
HypervisorAddress:        {
 http:\\address }

UserName:                 user
Persistent:               True
PluginId:                 XenFactory
SupportsPvsVMs:           True
Revision:                 1b0b0d02-bc1b-49d8-b2b0-be6fb7f150ad
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
MaintenanceMode:           False
Metadata:                  {
 MaxAbsoluteActiveActions = 100,
                           MaxAbsoluteNewActionsPerMinute = 100,
                           MaxPowerActionsPercentageOfDesktops = 20 }
```

To Create a Hosting Unit

```
New-Item -Path "xdhyp:\HostingUnits"
    -Name MyHU
    -HypervisorConnectionName MyConn
    -RootPath XDHYP:\Connections\MyConn
    -NetworkPath XDHYP:\Connections\MyConn\Network 0.network
    -StoragePath XDHYP:\Connections\MyConn\Local storage on
    myXenServer.storage
PSPath:                Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor::XDHyp:\HostingUnits\MyHU
PSParentPath:          Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor::XDHyp:\HostingUnits
PSChildName:           MyHU
PSDrive:               XDHyp
PSProvider:            Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor
PSIsContainer:         True
HostingUnitUid:        df91f886-1141-4280-bd59-2ee260a4df79
HostingUnitName:       MyHU
HypervisorConnection: MyConn
RootPath:              /
RootId:
NetworkPath:           /Network 0.network
NetworkId:             ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage:               {
 /Local storage on myXenServer.storage }

VMTaggingEnabled:      True
Metadata:              {
  }
```

Relative paths can be used for all parameters.

Object Definitions

Citrix.XDInterServiceTypes.HypervisorConnection

The hypervisor connection object is returned when a connection item is located. This item has the following parameters.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the connection item.

HypervisorConnectionName <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the name of the connection item.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the type of hypervisor that the connection is for.
Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

HypervisorAddress <String[]>

Specifies the addresses that can be used to contact the
required hypervisor.

Username <String>

Specifies the administrator user name for the connection to the hypervisor
(from the user name and password given as administrator credentials when

setting up this connection)

Persistent <Boolean>

Specifies whether or not the connection is persistent.

PluginId <String>

Specifies the Citrix Managed Machine class identifier for the
hypervisor.

SupportsPvsVM <Boolean>

Specifies whether or not the connection can be used as part of a
hosting unit. If this parameter is set to 'True', a hosting unit
referencing this connection can be created.

Revision <Guid>

A unique identifier that is changed every time any properties of
the connection are changed.

MaintenanceMode <Boolean>

Specifies whether or not the connection is currently in maintenance
mode.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

The collection of metadata associated with the connection.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Citrix.XDInterServiceTypes.HostingUnit

The hosting unit object is returned when a hosting unit item is located. This item has the following parameters.

HostingUnitName <String>

Specifies the name of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HypervisorConnection <Citrix.XDInterServiceTypes.HypervisorConnection>

Specifies the hypervisor connection item that the hosting unit references.

NetworkId <String>

Specifies the unique identifier for the network in the hypervisor context that the hosting unit references.

NetworkPath <String>

Specifies the path to the network in the Host Service provider.

RootId <String>

Specifies the unique identifier for the root connection item in the hypervisor context that the hosting unit references.

RootPath <String>

Specifies the path to the root of the hosting unit from within the Host Service provider.

Storage <Citrix.XDInterServiceTypes.Storage[]>

Specifies the collection of storage objects that are defined for use as part of the hosting unit. This object contains the following parameters.

StorageID <String>

Specifies the identifier for the storage in the hypervisor context.

StoragePath <String>

Specifies the path to the storage in the Host Service provider.

VMTaggingEnabled <Boolean>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies whether or not virtual machine metadata is used to tag virtual machines created by XenDesktop.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

Specifies the collection of metadata associated with the hosting unit.

Citrix.HostingUnitService.Sdk.HypervisorObject

The hypervisor object is returned when any item is located from within a Connection or HostingUnit folder. This item has the following parameters.

AdditionalData <Dictionary<String,String>

Stores extra untyped data for the item. This dictionary contains different information for each item type.

For Storage Items

Key = StorageType
Values = Shared or Local

For VM Items

Key = PowerState
Values = PoweredOn,

PoweredOff,
Suspended,
TransitioningToOn,
TransitioningToOff,
Suspending,
Resuming,
Unknown,
Error

Key = TemplateIsWindowsTemplate
Values = True or False

For Snapshot Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure Managed Disk Items

Key = TemplateIsWindowsTemplate
Values = True or False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

For Azure SIG Image Definition Items

Key = TemplateIsWindowsTemplate
Values = True or False

Name <String>

Specifies the name of the item.

FullName <String>

Specifies the name with the appropriate file extension.

ObjectPath <String>

Specifies the relative path to the item from the root of the connection of which the item is part.

FullPath <String>

Specifies the absolute path to the item in the Citrix.Hypervisor provider.

Id <String>

Specifies the identity of the item in the hypervisor context.

IsContainer <Boolean>

Specifies whether or not the item can contain other items.

IsSymLink <Boolean>

Specifies whether or not the item can be used as a RootPath of a hosting unit.

ObjectType <Citrix.HostingUnitService.Sdk.NodeType>

Specifies the item type.

Error Codes

The provider commands can return the following error codes.

New-Item

ConnectionNameOrUidInvalid

The name or unique identifier of the hypervisor connection specified for the hosting unit is invalid.

HostingUnitRootPathInvalid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The root path specified for the hosting unit is invalid. The root path must be a valid item in the hypervisor tree and a SymLink.

HostingUnitNetworkPathInvalid

The network path specified for the hosting unit is invalid. The network path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitStoragePathInvalid

The storage path specified for the hosting unit is invalid. The storage path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitDuplicateObjectExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HostingUnitStorageDuplicateObjectExists

A hosting unit storage object with the same storage path already exists for this hosting unit. There can be only one object for each combination of hosting unit and storage path.

HypervisorNotContactable

The hypervisor could not be contacted at the supplied address, which is either invalid or unreachable.

HypervisorAddressInvalidFormat

The address is not in a valid form for the specified hypervisor type.

ConnectionAddressInvalid

The specified address is invalid and does not belong to the same pool.

HypervisorConnectionDuplicateObjectExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

HypervisorConnectionAddressDuplicateObjectExists

A hypervisor connection address object with the same address already exists for this hypervisor connection. There can be only

© 1997–2025 Citrix Systems, Inc. All rights reserved.

one object for each combination of hypervisor connection and address.

HypervisorConnectionForHostingUnitIsVirtual

The specified hypervisor connection for the hosting unit is a virtual non-persistent connection. A persistent connection is required when creating a hosting unit.

InputNameInvalid

The name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ScopeNotFound

One or more of the scopes nominated for the new connection do not exist.

CannotCreateSecurityGroupHere

Security groups can only be created in a virtual private cloud (VPC).

Get-Item and Get-ChildItem

HypervisorConnectionObjectNotFound

The hypervisor connection object specified in the path could not be found.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitObjectNotFound

The specified hosting unit object could not be found.

HypervisorInMaintenanceMode

The hypervisor for the specified connection is currently in maintenance mode and cannot be accessed.

FailureToRetrieveConnectionPassword

The password for the HypervisorConnection cannot be retrieved or decrypted.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Remove-Item

HostingUnitObjectToDeleteDoesNotExist

The specified hosting unit object does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The specified hypervisor connection object does not exist.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HypervisorConnectionObjectToDeleteIsInUse

The specified hypervisor connection object cannot be deleted because it is being used by one or more hosting units.

ExceptionThrown

An unexpected error occurred.

DatabaseError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

ObjectCannotBeRemoved

The specified object cannot be removed.

Rename-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitDuplicateNameExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HypervisorConnectionDuplicateNameExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

InputNameInvalid

The new name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Set-Item

InputPathInvalid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitObjectToUpdateDoesNotExist

The specified hosting unit object does not exist.

HostingUnitNetworkPathInvalid

The new network path specified for the hosting unit is invalid. Either the network path does not exist or it is not relative to the root path of the hosting unit.

HypervisorConnectionObjectToUpdateDoesNotExist

The specified hypervisor connection object does not exist.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

CommunicationError

There was a problem communicating with the remote service.

about_HypHostSnapIn

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Topic

about_HypHostSnapin

Short Description

The Host Service PowerShell snap-in provides administrative functions for the Host Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Hyp'.

Long Description

The Host Service PowerShell snap-in enables both local and remote administration of the Host Service. It lets you configure XenDesktop deployments to make use of hypervisors, networks, and storage, and enables browsing of their contents using the Host PowerShell provider (Citrix.HypervisorProvider).

The provider creates a default PSDrive with a drive identifier of 'XDHyp'. This drive provides two root folders:

HostingUnits Folder

Contains a list of all the hosting units that have been defined using the New-Item provider command.

Hosting units define not only a hypervisor connection, but also reference networks and storage. Hosting units are used by the Machine Creation Service to provide the information required to create and manage virtual machines that can be used by other services. A hosting unit references a root path. This is a specific point in the provider connection tree. The hosting unit is constrained to provide only items below this point in the tree. This restricts the locations that the Machine Creation Service can use to create virtual machines and the networks and storage that can be used.

Connections Folder

Contains a list of all the hosting unit connections that are defined using the New-Item provider command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Change directory to a specific connection and use the dir/Get-ChildItem command to list all of the infrastructure (such as folders, hypervisors, networks, storage, and virtual machines) that is available in the hosting unit to which the connection refers. The paths to these items are used as the input to commands in the Host Service and Machine Creation Service snap-ins.

The contents of the Hosting Unit and Connection folders reflect the content and structure of the hypervisor to which they refer. The item extensions reflect the object type for each item. Not all item types are appropriate for all hypervisor types. Possible item types are:

Virtual Machine (.vm)
Snapshot (.snapshot)
Cluster (.cluster)
Host (.host)
HostGroup (.hostgroup)
DataCenter (.datacenter)
Folder (.folder)
ResourcePool (.resourcepool)
ComputeResource (.computeresource)

When used with a path that refers to the Host provider (with a default drive of 'XDHyp:'), the Host provider extends the standard New-Item, Get-Item, Get-ChildItem, Remove-Item, Rename-Item, and Set-Item commands as described below. For more information about the basic behavior of these commands, see the help for the command. The Move-Item and Copy-Item commands are not supported for the Host provider.

New-Item

The following parameters are available when using New-Item in the Connections directory (or a path that refers to the directory). The Credential parameter is not supported.

-Name

Specifies the name of the connection, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the connection name must be specified as part of the Path parameter.

-HypervisorAddress <String[]>

Specifies an array of addresses that can be used to contact the required hypervisor. All the addresses are considered equivalent,

© 1997–2025 Citrix Systems, Inc. All rights reserved.

that is, all of the addresses provide access to the same virtual machines, snapshots, network, and storage.

-ConnectionType <ConnectionType>

Specifies the type of hypervisor that the connection is for. Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

-PluginId <String>

Specifies the class name for the Citrix Managed Machine library that is used to access the hypervisor. You can obtain this list using the Get-HypHypervisorPlugin command. The PluginId parameter must be specified if the ConnectionType is set to 'Custom'.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. You can specify the password as either Password or SecurePassword, but not both. The UserName parameter, and either Password or SecurePassword, specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as UserName and either Password or SecurePassword, so use of one precludes use of the other.

-Persist

Specifies that the connection details are persistent. If this parameter is not included, the connection is held only for the duration of the current runspace and PSDrive combination. Only persistent connection items are visible to administrators in other runspaces and PSDrives. Hosting units cannot be created from connections that are not persistent.

-AdminAddress <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-Scopes <String[]>

Specifies the list of administrative scopes that the new connection will be a part of. The scopes control which administrators are able to work with the connection.

-ZoneUid <Guid>

Specifies the ZoneUid the connection belongs to. The zone determines which connections are local to the controller.

-IncludeUnavailable <Boolean>

Specifies whether or not to show all hypervisor plug-ins regardless of availability.

The following parameters are available when using New-Item in the HostingUnits directory (or a path that refers to the directory).

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-HypervisorConnectionName <String>

Specifies the name of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-HypervisorConnectionUid <Guid>

Specifies the unique identifier of the connection that the hosting unit uses. To create a hosting unit, the referenced connection

© 1997–2025 Citrix Systems, Inc. All rights reserved.

must be persistent and the ConnectionType must not be set to 'Custom'.

-RootPath <String>

Specifies the location in a connection that is used as the starting reference for the hosting unit. The path must point to an item in the connection that is marked as a SymLink. The root of a XenServer connection is a special case that is also considered a SymLink. If this parameter is not included, the current location in the provider is used.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-StoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. If the connection is based on cloud infrastructure, storage items are typically not available, in which case this parameter can be omitted.

-PersonalvDiskStoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates disks for the virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the address of the Host Service that the command will communicate with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-GpuGroup

Specifies a path to a GPU Group in a connection that will be used when Machine Creation Services creates VMs. Only a single GPU Group is supported and the value is immutable.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-JobGroup <Guid>

Specifies the Uid assocuiated with the HypStorage object created with the New-HypStorage command. This HypStorage object specifies any additional storage details required for the new connection.

The following parameters are available when using New-Item relative to a connection or hosting unit.

-ItemType <String>

Specifies the type of item to create when invoked relative to a connection or hosting unit. Supported ItemType values are:

SecurityGroup (cloud only)

-Description

Specifies a description for the security group.

-VpcId

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies a VPC ID for the security group.

Get-Item

Get-ChildItem (alias dir)

Rename-Item

Remove-Item

The following additional parameters are available.

AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

You can specify the Path parameter by name or by using the unique identifier for the connection or hosting unit enclosed in braces. For example:

-Path XDHyp:{1233-3213ACDF-12323}

The Filter parameter is not supported. Virtual machines created by the Machine Creation Service are returned only if the -Force parameter is used or if virtual machine tagging was disabled on the hosting unit with the NoVmTagging parameter when the VMs were created.

Set-Item

The following parameters are available when using Set-Item in the Connections directory.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>

Specifies the credentials for the connection to the hypervisor. The password can be given as either Password or SecurePassword, but not

© 1997–2025 Citrix Systems, Inc. All rights reserved.

both. The UserName parameter and either Password or SecurePassword specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>

Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as the UserName parameter and either Password or SecurePassword, so use of one precludes use of the other.

-HypervisorAddress <String[]>

Specifies the addresses of the hypervisor that this connection represents. This replaces all existing addresses.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-MaintenanceMode <Boolean>

Places the connection into maintenance mode which disables all communication between XenDesktop and the Hypervisor. Use this mode when making changes to the hypervisor; for instance, if the password for the access account needs to be changed.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command tries to use a local Host Service.

The Credential parameter is not supported. Addresses can be modified with the Add-HypHypervisorConnectionAddress and Remove-HypHypervisorConnectionAddress commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The following parameters are available when using New-Item in the HostingUnits directory.

-Name

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()'"{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching <Boolean>

When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Storage can be modified with the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. Metadata can be modified with

© 1997–2025 Citrix Systems, Inc. All rights reserved.

the Add-HypMetadata and Remove-HypMetadata commands.

The item types returned when these commands are used in the Host Service provider are defined in the Object Definitions section below.

Examples

To Create a Persistent Hypervisor Connection

```
New-Item -path "xdhyp:\Connections" -Name MyConn -ConnectionType
    XenServer -HypervisorAddress "http:\\address" -UserName user
    -Password password -Persist
PSPath:                   Citrix.HostingUnitService.Admin.V1.0\
                          Citrix.Hypervisor::XDHyp:\Connections\MyConn
PSParentPath:             Citrix.HostingUnitService.Admin.V1.0\
                          Citrix.Hypervisor::XDHyp:\Connections
PSChildName:              MyConn
PSDrive:                  XDHyp
PSProvider:               Citrix.HostingUnitService.Admin.V1.0\
                          Citrix.Hypervisor
PSIsContainer:            True
HypervisorConnectionUid:  04e6daa2-5cbd-4491-b70c-6daf733ee82a
HypervisorConnectionName: MyConn
ConnectionType:           XenServer
HypervisorAddress:        {
 http:\\address }

UserName:                 user
Persistent:               True
PluginId:                 XenFactory
SupportsPvsVMs:           True
Revision:                 1b0b0d02-bc1b-49d8-b2b0-be6fb7f150ad
MaintenanceMode:          False
Metadata:                 {
 MaxAbsoluteActiveActions = 100,
                          MaxAbsoluteNewActionsPerMinute = 100,
                          MaxPowerActionsPercentageOfDesktops = 20 }
```

To Create a Hosting Unit

```
New-Item -Path "xdhyp:\HostingUnits"
    -Name MyHU
    -HypervisorConnectionName MyConn
    -RootPath XDHYP:\Connections\MyConn
    -NetworkPath XDHYP:\Connections\MyConn\Network 0.network
    -StoragePath XDHYP:\Connections\MyConn\Local storage on
    myXenServer.storage
PSPath:               Citrix.HostingUnitService.Admin.V1.0\
                      Citrix.Hypervisor::XDHyp:\HostingUnits\MyHU
PSParentPath:         Citrix.HostingUnitService.Admin.V1.0\
                      Citrix.Hypervisor::XDHyp:\HostingUnits
PSChildName:          MyHU
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
PSDrive:               XDHyp
PSProvider:            Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor
PSIsContainer:         True
HostingUnitUid:        df91f886-1141-4280-bd59-2ee260a4df79
HostingUnitName:       MyHU
HypervisorConnection: MyConn
RootPath:              /
RootId:
NetworkPath:           /Network 0.network
NetworkId:             ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage:               {
 /Local storage on myXenServer.storage }

VMTaggingEnabled:      True
Metadata:              {
  }
```

Relative paths can be used for all parameters.

Object Definitions

Citrix.XDInterServiceTypes.HypervisorConnection

The hypervisor connection object is returned when a connection item is located. This item has the following parameters.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the connection item.

HypervisorConnectionName <String>

Specifies the name of the connection item.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the type of hypervisor that the connection is for.
Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

HypervisorAddress <String[]>

Specifies the addresses that can be used to contact the required hypervisor.

Username <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the administrator user name for the connection to the hypervisor (from the user name and password given as administrator credentials when

setting up this connection)

Persistent <Boolean>

Specifies whether or not the connection is persistent.

PluginId <String>

Specifies the Citrix Managed Machine class identifier for the hypervisor.

SupportsPvsVM <Boolean>

Specifies whether or not the connection can be used as part of a hosting unit. If this parameter is set to 'True', a hosting unit referencing this connection can be created.

Revision <Guid>

A unique identifier that is changed every time any properties of the connection are changed.

MaintenanceMode <Boolean>

Specifies whether or not the connection is currently in maintenance mode.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

The collection of metadata associated with the connection.

Citrix.XDInterServiceTypes.HostingUnit

The hosting unit object is returned when a hosting unit item is located. This item has the following parameters.

HostingUnitName <String>

Specifies the name of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HypervisorConnection <Citrix.XDInterServiceTypes.HypervisorConnection>

Specifies the hypervisor connection item that the hosting unit references.

NetworkId <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the unique identifier for the network in the hypervisor context that the hosting unit references.

NetworkPath <String>

Specifies the path to the network in the Host Service provider.

RootId <String>

Specifies the unique identifier for the root connection item in the hypervisor context that the hosting unit references.

RootPath <String>

Specifies the path to the root of the hosting unit from within the Host Service provider.

Storage <Citrix.XDInterServiceTypes.Storage[]>

Specifies the collection of storage objects that are defined for use as part of the hosting unit. This object contains the following parameters.

StorageID <String>

Specifies the identifier for the storage in the hypervisor context.

StoragePath <String>

Specifies the path to the storage in the Host Service provider.

VMTaggingEnabled <Boolean>

Specifies whether or not virtual machine metadata is used to tag virtual machines created by XenDesktop.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>

Specifies the collection of metadata associated with the hosting unit.

Citrix.HostingUnitService.Sdk.HypervisorObject

The hypervisor object is returned when any item is located from within a Connection or HostingUnit folder. This item has the following parameters.

AdditionalData <Dictionary<String,String>

Stores extra untyped data for the item. This dictionary contains different information for each item type.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

For Storage Items

Key = StorageType
Values = Shared or Local

For VM Items

Key = PowerState
Values = PoweredOn,

PoweredOff,
Suspended,
TransitioningToOn,
TransitioningToOff,
Suspending,
Resuming,
Unknown,
Error

Key = TemplateIsWindowsTemplate
Values = True or False

For Snapshot Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure Managed Disk Items

Key = TemplateIsWindowsTemplate
Values = True or False

For Azure SIG Image Definition Items

Key = TemplateIsWindowsTemplate
Values = True or False

Name <String>

Specifies the name of the item.

FullName <String>

Specifies the name with the appropriate file extension.

ObjectPath <String>

Specifies the relative path to the item from the root of the connection of which the item is part.

FullPath <String>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the absolute path to the item in the Citrix.Hypervisor provider.

Id <String>

Specifies the identity of the item in the hypervisor context.

IsContainer <Boolean>

Specifies whether or not the item can contain other items.

IsSymLink <Boolean>

Specifies whether or not the item can be used as a RootPath of a hosting unit.

ObjectType <Citrix.HostingUnitService.Sdk.NodeType>

Specifies the item type.

Error Codes

The provider commands can return the following error codes.

New-Item

ConnectionNameOrUidInvalid

The name or unique identifier of the hypervisor connection specified for the hosting unit is invalid.

HostingUnitRootPathInvalid

The root path specified for the hosting unit is invalid. The root path must be a valid item in the hypervisor tree and a SymLink.

HostingUnitNetworkPathInvalid

The network path specified for the hosting unit is invalid. The network path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitStoragePathInvalid

The storage path specified for the hosting unit is invalid. The storage path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitDuplicateObjectExists

A hosting unit object with the same name already exists. Hosting unit names must be unique.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitStorageDuplicateObjectExists

A hosting unit storage object with the same storage path already exists for this hosting unit. There can be only one object for each combination of hosting unit and storage path.

HypervisorNotContactable

The hypervisor could not be contacted at the supplied address, which is either invalid or unreachable.

HypervisorAddressInvalidFormat

The address is not in a valid form for the specified hypervisor type.

ConnectionAddressInvalid

The specified address is invalid and does not belong to the same pool.

HypervisorConnectionDuplicateObjectExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

HypervisorConnectionAddressDuplicateObjectExists

A hypervisor connection address object with the same address already exists for this hypervisor connection. There can be only one object for each combination of hypervisor connection and address.

HypervisorConnectionForHostingUnitIsVirtual

The specified hypervisor connection for the hosting unit is a virtual non-persistent connection. A persistent connection is required when creating a hosting unit.

InputNameInvalid

The name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ScopeNotFound

One or more of the scopes nominated for the new connection do not exist.

CannotCreateSecurityGroupHere

Security groups can only be created in a virtual private cloud (VPC).

Get-Item and Get-ChildItem

HypervisorConnectionObjectNotFound

The hypervisor connection object specified in the path could not be found.

HostingUnitObjectNotFound

The specified hosting unit object could not be found.

HypervisorInMaintenanceMode

The hypervisor for the specified connection is currently in maintenance mode and cannot be accessed.

FailureToRetrieveConnectionPassword

The password for the HypervisorConnection cannot be retrieved or decrypted.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Remove-Item

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitObjectToDeleteDoesNotExist

The specified hosting unit object does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The specified hypervisor connection object does not exist.

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HypervisorConnectionObjectToDeleteIsInUse

The specified hypervisor connection object cannot be deleted because it is being used by one or more hosting units.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

ObjectCannotBeRemoved

The specified object cannot be removed.

Rename-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitDuplicateNameExists

© 1997–2025 Citrix Systems, Inc. All rights reserved.

A hosting unit object with the same name already exists. Hosting unit names must be unique.

HypervisorConnectionDuplicateNameExists

A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

InputNameInvalid

The new name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()'"{}.

ExceptionThrown

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

CommunicationError

There was a problem communicating with the remote service.

Set-Item

InputPathInvalid

The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits{Guid}

HostingUnitObjectToUpdateDoesNotExist

The specified hosting unit object does not exist.

HostingUnitNetworkPathInvalid

The new network path specified for the hosting unit is invalid. Either the network path does not exist or it is not relative to the root path of the hosting unit.

HypervisorConnectionObjectToUpdateDoesNotExist

The specified hypervisor connection object does not exist.

ExceptionThrown

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An unexpected error occurred.

DatabaseError

There was a problem communicating with the database.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

CommunicationError

There was a problem communicating with the remote service.

about_HypStorage

August 14, 2025

Topic

about_HypStorage

Short Description

The HypStorage object defines parameters for a hosting unit. The parameters specify a storage tier definition made up of the storage type and one or more storage locations. When created it is assigned a job group uid with the -JobGroup parameter.

The HypStorage can then be used with a subsequent New-Item operation via the -JobGroup reference.

Long Description

A HypStorage object defines a set of parameters for a hosting unit. The parameters specify a storage tier definition and the HypStorage can then be used with a subsequent New-Item operation via the -JobGroup reference.

-JobGroup <Uid>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the unique id of the new job group

-StoragePath <String>

Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines.

-StorageType <storage type>

Specifies the type of the new storage tier. Currently the only storage type supported is TemporaryStorage.

Once added to the HostingUnit with the New-Item cmdlet, the additional storage can subsequently be modified or removed with the Add-HypHostingUnitStorage, Set-HypHostingUnitStorage and Remove-HypHostingUnitStorage cmdlets.

Examples

To create a HypStorage and use it when defining a new Hosting Unit

Get A Unique Id For The Job Group

$job = [Guid]::NewGuid()

Define The Storage Tier

New-HypStorage -JobGroup $job -StorageType TemporaryStorage -StoragePath @('XDHyp:\Connections\MyConne
Storage.storage')

Use It In The New-Item Call

New-Item -HypervisorConnectionName 'MyConnection'-JobGroup $job -NetworkPath @('XD-Hyp:\Connections\MyConnection\Network 1.network') <additional New-Item parameters…>

about_Hyp_CustomProperties

August 14, 2025

Topic

XenServer SDK - Custom Properties

Short Description

Overview of custom properties settings for a HypervisorConnection object.

Long Description

Custom properties are properties of the HypervisorConnection object, which are specific to the object's hosting hypervisor infrastructure. Custom properties can be used to control or tune behaviors of the hosting connection.

Custom Properties For Azure Resource Manager

The following custom properties are specific to AzureRM.

- SubscriptionId: (String) The Azure Subscription ID.
- TenantId: (String) The Azure Tenant ID.
- AuthenticationAuthority: (String) The Microsoft user authentication endpoint.
  e.g. "https://login.microsoftonline.com/"
- ManagementEndpoint: (String) The Azure Resource Manager endpoint used to establish communications with Azure APIs.
  e.g. "https://management.azure.com/"
- StorageSuffix: (String) The DNS suffix of the Azure Storage endpoint URL. There are 4 default suffix strings, each one belonging to a different Azure environment:
  Azure Global: "core.windows.net"
  Azure China: "core.chinacloudapi.cn"

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Azure US Government: "core.usgovcloudapi.net"
Azure Germany: "core.cloudapi.de"

- ResourceManagementOperationPollingInterval: (Int) How long Azure waits before polling the status of all running operations managed by Azure's ResourceManagementClient class. Default is 3 seconds in order to poll often without throttling Azure by polling more often than necessary.
- MaximumConcurrentProvisioningOperations: (Int) The number of threads to use within the hypervisor manager, which limits number of simultaneous MCS Operations that are permitted in the provisioning workflow. Default is 500 threads for Azure, where each thread manages exactly one MCS Operation. Increasing the number of threads is not recommended.
- PowerStateCacheExpirationInMinutes: (Int) The number of minutes until the memory cache, where the power state is stored, is expired. Once expired, one Azure API call will be made to get the latest power status for all Azure related catalogs in the site. This effectively refreshes the memory cache. Default is 5 mins.
- PowerStateCacheDegreeOfParallelism: (Int) The number of threads that should be used to fetch missing power states, individually, in parallel, in the event where some machines may be missing from an Azure Resource Graph (ARG) response. In such cases, power states for machines are fetched individually, either through another ARG query or a Virtual Machine 'Get'call. Default number of threads is 10. The number of threads provided as an argument must be between 1 and 512.
- PowerStateCacheUseCachedValuesOnlyAfterInSeconds: (Int) The number of seconds that can elapse before individual 'Get'state calls to Azure are no longer queried and instead machine power states are returned from the memory cached.

  Querying machine power states follows a three step process:

  1. A single Azure Resource Graph (ARG) call is used to query all machine

  power states.

  1. Machine power states that were not picked up by ARG are subsequently

  individually queried by Azure 'Get'state calls.

  1. Machine power states not successfully queried by Azure 'Get'state

  calls within this custom property's timeframe will be returned from the memory cache.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If a machine's power state is not found in the memory cache, then it will be reported as Unknown. Default is 180 seconds. This property does not check if any query has timed out.

- AuthenticationMode: (String) Specify the authentication method for interacting with Azure services. It can be set to one of three values: AppClientSecret, SystemAssignedManagedIdentity, and UserAssignedManagedIdentity.

    1. AppClientSecret: used for authentication scenarios involving an application

    ID and a client secret. Fill in application ID as UserName and client secret as SecurePassword of the hosting connection.

    1. SystemAssignedManagedIdentity: refers to the use of Azure's system-assigned

    managed identities, which are automatically managed by Azure and tied to a specific Azure service instance, providing a seamless and secure authentication method without the need for credentials in code. Fill in "system-assigned"as the UserName and SecurePassword of the hosting connection.

    1. UserAssignedManagedIdentity: allows for the use of Azure's user-assigned

    managed identities, offering more flexibility by allowing a single identity to be used across multiple Azure services. Fill in the client id of the user-assigned managed identity as UserName and "user-assigned"as the SecurePassword of the hosting connection.

- DisableInstanceDiscovery: (Boolean) Disables validation that the provided AuthenticationAuthority is one of the known defaults for standard Azure environments (Azure Public, Azure Government, etc). Instance discovery is required to be disabled when setting up a hosting connection with custom endpoints.
- AuthenticationObjectId: (String) This custom property stores the Azure Service Principal Object ID. This property is required when DisableInstanceDiscovery is set to True and is used to determine the roles and permissions assigned to the Service Principal, especially in Azure Secret environment where querying the Object ID via Azure Graph is not supported.

Custom Properties For Aws

The following custom properties are specific to the HypervisorConnection object using the AWS plugin.

- MaximumConcurrentProvisioningOperations: (Int) The number of threads to use within the hypervisor manager, which limits number of simultaneous

© 1997–2025 Citrix Systems, Inc. All rights reserved.

MCS Operations that are permitted in the provisioning workflow. Default is 100 threads for AWS, where each thread manages exactly one MCS Operation. Increasing the number of threads is not recommended.

Custom Properties For Gcp

The following custom properties are specific to the HypervisorConnection object using the GCP plugin.

- MaximumConcurrentProvisioningOperations: (Int) The number of threads to use within the hypervisor manager, which limits number of simultaneous MCS Operations that are permitted in the provisioning workflow. Default is 500 threads for GCP, where each thread manages exactly one MCS Operation. Increasing the number of threads is not recommended.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

Add-HypHostingUnitMetadata

August 14, 2025

Adds metadata on the given HostingUnit.

Syntax

```
Add-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
   [-InputObject] <HostingUnit[]>
   -Name <String>
   -Value <String>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
    [-InputObject] <HostingUnit[]>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
    [-HostingUnitName] <String>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-HypHostingUnitMetadata
    [-HostingUnitName] <String>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HostingUnit objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHostingUnitMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the HostingUnit with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Add-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Property                                Value
--------                                -----
property                                value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HostingUnitUid

Id of the HostingUnit

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HostingUnitName

Name of the HostingUnit

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	HostingUnit[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.Metadata

Add-HypHostingUnitMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Add-HypHostingUnitNetwork

August 14, 2025

Makes additional hypervisor networks available for use in a HostingUnit.

Syntax

```
Add-HypHostingUnitNetwork
   [-NetworkPath] <String>
   [-LiteralPath] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Use this command to extend the set of hypervisor networks that are made available through the HostingUnit to the Citrix Machine Creation Service. When new machines are created, their virtual NICs can be associated only with networks that are in this set. This command cannot be used if the connection for the hosting unit is in maintenance mode.

Examples

EXAMPLE 1

The command adds a new network called "newNetwork.network"to the hosting unit called "MyHostingUnit".

```
Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
   newNetwork.network'

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage }

          PersonalvDiskStorage : {
  }

          VMTaggingEnabled     : True
          Metadata             : {
  }

          PermittedNetworks    : {
 /Network 0.network, /newNetwork.network }
```

EXAMPLE 2

The command adds a new network called "newNetwork.network"to the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\MyHostingUnit>Add-HypHostingUnitNetwork -
   LiteralPath . -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
   newNetwork.network'

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage              : {
/Local storage.storage }

PersonalvDiskStorage : {
 }

VMTaggingEnabled     : True
Metadata             : {
 }

PermittedNetworks    : {
/Network 0.network, /newNetwork.network }
```

EXAMPLE 3

The command adds all of the networks that are available in the hosting unit to the specified hosting unit.

```
XDHyp:\HostingUnits\MyHostingUnit>dir *.network | Add-
   HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit
```

EXAMPLE 4

The command adds a new network location called “newNetwork.network”to the hosting unit called “MyHostingUnit”.

```
Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
   newNetwork.network'

HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage              : {
 /Local storage.storage }

PersonalvDiskStorage : {
  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
15
16  VMTaggingEnabled     : True
17  Metadata             : {
18    }
19
20  PermittedNetworks    : {
21   /Network 0.network, /newNetwork.network }
```

Parameters

-LiteralPath

Specifies the path to the hosting unit to which the network will be added. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkPath

Specifies the path to the network that will be added. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyNetwork.network

or <drive>:\Connections{<Connection Uid>}\MyNetwork.network

or <drive>:\HostingUnits\<HostingUnitName>\MyNetwork.network

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyNetwork.network

Type:	String
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

String

You can pipe a string that contains a path to Add-HypHostingUnitNetwork (NetworkPath parameter).

Outputs

Citrix.Host.Sdk.HostingUnit

Add-HypHostingUnitNetwork returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.Host.Sdk.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the default network specified for the hosting unit.

NetworkPath <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The hosting unit provider path to the default network specified for the hosting unit.

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

PermittedNetworks <Citrix.Host.Sdk.Network[]>

A full list of the hypervisor networks that are exposed for use in the hosting unit.

Notes

The network path must be valid for the hosting unit. The rules that are applied are as follows:

XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The network path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

NA

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkPathInvalid

The specified path is invalid.

HostingUnitNetworkPathInvalid

The network path cannot be found or is invalid. See notes above about validity.

HostingUnitNetworkDuplicateObjectExists

The specified network path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Add-HypHostingUnitStorage

August 14, 2025

Adds storage locations to a hosting unit.

Syntax

```
Add-HypHostingUnitStorage
    [-StoragePath] <String>
    [-StorageType <StorageType>]
    [-LiteralPath] <String>
    [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to add storage locations for storing the hard disks required by the virtual machines created by the Citrix Machine Creation Service. You cannot use this command if the connection for the hosting unit is in maintenance mode.

Examples

EXAMPLE 1

The command adds a new storage location called "newStorage.storage"to the hosting unit called "MyHostingUnit".

```
Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage'

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage, /newStorage.storage }

          PersonalvDiskStorage : {
 /newStorage.storage }

          VMTaggingEnabled     : True
          AdditionalStorage    : {
 TemporaryStorage }

          Metadata             : {
  }
```

EXAMPLE 2

The command adds a new storage location called "newStorage.storage"to the current directory. The dot (.) represents the current location (not its contents).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
XDHyp:\HostingUnits\MyHostingUnit>Add-HypHostingUnitStorage -
    LiteralPath . -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
    newStorage.storage' -StorageType OSStorage

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage, /newStorage.storage }

          PersonalvDiskStorage : {
 /Local storage.storage }

          VMTaggingEnabled     : True
          AdditionalStorage    : {
 TemporaryStorage }

          Metadata             : {
  }
```

EXAMPLE 3

The command adds all of the storage that is available in the hosting unit to the specified hosting unit.

```
XDHyp:\HostingUnits\MyHostingUnit>dir *.storage | Add-
    HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit
```

EXAMPLE 4

The command adds a new storage location called “newStorage.storage”to the hosting unit called “My-HostingUnit”.

```
Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
    MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
    newStorage.storage' -StorageType PersonalvDiskStorage

HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Storage              : {
 /Local storage.storage }

PersonalvDiskStorage : {
 /Local storage.storage, /newStorage.storage }

VMTaggingEnabled     : True
AdditionalStorage    : {
 TemporaryStorage }

Metadata             : {
  }
```

Parameters

-LiteralPath

Specifies the path to the hosting unit to which storage will be added. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path to the storage that will be added. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyStorage.storage

or <drive>:\Connections{<Connection Uid>}\MyStorage.storage

or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyStorage.storage

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StorageType

Specifies the type of storage in StoragePath. Supported storage types are:

OSStorage

PersonalvDiskStorage

TemporaryStorage

Type:	StorageType
Accepted values:	OSStorage, TemporaryStorage
Position:	Named
Default value:	OSStorage
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

Outputs

Citrix.Host.Sdk.HostingUnit

Add-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.Host.Sdk.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

AdditionalStorage

The list of additional storage items that the hosting unit can use.

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

The storage path must be valid for the hosting unit. The rules that are applied are as follows:

XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStoragePathInvalid

The specified path is invalid.

HostingUnitStoragePathInvalid

The storage path cannot be found or is invalid. See notes above about validity.

HostingUnitStorageDuplicateObjectExists

The specified storage path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Add-HypHypervisorConnectionAddress

August 14, 2025

Add a connection address to a hypervisor connection.

Syntax

```
Add-HypHypervisorConnectionAddress
    [-LiteralPath] <String>
    [-HypervisorAddress] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to add addresses by which a hypervisor can be contacted. All addresses added to a single hypervisor connection are assumed to be equivalent (i.e. they all result in the ability to communicate with the same hypervisors). The hypervisor that the addresses reference is stored at the point of creation of the hypervisor connection. Once this is done, to be valid, all addresses must resolve to this hypervisor.

The addresses required are;

XenServer - The address of the XenServer machines (must all reference the same XenServer pool).

VMWare vSphere/ESX - The address of a vCenter Server.

Microsoft SCVMM/Hyper-V - the address of an SCVMM server.

Examples

EXAMPLE 1

Add the address ‘http:\\myserver.com’to the hypervisor connection called “MyConnection”.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Add-HypHypervisorConnectionAddress -LiteralPath XDHyp:\Connections\
    MyConnection -HypervisorAddress http:\\myserver.com

PSPath                   : Citrix.HostingUnitService.Admin.V1.0\Citrix.
    Hypervisor::XDHyp:\Connections\MyConnection
PSParentPath             : Citrix.HostingUnitService.Admin.V1.0\Citrix.
    Hypervisor::XDHyp:\Connections
PSChildName              : MyConnection
PSDrive                  : XDHyp
PSProvider               : Citrix.HostingUnitService.Admin.V1.0\Citrix.
    Hypervisor
PSIsContainer            : True
HypervisorConnectionUid  : 85581f42-c5da-4976-970c-ebc3448ea1e3
HypervisorConnectionName : MyConnection
ConnectionType           : XenServer
HypervisorAddress        : {
 http:\\myserver2.com,http:\\myserver.com }

UserName                 : root
Persistent               : False
PluginId                 : XenFactory
SupportsPvsVMs           : True
Revision                 : 4c95c857-c54d-4f92-abef-0cce32c02502
Metadata                 :
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats;

<drive>:\Connections\<HypervisorConnectionName>

or <drive>:\Connections{HypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-HypervisorAddress

Specifies the address to be used. The address will be validated and the hypervisor must be contactable at the address supplied.

XenServer (ConnectionType = XenServer)

The address being added must reference the same XenServer pool referenced by any existing addresses for the same connection.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.HypervisorConnection

Add-HypHypervisorConnectionAddress returns an object containing the new definition of the hypervisor connection.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the hypervisor connection.

HypervisorConnectionName <string>

Specifies the name of the hypervisor connection.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the connection type of the connection.

XenServer - A XenServer hypervisor

SCVMM - A Microsoft SCVMM/Hyper-V hypervisor

vCenter - A VMWare vSphere/ESX hypervisor

Custom - A 3rd party hypervisor

HypervisorAddress <string[]>

A list of addresses that can be used to communicate with the hypervisor.

UserName <string>

The user name that is used when connecting to the hypervisor.

Persistent <Boolean>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Indicates whether the connection is stored in the database or is a temporary connection only with the same lifetime as the current Powershell session.

PlugInId <string>

The Citrix identifier for the Citrix Machine Management plug-in.

Revision <Guid>

Identifier for the current version of the hypervisor connection. This value changes every time a property of the hypervisor connection is updated.

SupportsPvsVMs <Boolean>

Indicates whether or not the connection can be used as part of a hosting unit and therefore used by the Citrix XenDesktop Machine Creation Service to create virtual machines. Only the built-in supported hypervisor connection types can be used for this (i.e. XenServer, SCVMM and vCenter).

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information relating to the hosting unit.

Notes

The address format must be valid for the hypervisor connection. The rules that are applied are as below:

XenServer (HypervisorConnection Type = XenServer)

http:\\<IP Address>

or http:\\<server Name>

or https:\\<server Name>

Note: To use multiple addresses to the same XenServer pool to provide failover functionality, all XenServers in the pool must have a shared block storage device. If the use of https connections and failover is required, the certificates on the servers must be trusted by all of the controllers (typically this means having a root certificate installed).

Note: If XenServers are moved to new XenServer pools after being added to a hypervisor connection, unpredictable results can occur. Once a XenServer is assigned to a hypervisor connection, it must not be moved to a new XenServer pool.

In the case of failure the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InputConnectionsPathInvalid

The path provided is not to an item in a sub directory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist

The hypervisor connection to which the address is to be added could not be located.

ConnectionAddressInvalid

The address could not be used to contact a hypervisor or the validation rules have not been met.

HypervisorConnectionAddressDuplicateObjectExists

The address specified is already part of the hypervisor connection.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Add-HypHypervisorConnectionMetadata

August 14, 2025

Adds metadata on the given HypervisorConnection.

Syntax

```
Add-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
   [-InputObject] <HypervisorConnection[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
   [-InputObject] <HypervisorConnection[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
   [-HypervisorConnectionName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionMetadata
   [-HypervisorConnectionName] <String>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHypervisorConnectionMetadata

cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of 'property'and a value of 'value'to the HypervisorConnection with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

```
Add-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E
    -48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Property                                Value
--------                                -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Id of the HypervisorConnection

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Name of the HypervisorConnection

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.Metadata

Add-HypHypervisorConnectionMetadata returns an array of objects containing the new definition of the metadata.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Add-HypHypervisorConnectionScope

August 14, 2025

Add the specified HypervisorConnection(s) to the given scope(s).

Syntax

```
Add-HypHypervisorConnectionScope
   [-Scope] <String[]>
   -HypervisorConnectionUid <Guid[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionScope
   [-Scope] <String[]>
   -InputObject <HypervisorConnection[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-HypHypervisorConnectionScope
   [-Scope] <String[]>
   -HypervisorConnectionName <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The Add-HypHypervisorConnectionScope command is used to associate one or more HypervisorConnection objects with given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter
- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid
- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To add a HypervisorConnection to a scope you need permission to change the scopes of the HypervisorConnection and permission to add objects to all of the scopes you have specified.

If the HypervisorConnection is already in a scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Adds a single HypervisorConnection to the 'Finance'scope.

```
Add-HypHypervisorConnectionScope Finance -HypervisorConnectionUid 6702
    C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Adds a single HypervisorConnection to the multiple scopes.

```
Add-HypHypervisorConnectionScope Finance,Marketing -
    HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Adds all visible HypervisorConnection objects to the 'Finance'scope.

```
Get-HypHypervisorConnection | Add-HypHypervisorConnectionScope Finance
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 4

Adds HypervisorConnection objects with a name starting with an 'A'to the 'Finance'scope.

```
Add-HypHypervisorConnectionScope Finance -HypervisorConnectionName A*
```

Parameters

-InputObject

Specifies the HypervisorConnection objects to be added.

Type:	HypervisorConnection[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Specifies the HypervisorConnection objects to be added by HypervisorConnectionUid.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Specifies the HypervisorConnection objects to be added by HypervisorConnectionName.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Scope

Specifies the scopes to add the objects to.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Add-HypMetadata

August 14, 2025

Adds metadata to a hypervisor connection or a hosting unit.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Add-HypMetadata
   [-Property] <String>
   [-Value] <String>
   [-LiteralPath] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to store additional custom data against a hosting unit or hypervisor connection. This data is not used by the Machine Creation Service, and is provided only for consumers of the services to store any data that may be required for their operations. The metadata is returned along with the hypervisor connection or hosting unit that it is assigned to.

Examples

EXAMPLE 1

The command adds the metadata with the property name of "MyProperty"and value of "MyValue"to the hypervisor connection item called "MyConnection".

```
Add-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -Property
   MyProperty -Value MyValue

Property                                                    Value
--------                                                    -----
MyProperty                                                  MyValue
```

EXAMPLE 2

The command adds the metadata with the property name of "MyProperty"and value of "MyValue"to all the hypervisor connection items that begin with the string "Citrix".

```
dir xdhyp\connections\Citrix* | Add-HypMetadata -Property MyProperty -
   Value MyValue

Property                                                    Value
--------                                                    -----
MyProperty                                                  MyValue
MyProperty                                                  MyValue
MyProperty                                                  MyValue
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the hosting unit or hypervisor connection item to which to add the metadata. The path specified must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

or <drive>:\Connections\<Connection Name>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Property

Specifies the property name of the metadata to be added. The property must be unique for the item specified by the path.

The property cannot contain any of the following characters \/;:#.*?=<>|[]()’””

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Value

Specifies the value for the property.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string the contains a path to Add-HypMetadata (Path parameter).

Outputs

Citrix.Host.Sdk.Metadata

Add-HypMetadata returns an array of objects containing the new definition of the metadata.

- Property <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataForeignKeyObjectDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionMetadataForeignKeyObjectDoesNotExist

The hypervisor connection supplied in the path does not exist.

HostingUnitMetadataDuplicateObjectExists

Metadata for the specified hosting unit item already exists with the same property name.

HypervisorConnectionMetadataDuplicateObjectExists

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Metadata for the specified hypervisor connection item already exists with the same property name.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-HypConfigurationDataForItem

August 14, 2025

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-HypConfigurationDataForItem
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in, the only provider items that can be used with this operation are VM items. For a VM, this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (in GB).

Examples

EXAMPLE 1

This command gets the configuration properties for a VM called 'MyVm.vm'within a hypervisor connection called 'MyConnection'.

```
Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
   MyConnection\MyVm.vm

                              CpuCount
                                 MemoryMB
                                 HardDiskSizeGB
                              --------
                                 --------
                                 --------------
                                     1

                                         1024

                                         24
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

This command gets the configuration properties for a VM called 'MyVm.vm'within the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\
    MyVm.vm

                              CpuCount
                                 MemoryMB
                                 HardDiskSizeGB
                              --------
                                 --------
                                 --------------
                                     1

                                         1024

                                         24
```

EXAMPLE 3

This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type "(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member".

```
(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
    MyConnection\MyVm.vm).CPUCount
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats;

<drive>:\Connections\<Connection Name>\<Item Path of VM object>

or <drive>:\Connections{<connection Uid>\<Item Path of VM object>}

or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>

or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Outputs

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item ——————- CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

For this release, this cmdlet provides only configuration data for VM objects in the provider. Using a path to an item that is not a VM results in a error.

In the case of failure the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-HypConfigurationObjectForItem

August 14, 2025

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

```
Get-HypConfigurationObjectForItem
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in the only provider items that can be used with this operation are VM items. For a VM this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (GB).

Examples

EXAMPLE 1

This command gets the configuration properties for a VM called ‘MyVm.vm’within a hypervisor connection called ‘MyConnection’.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
    MyConnection\MyVm.vm

                                CpuCount
                                    MemoryMB
                                    HardDiskSizeGB
                                --------
                                    --------
                                    --------------
                                        1

                                            1024

                                            24
```

EXAMPLE 2

This command gets the configuration properties for a VM called 'MyVm.vm'within the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\
    MyVm.vm

                                CpuCount
                                    MemoryMB
                                    HardDiskSizeGB
                                --------
                                    --------
                                    --------------
                                        1

                                            1024

                                            24
```

EXAMPLE 3

This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type "(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member".

```
(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\
    MyConnection\MyVm.vm).CPUCount
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats;

<drive>:\Connections\<Connection Name>\<Item Path of VM object>

or <drive>:\Connections{<connection Uid>\<Item Path of VM object>}

or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>

or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string the contains a path to Get-HypConfigurationDataForItem

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item ——————- CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

Network Map

The networks that this VM or Snaphot is connected to.

Notes

For this release this cmdlet only provides configuration data for VM objects in the provider. Using a path to an item that is not a VM will result in a error.

In the case of failure the following errors can be produced.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError

An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be completed as the database for the service is not configured.

DataStoreException

An error occurred in the service whilst attempting a database operation - communication to database failed for

for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

- about_HypHostSnapin
- Get-Item

Get-HypConnectionRegion

August 14, 2025

Enumerates the regions of a hypervisor connection that are based on cloud technology.

Syntax

```
Get-HypConnectionRegion
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Use this command to enumerate the available regions within a public or private cloud, when making hypervisor connections to cloud services. Sometimes, regions need to be selected and applied before the cloud connection can be used in a meaningful way. This cmdlet allows the supported regions to be listed so that one may be selected.

Once a region has been chosen, use the standard Set-Item provider cmdlet to select it. See the examples for further details.

This cmdlet may return no output, in which case the cloud connection can be considered "regionless" (or, implicitly, all within a single region). In such cases, there is no need to select a region, and the hypervisor connection can be used as is.

Examples

EXAMPLE 1

This sequence of commands enumerates the available regions of an Amazon AWS cloud connection, and then selects one of them for use in the connection.

```
Get-HypConnectionRegions -LiteralPath XDHyp:\Connections\AWS

          RegionName           : us-east-1
          Endpoint             : ec2.us-east-1.amazonaws.com

          RegionName           : us-west-1
          Endpoint             : ec2.us-west-1.amazonaws.com

          RegionName           : eu-west-1
          Endpoint             : ec2.eu-west-1.amazonaws.com

          (...)

          c:\PS>Set-Item -Path XDHyp:\Connections\AWS -Region "us-east
             -1"
```

Parameters

-LiteralPath

Specifies the path to the hypervisor connection whose regions are being examined. This cmdlet is valid only for hypervisor connections that have the UsesCloudInfrastructure flag set to true. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConnectionRegion (LiteralPath parameter).

Outputs

Citrix.Host.Sdk.HypervisorRegion

Get-HypConnectionRegion returns zero or more instances of the HypervisorConnectionRegion object, each of which contain the following properties:

Name <string>

Specifies the unique name of the region.

Endpoint <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the URL endpoint that is specific to the region, if relevant. This may be an empty string, and is returned only for information purposes.

A full list of the hypervisor networks that are exposed for use in the hosting unit.

Notes

In the case of failure, the following errors can be produced.

Error Codes

ConnectionsPathInvalid

The path provided is not to an item in the Connections subdirectory of the host service provider.

HypervisorConnectionObjectNotFound

The path provided could not be resolved to an existing hypervisor connection. The name or GUID is invalid.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

ConnectionIsNotCloud

The hypervisor connection is not associated with cloud infrastructure, making it invalid to enumerate regions.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-HypDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the Host Service.

Syntax

```
Get-HypDBConnection
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected Host Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Host Service instance running on controller "controller1.mydomain.net".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-HypDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
    Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Host Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the HostService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-HypDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix Host Service.

Syntax

```
Get-HypDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Host Service database schema, add a new Host service to an existing site, remove a Host service from a site, or create a database server logon for a

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Host service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Host service instance, otherwise the scripts relate to Host service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Host service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Host service roles

If ScriptType is Evict, the returned script contains:

- Removal of Host service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Host Service and copies it to a file called "C:\HostSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Host service schema.

```
Get-HypDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\HostSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Host service. This can be used when configuring a mirror server for use.

```
Get-HypDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    HostLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new Host service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Host services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix Host Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a Host Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a Host Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Adds a logon for the Host Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Host services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Host Service instance to remove from the database is running (only valid for a script type of Evict).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix Host Service.

Syntax

```
Get-HypDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Host Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Host Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Host Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Host Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Host Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-HypServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-HypDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Host Service schema to be updated.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-HypDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Host Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Host services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-HypServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-HypHypervisorPlugin

August 14, 2025

Gets the available hypervisor types.

Syntax

```
Get-HypHypervisorPlugin
   [-ZoneUid <Guid>]
   [-IncludeUnavailable <Boolean>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to retrieve a list of all the available hypervisor types, and their localized names.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the available hypervisor management plug-ins.

```
Get-HypHypervisorPlugin | Format-Table -AutoSize

          ConnectionType DisplayName              PluginFactoryName
             UsesCloudInfrastructure CitrixVerified
          -------------- -----------              -----------------
             ------------------------ --------------
                SCVMM Microsoft virtualization MicrosoftPSFactory
                                       False           True
              VCenter VMware virtualization    VmwareFactory
                                         False           True
           XenServer XenServer                 XenFactory
                                          False           True
```

EXAMPLE 2

Get the available hypervisor management plug-ins for the zone with the specified ZoneUid.

```
Get-HypHypervisorPlugin -ZoneUid 2534080e-9226-4af2-a2fc-ec6be14f9552
```

EXAMPLE 3

Get all Citrix supported hypervisor plug-ins for the specified ZoneUid.

```
Get-HypHypervisorPlugin -ZoneUid 2534080e-9226-4af2-a2fc-ec6be14f9552 -
    IncludeUnavailable $true
```

Parameters

-ZoneUid

ID of the Zone

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2206

-IncludeUnavailable

Specifies whether or not to show all hypervisor plug-ins regardless of availability.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2305

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Guid

Outputs

Citrix.Host.Sdk.HypervisorPlugin

Get-HypHypervisorPlugin returns a list of objects containing the definition of the hypervisor plug-ins.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

The hypervisor connection type. This can be one of the following:

XenServer - XenServer hypervisor

SCVMM - Microsoft SCVMM/Hyper-V

vCenter - VMWare vSphere/ESX

Custom - a third-party hypervisor

DisplayName <string>

The localized display name (localized using the locale of the Powershell snap-in session)

PluginFactoryName <string>

The name of the hypervisor plug-in factory used to manage the hypervisor connections.

UsesCloudInfrastructure <Boolean>

Specifies whether or not the underlying hypervisor plug-in factory employs cloud-hosted infrastructure.

CitrixVerified <Boolean>

Specifies whether or not the underlying hypervisor plug-in is verified by Citrix.

Notes

To use third-party plug-ins, the plug-in assemblies must be installed into the appropriate location on each controller machine that forms part of the Citrix controller site. Failure to do this can result in unpredictable behavior, especially during service failover conditions.

In the case of failure the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseError

An error occurred in the service while attempting a database operation.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-HypInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the Host Service.

Syntax

```
Get-HypInstalledDBVersion
   [-Upgrade]
   [-Downgrade]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Host Service database schema when called with no parameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-HypDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Host Service database schema version number.

```
Get-HypInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the Host Service database schema for which upgrade scripts are supplied.

```
Get-HypInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Version

Get-HypInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the Host Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-HypInventoryItem

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Gets the resource items and child items from specified inventory locations using the resource type and a set of filtering and pagination parameters.

Syntax

```
Get-HypInventoryItem
   -ResourceType <String[]>
    [-ContinuationToken <String>]
    [-MaxRecords <Int32>]
    [-Skip <Int32>]
    [-ContainsName <String>]
    [-ForwardDirection <Boolean>]

    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The ‘Get-HypInventoryItem‘ cmdlet gets the resource items and child items from specified inventory locations using the resource type and a set of filtering and pagination parameters.

‘Get-HypInventoryItem‘ requires a Hosting Unit path and the ResourceType parameter. The ResourceType specifies the resource extension, such as ‘template‘, ‘vm‘, etc.

Optional parameters control how many items to return, where to start the list of items and how to filter items so that only a subset are returned.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets the first template resource from the ctx-test Hosting Unit

```
PS C:\Users\admin> Get-HypInventoryItem -LiteralPath "XDHyp:\
   HostingUnits\ctx-test" -ResourceType vm

Parameters

-ResourceType

This parameter specifies the type of the resources to return. This is a required parameter and corresponds to the resource Name extension, such as ‘template‘, ‘vm‘, ‘launchtemplateversion’(only supported in AWS), or ‘snapshot’(supported in VMware, Azure). For Azure and AWS, this parameter supports multiple inputs.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LiteralPath

This specifies the XDHyp:\ path to the Hosting Unit for the inventory to use. This parameter is required.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-ContinuationToken

This parameter controls where to start including items from the inventory. This is usually the ‘Id‘ of an item and the included items begin after the given item is found.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-MaxRecords

The maximum number of items to return for the given call of the cmdlet. The default is to return one item.

Type:	Int32
Position:	Named
Default value:	1
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ContainsName

This parameter filters items so that only the ones containing the given string in the ‘Name‘ are included.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-ForwardDirection

Specifies whether the items are returned in forward page order (the default) or reverse.

Type:	Boolean
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Tags

This parameter specifies a JSON dictionary where the keys are the tag names and the values are the tag values. The parameter is used to filter items which have the given tags. An item must have all the given tags to match. Special values of ‘Not tagged‘ and ‘All values‘ are supported. For VMware, refer for additional usage details.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Id

This parameter returns a single item with the given Identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-AdditionalDataFilter

This specifies a JSON dictionary of parameters to use in filtering resources using the AdditionalData properties. All values given must match for an item to be included.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Template

This parameter is used for the Machine Profile ResourceTypes only. It specifies a Template identifier or name to use in validation of the Machine Profile with the given Template. The validation will pass if the given Machine Profile resource is compatible with the given Template. Only Machine Profiles which pass this validation are included.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

-Warn

This parameter is used for along with any validation filtering parameter (such as TemplateId). It specifies that rather than excluding the items which failed validation, the item is included but with a Warning property added to the AdditionalData. This property carries a string which describes the reason for validation failure.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Force

Specifies whether to return the full list of items or whether to exclude the items created as part of Machine Creation Services. The default behavior is to exclude the MCS created items.

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

PSObject

A list of inventory items which are found in the given Hosting Unit inventory of the given ResourceType and matching any optional filtering parameters. As a convenience the first item of the list contains AdditionalData fields for 'TotalItemsCount', 'TotalFilteredItemsCount' and 'Tags'. These fields provide the counts of all the items of the ResourceType in the inventory, the set of items which would match the filters and a set of tags which may be used to filter the items, respectively.

Notes

For filtering in VMware, Tag's name is treated as the key and its category name as the value. Apart from Tags, VMware also has Custom Attributes which are key-value pair based metadata for the resources. Both of them can be applied to filtering using '-Tags' parameter.

In VMware, snapshots don't have tags or custom attributes of their own. So, these values are fetched from their parent VMs.

Get-HypLocalizedString

August 14, 2025

Obtains human-readable and locale-aware status messages from a hosting connection.

Syntax

```
Get-HypLocalizedString
    [-Locale] <String>
    [-Category] <String>
    [[-LookupKey] <String>]
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

TODO

Examples

EXAMPLE 1

This command illustrates how a single error/exception message can be obtained for a hosting operation that failed (such as a provisioning operation). The caller specifies that they need to display the message in the en-US locale. They also specify a lookup key or message ID for the message, which will have been obtained as an exception code from the failed operation. The locale and key/ID are traded for a readable message, which also includes substitutions.

```
Get-HypLocalizedString -LiteralPath XDHyp:\Connections\MyCloud -
    Category Exception -Locale "en-US" -LookupKey "MyCloud.
    InsufficientFreeIpSpace"

          Category             : Exception
          LookupKey            : MyCloud.InsufficientFreeIpSpace
          DisplayText          : There are not enough free IP addresses
              on the network {
 0 }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LiteralPath

Specifies the path to the hypervisor connection whose strings are being queried. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Locale

The requested locale for the message, such as “en-US”.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Category

The category of the localized string.

Type:	String
Position:	3

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LookupKey

The lookup key or message ID.

Type:	String
Position:	4
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypLocalizedString (LiteralPath parameter).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Host.Sdk.HypervisorString

Get-HypLocalizedString returns zero or more instances of the HypervisorString object, each of which contain the following properties:

Category <string>

Specifies the category of the string, such as "Exception".

LookupKey <string>

Specifies the unique lookup key or message ID within the category.

DisplayText <string>

Specifies the locale-aware and human-readable text.

Notes

In the case of failure, the following errors can be produced.

Error Codes

ConnectionsPathInvalid

The path provided is not to an item in the Connections subdirectory of the host service provider.

HypervisorConnectionObjectNotFound

The path provided could not be resolved to an existing hypervisor connection. The name or GUID is invalid.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-HypPvsDiskInfo

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Gets instances of Pvs Disk Info.

Syntax

```
Get-HypPvsDiskInfo
   [-FarmId <Guid>]
   -SiteId <Guid>
   -DiskLocatorId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsDiskInfo
   -FarmId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-HypPvsDiskInfo
   -SiteId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsDiskInfo
   [-FarmId <Guid>]
   -SiteId <Guid>
   -StoreId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve Pvs Disk Info of the farm ID provided

Examples

EXAMPLE 1

This command lists the PVS disk Locators of a farm.

```
Get-HypPvsDiskInfo -FarmId 00000000-0000-0000-0000-000000000000
```

Parameters

-FarmId

Specifies a filter for the FarmId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Type:	Guid

Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SiteId

Specifies a filter for the SiteId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StoreId

Specifies a filter for the StoreId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DiskLocatorId

Specifies a filter for the DiskLocatorId.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a farm to retrieve from.

Guid

The GUID of a site to retrieve from.

Guid

The GUID of a site to retrieve from.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Get-HypPvsServer

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Gets instances of PvsServers.

Syntax

```
Get-HypPvsServer
    [-ServerId <Guid>]
    [-ServerName <String>]
    [-ServerAddress <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve PvsServer whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all PvsSite objects.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

This command lists the PVS servers that match the corresponding filters.

```
Get-HypPvsServer -ServerId 00000000-0000-0000-0000-000000000000 -
    ServerName "exampleServer" -ServerAddress "xyz.abc.local"
```

Parameters

-ServerId

Specifies a filter for the ServerId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ServerName

Specifies a filter for the ServerName.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ServerAddress

Specifies a filter for the ServerAddress.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a server to retrieve.

Outputs

Citrix.Host.Sdk.PvsServer

This cmdlet returns matching PvsServer objects.

Get-HypPvsSite

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2209

Gets instances of PvsSites.

Syntax

```
Get-HypPvsSite
   [-SiteId <Guid>]
   [-SiteName <String>]
   [-FarmId <Guid>]
   [-FarmName <String>]
   [-ResourceLocation <Guid>]
   [-Property <String[]>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve PvsSite whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all PvsSite objects.

Examples

EXAMPLE 1

This command lists the PVS sites that match the corresponding filters.

```
Get-HypPvsSite -SiteId 00000000-0000-0000-0000-000000000000 -SiteName "
    exampleSite" -FarmId 00000000-0000-0000-0000-000000000000 -FarmName
    "exampleFarm" -ResourceLocation 00000000-0000-0000-0000-000000000000
```

Parameters

-SiteId

Specifies a filter for the SiteId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SiteName

Specifies a filter for the SiteName.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-FarmId

Specifies a filter for the FarmId.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-FarmName

Specifies a filter for the FarmName.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ResourceLocation

Specifies a filter for the ResourceLocation.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

Get-HypPvsStore

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2212

Gets instances of Pvs Store.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-HypPvsStore
   -FarmId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypPvsStore
   [-FarmId <Guid>]
   -SiteId <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrieve Pvs Disk Locators of the farm ID provided

Examples

EXAMPLE 1

This command lists the PVS stores of a farm.

```
Get-HypPvsStore -FarmId 00000000-0000-0000-0000-000000000000
```

Parameters

-FarmId

Specifies a filter for the FarmId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SiteId

Specifies a filter for the SiteId.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

Get-HypResourcePrices

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the resource prices for different hypervisor resource settings.

Syntax

```
Get-HypResourcePrices
   -HypervisorConnectionName <String>
   -ResourceSettings <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-HypResourcePrices
   -HypervisorConnectionUid <Guid>
   -ResourceSettings <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

The cmdlet gets the prices for resource settings. The prices are returned as a list object, each object containing the resource setting information and list of prices associated with resources. Prices for a resource setting are calculated by one or more resources pricing information, which are used to track a resource's usage throughout its lifetime. When the resource of specific setting is created, each resource begins emitting usage records. This usage and the resource's price are tracked in the metering system.

Examples

EXAMPLE 1

Gets the pricing information from the resource settings which are in json format for the connection "MyConnection".

```
PS C:\Users\admin> $resourceSettings = '{
 "VmSettings":[{
 "MachineSize":"Standard_D2s_v3","OsType":"Windows","ByoLicense":true,"
    Location":"eastus","InstanceType":"Shared" }
 ],"DiskSettings":[{
 "StorageType":"Premium_LRS","Location":"eastus","SizeInGB":127 }
 ,{
 "StorageType":"StandardSSD_LRS","Location":"eastus","SizeInGB":1 }
 ,{
 "StorageType":"Standard_LRS","Location":"eastus","SizeInGB":64 }
 ] }
 '
PS C:\Users\admin> Get-HypResourcePrices -HypervisorConnectionName '
   MyConnection' -ResourceSettings $resourceSettings

Parameters

-HypervisorConnectionUid

Specifies the hypervisor connection provider to which to get the prices of different resource settings.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceSettings

Specifies the different resource settings. The ResourceSettings must be in one of the following formats:

1. A json string containing the resource settings.
2. An object of type Citrix.Host.Sdk.ResourceSettings.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionName

Specifies the hypervisor connection provider to which to get the prices of different resource settings.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

HypervisorResourcePricesResult

The result of hypervisor resource prices which contains:

1. A list of pricing information which are found in the given hypervisor connection according specific resource settings.
2. The warning messages if any.

Get-HypScopedObject

August 14, 2025

Gets the details of the scoped objects for the Host Service.

Syntax

```
Get-HypScopedObject
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-ObjectType <ScopedObjectType>]
    [-ObjectId <String>]
    [-ObjectName <String>]
    [-Description <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Examples

EXAMPLE 1

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in

© 1997–2025 Citrix Systems, Inc. All rights reserved.

any scope. The ScopeId and ScopeName values returned are null in the final record.

```
Get-HypScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Parameters

-ScopeId

Gets scoped object entries for the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ScopeName

Gets scoped object entries with the given scope name.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectType

Gets scoped object entries for objects of the given type.

Type:	ScopedObjectType
Accepted values:	HypervisorConnection
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ObjectId

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ObjectName

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-Description

Gets scoped object entries for objects with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.ScopedObject

The Get-HypScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Get-HypServerAddressDetails

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Gets all the available addresses for a hypervisor connection.

Syntax

```
Get-HypServerAddressDetails
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this cmdlet to retrieve all the available hypervisor connection addresses that can be used to connect to the same Server pool. When used in conjunction with Add-HypHypervisorConnectionAddress, you can easily populate a connection with all the addresses that can be used to provide full failover support for a Server connection.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the addresses are https addresses, the command uses the certificates installed on the Servers to provide https addresses along with thumbprints and pem certs.

Examples

EXAMPLE 1

Gets the available addresses for the connection "MyConnection".

```
Get-HypServerAddressDetails -LiteralPath XDHyp:\Connections\
    MyConnection

https:\\myserver.com
https:\\myServer1.com
```

EXAMPLE 2

Adds all the available addresses for the Server pool in "MyConnection"to the hypervisor connection.

```
Get-HypServerAddressDetails -LiteralPath XDHyp:\Connections\
    MyConnection | Add-HypHypervisorConnectionAddress -LiteralPath XDHyp
    :\Connections\MyConnectionPath
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats:

<drive>:\Connections\<HypervisorConnectionName>

or <drive>:\Connections{HHypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

HypervisorHostDetails

Get-HypServerAddressDetails returns a list of strings containing the available address and their certs/tumbprint info.

Notes

For this to work as required with https connections, the certificates installed on the Servers must be trusted by all controllers. Typically this means having the root certificate for the certificate trust chain installed on all controllers.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub-directory of a hosting unit item.

SupportsEnumerateHypervisorHostDetailsCapabilityMissing

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The hypervisor is missing EnumerateHypervisorHostDetailsCapability.

HypervisorConnectionObjectNotFound

The hypervisor connection at the path specified cannot be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the Desktop logs.

Get-HypService

August 14, 2025

Gets the service record entries for the Host Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-HypService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the Host Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Host Service running in the current service group.

```
Get-HypService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.Service

The Get-HypServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-HypServiceAddedCapability

August 14, 2025

Gets any added capabilities for the Host Service on the controller.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-HypServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Host Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Host Service.

```
Get-HypServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-HypServiceInstance

August 14, 2025

Gets the service instance entries for the Host Service.

Syntax

```
Get-HypServiceInstance
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Host Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Host Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-HypServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.ServiceInstance

The Get-HypServiceInstance command returns an object containing the following properties.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This

© 1997–2025 Citrix Systems, Inc. All rights reserved.

indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.Host.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-HypServiceStatus

August 14, 2025

Gets the current status of the Host Service on the controller.

Syntax

```
Get-HypServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Host Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the current status of the Host Service.

```
Get-HypServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-HypServiceStatus cmdlet returns an object containing the status of the Host Service together with extra diagnostics information.

- DBUnconfigured

  The Host Service does not have a database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBRejectedConnection

  The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The Host is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The Host is connected to a database that is valid, but it does not have the full functionality required so the Host cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

- DBOlderVersionThanService

  The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The Host Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the Host Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Host and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Host service cannot operate while its connection to the database is unavailable.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-HypVMMacAddress

August 14, 2025

Retrieves a list the MAC addresses for the VMs in the specified connection.

Syntax

```
Get-HypVMMacAddress
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to obtain a list of MAC addresses of all the virtual machines in the specified connection.

Examples

EXAMPLE 1

This command gets the MAC addresses for the connection called "MyConnection".

```
Get-HypVMMacAddress -LiteralPath XDHyp:\Connections\MyConnection

MacAddress                              VMId
----------                              ----
52:b0:1c:ed:60:fa                       f3395d2a-a196-41c2-e37d-764
   acf871599
62:6f:f0:40:d5:af                       5f4457b0-cc3c-f806-8ca7-5
   f57e4bdf2d1
4e:a5:9f:00:b2:0c                       3115177b-85a9-d8ee-d0f9-0
   c7437483c09
```

EXAMPLE 2

This command gets the MAC addresses for the connection at the current directory. The dot (.) represents the current location (not its contents).

```
XDHyp:\Connections\MyConnection>Get-HypVMMacAddress -Path .

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
MacAddress                                VMId
----------                                ----
52:b0:1c:ed:60:fa                         f3395d2a-a196-41c2-e37d-764
    acf871599
62:6f:f0:40:d5:af                         5f4457b0-cc3c-f806-8ca7-5
    f57e4bdf2d1
4e:a5:9f:00:b2:0c                         3115177b-85a9-d8ee-d0f9-0
    c7437483c09
```

EXAMPLE 3

This command gets the MAC addresses for the connection that has a ConnectionUid of 268c66db-9b8c-47f6-9265-42326dbff006.

```
Get-HypVMMacAddress -LiteralPath Xdhyp:\connections\"{
 268c66db-9b8c-47f6-9265-42326dbff006 }
 "
```

Parameters

-LiteralPath

The path to a connection item in the hosting provider. Paths to anything other than a connection item will result in an error being returned. The path can be provided as either

<drive>:\connections\<Connection Name>

or <drive:>\connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Outputs

Citrix.Host.Sdk.HypervisorVMObject

Get-HypVMMacAddress returns an object containing the following properties.

MacAddress <string> - specifies the MAC address of the VM. VMId <string> - specifies the identifier for the VM as defined in the hypervisor hosting it.

Notes

The path must refer to a connection item. Hosting unit items are not valid.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

If the path is not provided in an expected format, an InputConnectionsPathInvalid error results.

HypervisorConnectionObjectNotFound

The hypervisor connection object specified cannot be found.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Get-HypVolumeServiceConfiguration

August 14, 2025

Gets instances of the VolumeServiceConfiguration that are configured for this site.

Syntax

```
Get-HypVolumeServiceConfiguration
   [-VolumeServiceConfigurationUid <Guid>]
   [[-VolumeServiceConfigurationName] <String>]
   [-ConnectionType <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Retrieve VolumeServiceConfigurations whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all VolumeServiceConfiguration objects.

Examples

EXAMPLE 1

This command lists the site default volume service configuration for connections that use Citrix Cloud Platform.

```
Get-HypVolumeServiceConfiguration -VolumeServiceConfigurationName
    SiteDefault -ConnectionType CloudPlatform
```

Parameters

-VolumeServiceConfigurationUid

Specifies a filter for the configuration ID.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ConnectionType

Specifies a filter for the cloud connection type, such as “AWS”or “CloudPlatform”.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-VolumeServiceConfigurationName

Specifies a filter for the configuration name.

Type:	String
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The name of a configuration (or set of configurations) to retrieve.

Outputs

Citrix.Host.Sdk.VolumeServiceConfiguration

This cmdlet returns matching VolumeServiceConfiguration objects.

Get-HypXenServerAddress

August 14, 2025

Gets all the available addresses for a XenServer hypervisor connection.

Syntax

```
Get-HypXenServerAddress
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this cmdlet to retrieve all the available hypervisor connection addresses that can be used to connect to the same XenServer pool. When used in conjunction with Add-HypHypervisorConnectionAddress, you can easily populate a connection with all the addresses that can be used to provide full failover support for a XenServer connection.

If the addresses are https addresses, the command uses the certificates installed on the XenServers to provide suitable https addresses where possible. Only servers that can be resolved are returned.

Examples

EXAMPLE 1

Gets the available addresses for the connection "MyConnection".

```
Get-HypXenServerAddress -LiteralPath XDHyp:\Connections\MyConnection

https:\\myserver.com
https:\\myServer1.com
```

EXAMPLE 2

Adds all the available addresses for the XenServer pool in "MyConnection"to the hypervisor connection.

```
Get-HypXenServerAddress -LiteralPath XDHyp:\Connections\MyConnection |
    Add-HypHypervisorConnectionAddress -LiteralPath XDHyp:\Connections\
    MyConnectionPath
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats:

<drive>:\Connections\<HypervisorConnectionName>

or <drive>:\Connections{HHypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

String

Get-HypXenServerAddress returns a list of strings containing the available address.

Notes

For this to work as required with https connections, the certificates installed on the XenServers must be trusted by all controllers. Typically this means having the root certificate for the certificate trust chain installed on all controllers. Wildcard certificates are not supported for this operation.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub-directory of a hosting unit item.

HypervisorConnectionNotXenServer

The hypervisor connection to which the path refers is not for XenServer.

HypervisorConnectionObjectNotFound

The hypervisor connection at the path specified cannot be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Grant-HypSecurityGroupEgress

August 14, 2025

Adds an egress rule to a security group.

Syntax

```
Grant-HypSecurityGroupEgress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -IPRange <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Grant-HypSecurityGroupEgress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -GroupId <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

This cmdlet is deprecated. Adding an egress rule permits network traffic from instances within the security group to pass to one or more destination CIDR IP address ranges or security groups.

Examples

EXAMPLE 1

Create a security group and grant full egress to anywhere.

```
$Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup -Description 'Example group'
Grant-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '
    0.0.0.0/16'
```

EXAMPLE 2

Make 2 security groups and permit group 1 to ping group 2.

```
$Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
     -Name MySecurityGroup1 -Description 'Example group 1'
$Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    \MySecurityGroup2 -Description 'Example group 2'
Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 0 -ToPort 0 -
    Protocol icmp -GroupId $Group2.Id
Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 0 -ToPort 0 -
    Protocol icmp -GroupId $Group1.Id
```

Parameters

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more destination security groups to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more destination CIDR IP address ranges to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

- Revoke-HypSecurityGroupIngress
- Revoke-HypSecurityGroupEgress

Grant-HypSecurityGroupIngress

August 14, 2025

Adds an ingress rule to a security group.

Syntax

```
Grant-HypSecurityGroupIngress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -IPRange <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Grant-HypSecurityGroupIngress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -GroupId <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

This cmdlet is deprecated. Adding an egress rule permits network traffic from source CIDR IP address ranges or security groups to pass to instances within a security group.

Examples

EXAMPLE 1

Create a security group and grant ingress on port 80 from anywhere.

```
$Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup -Description 'Example group'
Grant-HypSecurityGroupIngress $Group.FullPath -FromPort 80 -ToPort 80 -
    Protocol tcp -IPRange '0.0.0.0/0'
```

EXAMPLE 2

Make 2 security groups and permit group 1 access to group 2 only on port 8080 while granting full access to group 1 from group 2.

```
$Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
     -Name MySecurityGroup1 -Description 'Example group 1'
$Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    \MySecurityGroup2 -Description 'Example group 2'
Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort
    8080 -Protocol tcp -GroupId $Group2.Id
Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort
    8080 -Protocol tcp -GroupId $Group1.Id
Grant-HypSecurityGroupEgress $Group2.FullPath -Protocol '-1' -GroupId
    $Group1.Id
Grant-HypSecurityGroupIngress $Group1.FullPath -Protocol '-1' -GroupId
    $Group2.Id
```

Parameters

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more source security groups from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more source CIDR IP address ranges from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

New-HypStorage

August 14, 2025

Creates a new storage tier definition for use in a subsequent New-Item operation.

Syntax

```
New-HypStorage
   [-JobGroup] <Guid>
   -StorageType <StorageType>
   -StoragePath <String[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to create a new storage tier definition, this definition can then be associated with a subsequent New-Item operation via the JobGroup reference.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

The command creates a new job group with the unique id specified by $job which can subsequently be fed into the New-Item cmdlet. It defines a TemporaryStorage tier which will cause disks to be added to the storage path 'XDHyp:\Connections\MyConnection\Primary Storage.storage'.

```
$job = [Guid]::NewGuid()
New-HypStorage -JobGroup $job -StorageType TemporaryStorage -
    StoragePath @('XDHyp:\Connections\MyConnection\Primary Storage.
    storage')
```

Parameters

-StorageType

The type of the new storage tier. Currently the only storage type is TemporaryStorage.

Type:	StorageType
Accepted values:	OSStorage, TemporaryStorage
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path to the storage that will be added. The path must be in one of the following formats: <drive>:\Connections\<ConnectionName>\MyStorage.storage or <drive>:\Connections{<ConnectionUid>}\MyStorage.storage

Type:	String[]
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-JobGroup

Specifies the JobGroup uid that is used to associate data from calls to this cmdlet with the subsequent New-Item operation.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

New-HypVMSnapshot

August 14, 2025

Creates a new snapshot for the specified VM item path.

Syntax

```
New-HypVMSnapshot
   [-SnapshotName] <String>
   [[-SnapshotDescription] <String>]
   [-LoggingId <Guid>]
   [-LiteralPath] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this command to create a new snapshot of a virtual machine, for a given Host Service provider path to a VM. The resulting snapshot can then be used for operations that require a snapshot to work.

Examples

EXAMPLE 1

This command creates a snapshot of a VM called ‘MyVm.vm’within a hypervisor connection called ‘MyConnection’.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
New-HypVMSnapshot -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
    -SnapshotName "New snapshot" -SnapshotDescription "Example snapshot"

                    XDHyp:\Connections\MyConnection\MyVm.vm\New
                       snapshot.snapshot
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the virtual machine item for which to create a new snapshot. The path specified must be in one of the following formats:

<drive>:\Connections\<Connection Name>\<Item Path of VM object>

or <drive>:\Connections{<connection Uid>\<Item Path of VM object>}

or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>

or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-SnapshotName

The name of the new snapshot. This is visible in the hypervisor management console.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SnapshotDescription

The description to add to the snapshot. This is visible in the hypervisor management console.

Type:	String
Position:	3
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

String

You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Outputs

String

The provider path to the newly created snapshot.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

SnapshotNameAlreadyInUse

The specified name is already in use and will cause a name resolution clash.

FailedToCreateSnapshot

The snapshot creation process failed.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

SnapshotChainTooLong

Snapshot creation failed. Snapshot chain is too long.

SnapshotCreationNotAuthorized

Snapshot creation failed. User not authorized to create snapshots.

Register-HypPvsServer

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Register PVS Site.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Register-HypPvsServer
        -SiteId <Guid>
        -SiteName <String>
        -FarmId <Guid>
        -FarmName <String>
        -ServerId <Guid>
        -ServerName <String>
        -ServerAddress <String>
        -Thumbprint <String>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Use this command to register PvsSites with with SiteId FarmId and ResourceLocation.

Examples

EXAMPLE 1

This command registers a PvsServer with 00000000-0000-0000-0000-000000000000 in each attribute

```
Register-HypPvsServer -SiteId 00000000-0000-0000-0000-000000000000 -
    SiteName exampleSiteName -FarmId
    00000000-0000-0000-0000-000000000000 -FarmName exampleFarmName -
    ServerId 00000000-0000-0000-0000-000000000000 -ServerAddress xyz.abc
    .local -ServerName exampleServerName
```

Parameters

-SiteId

The ID of the PVS site.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SiteName

The Name of the PVS site.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FarmId

The ID of the PVS farm.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FarmName

The Name of the PVS farm.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ServerId

The Server ID of the PVS server.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServerName

The PVS Server Name

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServerAddress

The PVS Server Address

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Thumbprint

The PVS Server Certificate SSL Thumbprint

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Register-HypPvsSite

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2209

Register PVS Site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Register-HypPvsSite
        -SiteId <Guid>
        -SiteName <String>
        -FarmId <Guid>
        -FarmName <String>
        -ResourceLocation <Guid>
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Use this command to register PvsSites with with SiteId FarmId and ResourceLocation.

Examples

EXAMPLE 1

This command registers a PvsSite with 00000000-0000-0000-0000-000000000000 in each attribute

```
Register-HypPvsSite -SiteId 00000000-0000-0000-0000-000000000000 -
    SiteName exampleSiteName -FarmId
    00000000-0000-0000-0000-000000000000 -FarmName exampleFarmName -
    ResourceLocation 00000000-0000-0000-0000-000000000000
```

Parameters

-SiteId

The ID of the PVS site.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SiteName

The Name of the PVS site.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

Remove-HypHostingUnitMetadata

August 14, 2025

Removes metadata from the given HostingUnit.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-HypHostingUnitMetadata
       [-HostingUnitUid] <Guid>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-HostingUnitUid] <Guid>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-InputObject] <HostingUnit[]>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-InputObject] <HostingUnit[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-HostingUnitName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-HypHostingUnitMetadata
       [-HostingUnitName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given HostingUnit.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Remove all metadata from all HostingUnit objects.

```
Get-HypHostingUnit | % {
  Remove-HypHostingUnitMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HostingUnitUid

Id of the HostingUnit

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HostingUnitName

Name of the HostingUnit

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HostingUnit[]
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-HypHostingUnitNetwork

August 14, 2025

Removes networks from a hosting unit.

Syntax

```
Remove-HypHostingUnitNetwork
      [-NetworkPath] <String>
      [-LiteralPath] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove networks from a hosting unit. This does not remove the network from the hypervisor, only the reference to the network for the Host Service. After it is removed, the network is no longer available for associating with virtual NICs (when creating new virtual machines with the Machine Creation Service). Any virtual machines that have been created already continue to use the network until they are removed from the deployment. This command cannot be used if the connection for the hosting unit is in maintenance mode. If the network to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the network location.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

The command removes the network called “newNetwork.network”from the hosting unit called “MyHostingUnit”

```
Remove-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\
    MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\
    newNetwork.network'
```

Parameters

-LiteralPath

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkPath

Specifies the path in the hosting unit provider of the network to remove. The path specified must be in one of the following formats: <drive>:\Connections\<HostingUnitName>\MyNetwork.network or <drive>:\Connections{<hostingUnit Uid>}\MyNetwork.network

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypHostingUnitNetwork (Path parameter).

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkObjectToDeleteDoesNotExist

The network path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Remove-HypHostingUnitStorage

August 14, 2025

Removes storage from a hosting unit.

Syntax

```
Remove-HypHostingUnitStorage
      [-StoragePath <String>]
      [-StorageType <StorageType>]
      [-LiteralPath] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove storage locations from a hosting unit. This does not remove the storage from the hypervisor, only the reference to the storage for the Host Service. After removal, the storage is no longer used to store hard disks (when creating new virtual machines with the Machine Creation Service). The hard disks located already on the storage remain in place and virtual machines that have been created already continue to use the storage until they are removed from the deployment. Do not use this command if the connection for the hosting unit is in maintenance mode. If the storage location to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the storage location.

Examples

EXAMPLE 1

The command removes the OS storage location called "newStorage.storage"from the hosting unit called "MyHostingUnit"

```
Remove-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage'
```

EXAMPLE 2

The command removes all OS storage from all hosting units called "Host1".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ChildItem XDHYP:\HostingUnits\Host\*.storage | Remove-
    HypHostingUnitStorage XDHYP:\HostingUnits\Host1
```

EXAMPLE 3

The command removes all PersonalvDisk storage from all hosting units called “Host1”.

```
Get-ChildItem XDHYP:\HostingUnits\Host\*.storage | Remove-
    HypHostingUnitStorage -StorageType PersonalvDiskStorage
```

Parameters

-LiteralPath

Specifies the path to the hosting unit which defines the storage. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path in the hosting unit provider of the storage to remove. If StoragePath is not specified, all storage is removed from the hosting unit.

The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyStorage.storage

or <drive>:\Connections{<Connection Uid>}\MyStorage.storage

or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage

© 1997–2025 Citrix Systems, Inc. All rights reserved.

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyStorage.storage

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StorageType

Specifies the type of storage in StoragePath. Supported storage types are:

OSStorage

PersonalvDiskStorage

TemporaryStorage

Type:	StorageType
Accepted values:	OSStorage, TemporaryStorage
Position:	Named
Default value:	OSStorage
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypHostingUnitStorage (StoragePath parameter).

Outputs

Citrix.XDPowerShell.HostingUnit

Remove-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.XDPowerShell.HypervisorConnection>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

AdditionalStorage

The list of additional storage items that the hosting unit can use.

Metadata <Citrix.XDPowerShell.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

After storage is removed, it is the administrator's responsibility to maintain its contents. The Citrix XenDesktop Machine Creation Service does not attempt to clean up any data that is stored in the storage location.

If all storage is removed from the hosting unit, other features of the Machine Creation Service stops functioning until some storage is added again.

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStorageObjectToDeleteDoesNotExist

The storage path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Remove-HypHypervisorConnectionAddress

August 14, 2025

Removes addresses from the list of available connection addresses.

Syntax

```
Remove-HypHypervisorConnectionAddress
      [-LiteralPath] <String>
      [-HypervisorAddress] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Use this command to remove addresses that can be used to connect to the hypervisor specified by the hypervisor connection. If all addresses are removed, the connection cannot be used until a valid address is added to the hypervisor connection.

Examples

EXAMPLE 1

The command removes the address “http:\\myserver.com”from the hypervisor connection called “MyHypervisorConnection”.

```
Remove-HypHypervisorConnectionAddress -LiteralPath XDHyp:\HostingUnits\
   MyHypervisorConnection -HypervisorAddress 'http:\\myserver.com'
```

EXAMPLE 2

The command removes all addresses from all the hypervisor connections currently defined.

```
Get-Item -Path XDHYP:\Connections\* | Remove-
   HypHypervisorConnectionAddress
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hosting unit item to which to add the address. The path specified must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{HostingUnit Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorAddress

Specifies the address to be removed. If this parameter is not provided, all addresses are removed from the hypervisor connection.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypHypervisorConnectionAddress (Path parameter).

Outputs

None

By default, this cmdlet returns no output.

Notes

Changes to a hypervisor connection affect all entities that reference the connection. If all addresses are removed from the connection, any other entities that reference the hypervisor connection (e.g. hosting units) cannot make new connections to the hypervisor.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist

The hypervisor connection to which the address is to be added could not be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-HypHypervisorConnectionMetadata

August 14, 2025

Removes metadata from the given HypervisorConnection.

Syntax

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-InputObject] <HypervisorConnection[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-InputObject] <HypervisorConnection[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionName] <String>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionMetadata
      [-HypervisorConnectionName] <String>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
6         [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given HypervisorConnection.

Examples

EXAMPLE 1

Remove all metadata from all HypervisorConnection objects.

```
1 Get-HypHypervisorConnection | % {
2   Remove-HypHypervisorConnectionMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Id of the HypervisorConnection

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Name of the HypervisorConnection

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-HypHypervisorConnectionScope

August 14, 2025

Remove the specified HypervisorConnection(s) from the given scope(s).

Syntax

```
Remove-HypHypervisorConnectionScope
      [-Scope] <String[]>
      -HypervisorConnectionUid <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionScope
      [-Scope] <String[]>
      -InputObject <HypervisorConnection[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypHypervisorConnectionScope
      [-Scope] <String[]>
      -HypervisorConnectionName <String[]>
      [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
5         [<CitrixCommonParameters>]
6         [<CommonParameters>]
```

Description

The Remove-HypHypervisorConnectionScope command is used to remove one or more Hypervisor-Connection objects from the given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter
- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid
- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To remove a HypervisorConnection from a scope you need permission to change the scopes of the HypervisorConnection.

If the HypervisorConnection is not in a specified scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Removes a single HypervisorConnection from the 'Finance'scope.

```
1 Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionUid
      6702C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Removes a single HypervisorConnection from multiple scopes.

```
1 Remove-HypHypervisorConnectionScope Finance,Marketing -
      HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Removes all visible HypervisorConnection objects from the 'Finance'scope.

```
1 Get-HypHypervisorConnection | Remove-HypHypervisorConnectionScope
      Finance
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 4

Removes HypervisorConnection objects with a name starting with an 'A'from the 'Finance'scope.

```
Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionName A
    *
```

Parameters

-InputObject

Specifies the HypervisorConnection objects to be removed.

Type:	HypervisorConnection[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionUid.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionName.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Scope

Specifies the scopes to remove the objects from.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the XenDesktop logs.

Remove-HypMetadata

August 14, 2025

Removes metadata from a hypervisor connection or hosting unit.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-HypMetadata
       [-Property <String>]
       [-LiteralPath] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Use this command to remove custom data from a specific hosting unit or hypervisor connection. If the Property parameter is not provided, all metadata is removed from the specified item.

Examples

EXAMPLE 1

The command removes the metadata with the property "MyProperty"from the hypervisor connection called "MyConnection".

```
Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -
   Property MyProperty
```

EXAMPLE 2

The command removes all the metadata from the hypervisor connection called "MyConnection".

```
Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection
```

EXAMPLE 3

The command removes all the metadata from all the hypervisor connections.

```
dir XDHyp:\connections | Remove-HypMetadata
```

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hosting unit or hypervisor connection item from which to remove the metadata. The path specified must be in one of the following formats:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

or <drive>:\Connections\<Connection Name>

or <drive>:\Connections{<Connection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Property

Specifies the property name of the metadata to be removed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Remove-HypMetadata (Path parameter).

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataObjectToDeleteDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The hypervisor connection supplied in the path does not exist.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-HypServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-HypServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-HypServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Host Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-HypService | % {
  Remove-HypServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ServiceHostId

Id of the Host Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Host service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Reset-HypEnabledFeatureList

August 14, 2025

Refreshes the Host service's list of enabled features.

Syntax

```
Reset-HypEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Synchronizes the currently selected Citrix Host Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected Host service instance's list of enabled features.

```
Reset-HypEnabledFeatureList
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Related Links

Reset-HypServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the Host Service.

Syntax

```
Reset-HypServiceGroupMembership
      [-ConfigServiceInstance] <ServiceInstance[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the Host Service.

The Reset-HypServiceGroupMembership cmdlet must be run on at least one instance of the service type (Hyp) after installation and registration with the configuration service. Without this operation, the Host services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-HypServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    HypServiceGroupMembership
```

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-HypServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Host.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-HypServiceGroupMembership command.

Outputs

Citrix.Host.Sdk.ServiceInstance

Reset-HypServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Host Service instance.

Notes

If the command fails, the following errors can be returned:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Revoke-HypSecurityGroupEgress

August 14, 2025

Removes an egress rule from a security group.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Revoke-HypSecurityGroupEgress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -IPRange <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Revoke-HypSecurityGroupEgress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -GroupId <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is deprecated. To remove a rule, specify parameters matching an existing rule's values.

Examples

EXAMPLE 1

Create a security group, grant full egress to anywhere, then revoke access and delete the security group.

```
$Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup -Description 'Example group'
Grant-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '
    0.0.0.0/0'
Revoke-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '
    0.0.0.0/0'
Remove-Item $Group.FullPath
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more destination security groups to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more destination CIDR IP address ranges to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups cannot be removed in AWS if they are referened by rules from other security groups.

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Revoke-HypSecurityGroupIngress

August 14, 2025

Removes an ingress rule from a security group.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Revoke-HypSecurityGroupIngress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -IPRange <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Revoke-HypSecurityGroupIngress
      [-LiteralPath] <String>
      -Protocol <String>
      [-FromPort <Decimal>]
      [-ToPort <Decimal>]
      -GroupId <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet is deprecated. To remove a rule, specify parameters matching an existing rule's values.

Examples

EXAMPLE 1

Create 2 security groups, grant access from group 1 to group 2, then revoke access.

```
$Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup1 -Description 'Example group 1'
$Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS
    -Name MySecurityGroup2 -Description 'Example group 2'
Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group2.Id
Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group1.Id
Revoke-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group2.Id
Revoke-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort
    8085 -Protocol tcp -GroupId $Group1.Id
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Protocol

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-GroupId

Specifies one or more source security groups from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IPRange

Specifies one or more source CIDR IP address ranges from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LiteralPath

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-FromPort

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ToPort

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Type:	Decimal
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

String

The LiteralPath can be piped in.

Outputs

None

By default, this cmdlet returns no output.

Notes

Security groups cannot be removed in AWS if they are referened by rules from other security groups.

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Set-HypAdminConnection

August 14, 2025

Set the controller to be used by the cmdlets that form the Host service PowerShell snap-in.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-HypAdminConnection
   [-AdminAddress <String>]
   [-BearerToken <String>]
   [-AdminClientIP <String>]
   [-TraceParent <String>]
   [-TraceState <String>]
   [<CommonParameters>]
```

Description

Use this command to set the default controller address to be used by the cmdlets to communicate with the controller. Most Host service cmdlets take an 'AdminAddress'parameter that can be used to define the controller (when used, this overrides this setting). However, the Set-Location cmdlet in the Host service provider does not offer this option. Therefore, the controller address must be set using this cmdlet, if no other cmdlets have set the address previously in the current runspace.

Examples

EXAMPLE 1

This command sets the controller address for the commands to be "myserver.com". All commands run use this address until it is altered, either by another call to this command or by the use of the 'AdminAddress'parameter in another command in the Host service snap-in.

```
Set-HypAdminConnection -AdminAddress myserver.com
```

Parameters

-AdminAddress

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Type:	String
Position:	Named
Default value:	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-BearerToken

Specifies the bearer token assigned to the calling user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminClientIP

Specifies the client IP of the calling user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2305

-TraceParent

Specifies the trace parent assigned for internal diagnostic tracing use

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-TraceState

Specifies the trace state assigned for internal diagnostic tracing use

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

- about_HypHostSnapin

Set-HypDBConnection

August 14, 2025

Configures a database connection for the Host Service.

Syntax

```
Set-HypDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix Host Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-HypDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-HypDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the Host Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-HypDBConnection cmdlet returns an object describing the status of the Host Service together with extra diagnostics information. Possible values are:

- OK

  The Host Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the Host Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Host Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Host Service currently in use is newer than, and incompatible with, the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

- DBOlderVersionThanService

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The version of the Host Service schema on the database is newer than, and incompatible with, the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Host Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Host Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Host Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-HypDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the Host Service.

Syntax

```
Set-HypDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix Host Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional Host Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-HypDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-HypDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-HypDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-HypDBCredentials $null
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Set-HypHostingUnitMetadata

August 14, 2025

Adds or updates metadata on the given HostingUnit.

Syntax

```
Set-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-HostingUnitUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-InputObject] <HostingUnit[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-HypHostingUnitMetadata
   [-InputObject] <HostingUnit[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-HostingUnitName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHostingUnitMetadata
   [-HostingUnitName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HostingUnit objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the HostingUnit with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2
   A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HostingUnitUid

Id of the HostingUnit

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HostingUnitName

Name of the HostingUnit

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	HostingUnit[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-HypHostingUnitMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-HypHostingUnitStorage

August 14, 2025

Sets options for a storage location on a hosting unit.

Syntax

```
Set-HypHostingUnitStorage
   [-LiteralPath] <String>
   [-StoragePath] <String>
   [-StorageType <StorageType>]
   [-Superseded <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Use this command to set options for storage locations that are defined for a hosting unit. Do not use this command if the connection for the hosting unit is in maintenance mode.

Examples

EXAMPLE 1

The command updates a storage location called "newStorage.storage"associated with the hosting unit called "MyHostingUnit".

```
Set-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\
   MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\
   newStorage.storage' -Superseded $true

          HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
          HostingUnitName      : MyHostingUnit
          HypervisorConnection : MyConnection
          RootPath             : /
          RootId               :
          NetworkPath          : /Network 0.network
          NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
          Storage              : {
 /Local storage.storage, /newStorage.storage }

          PersonalvDiskStorage : {
 /newStorage.storage }

          VMTaggingEnabled     : True
          AdditionalStorage    : {
 TemporaryStorage }

          Metadata             : {
  }
```

Parameters

-LiteralPath

Specifies the path to the hosting unit which defines the storage. The path must be in one of the following formats:

<drive>:\HostingUnits\<HostingUnitName>

or <drive>:\HostingUnits{<HostingUnit Uid>}

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StoragePath

Specifies the path to the storage that will be modified. The path must be in one of the following formats:

<drive>:\Connections\<ConnectionName>\MyStorage.storage

or <drive>:\Connections{<Connection Uid>}\MyStorage.storage

or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage

or <drive>:\HostingUnits{<hostingUnit Uid>}\MyStorage.storage

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-StorageType

Specifies the type of storage in StoragePath. Supported storage types are:

OSStorage

PersonalvDiskStorage

TemporaryStorage

Type:	StorageType

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accepted values:	OSStorage, TemporaryStorage
Position:	Named
Default value:	OSStorage
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Superseded

Specifies that this storage has been superseded and must not be used for future provisioning operations. Existing virtual machines using this storage will continue to function.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

Outputs

Citrix.XDPowerShell.HostingUnit

Set-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.XDPowerShell.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

AdditionalStorage

The list of additional storage items that the hosting unit can use.

Metadata <Citrix.XDPowerShell.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

The storage path must be valid for the hosting unit. The rules that are applied are as follows:

XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can be produced.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStoragePathInvalid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The specified path is invalid.

HostingUnitStoragePathInvalid

The storage path cannot be found or is invalid. See notes above about validity.

HostingUnitStorageDuplicateObjectExists

The specified storage path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Set-HypHypervisorConnectionMetadata

August 14, 2025

Adds or updates metadata on the given HypervisorConnection.

Syntax

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-InputObject] <HypervisorConnection[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-InputObject] <HypervisorConnection[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypHypervisorConnectionMetadata
   [-HypervisorConnectionName] <String>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the HypervisorConnection with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E
    -48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-HypervisorConnectionUid

Id of the HypervisorConnection

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-HypervisorConnectionName

Name of the HypervisorConnection

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	HypervisorConnection[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-HypHypervisorConnectionMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Set-HypServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

```
Set-HypServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypServiceMetadata
   [-InputObject] <Service[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Allows you to store additional custom data against given Host Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-HypServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                          Value
---                                          -----
property                                     value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-InputObject

Host service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Set-HypVolumeServiceConfiguration

August 14, 2025

Applies a change to one of the VolumeServiceConfiguration instances in the site.

Syntax

```
Set-HypVolumeServiceConfiguration
   -ConnectionType <String>
   -VolumeServiceConfigurationName <String>
   -RegionName <String>
   -BaseLinuxTemplateId <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-HypVolumeServiceConfiguration
   -ConnectionType <String>
   -VolumeServiceConfigurationName <String>
   -VolumeWorkerPackageUri <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Volume service configurations are used to control how cloud-based host connections behave when provisioning machines. They contain two pieces of information. The first is a per-region specification of the cloud template that provides the standard Linux operating system for the cloud. The second is the specification of a URL from which the Citrix Volume Worker software can be installed (not all cloud connections make use of this URL, but they all make use of the template map).

Each cmdlet invocation can be used to either change the volume worker URL, or to modify (or add) an entry in the Linux template map. These two operations are supported by parameter sets. To change both properties, you must invoke the cmdlet twice.

Examples

EXAMPLE 1

This command specifies a Linux template that should be used by default for CloudPlatform connections.

```
Set-HypVolumeServiceConfiguration -VolumeServiceConfigurationName
    SiteDefault -ConnectionType CloudPlatform -RegionName Region1 -
    BaseLinuxTemplateId 9883ba7a-74bf-4002-9b12-18bcc2c2fae8
```

EXAMPLE 2

This command specifies a worker package download URL that should be used by default for CloudPlatform connections.

```
Set-HypVolumeServiceConfiguration -VolumeServiceConfigurationName
    SiteDefault -ConnectionType CloudPlatform -VolumeWorkerPackageUri "
    http://cloudadmin.net/citrix/volumeworker/version1"
```

Parameters

-ConnectionType

Specifies the cloud connection type, such as “AWS”or “CloudPlatform”.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VolumeServiceConfigurationName

Specifies the name of the configuration you want to modify. This parameter is used alongside the ConnectionType to specify a single configuration set unambiguously. There can be only one named configuration per connection type. In a newly-configured site, there will be exactly one configuration set called “SiteDefault”for each of CloudPlatform and AWS.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-VolumeWorkerPackageUri

Specifies a (new) URI for the volume worker package.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-RegionName

Specifies the cloud region in which the Linux template resides. This parameter is used only when passing the BaseLinuxTemplateId parameter. The format of the string is cloud-specific. For example, for an AWS-based cloud, it would be a region identifier such as “us-east-1”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-BaseLinuxTemplateId

Specifies a change to the standard Linux template that should be used in the cloud. When passing this parameter, you must also specify the RegionName parameter to indicate the region in which this template resides. The format of the string is cloud-specific. For example, for an AWS-based cloud, it would be an AMI identifier such as “ami-1234abcd”.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.Sdk.VolumeServiceConfiguration

This cmdlet returns the updated VolumeServiceConfiguration object.

Start-HypVM

August 14, 2025

Starts a VM.

Syntax

```
Start-HypVM
      [-LiteralPath] <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This command provides a mechanism to start a VM.

Examples

EXAMPLE 1

This command starts a VM called 'MyVm.vm'within a hypervisor connection called 'MyConnection'
.

```
Start-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the virtual machine item to start. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Stop-HypVM

August 14, 2025

Stops a VM by issuing a Shutdown request

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Stop-HypVM
    [-LiteralPath] <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to change the power state of a VM from running to stopped.

Examples

EXAMPLE 1

This command stops a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

```
Stop-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
```

Parameters

-LiteralPath

Specifies the path within a hosting unit provider to the virtual machine item to stop. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits{<hostingUnit Uid>\<Item Path of VM object>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a string that contains a path.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Test-HypDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix Host Service.

Syntax

```
Test-HypDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-HypDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-HypDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Host Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Host SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-HypDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
   Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix Host Service instance.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-HypDBConnection cmdlet returns an object describing the status of the selected Host Service instance that would result if the connection string were used with the Set-HypDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-HypDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the Host Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the Host Service instance, or the service's schema within the database is invalid.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the Host Service currently in use is newer than, and incompatible with, the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

- DBOlderVersionThanService

  The version of the Host Service schema on the database is newer than, and incompatible with, the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the Host Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Host Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the Host Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Test-HypHostingUnit

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Checks to ensure that the Hosting Unit has the required permission.

Syntax

```
Test-HypHostingUnit
    -HostingUnitName <String>
    [-PermissionType <String[]>]
    [-UserName <String>]
    [-SecurePassword <SecureString>]
    [-AdminCredentials <PSCredential>]
    [-CustomProperties <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-HypHostingUnit
    -HostingUnitUid <Guid>
    [-PermissionType <String[]>]
    [-UserName <String>]
    [-SecurePassword <SecureString>]
    [-AdminCredentials <PSCredential>]
    [-CustomProperties <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to check that the Hosting Unit has the required permissions. This check is done based on the hypervisor connection type, as each hypervisor will have their set of attributes for authentication.

Examples

EXAMPLE 1

This command checks the permissions for the given Hosting Unit, using the HostingUnit GUID. A SecurePassword can be generated using Get-Credential.

```
$result = Test-HypHostingUnit -HostingUnitUid "your_guid" -UserName "
    yourusername" -SecurePassword "yourpassword_as_securestring"
```

EXAMPLE 2

This command checks the permissions for the given Hosting Unit, using the Hosting Unit Name. A SecurePassword can be generated using Get-Credential.

```
$result = Test-HypHostingUnit -HostingUnitName "yourhostingunit" -
    UserName "yourusername" -SecurePassword "
    yourpassword_as_securestring"
```

Parameters

-HostingUnitName

Hosting Unit Name

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

Hosting Unit GUID

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PermissionType

Permission Types to check for

Type:	String[]
Accepted values:	Browse, PowerManagement, Lifecycle
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-UserName

UserName for Administrator account in Hypervisor

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecurePassword

Password for Administrator account in Hypervisor

Type:	SecureString
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AdminCredentials

Hypervisor Administrator credentials object

Type:	PSCredential
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-CustomProperties

Custom properties for the connection

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

HostingUnitTestResult>

An array of HypervisorConnectionTestResult which contains missing permissions, corrective action and the category with the description.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, we are given direction for corrective action and what permissions are missing.

Category CorrectiveAction MissingPermissions

PowerManagement Add missing permissions to the user:MyUser Permission1:FALSE,Permission2:TRUE

...

Test-HypHostingUnitNameAvailable

August 14, 2025

Checks to ensure that the proposed name for a hosting unit is unused.

Syntax

```
Test-HypHostingUnitNameAvailable
    -HostingUnitName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to check that the proposed name for a hosting unit is unused. This check is done without regard for scoping of the existing hosting unit, so the names of inaccessible hosting units are also checked.

Examples

EXAMPLE 1

This tests whether the value of $NewHostingUnitName is unique or not, and can be used to create a new hosting unit or rename an existing one without failing. True is returned if the name is unique.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-HypHostingUnitNameAvailable -HostingUnitName $NewHostingUnitName
```

Parameters

-HostingUnitName

The name or names of the hosting units(s) to be tested.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False
Length range:	1 to 64

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

object[]

An array of PSObjects which pair the name and availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Test-HypHypervisorConnectionNameAvailable

August 14, 2025

Checks to ensure that the proposed name for a hypervisor connection is unused.

Syntax

```
Test-HypHypervisorConnectionNameAvailable
    -HypervisorConnectionName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Use this command to check that the proposed name for a hypervisor connection is unused. This check is done without regard for scoping of the existing hypervisor connection, so the names of inaccessible hypervisor connection are also checked.

Examples

EXAMPLE 1

This tests whether the value of $NewConnectionName is unique or not, and can be used to create a new hypervisor connection or rename an existing one. True is returned if the name is unique.

```
Test-HypHypervisorConnectionNameAvailable -HypervisorConnectionName
   $NewConnectionName
```

Parameters

-HypervisorConnectionName

The name or names of the hypervisor connection(s) to be tested.

Type:	String[]
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False
Length range:	1 to 64

CitrixCommonParameters

Test-HypPvsCollectionNameAvailable

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Tests availability of collection name.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-HypPvsCollectionNameAvailable
    -SiteId <Guid>
    -CollectionName <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Test the availability of a collection name against a site.

Examples

EXAMPLE 1

This command tests the availability of a Collection Name.

```
Test-HypPvsCollectionNameAvailable -SiteId
    00000000-0000-0000-0000-000000000000 -CollectionName "CollectionName
    "
```

Parameters

-SiteId

Target Site ID to validate against.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-CollectionName

Collection name to test.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Guid

The GUID of a Site to validate against.

String

Collection name to test availability for.

Outputs

None

By default, this cmdlet returns no output.

Unregister-HypPvsServer

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Unregister PVS Server.

Syntax

```
Unregister-HypPvsServer
           -ServerId <Guid>
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

Description

Use this command to remove a PvsServer with the corresponding ServerId

Examples

EXAMPLE 1

This command unregisters the PVS server with ServerId 00000000-0000-0000-0000-000000000000

```
Unregister-HypPvsServer -ServerId 00000000-0000-0000-0000-000000000000
```

Parameters

-ServerId

The ID of the PVS Server.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

- Register-HypPvsServer

Unregister-HypPvsSite

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2209

Unregister PVS Site.

Syntax

```
Unregister-HypPvsSite
           -SiteId <Guid>
           [<CitrixCommonParameters>]
           [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Use this command to remove a PvsSite with the corresponding SiteId

Examples

EXAMPLE 1

This command unregisters the PVS site with SiteId 00000000-0000-0000-0000-000000000000

```
Unregister-HypPvsSite -SiteId 00000000-0000-0000-0000-000000000000
```

Parameters

-SiteId

The ID of the PVS site.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Update-HypHypervisorConnection

August 14, 2025

Requests the host service to update the connection properties that depend on the version of hypervisor in use.

Syntax

```
Update-HypHypervisorConnection
       [-LoggingId <Guid>]
       [-LiteralPath] <String>
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Use this command to update the version-specific properties of a hypervisor connection, after an upgrade to the hypervisor system which may provide new capabilities.

Examples

EXAMPLE 1

This command requests that the properties of Connection1 be updated to match the current capabilities of the hypervisor.

```
Update-HypHypervisorConnection -LiteralPath xdhyp:\connections\
   Connection1
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-LiteralPath

Specifies the path within a Host Service provider to the hypervisor connection item to be updated. The path specified must be in one of the following formats; <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections{HypervisorConnection Uid>}

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode and cannot be updated.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

© 1997–2025 Citrix Systems, Inc. All rights reserved.

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

about_ProvMachineCreationSnapIn

August 14, 2025

Topic

about_ProvMachineCreationSnapin

Short Description

The Machine Creation Service PowerShell snap-in provides administrative functions for the Machine Creation Service.

Command Prefix

All commands in this snap-in have the noun prefixed with 'Prov'.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Long Description

The Machine Creation Service PowerShell snap-in enables both local and remote administration of the Machine Creation Service. It provides facilities to create virtual machines and manage the associated disk images.

The snap-in provides two main entities:

Provisioning Scheme

Specifies details of new virtual machines created by the Machine Creation Service. Provisioning schemes define the following information.

Hosting Unit

Provides details of the hypervisor and storage on which new virtual machines will be created. Stored and maintained by the Host Service and PowerShell snap-in.

Identity Pool

Lists the Active Directory computer accounts available for use by new virtual machines. Stored and maintained by the Active Directory Identity Service and PowerShell snap-in.

Master Image

Specifies the disk image that will be used for new virtual machines. Accessed through the hosting provider in the Host Service snap-in.

Provisioned VM

Defines the virtual machines created by the Machine Creation Services. These virtual machines are associated with the provisioning scheme from which they were created.

The processes of creating provisioning schemes and new virtual machines can take a significant amount of time to complete. For this reason, these long-running tasks can be run asynchronously so that other commands are accessible while the processes are running. Note, however, that only one long-running task can operate on a provisioning scheme at any one time. The processes are monitored using the Get-ProvTask command. For more information, see the help for Get-ProvTask.

Citrix Machine Creation Service SDK - Custom Properties

Short Description

Overview of custom properties settings of the provisioning scheme.

Long Description

Custom properties are the properties of the provisioning scheme that are specific to the target hosting infrastructure. Custom properties can be used to control or tune behaviors of the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Custom Properties For Azure

The following custom properties are specific to hosting infrastructure targets using the AzureRM plugin.

- StorageAccountType: Deprecated. This property will be removed in the future, use property StorageType instead.
- StorageType: Storage type used for provisioned virtual machine disks. Storage types include: Standard_LRS, StandardSSD_ZRS, Premium_ZRS, StandardSSD_LRS and Premium_LRS. If this property is not specified, Standard_LRS is used by default.
- IdentityDiskStorageType: Storage type used for the provisioned virtual machine identity disk. If this property is not specified, StandardSSD_LRS is used by default.
- WBCDiskStorageType: Storage type for the provisioned virtual machine write back cache disk. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the value specified in the StorageType property is used for WBCDiskStorageType.
- StorageTypeAtShutdown: Storage type for the provisioned virtual machine disks when it's powered down. It applies to OS disk and write back cache disk only if the provisioning scheme has UseWriteBackCache enabled. When the machine is powered back on, its storage type will be switched back to StorageType property for OS disk and WBCDiskStorageType for write back cache disk. If WBCDiskStorageType is not specified, it will default to StorageType. Default value for this property is empty. Standard_LRS will result in storage type change at shutdown. Any other value will result in an error. Also, when StorageType is selected as either StandardSSD_ZRS or Premium_ZRS, setting StorageTypeAtShutdown to Standard_LRS will result in an error too as this feature is not compatible with ZRS.
- ResourceGroups: Resource groups used to contain provisioned virtual machines. If this property is not specified, Citrix managed resource groups are created. Once the provisioning scheme is created, this property cannot be changed from Citrix managed resource groups to user created resource groups, and vice versa. It can be changed only from one user created resource groups set to another.
- LicenseType: The license type used for provisioned virtual machines.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The valid values include Windows_Server, Windows_Client, RHEL_BYOS, and SLES_BYOS. Windows_Server and Windows_Client are for Windows OS. RHEL_BYOS and SLES_BYOS are for Linux OS. If LicenseType is not provided or a null value, Azure will charge the license.

- OsType: Operating system type used for the provisioned virtual machine. OS types include either Windows or Linux. If an OS type is not specified, Windows is used by default.
- UseManagedDisks: Indicate whether to use Azure managed disks for the provisioned virtual machine. Specify either True or False. If this property is not specified, the default value is determined upon the SchemaVersion custom property value (See SchemaVersion). Once the provisioning scheme is created, this property cannot be changed.
- PersistWBC: Persist the write back cache disk for the non-persistent provisioned virtual machine between power cycles. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the write back cache disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.
- PersistOsDisk: Persist the OS disk when power cycling the non-persistent provisioned virtual machine. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the OS disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.
- PersistVm: Persist the non-persistent provisioned virtual machines in Azure environments when power cycling. Specify either True or False. This property only applies when the PersistOsDisk property is set to True. If this property is not specified, they will be deleted from Azure when powered off.
- MachinesPerStorageAccount: The maximum number of virtual machines containing unmanged disks that can be provisioned under a single Azure storage account. This property only applies when the UseManagedDisks property is set to False. If this property is not specified, a maximum value of 40 is used by default.
- StorageAccountsPerResourceGroup: The maximum number of Azure storage accounts provisioned under a single Azure resource group. This property only applies when the UseManagedDisks property is set to False. If this

© 1997–2025 Citrix Systems, Inc. All rights reserved.

property is not specified, a maximum value of 100000 is used by default.

- DiskEncryptionSetId: The Azure Encryption Set ID that references the customer-managed encryption used for the server-side encryption key to encrypt disks for provisioned virtual machines. The supplied value must be a valid Azure resource ID. This property only applies when the UseManagedDisks property is set to True. If this property is not specified, Citrix takes no action on the provisioned virtual machines. Virtual machine disks use Azure storage encryption for data at rest. Once the provisioning scheme is created, this property cannot be changed.
- UseSharedImageGallery: Use Azure Shared Image Gallery as a published image repository for MCS to provision virtual machines in Azure. Specify either True or False. This property only applies when the UseManagedDisks property is set to True. If this property is not specified, UseSharedImageGallery is set to False by default, and the prepared images for the machine catalog are stored as managed disk snapshots.
- SharedImageGalleryReplicaRatio: The ratio of virtual machines to shared image gallery version replicas. This value is an integer greater than 0. This property only applies when the UseSharedImageGallery property is set to True. If this property is not specified, SharedImageGalleryReplicaRatio is set to 1000 for persistent OS disks and 40 for non-persistent OS disks by default.
- SharedImageGalleryReplicaMaximum: The maximum number of replicas for each shared image gallery version. This value is an integer greater than 0 and less than 100. This property only applies when the UseSharedImageGallery property is set to True. If this property is not specified, SharedImageGalleryReplicaMaximum is set to 100 by default.
- DedicatedHostGroupId: The Azure Dedicated Host Group ID. Format the value as “myResourceGroup/myHostGroup”. If this property is used, virtual machines are provisioned on the Azure dedicated hosts specified by DedicatedHostGroupId.
- EnableIntuneEnroll: Automatically enroll the provisioned virtual machines with Microsoft Intune to manage them with policy and apps at scale. This property only applies to a provisioning scheme with IdentityType set to “AzureAd”. If this property is not specified, the provisioned virtual machine will not be enrolled with Intune.
- Zones: The Azure Availability Zones containing provisioned virtual

© 1997–2025 Citrix Systems, Inc. All rights reserved.

machines. Use a comma as a delimiter for multiple zones. If this property is not specified, the provisioned virtual machine is randomly placed across all Azure Availability Zones in the region defined by the hosting unit.

- UseEphemeralOsDisk: Use Azure Ephemeral OS disk for the provisioned virtual machine. Specify either True or False. This property only applies when the UseManagedDisks property is not False and the UseSharedImageGallery property is set to True. When the UseEphemeralOsDisk property is set to True, the chosen virtual machine size supports the size of the Ephemeral OS disk and the cache disk, which is larger than the master image disk. If this property is not specified, UseEphemeralOsDisk is set to False by default. This property can be updated with Set-ProvScheme for existing catalogs.
- SchemaVersion: This value is a float and is added (value as float 2) automatically to CustomProperties if omitted in CustomProperties. If this property is set to greater than or equal to 2, MCS will use managed disks by default, unless UseManagedDisks property is set to False. If this property is set to less than 2, MCS will use unmanaged disks by default, unless UseManagedDisks property is set to True.
- UseTempDiskForWBC: Indicates whether to use Azure temporary storage to store write back cache file. Specify either True or False. If this property is not specified, the UseTempDiskForWBC parameter is set to False by default. The Azure temporary storage can be used to store write back cache file when all the following conditions are meet:

  PersistWBC is False
  UseTempDiskForWBC is True
  UseWriteBackCache is True
  UseEphemeralOsDisk is False
  Azure temporary storage has enough space for both paging file and write back cache file.
- PageFileDiskDriveLetterOverride: The drive letter of the disk where the page file is stored. The drive letter should be between 'C'and 'Z'. The properties 'PageFileDiskDriveLetterOverride', 'InitialPageFileSizeInMB', and 'MaxPageFileSizeInMB'should always come together.
- InitialPageFileSizeInMB: The initial page file size in megabytes which must be between 16 MB and 16777216 MB, and not greater than the maximum page file size.
- MaxPageFileSizeInMB: The maximum page file size in megabytes which must be greater

© 1997–2025 Citrix Systems, Inc. All rights reserved.

than or equal to the initial page file size, and less than 16777216 MB. Also it can not exceed the amount of free space on the drive.

- BackupVmConfiguration: A secondary list of service offerings optionally paired with type as Spot
  to fall back on when machine power on fails due to resource shortage error from Azure.
  Type when not specified will be inferred as Regular.
  We would always try to power on with the primary service offering first, and only when that fails we
  would try secondary config starting from the first item in the list.
  Failure to power on with primary or any of the secondary configs will result in a "Resource Not Available"error.
  Few examples of how to specify this property:
  "<CustomProperties>
  <Property xsi:type=""StringProperty"Name=""BackupVmConfiguration"Value=""[{'ServiceOffering': 'A', 'ServiceOffering': 'B', 'ServiceOffering': 'C'}]""/></CustomProperties>"
  <Property xsi:type=""StringProperty"Name=""BackupVmConfiguration"Value=""[{'ServiceOffering': 'A', 'Type': 'Spot'}, {'ServiceOffering': 'B', 'Type': 'Regular'}, {'ServiceOffering': 'C', 'Type': 'Spot'}]""/></CustomProperties>"

Custom Properties For Aws

The following custom properties are specific to hosting infrastructure targets using the AWS plugin.

- AwsCaptureInstanceProperties: Capture AWS instance properties, including the Identity Access Management role and tags from the master image, then apply them to the provisioned virtual machines. Specify either True or False. If this property is not specified, AwsCaptureInstanceProperties is set to False by default.
  Note: AwsCaptureInstanceProperties is now deprecated.
- AwsOperationalResourcesTagging: Apply tags from master image to all Citrix created operational resources including virtual machines, VM disks, VM network interfaces, S3 buckets, S3 objects, launch templates and AMIs. Specify either True or False. When setting this property to True, you must also set the AwsCaptureInstanceProperties parameter to True or must have supplied Machine Profile. If neither of these two values are specified, the AwsOperationalResourcesTagging parameter is set to False by default.
- WBCDiskStorageType: When using an MCSIO Write Back Cache disk, use the given

© 1997–2025 Citrix Systems, Inc. All rights reserved.

string parameter to specify the volume storage type of the disk. Refer to documentation for specific format details.

- PersistWBC: When using an MCSIO Write Back Cache disk, the disk will be reused when the instance is rebooted and will not be removed when the instance is shut down. This allows for quicker power management of instances which use MCSIO Write Back Cache at the expense of storage.
- PersistOSDisk: When using an MCSIO Write Back Cache disk, the OS disk will be reused when the instance is rebooted and will not be removed when the instance is shut down. This allows for quicker power management of instances which use MCSIO Write Back Cache at the expense of storage.
- PreformatWriteBackCache: When using an MCSIO Write Back Cache disk, the WBC disk is created using a preformatted disk snapshot. This is the default behavior but setting this to false will disable the creation and use of these snapshot disks. Using preformatted snapshots speeds up the power up of instances which use MCSIO but requires that the snapshot be kept on hand and be created when it is first used.
- BackupVmConfiguration: A secondary list of service offerings optionally to fall back on when machine power on fails due to resource shortage error from AWS. Type when not specified will be inferred as On-Demand.
  We would always try to power on with the primary service offering first, and only when that fails we would try secondary config starting from the first item in the list.
  Failure to power on with primary or any of the secondary configs will result in a "Resource Not Available"error.
  An example of how to specify this property:
  BackupVmConfiguration,t2.small|t2.large|t3.small|t3.large
  BackupVmConfiguration,t2.small|t2.large|t3.small:Spot|t3.large:Spot
  Note: Make sure the primary service offering is not in the secondary service offering list. Including the primary service offering in the secondary list will cause a failure.

Custom Properties For Gcp

The following custom properties are specific to hosting infrastructure targets using the GCP plugin.

- CatalogZones: GCP zones to place provisioned virtual machines. Use comma as delimiter for multiple zones. If this property is not specified, the provisioned virtual machine is randomly placed across GCP zones.
- CryptoKeyId: Use the customer-managed encryption key to encrypt data on provisioned virtual machines. Format the value as "project:location:keyRing:key".If this property is not specified,

© 1997–2025 Citrix Systems, Inc. All rights reserved.

a google managed encryption key is used.

- StorageType: Storage type used for provisioned virtual machine disks. Storage types depend on the region/zone, but can include: pd-standard, pd-balanced, pd-ssd, local-ssd, and pd-extreme. If this property is not specified, the master image's boot disk type is used by default.
- IdentityDiskStorageType: Storage type used for the provisioned virtual machine identity disk. If this property is not specified, 'pd-standard' is used by default.
- WBCDiskStorageType: Storage type for the provisioned virtual machine write back cache disk. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, 'pd-standard'is used by default.
- PersistOsDisk: Persist the OS disk when power cycling the non-persistent provisioned virtual machine. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the OS disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.
- PersistWBC: Persist the write back cache disk for the non-persistent provisioned virtual machine between power cycles. Specify either True or False. This property only applies to a provisioning scheme with UseWriteBackCache enabled. If this property is not specified, the write back cache disk is deleted when the virtual machine is shut down, and is re-created when the virtual machine is powered on.

Custom Properties For Vmware

The following custom properties are specific to hosting infrastructure targets using the VMware plugin.

- FolderId: The ID of a VM Placement Folder. If a valid value for the FolderID is specified, for example, "group-v1234", VMs are created in that folder ID. If the property is not specified, VMs are created in the same folder where the master image is placed.

Custom Properties For Scvmm

The following custom properties are specific to hosting infrastructure targets using the SCVMM plugin.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- AzureArcSubscriptionId: Azure subscription id that the virtual machine will be connected to as an Azure Arc connected virtual machine. If this property is not specified, the virtual machine will fail to connect to Azure Arc.
- AzureArcRegion: Azure region that the virtual machine will be connected to as an Azure Arc connected virtual machine. If this property is not specified, the virtual machine will fail to connect to Azure Arc.
- AzureArcResourceGroup: Azure resource group that the virtual machine will be connected to as an Azure Arc connected virtual machine. If this property is not specified, the virtual machine will fail to connect to Azure Arc.
- EnableAzureArcOnboarding: Indicates whether to connect the MCS provisioned virtual machines to Azure Arc. Specify either True or False.
  This property only applies to the SCVMM managed Azure Stack HCI cluster.

Topic

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy ‘Name,-Count’

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy ‘MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id’

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
           # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
if ($sessions.Length -eq 0)
{
break;
}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}
```

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

© 1997–2025 Citrix Systems, Inc. All rights reserved.

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, “-1:30”means 1 hour and 30 minutes ago.

about_Prov_MachineProfile

Topic

Citrix Machine Creation Service SDK - Machine Profile

Short Description

Overview of Machine Profile and how to use it to provision machines across different hypervisors

Long Description

Machine Profile provides a way to specify a template that will be used for provisioning machines in a provisioning scheme. Depending on the hypervisor, the template can provide hardware details (CPU/memory, disk tier), networking settings (subnets, security groups) and hypervisor-specific features (disk encryption, accelerated networking, availability zones) that will be carried through to created machines.

Machine Profile allows for having one place to specify all virtual machine settings, instead of having to pass the settings individually when creating or updating a catalog. For instance, the ServiceOffering

© 1997–2025 Citrix Systems, Inc. All rights reserved.

for a catalog will be automatically set to whatever Machine Profile is using if it's not provided explicitly via the -ServiceOffering PowerShell parameter. There's also the added benefit of knowing all settings will be compatible with each other if the hypervisor supports using an already created virtual machine as Machine Profile.

Another key benefit is when new features are implemented by the hypervisor, they have the potential to be supported on day zero. A recent example was Azure adding in support for placing created machines in a proximity group. Right after the feature was released by Azure, if a Machine Profile was configured to use a proximity group, machines provisioned based on that Machine Profile would use the same proximity group.

Property Processing Order

Some properties present in Machine Profile were given explicitly prior to Machine Profile being supported, either via hypervisor specific CustomProperties or through other more general parameters shared across hypervisors like ServiceOffering, NetworkMapping.

Methods of giving parameters explicitly will override any values given in Machine Profile. For instance, if ServiceOffering is given to be Standard_D2s_v3 and Machine Profile specifies a machine size of Standard_D4s_v5, machines will be provisioned with Standard_D2s_v3.

Additionally, some properties will be inferred from the chosen master image if not defined explicitly or via Machine Profile.

To summarize the order in which properties are taken for New-ProvScheme follows:

- PowerShell parameters (CustomProperties, ServiceOffering, etc) > MachineProfile values > Master image values > Default values

Consider the below example that illustrates the order in which properties are used:

- PowerShell parameters provided: ServiceOffering, CustomProperties (containing one property: CustomA)
- MachineProfile defines: ServiceOffering, NetworkMapping, CustomProperties (containing two properties: CustomA, CustomB)
- Master image defines: CustomProperties (containing two properties: CustomB, CustomC)
- The end result is that the catalog will use ServiceOffering and custom property CustomA from the provided PowerShell parameters, NetworkMapping and custom property CustomB from MachineProfile, custom property CustomC from the master image.

It's also important to note the behavior of commands that update existing provisioning schemes/virtual machines: Set-ProvScheme and Set-ProvVM. If a property was set explicitly previously, it will be overridden when the property can be read from a provided Machine Profile and the property is not separately provided. Take the following example:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Catalog is created using a MachineProfile and a ServiceOffering provided explicitly of Standard_D2s_v3 and CustomProperties providing a StorageType of Premium_LRS
- Catalog is updated providing only a MachineProfile that has a ServiceOffering defined as Standard_D4s_v5
- The end result is that the catalog's MachineProfile is updated to the new value, the ServiceOffering is updated to Standard_D4s_v5, and StorageType remains as Premium_LRS

In short, for Set-ProvScheme / Set-ProvVM, the order in which properties are used is the following:

- PowerShell parameters (CustomProperties, ServiceOffering, etc) > MachineProfile values > Previously configured values

Azure Specific Information

When using Azure, there are two types of resources that can be used as a Machine Profile:

- Virtual Machine: An ARM template will be generated from the virtual machine selected and related resources that are attached (NICs, OS disk, virtual machine extensions, Azure Monitor data collection rules and diagnostic settings) which will be used to create machines in a provisioning scheme.
- Template Spec Version: An ARM template given explicitly which will be used to create machines in a provisioning scheme. It must contain a definition for a virtual machine resource and at least one network interface. And may include one definition for a disk and any number of virtual machine extensions, Azure Monitor data collection rules and diagnostic settings. A template spec version can be checked for any validation errors prior to use with the cmdlet Test-ProvInventoryItem. A good starting point when building an ARM template to use as Machine Profile is to export the ARM templates for an existing virtual machine and its NIC and make changes from there.

Both types of Machine Profile fully support the same features so whichever is more convenient can be used.

The following are example properties that can be captured from the resource provided as Machine Profile input:

- Trusted launch (vTPM)
- Disk Encryption Set
- Disk storage type
- Machine size
- Tags
- NIC accelerated networking

© 1997–2025 Citrix Systems, Inc. All rights reserved.

When the Machine Profile provides virtual machine extensions, only extension types on the allowed list of extensions are carried through, the rest are stripped out. The following extension types are allowed by default:

- AADLoginForWindows
- AzureMonitorWindowsAgent
- AzureMonitorLinuxAgent

O Guestattestation

Other extension types can be added to the allowed list of extension types with Add-ProvMetadataConfiguration.

Azure has the following properties that can be provided explicitly or through Machine Profile:

- ServiceOffering (via properties/hardwareProfile/vmSize from the VM resource)
- NetworkMapping (via properties/ipConfigurations/subnet/id from the NIC resources)
- SecurityGroups (via properties/ipConfigurations/networkSecurityGroup/id from the NIC resources)
- CustomProperties
  - DiskEncryptionSetId (via properties/storageProfile/osDisk/managedDisk/diskEncryptionSet/id from the VM resource or properties/encryption/diskEncryptionSetId from the disk resource)
  - StorageType (via properties/storageProfile/osDisk/managedDisk/storageAccountType from the VM resource or sku/name from the disk resource)
  - OsType (via properties/storageProfile/osDisk/osType from the VM resource or properties/osType from the disk resource)
  - Zones (via zones on the VM resource. Note: This property sets the availability zones)
  - LicenseType (via properties/licenseType from the VM resource)
  - DedicatedHostGroupId (via host/id or hostgroup/id from the VM resource)

Additionally, the following CustomProperties will be read from the master image if not provided explicitly or through Machine Profile:

- OsType
- DiskEncryptionSetId

Aws Specific Information

When using AWS, there are two types of resources that can be used as a Machine Profile:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- EC2 instance: An AWS VM and resources attached to it (e.g., ENIs, root volume, EBS volume properties) will be used to create machines in a provisioning scheme.
- Launch Template Version: An AWS Launch Template Version given explicitly which will be used to create machines in a provisioning scheme.

The following are example properties that can be captured from the resource provided as Machine Profile input:

- Instance type
- EBS optimization
- Hibernation
- Elastic Graphics
- Tags
- Security Groups
- IAM profile

AWS also has the following properties that can be provided explicitly or through Machine Profile:

- ServiceOffering
- NetworkMapping
- TenancyType
- SecurityGroups

Gcp Specific Information

When using Google Cloud Platform, there are two types of resources that can be used as a Machine Profile:

- VM Instance: Virtual Machines within GCP
- Instance Template: Serialized Hardware Properties of a GCP Instance

Both types of Machine Profile fully support the same features so whichever is more convenient can be used.

The following are example properties that can be captured from the resource provided as Machine Profile input:

- Service accounts (via properties/serviceAccounts from the resource)
- Accelerators (via properties/GuestAccelerators from the resource)
- Availability policies (via Properties/AvailabilityPolicies from the resource)
- Shielded VM policies (via Properties/AvailabilityPolicies from the resource)
- Tags (coming soon)

GCP has the following properties that can be provided explicitly or through Machine Profile:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ServiceOffering (via properties/MachineType from the machine profile resource)
- CustomProperties
  - CatalogZones (via properties/zone. Not applicable if Machine profile is an instance template since instance templates are global resources. All zones in the region will be used in this case.)
  - StorageType (via properties/type from OS disk attached to resource)
  - CryptoKeyId (via properties/Encryption/KeyId from OS disk attached to resource)

Scvmm Specific Information

When using SCVMM, the following resource can be used as a Machine Profile input:

- Virtual Machine: The properties of the Virtual Machine will be used to create machines in a provisioning scheme.

Note: In SCVMM, we do not support template for Machine Profile.

The following are all the properties that can be captured from the resource provided as Machine Profile input:

- CPU count
- CPU Type
- LimitCPUForMigration
- TPM (Trusted Platform Module)
- NetworkInterfaceDetails (through network adapters)
- Memory
- Nested Virtualization
- Secure Boot
- Operating System
- VM Generation

Note: Tags are not captured from the virtual machine as machine profile input in SCVMM

SCVMM has the following properties that can be provided explicitly or through Machine Profile:

- VMCpuCount
- VMMemoryMB
- NetworkMapping

Note: Machine Profile cannot be added/updated on existing machines as SCVMM does not currently support either Set-ProvVMUpdateTimeWindow or Set-ProvVM

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Xenserver Specific Information

When using XenServer, the following resource can be used as a Machine Profile input:

- Virtual Machine: Snapshot of a Virtual Machine

The following are example properties that can be captured from the resource provided as Machine Profile input:

- CPU count
- Memory
- Network Mapping
- Tags
- Generation
- VGPU

XenServer has the following properties that can be provided explicitly or through Machine Profile:

- VMCpuCount
- VMMemoryMB
- NetworkMapping

Note: Machine Profile cannot be added/updated on existing machines as SCVMM does not currently support either Set-ProvVMUpdateTimeWindow or Set-ProvVM

Vmware Specific Information

When using VMware, the following resource can be used as machine profile input:

- VM Template: Can be created in two ways - Converting an existing VM into a VM Template, or cloning an existing VM to a VM Template.

All hardware properties are captured from the machine profile template. Here are some relevant examples:

- Folder ID
- vTPM Data
- Memory
- CPU Count
- Storage Policy
- Guest OS
- NIC Count
- VM Tags

© 1997–2025 Citrix Systems, Inc. All rights reserved.

VMWare has the following properties that can be provided explicitly or through Machine Profile:

- VMCpuCount
- VMMemoryMB
- NetworkMapping
- CustomProperties
  - FolderId (How to find the folder ID: https://docs.citrix.com/en-us/citrix-virtual-apps-desktops/install-configure/machine-catalogs-manage/manage-machine-catalog-vmware.html#find-the-folder-id-in-vsphere)

Note the following information around specific properties:

- vTPM: If the master image VM is vTPM enabled, the VM template must come from the same master image VM.
- CPU and Cores per Socket: For VMware, CPU Count must be an integral multiple of Cores per Socket. For example, 6 CPU count can have 1,2,3, or 6 Cores per Socket. 4 CPU count can have 1,2, or 4 Cores per Socket.
  - For a new Catalog, both CPU Count and Cores per Socket value are picked up from the machine profile. Unless CPU count is also provided as a parameter, in which case that value is used.
  - For an existing catalog, CPU Count by itself can be updated using the "VmCpuCount"parameter of Set-ProvScheme, but this does not change the value of Cores per Socket. To update both values, provide a new VM Template with the required changes as the Machine Profile parameter in Set-ProvScheme.
- Storage Policy: Only captured in a vSAN Datastore.
- NICs: Only the NIC count from the Machine Profile is used. Network mappings from the Machine Profile are not used.
  - NIC count cannot be 0 or higher than what the hosting unit can support.
  - If NIC count is 1, and no mapping is provided, default network/subnet from the Hosting Unit is used.
  - If NIC count is greater than 1, network mapping needs to be provided for each NIC.
  - Mapping has to be 1:1, that is, only one NIC can be mapped to one subnet on the Hosting Unit.

Add-ProvImageDefinitionConnection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Add an image definition connection.

Syntax

```
Add-ProvImageDefinitionConnection
   -ImageDefinitionName <String>
   -HypervisorConnectionName <String>
   [-CustomProperties <String>]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvImageDefinitionConnection
   -ImageDefinitionUid <Guid>
   -HypervisorConnectionUid <Guid>
   [-CustomProperties <String>]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to link an image definition with a hypervisor connection and make customize configurations.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add an image version spec.

```
Add-ProvImageDefinitionConnection -ImageDefinitionUid 7ccc900b-f737-416a-8f65-68383343007b -HypervisorConnectionUid 436cb4f7-2b57-484c-a364-d3c7795cb0c7 -RunAsynchronously

TaskId                    : a6566749-d445-4fcf-ab83-6bd2bba624b4
Active                    : False
Host                      : E73178-78-1
DateStarted               : 5/9/2024 5:31:09 AM
Metadata                  : {
  }

ImageDefinitionName       : test
ImageDefinitionUid        : 7ccc900b-f737-416a-8f65-68383343007b
HypervisorConnectionName  : azure28
HypervisorConnectionUid   : 436cb4f7-2b57-484c-a364-d3c7795cb0c7
CustomProperties          :
TaskState                 : Finished
TaskType                  : RemoveProvImageDefinitionConnection
LastUpdateTime            : 5/9/2024 5:31:09 AM
CurrentOperation          :
TerminatingError          :
TaskProgress              : 100
WorkFlowStatus            : Completed
DateFinished              : 5/9/2024 5:31:09 AM
TaskExpectedCompletion    : 5/9/2024 5:31:09 AM
ActiveElapsedTime         : 0
Status                    : Finished
TaskStateInformation      : Completed
Type                      : RemoveProvImageDefinitionConnection
```

Parameters

-ImageDefinitionName

The name of image definition.

Type:	String
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionName

The name of the hypervisor connection to be used.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageDefinitionUid

The identifier of image definition.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionUid

The identifier of the hypervisor connection to be used.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The name of the hosting unit to be used for the image definition.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

ImageDefinitionUid <Guid>

The unique identifier of the image definition.

ImageDefinitionName <string>

The name of the image definition.

HypervisorConnectionName <string>

The name of the hypervisor connection being used by this image definition connection.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection being used by this image definition connection.

CustomProperties <string>

The custom properties of the image definition connection.

TaskType <Citrix.XDInterServiceTypes.JobType>

The type of the task. For new image version tasks this is always "RemoveProvImageDefinitionConnection".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

InvalidCustomProperties

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The custom properties are not valid.

UnableToAddImageDefinitionConnectionDueToAlreadyExists

Unable to add image definition connection due to already exists.

Add-ProvImageVersionSpec

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

Add a master image version spec.

Syntax

```
Add-ProvImageVersionSpec
   -ImageDefinitionName <String>
   -ImageVersionNumber <Int32>
   -HostingUnitName <String>
   -MasterImagePath <String>
   [-Metadata <Hashtable>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvImageVersionSpec
   -ImageVersionUid <Guid>
   -HostingUnitUid <Guid>
   -MasterImagePath <String>
   [-Metadata <Hashtable>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to add a master image version spec.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add an image version spec.

```
Add-ProvImageVersionSpec -ImageVersionUid f6ab733f-b5f5-4399-8e86-8

```

Parameters

-ImageVersionUid

The identifier for the image version used for the image version spec.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit used for the image version spec.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MasterImagePath

The path in the hosting unit provider to the virtual machine snapshot that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot item in the same hosting unit that the hosting unit name or hosting unit Uid refers to.

Valid paths are of the format; XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<SnapshotName>

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageDefinitionName

The name of image definition used for the image version spec.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ImageVersionNumber

The version number used for the image version spec.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HostingUnitName

The name of the hosting unit to be used for the image version spec.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets or sets metadata of the image version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.DataModel.ImageVersionSpec

This object provides details of the image version spec and contains the following information:

ImageVersionSpecUid <Guid>

The unique identifier of the image version spec.

ImageVersionNumber <string>

The version number of the image versions.

ImageVersionUid <Guid>

The unique identifier of the image versions.

ImageDefinitionName <string>

The name of the image definition.

HostingUnitName <string>

The name of the hosting unit being used by this image version spec.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image version spec.

Context <string>

The context of the image version spec.

CreationTime <DateTime>

The creation time of the image version spec.

Error <Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskTerminatingError>

Errors that have occurred with this image version spec.

ImageInstances <Citrix.MachineCreation.DataModel.ImageInstance[]>

Image replication information for this image version.

ImageRuntimeInfo <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The image runtime information like operating system info, VDA components, etc.

ImageVersionSpecStatus <string>

The status of this image version spec.

ImportType <string>

Indicate if this image version spec is imported by user.

PreparationType <string>

The preparation type of the image version spec

IsCitrixManaged <bool>

Indicate if this image version spec is managed by Citrix.

MasterImagePath <string>

The inventory path to the VM snapshot copy used in this image version spec.

Metadata <IDictionary<string,string»

The metadata associated with this image version spec.

Warnings <Citrix.MachineCreation.DataModel.ProvSchemeWarning[]>

Warning states that have occurred with this image version spec.

ZoneUid <Guid>

The unique identifier of the zone.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

© 1997–2025 Citrix Systems, Inc. All rights reserved.

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Add-ProvImageVersionSpecHostingUnit

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Replicate a prepared image version spec to the specified hosting unit.

Syntax

```
Add-ProvImageVersionSpecHostingUnit
   -ImageVersionSpecUid <Guid>
   -HostingUnitName <String>
   [-CustomProperties <String>]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvImageVersionSpecHostingUnit
   -ImageVersionSpecUid <Guid>
    -HostingUnitUid <Guid>
    [-CustomProperties <String>]
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

The prepared image version spec can be shared to other hosting units, so the image version spec can be assigned to provisioning schemes to provision virtual machines in the hosting unit.

Examples

EXAMPLE 1

Add an image version spec hosting unit.

```
Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid 05e7aa58-76be
    -4bca-9d3c-9cc7a21dea2b -HostingUnitName west28 -RunAsynchronously

TaskId                 : 6eef9caa-4dfc-4214-b8f9-fd50a2fd66da
Active                 : True
Host                   : R80109-19-1
DateStarted            : 5/31/2024 7:22:57 AM

```

Parameters

-ImageVersionSpecUid

The identifier for the image version spec.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit to be used.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitName

The name of the hosting unit to be used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties for the specified hosting unit that are specific to the target hosting infrastructure.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid> The identifier for the task that was performed. Active <Boolean> Indicates whether the task is still processing or is complete. Host <string> The name of the host on which the task is running or was run. DateStarted <DateTime> The date and time when the task was started. ImageDefinitionUid <Guid> The unique identifier of the image definition. ImageDefinitionName <string> The name of the image definition. HypervisorConnectionName <string> The name of the hypervisor connection being used by this image definition connection. HypervisorConnectionUid <Guid> The unique identifier of the hypervisor connection being used by this image definition connection. CustomProperties <string> The custom properties of the image definition connection. TaskType <Citrix.XDInterServiceTypes.JobType> The type of the task. For new image version tasks this is always "RemoveProvImageDefinitionConnection". ActiveElapsedTime <int> Number of seconds the task has taken for active execution. TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState> The state of the task.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

TaskAlreadyRunningForImageVersionSpec

The operation could not be completed because there is already an active task running for this image version spec.

Add-ProvMetadataConfiguration

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Add VM metadata configuration settings for a plugin.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Add-ProvMetadataConfiguration
   [-PluginType] <String>
   [-ConfigurationName] <String>
   [-ConfigurationValue] <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to configure metadata setting for a hypervisor. Customer can run the command to manage the allowed Azure VM extension list.

When an extension is added, it will be installed for catalog machines if the extension is also defined in MachineProfile VM/Template.

Extensions that are not in the allowed list will be automatically ignored during catalog creation.

Examples

EXAMPLE 1

Add Azure VM extension AADLoginForWindows

```
Add-ProvMetadataConfiguration -PluginType "AzureRmFactory" -
   ConfigurationName "Extension" -ConfigurationValue "
   AADLoginForWindows"
```

Parameters

-PluginType

The name of the hypervisor plug-in factory. Currently, AzureRmFactory is the only supported plug-in factory.

Type:	String
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 50

-ConfigurationName

The configuration name. Currently, Extension is the only supported configuration.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 50

-ConfigurationValue

The setting for metadata configuration, for example Azure extension type.

Type:	String
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationValueAlreadyExists

The configuration has already been added to the database.

ConfigurationNotValid

The plugin type or configuration name is not valid. AzureRmFactory is the only plugin type, and Extension is the only configuration supported.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, check the Windows event logs on your self-hosted delivery controller or contact Citrix support if using Citrix DaaS (Citrix-hosted delivery controller).

Add-ProvSchemeControllerAddress

August 14, 2025

Adds a list of controller addresses to a provisioning scheme, not recommended any more due to an enhancement in that the list of controller address can be automatically retrieved from the broker.

Syntax

```
Add-ProvSchemeControllerAddress
   [-ProvisioningSchemeName] <String>
   [-ControllerAddress] <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeControllerAddress
   -ProvisioningSchemeUid <Guid>
   [-ControllerAddress] <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to associate controller hosts, or a set of brokers, with a specific provisioning scheme. This optional data is passed to the machines created by the Machine Creation Services, where it is used to associate the newly created machine with a broker. The list is returned along with the assigned provisioning scheme.

Examples

EXAMPLE 1

Add a set of controllers to the provisioning scheme with the identifier "01a4a008-8ce8-4165-ba9c-cdf15a6b0501".

```
Add-ProvSchemeControllerAddress -ProvisioningSchemeUid "01a4a008-8ce8
   -4165-ba9c-cdf15a6b0501" -ControllerAddress (ddcA.citrix.com,ddcB.
   citrix.com,ddcC.citrix2.com)

CleanOnBoot                  : True
ControllerAddress            : {

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme that the list of addresses is to be added to.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name for the provisioning scheme that the list of addresses is to be added to.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ControllerAddress

Specifies the array of controller DNS names to be added to the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String[]
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Add-ProvSchemeControllerAddress.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

Add-ProvSchemeControllerAddress returns the updated ProvisioningScheme object containing the union of the old and new controller address lists.

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Add-ProvSchemeMetadata

August 14, 2025

Adds metadata on the given provisioning scheme.

Syntax

```
Add-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-InputObject] <ProvisioningScheme[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
   [-InputObject] <ProvisioningScheme[]>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
    [-ProvisioningSchemeName] <String>
    -Name <String>
    -Value <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Add-ProvSchemeMetadata
    [-ProvisioningSchemeName] <String>
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability for additional custom data to be stored against given provisioning scheme objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ProvSchemeMetadata cmdlet instead.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the provisioning scheme with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Add-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the provisioning scheme specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[string, string];").

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Id of the ProvisioningScheme

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Name of the ProvisioningScheme

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

ProvisioningScheme objects to which the metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ProvisioningScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Add-ProvSchemeMetadata.

PSObject

A metadata map object can be piped to the Add-ProvSchemeMetadata command.

Outputs

Citrix.MachineCreation.Sdk.Metadata

Add-ProvSchemeMetadata returns an array of objects containing the newly added metadata.

Property <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Add-ProvSchemeScope

August 14, 2025

Add the specified provisioning scheme(s) to the given scope(s).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Add-ProvSchemeScope
   [-Scope] <String[]>
   -ProvisioningSchemeUid <Guid[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeScope
   [-Scope] <String[]>
   -InputObject <ProvisioningScheme[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvSchemeScope
   [-Scope] <String[]>
   -ProvisioningSchemeName <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The Add-ProvSchemeScope command is used to associate one or more provisioning schemes with given scope(s).

To add a provisioning scheme to a scope, you need permission to change the scopes of the provisioning scheme and permission to add objects to all of the scopes you have specified.

If the provisioning scheme is already in a scope, that scope will be silently ignored.

Examples

EXAMPLE 1

Adds a single provisioning scheme to the 'Finance'scope.

```
Add-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073-4080-
   A0EE-EC74CB537C52
```

EXAMPLE 2

Adds a single provisioning scheme to the multiple scopes.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Add-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702C5D0-
    C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Adds all visible provisioning schemes to the 'Finance'scope.

```
Get-ProvScheme | Add-ProvSchemeScope Finance
```

EXAMPLE 4

Adds all provisioning schemes whose name starts with letter 'A'to the 'Finance'scope.

```
Add-ProvSchemeScope Finance -ProvisioningSchemeName A*
```

Parameters

-InputObject

Specifies the ProvisioningScheme objects to be added.

Type:	ProvisioningScheme[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Specifies the ProvisioningScheme objects to be added by the UID of the provisioning scheme.

Type:	Guid[]
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Specifies the ProvisioningScheme objects to be added by the name of the provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Scope

Specifies the scopes to add the objects to.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName' or 'ProvisioningSchemeUid' to Add-ProvSchemeScope.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Add-ProvTaskMetadata

August 14, 2025

Adds metadata on the given Task.

Syntax

```
Add-ProvTaskMetadata
   [-TaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvTaskMetadata
   [-TaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to store additional custom data against given Task objects.

This cmdlet does not overwrite existing metadata on an object - use the Set-ProvTaskMetadata cmdlet instead.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Task with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Add-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name
    property -Value value

Property                                 Value
--------                                 -----
property                                 value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskId

Id of the Task.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Add-ProvTaskMetadata command.

PSObject

A metadata map object can be piped to the Add-ProvTaskMetadata command.

Outputs

Citrix.MachineCreation.Sdk.Metadata

Add-ProvTaskMetadata returns an array of objects containing the newly added metadata.

Property <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Cancel-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Cancels a Maintenance Cycle

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Cancel-ProvMaintenanceCycle
      -MaintenanceCycleId <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Cancels an ongoing Maintenance Cycle, if the operation is not yet started by MCS on a virtual machine, the operation is cancelled.

However MCS does not cancel the operation that is running on the virtual machine, it is designed to allow it to continue and complete it

This is done to avoid putting the virtual machine in a bad state in the midst of an operation

Examples

Parameters

-MaintenanceCycleId

Indicates the Guid of the maintenance cycle

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Cancel-ProvSchedule

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Cancels a Provisioning Schedule

Syntax

```
Cancel-ProvSchedule
       -ScheduleId <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Cancels an ongoing Provisioning Schedule and sets it to inactive so as to avoid any future maintenance cycle creations

Examples

Parameters

-ScheduleId

Indicates the Guid of the Provisioning Schedule

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Cancel-ProvVMUpdate

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2212

(DEPRECATED) Cancels pending property updates on provisioned virtual machines.

Syntax

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeName <String>
      -VMName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Cancel-ProvVMUpdate
      -ProvisioningSchemeUid <Guid>
      -VMName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

This cmdlet has been deprecated and replaced by Clear-ProvVMUpdateTimeWindow. Clear-ProvVMUpdateTimeWindow is the new name for Cancel-ProvVMUpdate and provides all the same functionality, please use it going foward in place of Cancel-ProvVMUpdate.

This cmdlet clears the ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil fields on virtual machines, canceling any pending property updates. If a machine is already powering on with a property update, it cannot be cancelled with this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will have pending property updates cancelled.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId' and 'ProvisioningSchemeName' to Cancel-ProvVMUpdate.

Outputs

None

By default, this cmdlet returns no output.

Clear-ProvSchemeWarning

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Clears warnings from a Provisioning Scheme.

Syntax

```
Clear-ProvSchemeWarning
      -ProvisioningSchemeName <String>
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Clear-ProvSchemeWarning
      -ProvisioningSchemeUid <Guid>
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability to clear warnings from a provisioning scheme.

Examples

EXAMPLE 1

Clears all warnings from the provisioning scheme named 'MyScheme'.

```
Get-ProvScheme -ProvisioningSchemeName MyScheme | Clear-
    ProvSchemeWarning -All
```

EXAMPLE 2

Clears all warnings from the provisioning scheme named 'MyScheme'.

```
Clear-ProvSchemeWarning -ProvisioningSchemeName MyScheme -All
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme to clear warnings from.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to clear warnings from.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-All

Whether to clear all warnings from the provisioning scheme. This is the only option supported at this time.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe an object containing a string property called 'ProvisioningSchemeName'to Clear-ProvSchemeWarning.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Clear-ProvVMUpdateTimeWindow

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Cancels pending property updates on provisioned virtual machines.

Syntax

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeName <String>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeName <String>
     -VMName <String[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeUid <Guid>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Clear-ProvVMUpdateTimeWindow
     -ProvisioningSchemeUid <Guid>
     -VMName <String[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Provides the ability to clear pending property updates on existing virtual machines.

This cmdlet clears the ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil fields on virtual machines, canceling any pending property updates. If a machine is already powering on with a property update, it cannot be cancelled with this cmdlet.

Examples

EXAMPLE 1

Clear the time window for all VMs in azure-catalog, canceling the pending property update for each machine.

```
Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
    ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  -----------------------------
azu01                                 1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM
azu02                                 1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
azu03                                1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM
azu04                                1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM

Clear-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog

Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
    ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  ----------------------------
azu01                                1
azu02                                1
azu03                                1
azu04                                1
```

EXAMPLE 2

Clear the time window for machines azu01,azu02 in azure-catalog, canceling the pending property update for the two machines. The other machines remain having a property update time window set.

```
Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
    ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  ----------------------------
azu01                                1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM
azu02                                1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM
azu03                                1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM
azu04                                1               3/11/2022  11:00:00
    PM         3/12/2022  12:00:00 AM

Cancel-ProvVMUpdate -ProvisioningSchemeName azure-catalog -VMName azu01
    ,azu02

Get-ProvVM -ProvisioningSchemeName azure-catalog | select VMName,
    ProvisioningSchemeVersion, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  ----------------------------
```

    PM          3/12/2022  12:00:00 AM
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will have pending property updates cancelled.

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Clear-ProvVMUpdateTimeWindow.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Confirm-ProvOperationEvent

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Acknowledge a list of MCS operation events.

Syntax

```
Confirm-ProvOperationEvent
        [-EventRecordId <Int64[]>]
        [-LinkedObjectType <String>]
        [-LinkedObjectUid <Guid>]
        [-All]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Allows you to set the EventState from New to Acknowledged.

Examples

EXAMPLE 1

Sets the operation event with a EventRecordId of 42 to Acknowledged.

```
Set-ProvOperationEvent -EventRecordId 42
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Sets all operation events for provisioning scheme with ID 93f2c1b3-3015-4d63-92fe-678f1523b4de to Acknowledged.

```
Set-ProvOperationEvent -LinkedObjectType ProvisioningScheme -
    LinkedObjectUid 93f2c1b3-3015-4d63-92fe-678f1523b4de
```

Parameters

-EventRecordId

The array of event record id which all associated operation events will be set to Acknowledged.

Type:	Int64[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-LinkedObjectType

The type of the linked object for which all associated operation events will be set to Acknowledged.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LinkedObjectUid

The unique identifier of the linked object for which all associated operation events will be set to Acknowledged.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-All

All operation events will be set to Acknowledged.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-EventId

The array of event id which all associated operation events will be set to Acknowledged.

Replaced with parameter EventRecordId.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Export-ProvMachineProfile

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Get the machine profile of a prov scheme.

Syntax

```
Export-ProvMachineProfile
       [-ProvisioningSchemeUid <Guid>]
       [[-ProvisioningSchemeName] <String>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

The primary use of this cmdlet is to export the machine profile contents for a provisioning scheme.

Examples

EXAMPLE 1

Exports the deparameterized machine profile for the provisioning scheme with the name “catalog”
.

```
Export-ProvMachineProfile -ProvisioningSchemeName "catalog"
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

A JSON encoded string representing a deparameterized copy of the provisioning scheme's machine profile.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

MachineProfileDoesNotExist

The catalog does not have a machine profile.

CapabilityNotSupported

The hypervisor does not support machine profile export.

Export-ProvScheme

August 14, 2025

Exports a provisioning scheme in the form of a JSON encoded string.

Syntax

```
Export-ProvScheme
      -ProvisioningSchemeName <String>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Export-ProvScheme
      -ProvisioningSchemeUid <Guid>
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The primary use of this cmdlet is to export a provisioning scheme and the VMs provisioned with this scheme. The exported JSON string can then be used to import this provisioning scheme and provisioned VMs into another site. The exported JSON string contains data about the provisioning scheme, image history, and provisioned VMs. However, it does not contain any AD accounts created during provisioning. Use cmdlet Export-AcctIdentityPool to export the identity pool containing those AD accounts.

Examples

EXAMPLE 1

Exports the provisioning scheme with the name MyScheme.

```
Export-ProvScheme -ProvisioningSchemeName MyScheme
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Export-ProvScheme.

Outputs

String

A JSON encoded string describing the provisioning scheme, image history, and VMs created with the provisioning scheme.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Get-ProvCostSummary

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Get the cost summary.

Syntax

```
Get-ProvCostSummary
   -ProvisioningSchemeUid <Guid>
   [-SummaryType <SummaryType>]
   -Start <DateTime>
   -End <DateTime>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvCostSummary
   -HypervisorConnectionUid <Guid>
   -HostedMachineIds <String[]>
   -Start <DateTime>
   -End <DateTime>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Get the cost summarized by differnt types of resources, such as the cost of virtual machines, the cost of disks, etc.

Examples

EXAMPLE 1

Get the cost summary of the specified provisioning scheme and the cost is summarized by virtual machines.

```
$res = Get-ProvCostSummary -ProvisioningSchemeUid $provScheme.
   ProvisioningSchemeUid -Start $start -End $end

$res

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Start

The start date of the period for which the cost is calculated.

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-End

The end date of the period for which the cost is calculated.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ResourceCost

This object provides details of the cost summary.

ResourceCostItems <Citrix.MachineCreation.Sdk.ResourceCostItem[]> The cost items for the virtual machines.

Status <string> The status of the cost calculation.

Get-ProvDailyCost

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Get the daily cost.

Syntax

```
Get-ProvDailyCost
   -ProvisioningSchemeUid <Guid>
   -Start <DateTime>
   -End <DateTime>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvDailyCost
   -HypervisorConnectionUid <Guid>
   -HostedMachineIds <String[]>
   -Start <DateTime>
   -End <DateTime>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Get the daily cost according to the specified parameters, such as the provisioning scheme, the hosted machines. If the 'ProvisioningSchemeUid'is specified, the cost is calculated for the provisioned machines of the specified provisioning scheme. If the 'HypervisorConnectionUid'and 'HostedMachineIds'are specified, the cost is calculated for the non-provisioned machines.

Examples

EXAMPLE 1

Get the daily cost of provisioning scheme.

```
$res = Get-ProvDailyCost -ProvisioningSchemeUid $provScheme.
   ProvisioningSchemeUid -Start $start -End $end

$res

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Get the daily cost of non-provisioned machines of the specified hypervisor connection.

```
$hypervisorConnectionUid = '5096a060-3e8a-48fb-8a1e-34dc0dfbe281'

$provisionedVms = Get-BrokerMachine -CatalogName 'manual-powermanaged-
    catalog'
$vmIds = $provisionedVms| Select-Object -ExpandProperty HostedMachineId

$vmIds
TESTGROUP/vm1
TESTGROUP/vm2
TESTGROUP/vm3

$res = Get-ProvDailyCost -HypervisorConnectionUid
    $hypervisorConnectionUid -HostedMachineIds $vmIds -Start $start -End
     $end
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Start

The start date of the period for which the cost is calculated.

Type:	DateTime
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	True

-End

The end date of the period for which the cost is calculated.

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-HypervisorConnectionUid

The unique identifier of the hypervisor connection.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-HostedMachineIds

The unique identifier of the hosted machine.

Type:	String[]
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.DailyCost

This object provides details of the daily cost.

DailyCostItems <Citrix.MachineCreation.Sdk.DailyCostItem[]> The daily cost items.

Status <string> The status of the cost calculation.

Get-ProvDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the MachineCreation Service.

Syntax

```
Get-ProvDBConnection
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected MachineCreation Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the MachineCreation Service instance running on controller "controller1.mydomain.net".

```
Get-ProvDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
    Security=True
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current MachineCreation Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the MachineCreationService has not been specified.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-ProvDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix MachineCreation Service.

Syntax

```
Get-ProvDBSchema
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix MachineCreation Service database schema, add a new MachineCreation service to an existing site, remove a MachineCreation service from a site, or create a database server logon for a MachineCreation service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected MachineCreation service instance, otherwise the scripts relate to MachineCreation service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to MachineCreation service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to MachineCreation service roles

If ScriptType is Evict, the returned script contains:

- Removal of MachineCreation service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix MachineCreation Service and copies it to a file called "C:\MachineCreationSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a MachineCreation service schema.

```
Get-ProvDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\MachineCreationSchema.sql
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Gets a script to create the appropriate database server logon for the MachineCreation service. This can be used when configuring a mirror server for use.

```
1  Get-ProvDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
       MachineCreationLogins.sql
```

Parameters

-DatabaseName

Specifies the name of the database into which the new MachineCreation service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the MachineCreation services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix MachineCreation Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a MachineCreation Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a MachineCreation Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

  Adds a logon for the MachineCreation Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for MachineCreation services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the MachineCreation Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.
- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix MachineCreation Service.

Syntax

```
Get-ProvDBVersionChangeScript
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix MachineCreation Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix MachineCreation Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix MachineCreation Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix MachineCreation Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix MachineCreation Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-ProvServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
1 $update = Get-ProvDBVersionChangeScript -DatabaseName MyDb -
     TargetVersion 7.40.0.0
2 $update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix MachineCreation Service schema to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-ProvDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix MachineCreation Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any MachineCreation services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ProvServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-ProvImageDefinition

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Gets the list of image definitions.

Syntax

```
Get-ProvImageDefinition
    [-ImageDefinitionUid <Guid>]
    [[-ImageDefinitionName] <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Lets you retrieve the list of defined image definitions.

Examples

EXAMPLE 1

Returns all of the available image definitions.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvImageDefinition

        CreationTime            : 1/1/2022 12:00:00
        Description             : Windows image
        OsType                  : Windows
        VDASessionSupport       : MultiSession
        ImageDefinitionName     : Image1
        ImageDefinitionUid      : 7585f0de-192e-4847-a6d8-22713c3a2f42
        Metadata                :
        LatestVersion           : 2
        VersionsCount           : 2

        CreationTime            : 1/1/2022 12:00:00
        Description             : Linux image
        OsType                  : Linux
        VDASessionSupport       : MultiSession
        ImageDefinitionName     : Image2
        ImageDefinitionUid      : b5a55401-ad36-4f53-b0e0-dbb6a5bdf6fd
        Metadata                :
        LatestVersion           : 3
        VersionsCount           : 2
```

EXAMPLE 2

Returns all of the image definitions that have the name ‘Image0’or ‘Image1’.

```
Get-ProvImageDefinition -ImageDefinitionName Image[0-1]

        CreationTime            : 1/1/2022 12:00:00
        Description             : Windows image
        OsType                  : Windows
        VDASessionSupport       : MultiSession
        ImageDefinitionName     : Image1
        ImageDefinitionUid      : 7585f0de-192e-4847-a6d8-22713c3a2f42
        Metadata                :
        LatestVersion           : 3
        VersionsCount           : 2
```

Parameters

-ImageDefinitionUid

The unique identifier of the image definition.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageDefinitionName

The name of the image definition.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definition and contains the following information:

CreationTime <DateTime>

The date and time when the image definition was created.

Description <string>

The description of the image definition.

OsType <string>

The OS type for the image versions in this image definition.

VDASessionSupport <string>

The Session support of VDA for this image definition.

ImageDefinitionName <string>

The name of the image definition.

ImageDefinitionUid <Guid>

The unique identifier for the image definition.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image definition, if specified.

LatestVersion <int>

The latest version number in this definition.

VersionsCount <int>

The total versions count in this definition.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Get-ProvImageRuntimeEnvironment

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

Get image runtime Environment.

Syntax

```
Get-ProvImageRuntimeEnvironment
   -ImageVersionSpecUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvImageRuntimeEnvironment
   -ProvisioningSchemeUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allow you to extract information from ‘ImageRutimeInfo’field in provisioning scheme or image version.

Examples

EXAMPLE 1

Get the image runtime environment associated with the given image version.

```
$res = Get-ProvImageRuntimeEnvironment -ImageVersionSpecUid a80c8338-
   e7af-48d6-8f08-21d2590b21b6
PS C:\Users\hanw> $res

Capabilities           : {
 [AzureAdSupported, True], [HybridAzureAdSupported, True], [
    IntuneSupported, False] }

DeviceEnrollmentStatus : Unknown
IdentityJoinStatus     : NotDomainJoined
OperatingSystem        : Citrix.MachineCreation.Sdk.OperatingSystemInfo
PagingFileSettings     : {
 Citrix.MachineCreation.Sdk.PagingFileSetting }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
VDASessionSupport      : MultiSession

PS C:\Users\hanw> $res.OperatingSystem

FullName                            Type
--------                            ------------------
Windows Server 2019 Datacenter      Windows
```

EXAMPLE 2

Get the image runtime environment associated with the given provisioning scheme.

```
$res = Get-ProvImageRuntimeEnvironment -ProvisioningSchemeUid c0c55fa2
    -3d9f-44ee-8aba-3baec6547525
PS C:\Users\hanw> $res

Capabilities           : {
 [AzureAdSupported, False], [HybridAzureAdSupported, False], [
    IntuneSupported, True] }

DeviceEnrollmentStatus : Unknown
IdentityJoinStatus     : NotDomainJoined
OperatingSystem        : Citrix.MachineCreation.Sdk.OperatingSystemInfo
PagingFileSettings     :
VDASessionSupport      : SingleSession

PS C:\Users\hanw> $res.OperatingSystem

FullName       Type
--------       ------------------
Ubuntu 22.04   Linux
```

Parameters

-ImageVersionSpecUid

The unique identifier of image version spec.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ProvisioningSchemeUid

The unique identifier of provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ImageRuntimeEnvironment

This object provides details of the image runtime environment and contains the following infrmation:

Capabilities <System.Collections.Generic.IDictionary<string, string»

The capabilities of the image such as 'AzureAdSupported'.

DeviceEnrollmentStatus <string>

The device enrollment status of the image.

IdentityJoinStatus <string>

The identity join status of the image.

OperatingSystem <Citrix.MachineCreation.Sdk.OperatingSystemInfo>

The operating system information of the image.

PagingFileSettings <Citrix.MachineCreation.Sdk.PagingFileSetting[]>

The page file settings of the image.

VDASessionSupport <string>

Specifies the session support of the VDA on the image. Valid values are: 'SingleSession', 'MultiSession', 'Unknown'.

Notes

The Get-ProvImageRuntimeEnvironment cmdlet returns an object containing the following six subobjects:

- The image capabilities
- The device enrollment status
- The identity join status
- The operating system information of the image
- The page file settings of the image
- The type of VDA installed on the image

Get-ProvImagesPendingDelete

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2212

Returns the list of pending image(s) to be deleted

Syntax

```
Get-ProvImagesPendingDelete
    [-HostingUnitUid <Guid>]
    [[-ImageId] <String>]
    [-StorageId <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list for each pending image which needs to be deleted. This check is done without regard for scoping of existing provisioning schemes, and hosting connection.

Examples

EXAMPLE 1

Gets the operation 'f68c0712-4643-496e-bf94-14b95b2e5c47'.

```
Get-ProvPendingImageDelete -HostingUnitUid "f68c0712-4643-496e-bf94-14
    b95b2e5c47"

HostingUnitUid : f68c0712-4643-496e-bf94-14b95b2e5c47
Id             : 1
ImageId        : 2cf68213-bd35-4adc-9c69-5de723cba469
InProgress     : True
PendingState   : DiskInUse
Reason         : Begin Delete threw an exception
StorageId      : 693fa4ab-1d67-478f-98a2-c4766d63d7eb
TimeAdded      : 8/25/2022 4:04:39 AM
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-HostingUnitUid

The identifiers of the hosting units(s) to be tested.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StorageId

The identifier for the storage location on which the virtual image is located.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageId

The identifiers of the image(s)/ to be tested.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Host.Sdk.HostingUnit

Filter pending image for delete by hosting unit identifer.

Citrix.Host.Sdk.ImageId

Filter pending image for delete by image identifer.

Outputs

Citrix.MachineCreation.Sdk.PendingImageDelete

The object has the following properties: Id <Int> The unique image record id

HostingUnitUid <Guid> The unique identifier of the hostingunit.

ImageId <string> The unique identifier of the image to be deleted.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InProgress <bool> Indicates whether the operation is in progress.

StorageId <string> The storage location on the hypervisor where the image resides.

TimeAdded <DateTime> The date and time when the operation was last queued for action.

PendingState <string> The state of the pending images to be deleted.

Reason <string> The reason why the image is in the pending state for deletion.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned.

CouldNotQueryDatabase The query required to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvImageVersion

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Get a list of image versions.

Syntax

```
Get-ProvImageVersion
   [-ImageVersionUid <Guid>]
   [[-ImageVersionNumber] <Int32>]
   [-ImageDefinitionUid <Guid>]
   [-ImageDefinitionName <String>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to retrieve the list of defined image versions.

Examples

EXAMPLE 1

Returns all of the available image versions.

```
Get-ProvImageVersion

  ImageVersionNumber      : 1
  ImageVersionUid         : b1c7602c-b080-4a63-846b-9d2429d54bd1
  ImageDefinitionName     : myImage
  ImageDefinitionUid      : 42bd09f5-3fac-44a6-8b1c-7c09f1079cc0
  CreationTime            : 4/2/2022 2:57:21 AM
  Metadata                : {
  }

  Description             : version 1
  ImageVersionSpecsCount  : 0
```

EXAMPLE 2

Returns all of the available image versions for image definition “myImage”.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvImageVersion -ImageDefinitionName myImage

  ImageVersionNumber      : 1
  ImageVersionUid         : b1c7602c-b080-4a63-846b-9d2429d54bd1
  ImageDefinitionName     : myImage
  ImageDefinitionUid      : 42bd09f5-3fac-44a6-8b1c-7c09f1079cc0
  CreationTime            : 4/2/2022 2:57:21 AM
  Metadata                : {
  }

  Description             : version 1
  ImageVersionSpecsCount  : 0
```

Parameters

-ImageVersionUid

The image version identifier to retrieve.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionUid

The identifier of image definition where image versions are contained.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionName

The name of image definition where image versions are contained.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageVersionNumber

The image version number to retrieve.

Type:	Int32
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageVersion

This object provides details of the image version and contains the following information:

CreationTime <DateTime>

The date and time when the image version was created.

Description <string>

The description for this image version.

ImageDefinitionName <string>

The name of the image Definition the created image version belongs to.

ImageDefinitionUid <Guid>

The unique identifier of the image Definition the created image version belongs to.

ImageVersionUid <int>

The unique identifier for this image version.

ImageVersionNumber <int>

The version number fot this image version.

ImageVersionSpecsCount <int>

The total image version specs count in this image version.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image version, if specified.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Get-ProvImageVersionSpec

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

Get a list of image version specs.

Syntax

```
Get-ProvImageVersionSpec
    [[-ImageVersionSpecUid] <Guid>]
    [-ImageVersionUid <Guid>]
    [-ImageVersionNumber <Int32>]
    [-ImageDefinitionName <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to retrieve the list of defined image version specs.

Examples

EXAMPLE 1

Get and image version spec with uid “f80ede4d-4c43-4acc-8181-468af5f014f7”.

```
Get-ProvImageVersionSpec -ImageVersionSpecUid f80ede4d-4c43-4acc
    -8181-468af5f014f7

Context                  :
CreationTime             : 9/27/2023 1:11:26 AM

```

Parameters

-ImageVersionUid

Filter by the identifier of the image version.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageVersionNumber

Filter by the image version number.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ImageDefinitionName

Filter by the name of image definition.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageVersionSpecUid

Filter by the identifier of the image version specification.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.DataModel.ImageInstance

This object provides details of the image version spec and contains the following information:

ImageVersionSpecUid <Guid>

The unique identifier of the image version spec.

ImageVersionNumber <string>

The version number of the image versions.

ImageVersionUid <Guid>

The unique identifier of the image versions.

ImageDefinitionName <string>

The name of the image definition.

HostingUnitName <string>

The name of the hosting unit being used by this image version spec.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this image version spec.

Context <string>

The context of the image version spec.

CreationTime <DateTime>

The creation time of the image version spec.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Error <Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskTerminatingError>

Errors that have occurred with this image version spec.

ImageInstances <Citrix.MachineCreation.DataModel.ImageInstance[]>

Image replication information for this image version.

ImageRuntimeInfo <string>

The image runtime information like operating system info, VDA components, etc.

ImageVersionSpecStatus <string>

The status of this image version spec.

ImportType <string>

Indicate if this image version spec is imported by user.

IsCitrixManaged <bool>

Indicate if this image version spec is managed by Citrix.

MasterImagePath <string>

The inventory path to the VM snapshot copy used in this image version spec.

Metadata <IDictionary<string,string»

The metadata associated with this image version spec.

Platform <string>

The hypervisor associated with this image version spec.

Warnings <Citrix.MachineCreation.DataModel.ProvSchemeWarning[]>

Warning states that have occurred with this image version spec.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Get-ProvInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the MachineCreation Service.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvInstalledDBVersion
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix MachineCreation Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-ProvDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix MachineCreation Service database schema version number.

```
Get-ProvInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the MachineCreation Service database schema for which upgrade scripts are supplied.

```
Get-ProvInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Version

Get-ProvInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the MachineCreation Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Gets the list of Maintenance Cycles

Syntax

```
Get-ProvMaintenanceCycle
    [-MaintenanceCycleId <Guid>]
    [-ProvisioningSchemeName <String>]
    [-ProvisioningSchemeUid <String>]
    [-ScheduleId <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to obtain a list of the Maintenance Cycles that were created using Citrix Machine Creation Services.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Returns all of the available maintenance cycles

```
Get-ProvMaintenanceCycle

MaintenanceCycleId           : 10073b8e-7e94-4527-8580-0e448eae0ad1
MaintenanceCycleDescription  : Backing Up VMs
ScheduledStartTimeInUTC      : 4/8/2024 4:55:36 PM
ScheduledCompletionTimeInUTC : 4/8/2024 5:35:36 PM
MaxDurationInMinutes         : 40
Operation                    : TakeBackup
ProvisioningSchemeName       : MCSCatalog
PurgeDBAfterInDays           : 1
SessionWarningTimeInMinutes  : 35
SessionWarningLogOffTitle    : PLEASE SAVE SESSION BEFORE MACHINE IS
    TURNED OFF
MaintenanceCycleStatus       : Completed
FailedVirtualMachines        : {
  }

SessionWarningLogOffMessage  : Please turn off
ScheduleId                   : cf57bb18-c622-4078-a370-5c1bf23e7f66
MaxNumberOfBackups           : 3

MaintenanceCycleId           : 9b47d203-5952-4b98-868d-c9044a1deb93
MaintenanceCycleDescription  : Resetting ID Disk
ScheduledStartTimeInUTC      : 7/12/2024 9:33:14 AM
ScheduledCompletionTimeInUTC : 7/12/2024 11:13:14 AM
MaxDurationInMinutes         : 100
Operation                    : ResetIDDisk
ProvisioningSchemeName       : CVC
PurgeDBAfterInDays           : 1
SessionWarningTimeInMinutes  : 15
SessionWarningLogOffTitle    : RESET
MaintenanceCycleStatus       : Running
FailedVirtualMachines        : {
  }

SessionWarningLogOffMessage  : Please turn off
ScheduleId                   : 00000000-0000-0000-0000-000000000000
```

Parameters

-MaintenanceCycleId

The unique identifier of the maintenance cycle.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

Gets the maintenance cycle associated to the provisioning scheme name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ProvisioningSchemeUid

Gets the maintenance cycle associated to the provisioning scheme uid

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ScheduleId

Gets the maintenance cycle associated to the given schedule id

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-CatalogName

Gets the maintenance cycle associated to the catalog name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Removed in:	Citrix Virtual Apps and Desktop 7 2411

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.MaintenanceCycle

This object provides the details of the maintenance cycle and contains the following document

ProvisioningSchemeName < string>

The catalog name associated with the maintenance cycle object

MaintenanceCycleDescription < string>

A brief overview to understand what the maintenance cycle is about

MaintenanceCycleId < Guid>

Unique identifier to identify the maintenance cycle

MaintenanceCycleStatus < string>

Indicates the status at which the maintenance cycle is currently at

Operation < string>

Indicates the operation associated to the maintenance cycle

© 1997–2025 Citrix Systems, Inc. All rights reserved.

MaxDurationInMinutes < int>

Max duration in minutes allocated for the maintenance cycle

PurgeDBAfterInDays < int>

Max duration in Days after which maintenance cycle results will be purged from the database

Defaulted to 30

ScheduledStartTimeInUTC < datetime>

Scheduled start time in UTC for the maintenance cycle

ScheduledCompletionTimeInUTC < datetime>

Scheduled Completion time in UTC for the maintenance cycle

SessionWarningLogOffTitle < string>

A brief message intended to the user

SessionWarningLogOffMessage < string>

A crisp Message intended to be displayed as a heading to the user before powering down the vm

SessionWarningTimeInMinutes < int>

Buffer Time provided to the user to save date before powering down the vm by mcs

ScheduleId < Guid>

Unique identifier for the provisioning schedule

FailedVirtualMachines < string[]>

Indicates the machines that have failed in the maintenance cycle

Get-ProvMaintenanceCycleVM

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Gets the list of Maintenance Cycle Jobs

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvMaintenanceCycleVM
    [-MaintenanceCycleId <Guid>]
    [-VirtualMachineSid <String>]
    [-MaintenanceOperation <MaintenanceCycleOperationType>]
    [-MaintenanceStatus <MaintenanceCycleStatus>]
    [-MachineName <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to obtain a list of the Maintenance Cycles that were created using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Returns all of the available provisioning maintenance cycle vm objects for the machine sid provided

```
C:\Windows\system32> Get-ProvMaintenanceCycleVM -VirtualMachineSid "S
    -1-5-21-1369695582-2951410066-511316603-54729"

JobId                 : adcfd978-6de1-45c4-b365-a6b65f3cf6bc

```

Parameters

-MaintenanceCycleId

A Filter parameter to filter the maitenancecyclevm objects on Maintenance Cycle Id

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-VirtualMachineSid

A Filter parameter to filter the maitenancecyclevm objects on Virtual Machine Sid

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MaintenanceOperation

A Filter parameter to filter the maitenancecyclevm objects on Maintenance Operation

Type:	MaintenanceCycleOperationType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MaintenanceStatus

A Filter parameter to filter the maitenancecyclevm objects on MaintenanceStatus

Type:	MaintenanceCycleStatus
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MachineName

A Filter parameter to filter the maitenancecyclevm objects on Machine Name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.MaintenanceCycleVM

This object provides the details of the maintenance cycle vm object and contains the following document

VirtualMachineSid < string> The virtual machine sid associated with the maintenance cycle

JobId < Guid> Unique identifier to identify the maintenance cycle vm object

MachineName < string> The virtual machine name associated with the maintenance cycle

MaintenanceCycleId < string> Unique identifier to identify the maintenance cycle

MaintenanceStartTime < datetime> The time at which the machine started running the respective maintenance cycle operation

MaintenanceEndTime < datetime> The time at which the machine completed running the respective maintenance cycle operation

Operation < string> Indicates the operation associated to the maintenance cycle

MaintenanceStatus < string> Indicates the status at which the maintenance cycle vm object is currently at

MaintenanceInformation < string> Indicates the information about the current status of the maintenance cycle vm operation

Get-ProvMetadataConfiguration

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Get VM metadata configuration settings for a plugin.

Syntax

```
Get-ProvMetadataConfiguration
   [-PluginType <String>]
   [-ConfigurationName <String>]
   [-CitrixDefined <Boolean>]
   [-ReturnTotalRecordCount]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to get metadata settings for a specific hypervisor.

Examples

EXAMPLE 1

Get all configuration settings

```
Get-ProvMetadataConfiguration

PluginType ConfigurationName ConfigurationValue    CitrixDefined
---------- ----------------- ------------------    -------------
AzureRM    Extension         AADLoginForWindows             True
AzureRM    Extension         CustomScriptExtension         False
```

EXAMPLE 2

Get configuration settings for AzureRM plugin

```
Get-ProvMetadataConfiguration -PluginType "AzureRm"

PluginType ConfigurationName ConfigurationValue    CitrixDefined
---------- ----------------- ------------------    -------------
AzureRM    Extension         AADLoginForWindows             True
AzureRM    Extension         CustomScriptExtension         False
```

EXAMPLE 3

Get supported VM extensions for AzureRM plugin

```
Get-ProvMetadataConfiguration -PluginType "AzureRm" -ConfigurationName
   "Extension"

PluginType ConfigurationName ConfigurationValue    CitrixDefined
---------- ----------------- ------------------    -------------
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
5  AzureRM    Extension          AADLoginForWindows              True
6  AzureRM    Extension          CustomScriptExtension          False
```

Parameters

-PluginType

The name of the hypervisor plug-in factory. Currently, AzureRmFactory is the only supported plug-in factory.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 50

-ConfigurationName

The configuration name. Currently, Extension is the only supported configuration.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 50

-CitrixDefined

Indicates whether it is defined by Citrix

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvMetadataConfiguration

The object has the following properties:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PluginType <string>

The name of Plugin

ConfigurationName <string>

The name of configuration

ConfigurationValue <string>

The value of configuration

CitrixDefined <bool>

Indicates if the configuration is defined by Citrix.

Notes

In the case of failure, the following errors can result.

Error Codes

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

ExceptionThrown An unexpected error occurred. For more details, check the Windows event logs on your self-hosted delivery controller or contact Citrix support if using Citrix DaaS (Citrix-hosted delivery controller).

Get-ProvObjectReference

August 14, 2025

Returns the number of local objects holding references to objects from other services.

Syntax

```
Get-ProvObjectReference
   [-HostingUnitUid <Guid[]>]
   [-IdentityPoolUid <Guid[]>]
   [-HypervisorConnectionUid <Guid[]>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns for each hosting unit ,hosting connection or identity pool GUID the number of references by provisioning schemes, Image Definitions, Image Version Specs or by long running task. This check is done without regard for scoping of existing provisioning schemes, references by inaccessible schemes are also checked.

Examples

EXAMPLE 1

This checks a single hosting unit for objects that have references to it. The result shows there is only one provisioning scheme relating to it.

```
Get-ProvObjectReference -HostingUnitUid 5B66A060-85E1-4DBD-9D1B-
   BF79881D3BB1

Count          : 1
ObjectId       : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source         : ProvisioningScheme
Target         : HostingUnit

Count          : 0
ObjectId       : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source         : Task
Target         : HostingUnit
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

This iterates all available identity pools for objects that have references to them, using specification by property name. The result shows that for each identity pool there is one provisioning scheme relating to it.

```
Get-AcctIdentityPool | Get-ProvObjectReference

Count          : 1
ObjectId       : 7a63cd15-8a6f-450e-9c09-72fb9f211898
Source         : ProvisioningScheme
Target         : IdentityPool

Count          : 0
ObjectId       : 7a63cd15-8a6f-450e-9c09-72fb9f211898
Source         : Task
Target         : IdentityPool
```

Parameters

-HostingUnitUid

The identifiers of the hosting units(s) to be tested.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-IdentityPoolUid

The identifiers of the identity pool(s) to be tested.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-HypervisorConnectionUid

The identifiers of the hosting connection(s) to be tested.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.Host.Sdk.HostingUnit

You can pipe an object containing a parameter called 'HostingUnitUid' to Get-ProvObjectReference.

Citrix.ADIdentity.Sdk.IdentityPool

You can pipe an object containing a parameter called 'IdentityPoolUid' to Get-ProvObjectReference.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Citrix.Host.Sdk.HypervisorConnection

You can pipe an object containing a parameter called 'HypervisorConnectionUid' to Get-ProvObjectReference.

Outputs

ObjectReferenceCount

An object containing the input object identifier, its type, the types of referencing objects, and the number of references.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvOperationEvent

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Gets a list of MCS operation events.

Syntax

```
Get-ProvOperationEvent
    [-EventRecordId <Int64>]
    [-EventCategory <String>]
    [-EventSeverity <String>]
    [-EventSource <String>]
    [-OperationType <String>]
    [-OperationTargetType <String>]
    [-LinkedObjectType <String>]
    [-LinkedObjectUid <Guid>]
    [-Locale <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to retrieve the list of MCS operation events.

Examples

EXAMPLE 1

Returns the operation event with a record ID of 42.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvOperationEvent -EventRecordId 42
```

EXAMPLE 2

Returns the operation events for provisioning scheme with ID 93f2c1b3-3015-4d63-92fe-678f1523b4de.

```
Get-ProvOperationEvent -LinkedObjectType ProvisioningScheme -
    LinkedObjectUid 93f2c1b3-3015-4d63-92fe-678f1523b4de
```

Parameters

-EventRecordId

The record id of the operation event to retrieve.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-EventCategory

The category of the operation event to retrieve.

Type:	String
Accepted values:	Error, Warning
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-EventSeverity

The severity of the operation event to retrieve.

Type:	String
Accepted values:	Critical, Urgent, Significant, Important
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-EventSource

The source of the operation event to retrieve.

Type:	String
Accepted values:	Mcs, AzureRmPlugin, GcpPlugin, AwsEc2Plugin
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationType

The type of the operation event to retrieve.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accepted values:	ImageManagement, ProvisioningSchemeManagement, ProvisioningVmManagement, PowerManagement, ResourceManagement, ConfigurationManagement, PreflightCheck, None
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-OperationTargetType

The target type of the operation event to retrieve.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectType

The type of the linked object to get the operation events of.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectUid

The unique identifier of the linked object to get the operation events of.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Locale

The locale to get the operation event message and recommendation of.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-EventId

The id of the operation event to retrieve.

Replaced with parameter EventRecordId.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2407

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.OperationEvent

This object provides details of the operation event and contains the following information:

EventRecordId <int> The unique identifier of this operation event.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

LinkedObjectUid <Guid> The unique identifier for the linked resource this operation event is associated with.

LinkedObjectType <string> The type of the linked resource (e.g. ProvisioningScheme) this operation event is associated with.

EventCategory <string> The category of this operation event.

EventSeverity <string> The severity of this operation event.

EventSource <string> The source of this operation event.

EventState <string> The state of this operation event.

EventMessage <string> The description of this operation event.

EventDateTime <DateTime> The date and time this operation event was created (UTC).

EventAdditionalData <string> Optional, additional data related to this operation event.

OperationType <string> The type of the operation that triggers this event.

OperationName <string> The name of the operation that triggers this event.

OperationTargetType <string> The type of the object that the operation targets to.

OperationTargetName <string> The name of the object that the operation targets to.

Recommendation <string> Optional, the recommended action of this operation event.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvOrphanedResource

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Gets the list of orphaned resources created while schemes provisioning.

Syntax

```
Get-ProvOrphanedResource
   -HypervisorConnectionUid <Guid[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Let you retrieve the list of orphaned provisioning resources, such as disks, snapshots, galleries, virtual machines and network interfaces etc.

Examples

EXAMPLE 1

Returns the orphaned resource objects

```
$pluginId = 'AzureRmFactory'
$connections = Get-ChildItem xdhyp:\connections | where {
  $_.PluginId -eq $pluginId  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$result = Get-ProvOrphanedResource -HypervisorConnectionUid
    $connections.HypervisorConnectionUid
$result
resourceId

    ResourceType               ProvisioningSchemeId
    Metadata
-----------------

    ------------               --------
    --------
{
 /subscriptions/3fd5967f-7152-46c4-b061-2bd5d0cad70c/resourceGroups/
    citrix-xd-66575601-158f-48f1-a013-9c85e5f10c21-9peif/providers/
    Microsoft.Compute/snapshots/AZMC01-baseDisk-vy3ov }
 microsoft.compute/disks    d5a53d4e-dc8b-416a-80ce-8eef5eb2256f
```

Parameters

-HypervisorConnectionUid

Connection Uids group to specific hypervisor.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.HypResource

This object provides details of hypervisor orphaned resource.

Id <string> An Id of hypervisor orphaned resource.

ResourceType <string> Resource type of hypervisor orphaned resource.

ProvisioningSchemeId <string> ProvisioningSchemeId of hypervisor orphaned resource.

Metadata <Citrix.MachineCreation.Sdk.ProvisionedResourceMetadata[]> Hypervisor resource orphaned metadata key/value.

Notes

The Get-ProvOrphanedResource cmdlet returns an object containing three sub-objects:

- The Id of hypervisor orphaned resource.
- The ProvisioningSchemeId of hypervisor orphaned resource.
- The resource type of hypervisor orphaned resource.
- The hypervisor orphaned resource metadata.

Get-ProvRecommendation

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets details of a recommendation using Machine Creation Services.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvRecommendation
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to view recommendations using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Gets all the recommendations

```
Get-ProvRecommendation

           CreatedDateTimeInUTC      : 6/25/2024 2:36:42 PM
           Reason                    :
           RecommendationDescription : We recommend editing the catalog

```

Parameters

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.Recommendation

The object has the following properties:

RecommendationId <string>

The unique identifier of this recommendation.

RecommendationType <string>

The type or category of this recommendation.

RecommendationDescription <int>

The full description of this recommendation.

RecommendationMetadata <int>

The metadata associated with this recommendation.

RecommendationState <bool>

The state of this recommendation.

RecommendationSource <string>

The source of this recommendation.

TargetType <string>

The type of target associated with this recommendation. E.g. Provisioning Scheme.

TargetName <bool>

The name of the target associated with this recommendation. E.g. Provisioning Scheme Name.

Reason <datetime>

The reason why this recommendation was dismissed or rejected by the user.

CreatedDateTimeInUTC <bool>

The datetime at which this recommendation was generated by the system.

UpdatedDateTimeInUTC <int> The datetime at which this recommendation was updated.

RemindInDateTimeInUTC <int> The datetime at which this recommendation needs to be reminded.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned.

CouldNotQueryDatabase The query required to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvResource

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Gets the list of resources created for provisioning schemes, image versions, and virtual machines.

Syntax

```
Get-ProvResource
   -ProvisioningSchemeName <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvResource
   -ProvisioningSchemeUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Let you retrieve the list of provisioning resources, such as disks created for a provisioning scheme, image versions, and virtual machines.

Examples

EXAMPLE 1

Returns the ProvisionedScheme object, ProvisionedImageVersion object, and ProvisionedVirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result

ProvisionedScheme
    ProvisionedImageVersion
-----------------
    ----------------------
Citrix.MachineCreation.Sdk.ProvisionedSchemeResource {
 /example.vm/example.snapshot, /example...
```

EXAMPLE 2

Returns the Id, Name, and Resource of the ProvisionedScheme object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedScheme

Id                                   Name                   Resource
--                                   ----                   --------
e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92 Example_Catalog
```

EXAMPLE 3

Returns ImageStatus, ID, and Name of the ProvisionedImageVersion sub-object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedImageVersion

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
ImageStatus Id                                   Name
----------- --                                   ----
Deleted     92bd1cb2-4d16-43ad-8672-04b28889f072 /example.vm/example.

Current     def7badc-4769-4c5d-93e1-2c20018dca26 /example.vm/example.
   snapshot
Deleted     9dca4d28-acc6-49c8-bdc4-94cc12b958ea /example.vm/example.
   snapshot
```

EXAMPLE 4

Returns the Resource (Id, ResourceType, and Metadata) of the ProvisionedImageVersion object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
   a309-1d53f7882e92'
$result.ProvisionedImageVersion[1].Resource

Id                                   ResourceType Metadata
--                                   ------------ --------
0005f0fa-2f3f-4361-9103-5d9e6b9c656c Disk         {
 Role, StorageId }
```

EXAMPLE 5

Returns the Metadata (Role and StorageId) of the resource of the ProvisionedImageVersion sub-object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
   a309-1d53f7882e92'
$result.ProvisionedImageVersion[1].Resource[0].Metadata

Key       Value
---       -----
Role      Base Disk
StorageId 1a033f55-d552-5ba9-e364-2af7b859303e
```

EXAMPLE 6

Returns ID, Name, and Resource of the provisioned virtual machines for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
   a309-1d53f7882e92'
$result.ProvisionedVirtualMachine

```

00000000-0000-0000-0000-000000000000 Disk         {
 Role, StorageId }
```

EXAMPLE 8

Returns the Metadata (Role, ParentDiskID, and StorageId for OS Delta Disk) of the Resource of the ProvisionedVirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedVirtualMachine[0].Resource[0].Metadata

Key          Value
---          -----
Role         OS Delta Disk
ParentDiskId 5eef2ad5-2b05-442c-a5b5-1a7e9ecaf36d
StorageId    1a033f55-d552-5ba9-e364-2af7b859303e
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 9

Returns the Metadata (Role and StorageId for Identity Disk) of the Resource of the ProvisionedVirtual-Machine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedVirtualMachine[0].Resource[1].Metadata

Key       Value
---       -----
Role      Identity Disk
StorageId 1a033f55-d552-5ba9-e364-2af7b859303e
```

EXAMPLE 10

Returns the Metadata (Role and StorageId for Personal Virtual Disk) of the Resource of the Provisioned-VirtualMachine object for the provisioning scheme ID "e9aa1cf8-b2a8-4c3c-a309-1d53f7882e92."

```
$result = Get-ProvResource -ProvisioningSchemeUid 'e9aa1cf8-b2a8-4c3c-
    a309-1d53f7882e92'
$result.ProvisionedVirtualMachine[0].Resource[2].Metadata

Key       Value
---       -----
Role      PersonalVDisk
StorageId
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Get-ProvResource.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedResource

This object provides details of the provisioning scheme and contains the following information:

ProvisionedScheme <Citrix.MachineCreation.Sdk.ProvisionedSchemeResource>

An object containing provisioning scheme id, name, and resources attached to the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisionedImageVersion <Citrix.MachineCreation.Sdk.ProvisionedImageVersionResource[] >

A list of objects containing provisioning scheme id, name, and resources attached to the provisioning image versions.

ProvisionedVirtualMachine <Citrix.MachineCreation.Sdk.ProvisionedVirtualMachineResource[] >

A list of objects containing provisioning scheme id, name, and resources attached to the provisioned virtual machines.

Notes

The Get-ProvResource cmdlet returns an object containing three sub-objects:

- The provisioned scheme
- Array of provisioned image versions
- Array of provisioned virtual machines

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Get-ProvSchedule

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Gets the list of Schedules created

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvSchedule
    [-ScheduleId <Guid>]
    [-ProvisioningSchemeName <String>]
    [-ProvisioningSchemeUid <String>]
    [-ProvisioningScheduleName <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides a filtered list of the Provisioning Schedules created using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Returns all the available provisioning schedule

```
C:\Windows\system32> Get-ProvSchedule -ScheduleId cf57bb18-c622-4078-
    a370-5c1bf23e7f66

ScheduleId                              : cf57bb18-c622-4078-a370-5
    c1bf23e7f66
ProvisioningScheduleName                : AWSMCSVMWare
ProvisioningSchemeName                  : MCSCatalog
Operation                               : TakeBackup
ScheduleCreationTime                    : 4/8/2024 4:55:36 PM

ProvisioningScheduleActive              : False
SessionWarningInMinutes                 : 35
SessionWarningLogOffMessage             : PLEASE SAVE SESSION BEFORE
    MACHINE IS TURNED OFF
PurgeMaintenanceCycleInfoAfterInDays    : 1
RecurringSchedule                       : Daily
ScheduleDescription                     : Backing Up VMs
MaxNumberOfBackups                      : 3
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ScheduleId

Unique identifier for the schedule

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

Gets the provisioning schedules associated to the provisioning scheme name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

Gets the provisioning schedules associated to the provisioning scheme uid

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ProvisioningScheduleName

Gets the provisioning schedules associated to the provisioning schedule name

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Get-ProvScheme

August 14, 2025

Gets a list of provisioning schemes.

Syntax

```
Get-ProvScheme
   [-ProvisioningSchemeUid <Guid>]
   [[-ProvisioningSchemeName] <String>]
   [-ScopeId <Guid>]
   [-ScopeName <String>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Allows you to retrieve the list of defined provisioning schemes.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Returns all of the available provisioning schemes.

```
Get-ProvScheme

CleanOnBoot                  : True
ControllerAddress            : {
  }

CpuCount                     : 1

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ScopeId

Gets only results with a scope matching the specified scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ScopeName

Gets only results with a scope matching the specified scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ImageDefinitionName <string>

The name for the image definition used for the provisioning scheme.

ImageVersionNumber <string>

The version number for the image version used for the provisioning scheme.

ImageVersionUid <Guid>

The identifier for the image version used for the provisioning scheme.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

WindowsActivationType <string>

Windows Activation Type set on the Master Image which has a mapping with the Provisioning Scheme.This feature is supported from 2303 and successive VDA versions. Any previous VDA version or if the vda is not of Windows Operating System Type, the field would be "UnsupportedVDA"

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PartialData

Only a subset of the available data was returned

CouldNotQueryDatabase

The query to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvSchemeImageVersionSpecHistory

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Gets the list of image version spec history that have been used to provide hard disks to provisioning schemes.

Syntax

```
Get-ProvSchemeImageVersionSpecHistory
   [-ProvisioningSchemeName <String>]
   [-ProvisioningSchemeUid <Guid>]
   [-ImageVersionSpecUid <Guid>]
   [-ImageVersionSpecHistoryUid <Guid>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to discover the image version specs used to provide the hard disk image for provisioning schemes. This information includes the date and time when the image version spec is used by provisioning scheme.

By default, this cmdlet returns only those image version specs that have been used previously. This information can be used to roll-back a provisioning scheme to a previous image version spec.

The ShowAll parameter may be supplied to also show the image version spec currently in use.

Examples

EXAMPLE 1

Gets all the hard disk images that have been used across all provisioning schemes.

```
Get-ProvSchemeImageVersionSpecHistory

ImageVersionSpecHistoryUid      : 3cba3a75-89cd-4868-989b-27feb378fec5
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
ImageVersionSpecUid    : b6bd3640-3e29-4933-8989-2510e43456d9
Date                   : 17/05/2020 09:27:50
FunctionalLevel        :
ImageStatus            : Current
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
ImageNote                : Office365 installed
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ImageVersionSpecUid

The image version spec Uid used by provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ImageVersionSpecHistoryUid

The unique identifier of the image version spec history item.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvSchemeImageVersionSpecHistory

This object represents a master VM image history item. It contains the following parameters:

ProvSchemeImageVersionSpecHistoryUid <Guid>

The unique identifier of the history item.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme used for the VM.

ProvisioningSchemeName <string>

The name of the provisioning scheme used for the VM.

ImageVersionSpecUid <string>

The unique identifier of the image version spec that was used by provisioning scheme.

Date <DateTime>

The date and time when the VM or snapshot was used in the provisioning scheme.

FunctionalLevel <string>

The FunctionalLevel of the VDA installed on the VM.

ImageStatus <string>

The status of the provisioning scheme image.

ImageNote <string>

The note of the provisioning scheme image version spec.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PartialData

Only a subset of the available data was returned.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CouldNotQueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvSchemeMasterVMImageHistory

August 14, 2025

Gets the list of master VM snapshots that have been used to provide hard disks to provisioning schemes.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvSchemeMasterVMImageHistory
    [-ProvisioningSchemeName <String>]
    [-ProvisioningSchemeUid <Guid>]
    [-MasterImageVM <String>]
    [-VMImageHistoryUid <Guid>]
    [-ImageStatus <String>]
    [-ShowAll]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to discover the master VM snapshots used to provide the hard disk image for provisioning schemes. This information includes the date and time when the image was created.

By default, this cmdlet returns only those snapshots that have been used previously. This information can be used to roll-back a provisioning scheme to a previous image.

The ShowAll parameter may be supplied to also show the snapshot for the image currently in use, and the snapshots for any images prepared for later use.

Examples

EXAMPLE 1

Gets all the hard disk images that have been used across all provisioning schemes.

```
Get-ProvSchemeMasterVMImageHistory

VMImageHistoryUid      : 3cba3a75-89cd-4868-989b-27feb378fec5
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
MasterImageVM          : /Base.vm/base.snapshot
Date                   : 17/05/2020 09:27:50
FunctionalLevel        :
ImageStatus            : Current
MasterImageId          : base-vm\base
MasterImageNote        : Office365 installed
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Roll back the provisioning scheme to use the hard disk from the update1.snapshot for the provisioning scheme called “MyScheme”.

```
Get-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName MyScheme -
    masterImageVM "/BaseXp.vm/update1.snapshot" | Publish-
    ProvMasterVMImage
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-MasterImageVM

The inventory path to the VM snapshot item used as the master VM image.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMImageHistoryUid

The unique identifier of the image history item.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ImageStatus

The status of the provisioning scheme image.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ShowAll

Show all images. This includes images currently in use, and images prepared for later use.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.VMImage

This object represents a master VM image history item. It contains the following parameters:

VMImageHistoryUid <Guid>

The unique identifier of the history item.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme used for the VM.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeName <string>

The name of the provisioning scheme used for the VM.

MasterImageVM <string>

The inventory path to the Snapshot item that was used as the master VM image.

Date <DateTime>

The date and time when the VM or snapshot was used in the provisioning scheme.

FunctionalLevel <string>

The FunctionalLevel of the VDA installed on the VM.

ImageStatus <string>

The status of the provisioning scheme image.

MasterImageId <string>

The unique identifier of the snapshot, as assigned by the hosting unit.

MasterImageNote <string>

The note of the provisioning scheme image.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CouldNotQueryDatabase

The query required to get the database was not defined.

CommunicationError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvSchemeResourceInStorage

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Gets the summary of the base disk and machine count in each OS storage for the provisioning scheme.

Syntax

```
Get-ProvSchemeResourceInStorage
   [-ProvisioningSchemeName] <String>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvSchemeResourceInStorage
   -ProvisioningSchemeUid <Guid>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Lets you retrieve the resource summary in each OS storage of the provisioning scheme, such as base disks and the machine count.

Examples

EXAMPLE 1

Returns the provisioning scheme name, hosting unit name, hosting unit id, and provisioning resource in storage object of the associated provisioning scheme id.

```
Get-ProvSchemeResourceInStorage -ProvisioningSchemeUid '9c08beec-154e-4
    a00-ad56-f97adb69aad4'

 ProvisioningSchemeName       : Vmware-MC
 ProvisioningSchemeUid        : 9c08beec-154e-4a00-ad56-f97adb69aad4
 HostingUnitName              : Vmware-hostingUnit
 HostingUnitUid               : 56b22b5e-b54d-49bc-a6f7-5dd336f6f70b
 ProvResourceInStorage        : {
datastore-11, datastore-12 }
```

EXAMPLE 2

Returns the provisioning scheme name, hosting unit name, hosting unit id, and provisioning resource in storage object of all the provisioning schemes with hosting unit as “Vmware-hostingUnit”.

```
Get-ProvScheme |Where-Object {
 $_.HostingUnitName -eq "Vmware-hostingUnit" }
  | Get-ProvSchemeResourceInStorage

 ProvisioningSchemeName       : Vmware-MC
 ProvisioningSchemeUid        : 9c08beec-154e-4a00-ad56-f97adb69aad4
 HostingUnitName              : Vmware-hostingUnit
 HostingUnitUid               : 56b22b5e-b54d-49bc-a6f7-5dd336f6f70b
 ProvResourceInStorage        : {
datastore-11, datastore-12 }

 ProvisioningSchemeName       : Vmware-MC2
 ProvisioningSchemeUid        : e9aa1cf8-b2a8-4c3c-a309-1d53f7882e76
 HostingUnitName              : Vmware-hostingUnit
 HostingUnitUid               : 56b22b5e-b54d-49bc-a6f7-5dd336f6f70b
 ProvResourceInStorage        : {
datastore-11, datastore-12 }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 3

Returns the ID, name, and resource of the provisioned scheme object of the provisioning scheme id "9c08beec-154e-4a00-ad56-f97adb69aad4".

```
$result = Get-ProvSchemeResourceInStorage -ProvisioningSchemeUid '9
   c08beec-154e-4a00-ad56-f97adb69aad4'
$result.ProvResourceInStorage | Format-List -Property *

OSStorageId         : datastore-11
OSStoragePath       : /Datacenter1.datacenter/Cluster1.cluster/
   datastore1.storage
OSStorageSuperseded : False
BaseDiskId          : {
 Version=2,LsiLogicScsi,1000,group-v4,[Datastore1]
Vmware-MC-baseDisk-datastore-11/Vmware-MC-baseDisk-datastore-11.vmdk,
   resgroup-93,Vmfs }

MachineCount        : 2

OSStorageId         : datastore-12
OSStoragePath       : /Datacenter1.datacenter/Cluster1.cluster/
   datastore2.storage
OSStorageSuperseded : False
BaseDiskId          : {
  }

MachineCount        : 0
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Get-ProvSchemeResourceInSt

Outputs

Citrix.MachineCreation.Sdk.ProvSchemeResourceInStorage

The object provides the resource details of the provisioning scheme and contains the following information:

ProvisioningSchemeName <string>

The name of the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme.

HostingUnitName <string>

The name of the hosting unit being used by the provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by the provisioning scheme.

ProvisionedResourceInStorage <Citrix.MachineCreation.Sdk.ProvisionedResourceInStorage[]>

A list of objects containing the OS storage id, path, base disk Id, and the number of machines located in the storage.

Notes

The Get-ProvSchemeResourceInStorage cmdlet returns an object containing the following five sub-objects:

- The provisioned scheme name
- The provisioned scheme id
- The hosting unit name
- The hosting unit id
- Array of provisioned resource in OS storage

Get-ProvSchemeVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Gets saved provisioning scheme configuration versions

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvSchemeVersion
    [-ProvisioningSchemeName] <String>
    [-Version <Int32>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Get-ProvSchemeVersion
    [-ProvisioningSchemeUid] <Guid>
    [-Version <Int32>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to list saved provisioning scheme configuration versions.

Examples

EXAMPLE 1

Configurations are listed for provisioning scheme AzureCatalog

```
Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog
CpuCount               : 2
CustomProperties       :
MachineProfile         : machineprofile.folder\matspo.resourcegroup\
    matspo-vm.templatespec\hibernate-2nic-fix.templatespecversion
MemoryInMB             : 14336
NetworkMaps            : {
 0, 1 }

ProvisioningSchemeName : AzureCatalog
ProvisioningSchemeUid  : 5b37b311-fa3f-49dd-b93b-661b9e6fa571
SecurityGroups         : {
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
  }

ServiceOffering        : serviceoffering.folder\Standard_D2s_v5.
    serviceoffering
VMMetadata             : {
 , , ,  ... }

Version                : 2

CpuCount               : 2
CustomProperties       :
MachineProfile         : machineprofile.folder\matspo.resourcegroup\
    matspo-vm.templatespec\hibernate-2nic-fix.templatespecversion
MemoryInMB             : 14336
NetworkMaps            : {
 0, 1 }

ProvisioningSchemeName : AzureCatalog
ProvisioningSchemeUid  : 5b37b311-fa3f-49dd-b93b-661b9e6fa571
SecurityGroups         : {
  }

ServiceOffering        : serviceoffering.folder\Standard_D2s_v5.
    serviceoffering
VMMetadata             : {
 , , ,  ... }

Version                : 1
```

EXAMPLE 2

Version 2 is listed for provisioning scheme AzureCatalog

```
Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog -Version 2
CpuCount               : 2
CustomProperties       :
MachineProfile         : machineprofile.folder\matspo.resourcegroup\
    matspo-vm.templatespec\hibernate-2nic-fix.templatespecversion
MemoryInMB             : 14336
NetworkMaps            : {
 0, 1 }

ProvisioningSchemeName : AzureCatalog
ProvisioningSchemeUid  : 5b37b311-fa3f-49dd-b93b-661b9e6fa571
SecurityGroups         : {
  }

ServiceOffering        : serviceoffering.folder\Standard_D2s_v5.
    serviceoffering
VMMetadata             : {
 , , ,  ... }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Version                : 2
```

Parameters

-ProvisioningSchemeUid

Filter by the unique identifier of the provisioning scheme.

Type:	Guid
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

Filter by the name of the provisioning scheme.

Type:	String
Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Version

Filter by the version of the provisioning scheme

Type:	Int32
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningSchemeVersion

The object has the following properties:

Version <int>

The current version of the configuration

CpuCount <int>

The number of processors allocated to VMs in the provisioning scheme.

MemoryInMB <int>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The maximum amount of memory allocated to VMs in the provisioning scheme.

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in cloud hypervisors.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

Get-ProvSchemeWarning

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Gets a list of provisioning schemes warnings.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvSchemeWarning
    [-ProvisioningSchemeUid <Guid>]
    [-ProvisioningSchemeName <String>]
    [-WarningId <Int32>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to retrieve the list of provisioning scheme warnings.

Examples

EXAMPLE 1

Returns the warning with a warning Id of 42.

```
Get-ProvSchemeWarning -WarningId 42

ProvisioningSchemeName       : CatalogWindows11AWS
ProvisioningSchemeUid        : 7585f0de-192e-4847-a6d8-22713c3a2f42
WarningId                    : 42
WarningMessage               : Deprecated custom attribute
RecommendedAction            : Remove obsolete custom attribute
AdditionalData               : AwsCaptureInstanceProperties is now
    deprecated
WarningStateType             : New
OperationName                : New-ProvScheme
WarningReportingDateTime     : 17/05/2022 09:27:50
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to get the warnings of.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme to get the warnings of.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-WarningId

The id of the warning to retrieve.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvWarning

This object provides details of the provisioning scheme warning and contains the following information:

WarningId <int> The Unique identifier of this warning.

ProvisioningSchemeUid <Guid> The unique identifier for this provisioning scheme this warning is associated with.

ProvisioningSchemeName <Guid> The name for this provisioning scheme this warning is associated with.

WarningMessage <string[]> The warning description.

RecommendedAction <string> The optional recommended action to take to help resolve the warning.

AdditionalData <string> Optional, additional data related to the warning.

WarningStateType <string> The warning state of this provisioning scheme warning, either New or Acknowledged.

OperationName <string> The operation which triggered the warning.

WarningReportingDateTime <DateTime> The date and time the warning was created (UTC).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvScopedObject

August 14, 2025

Gets the details of the scoped objects for the Machine Creation Service.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvScopedObject
    [-ScopeId <Guid>]
    [-ScopeName <String>]
    [-ObjectType <ScopedObjectType>]
    [-ObjectId <String>]
    [-ObjectName <String>]
    [-Description <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Examples

EXAMPLE 1

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

```
Get-ProvScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Parameters

-ScopeId

Gets scoped object entries for the given scope identifier.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ScopeName

Gets scoped object entries with the given scope name.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ObjectType

Gets scoped object entries for objects of the given type.

Type:	ScopedObjectType
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ObjectId

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ObjectName

Gets scoped object entries for objects with the specified object identifier.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Description

Gets scoped object entries for objects with the specified description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ScopedObject

You can pipe any object containing a parameter called 'ScopeId', 'ScopeName', 'ObjectType', 'ObjectId' or 'ObjectName', or any combination of them as filter parameter(s) to Get-ProvScopedObject.

Outputs

Citrix.MachineCreation.Sdk.ScopedObject

The Get-ProvScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Unique identifier of the scope.

ScopeName <string>

Display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <string>

Unique identifier of the object.

ObjectName <string>

Display name of the object.

Description <string>

Description of the object (possibly $null if the object type does not have a description).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvService

August 14, 2025

Gets the service record entries for the MachineCreation Service.

Syntax

```
Get-ProvService
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns instances of the MachineCreation Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the MachineCreation Service running in the current service group.

```
Get-ProvService

Uid               : 1
ServiceHostId     : aef6f464-f1ee-4042-a523-66982e0cecd0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
DNSName             : MyServer.company.com
MachineName         : MYSERVER
CurrentState        : On
LastStartTime       : 04/04/2011 15:25:38
LastActivityTime    : 04/04/2011 15:33:39
OSType              : Win32NT
OSVersion           : 6.1.7600.0
ServiceVersion      : 5.1.0.0
DatabaseUserName    : NT AUTHORITY\NETWORK SERVICE
Sid                 : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

Parameters

-Metadata

Gets records with matching metadata entries. The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata “abc:x*”matches records with a metadata entry having a key name of “abc”and a value starting with the letter “x”.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.Service

The Get-ProvServiceInstance command returns an object containing the following properties.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-ProvServiceAddedCapability

August 14, 2025

Gets any added capabilities for the MachineCreation Service on the controller.

Syntax

```
Get-ProvServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the MachineCreation Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the MachineCreation Service.

```
Get-ProvServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvServiceConfigurationData

August 14, 2025

Gets configuration data for the service.

Syntax

```
Get-ProvServiceConfigurationData
    [-Name <String[]>]
    [-Value <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to retrieve the configuration parameters for the Machine Creation Service.

Examples

EXAMPLE 1

Get the Configuration data for the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvConfigurationData

Name                : DeltaDiskDelete.timeDelay
Value               : 10
```

Parameters

-Name

The configuration data item name.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Value

The configuration data item value.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ServiceConfigurationData

This object provides details of the configuration data and contains the following information:

Name <string>

The name for the configuration item.

Value <string>

The value for the configuration item.

Notes

In the case of failure the following errors can be produced.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Get-ProvServiceInstance

August 14, 2025

Gets the service instance entries for the MachineCreation Service.

Syntax

```
Get-ProvServiceInstance
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the MachineCreation Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the MachineCreation Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-ProvServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ServiceInstance

The Get-ProvServiceInstance command returns an object containing the following properties.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This

© 1997–2025 Citrix Systems, Inc. All rights reserved.

indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvServiceStatus

August 14, 2025

Gets the current status of the MachineCreation Service on the controller.

Syntax

```
Get-ProvServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the MachineCreation Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the current status of the MachineCreation Service.

```
Get-ProvServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-ProvServiceStatus cmdlet returns an object containing the status of the MachineCreation Service together with extra diagnostics information.

- DBUnconfigured

  The MachineCreation Service does not have a database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBRejectedConnection

  The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The MachineCreation is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The MachineCreation is connected to a database that is valid, but it does not have the full functionality required so the MachineCreation cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

- DBOlderVersionThanService

  The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The MachineCreation Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the MachineCreation Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Failed

  Connectivity between the MachineCreation and the database has been lost for an extended period of time, or has failed due to a configuration problem. The MachineCreation service cannot operate while its connection to the database is unavailable.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvTask

August 14, 2025

Gets the task history for the Machine Creation Service.

Syntax

```
Get-ProvTask
   [[-TaskId] <Guid>]
   [-Type <JobType>]
   [-Active <Boolean>]
   [-Metadata <String>]
   [-Property <String[]>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of tasks that have run or are currently running on the Machine Creation Service.

Examples

EXAMPLE 1

Get all completed tasks for the Machine Creation Service. All tasks will publish at least the fields listed above, plus more related to the particular task being performed.

```
Get-ProvTask -Active $false

TaskId                  : cfe5b3a2-c471-443e-b05e-8658e672d10f
Active                  : False
Host                    : NYSERVER
DateStarted             : 10/10/2020 15:27:34
Type                    : DisusedImageCleanup
Metadata                : {
  }

CurrentOperation        :
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
TaskProgress              : 100
LastUpdateTime            : 10/10/2020 15:28:12
ActiveElapsedTime         : 56
DateFinished              : 10/10/2020 15:28:12
TerminatingError          :
Status                    : Finished
TaskExpectedCompletion    : 10/10/2012 15:28:12
...
```

Parameters

-Type

Specifies the type of task to be returned.

Type:	JobType
Accepted values:	AllJobTypes, NewProvisioningScheme, NewVirtualMachine, PublishImage, RemoveVirtualMachine, ResetVMPendingDiskRemoval, DisusedImageCleanUp, VMRecreation, DiskReplication, DiskUpload, DiskCopy, ResetVMDisk, RemoveProvScheme, NewImageVersion, SetProvisioningSchemeImage, RemoveProvImageDefinition, MoveVMDisk, RemoveProvImageVersion, NewBackup, RestoreBackup, RemoveBackup, NewProvImageVersionSpec, RemoveProvImageVersionSpec, AddProvImageDefinitionConnection, RemoveProvImageDefinitionConnection, AddProvImageVersionSpecHostingUnit, RemoveProvImageVersionSpecHostingUnit, SwitchProvCatalog, RollbackProvCatalog, CleanupSourceResources
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Active

Specifies whether currently running tasks only or completed tasks only are returned.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Specifies the metadata entry that returned tasks should contain.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-TaskId

Specifies the task identifier to be returned.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains at least the fields listed below. The fields output order and additional fields are related to the particular task type being performed.

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Status <string>

Where in its lifecycle the task is.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

Notes

If the command fails, the following errors can result.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Get-ProvVM

August 14, 2025

Gets the VMs created using Machine Creation Services.

Syntax

```
Get-ProvVM
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-ADAccountSid <String>]
    [-VMName <String>]
    [-Locked <Boolean>]
    [-Tag <String>]
    [-OutOfDate]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to obtain a list of the VMs that were created using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Gets all the Virtual Machines that were provisioned using the Provisioning Scheme called 'MyScheme'.

```
Get-ProvVM -provisioningSchemeName MyScheme

ADAccountName                     : MYDomain\computer2$
ADAccountSid                      : S
    -1-5-21-3751941309-1176885247-1409628468-3179
CpuCount                          : 1
CreationDate                      : 17/05/2021 09:35:22
Domain                            : steve.dum.local
ImageOutOfDate                    : False
Lock                              : True
MemoryMB                          : 512
ProvisioningSchemeName            : XenPS
ProvisioningSchemeUid             : 5135a865-ba49-4e5f-87f2-2
    d65ee7a4e51
ProvisioningSchemeUpdateRequested : 17/05/2021 09:39:03

```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ADAccountSid

The SID of the VM.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-VMName

The name of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Locked

Indicates whether only VMs that are marked as locked are returned or not (see Lock-ProvVM and Unlock-ProvVM for details).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Tag

The tag string that was associated with the VM when it was locked.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-OutOfDate

Indicates that the image currently assigned to the VM is out of date. The image will be updated the next time the VM is restarted.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

The object has the following properties:

ADAccountSid <string>

The SID of the AD computer account that the VM is using.

ADAccountName <string>

The name of the AD computer account that the VM is using.

CpuCount <int>

The number of processors allocated to the VM.

CreationDate <DateTime>

The date and time when the VM was created.

CurrentBackupName <string>

The name of the provisioned backup roughly closest to the state of the VM.

If a backup is removed, the parent of the backup becomes the current backup.

If the backup has no parent, this field is empty.

Domain <string>

The Domain of the AD computer account that the VM is using.

ImageOutOfDate <bool>

Indicates if the image will be updated next time the VM is started.

Lock <bool>

Indicates whether the VM is locked or not.

MemoryMB <int>

The maximum amount of memory allocated to the VM.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

PropertyUpdateWindowStart <DateTime>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Defines the start of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

PropertyUpdateWindowEnd <DateTime>

Defines the end of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme currently used by this VM.

ProvVMConfigurationVersion <int>

The version of the custom configuration currently used by this VM.

Tag <string>

Provides the string associated with a locked VM.

VMId <string>

The identifier for the VM in the hypervisor.

VMName <string>

The name of the VM in the hypervisor.

AssignedImage <string>

The identifier (in the hypervisor) for the hard disk image that the VM is currently assigned.

BootedImage <string>

The identifier (in the hypervisor) for the hard disk image with which the VM is currently started.

HostingUnitUid <Guid>

The unique identifier of the hosting unit that was used to create the VM.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection that was used to create the VM.

IdentityDiskIndex <int>

The disk index on which the identity disk is attached.

LastBootTime <DateTime>

The date and time of the last start of the VM.

OSDiskIndex <int>

The disk index on which the hard disk image, from which the VM is currently started, is attached. It is set to [int]::MinValue for VMs inherited from versions of XenDesktop 5.6 or earlier.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PersonalVDiskIndex <int>

The disk index on which the personal vdisk is attached. Defaults to [int]::MinValue for VMs without a personal vDisk.

PersonalVDiskStorage <string>

The identifier (in the hypervisor) for the storage on which the personal vDisk image attached to the VM is located. This is set only if the VM has a personal vDisk attached.

StorageId <string>

The identifier (in the hypervisor) for the storage on which the hard disk image, from which the VM is currently started, is located.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings Used to create the VM.

IdentityDiskId <string>

The identifier (in the hypervisor) for the identity disk attached to the VM.

IdentityDiskStorage <string>

The identifier (in the hypervisor) for the storage on which the identity disk image from which the VM is currently started is located.

PersonalVDiskId <string>

The identifier (in the hypervisor) for the personal vDisk attached to the VM. This is set only if the VM has a personal vDisk attached.

SecurityGroups <string[]>

The security groups that has been applied to the VM. This only applies in a Cloud provisioning context.

AdditionalStorage <System.Collections.Generic.Dictionary[string, AdditionalStorageDiskImage]>

Additional storage disk images attached to this VM keyed by their storage tier names.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache if specified in MB.

UseFullDiskCloneProvisioning <bool>

Indicates if the VM was created using the dedicated full disk clone feature.

CustomVmData <string>

Hypervisor specific custom data packet that has been associated with the virtual machine if any.

WorkgroupMachine <bool>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Indicates if the VM is joined to a workgroup.

WindowsActivationType <string>

Windows Activation Type of the Provisioned Virtual Machine. The default value is unknown and the field is populated once the virtual machine registers with DDC. This is supported only on 2303 and successive versions.

WindowsActivationStatus <string>

Windows Activation Status of the provisioned virtual machine. This is by default set to unknown and is updated when the vda registers with the DDC. The updated values can be Active:The virtual machine is licensed and activated, Inactive:The virtual machine is unlicensed, Errored:An error occured while trying to activate the system.

WindowsActivationStatusErrorCode <string>

The default value is Unknown. If successful, it displays as Success, else it displays with the associated error code.

WindowsActivationStatusVirtualMachineError <string>

Provides a detailed information of potential error message seen while activating the windows system

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvVMBackup

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the provisioned backups created using Machine Creation Services.

Syntax

```
Get-ProvVMBackup
   [[-ProvisioningSchemeUid] <Guid>]
   [[-ProvisioningSchemeName] <String>]
   [-ScheduleId <Guid>]
   [-VMName <String>]
   [-BackupName <String>]
   [-BackupUid <Guid>]
   [-UserVisible <Boolean>]
   [-DeletionProtected <Boolean>]
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to obtain a list of provisioned backups that were created using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Gets all the Provisioned Backups of Virtual Machines that were provisioned using the Maintenance Schedule ID called 'MyScheduleID'.

```
Get-ProvVMBackup -MaintenanceScheduleId MyScheduleID
CreationDate              : 17/05/2021 09:35:22
ProvisioningSchemeName    : XenPS
ProvisioningSchemeUid     : 5135a865-ba49-4e5f-87f2-2d65ee7a4e51
BackupId                  : f312dteh-ddc5-8bd1-jh5e-4bjd44h39gck
BackupName                : Backup002
ProvisioningSchemeVersion : 1
VMId                      : a830de93-ddc5-b763-dc1a-35580a31401c
VMName                    : IP0051
HostingUnitUid            : ea17840f-cf2d-4d80-94e0-3b752b32e0af
HypervisorConnectionUid   : 99f9f826-31fc-4453-8ca0-9ba54306c3ac
DeletionProtection        : true
```

EXAMPLE 2

Gets all the Provisioned Backups of Virtual Machines that were provisioned using the Provisioning Scheme called 'MyScheme'.

```
Get-ProvVMBackup -provisioningSchemeName MyScheme
CreationDate              : 17/05/2021 09:35:22
ProvisioningSchemeName    : XenPS
ProvisioningSchemeUid     : 5135a865-ba49-4e5f-87f2-2d65ee7a4e51
BackupId                  : f312dteh-ddc5-8bd1-jh5e-4bjd44h39gck
BackupName                : Backup003
ProvisioningSchemeVersion : 1
VMId                      : a830de93-ddc5-b763-dc1a-35580a31401c
VMName                    : IP0051
HostingUnitUid            : ea17840f-cf2d-4d80-94e0-3b752b32e0af
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
HypervisorConnectionUid   : 99f9f826-31fc-4453-8ca0-9ba54306c3ac
DeletionProtection        : true
```

EXAMPLE 3

Gets all the Provisioned Backups with deletion protection, regardless of which Provisioning Scheme the associated VM was created with.

```
Get-ProvVMBackup -DeletionProtected $true
CreationDate              : 17/05/2021 09:35:22
ProvisioningSchemeName    : XenPS
ProvisioningSchemeUid     : 5135a865-ba49-4e5f-87f2-2d65ee7a4e51
BackupId                  : f312dteh-ddc5-8bd1-jh5e-4bjd44h39gck
BackupName                : Backu003
ProvisioningSchemeVersion : 1
VMId                      : a830de93-ddc5-b763-dc1a-35580a31401c
VMName                    : IP0051
HostingUnitUid            : ea17840f-cf2d-4d80-94e0-3b752b32e0af
HypervisorConnectionUid   : 99f9f826-31fc-4453-8ca0-9ba54306c3ac
DeletionProtection        : true
```

Parameters

-ScheduleId

The unique identifier of the maintenance schedule.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the associated VM in the hypervisor.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BackupName

The name of the provisioned backup in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-BackupUid

The Uid of the provisioned backup in the hypervisor.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-UserVisible

Indicates whether the backup is visible to users.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DeletionProtected

Indicates whether only provisioned backups that are marked as deletion protected are returned or not (see Delete-ProvVMBackup for details).

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedBackup

The object has the following properties:

CreationDate <DateTime>

The date and time when the backup was created.

Domain <string>

The Domain of the AD computer account that the VM is using.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the backup.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the backup.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme used by the associated VM at the time of backup creation.

BackupName <string>

The name of the provisioned backup.

BackupUid <Guid>

The unique identifier of the provisioned backup.

Description <string>

The description of the provisioned backup.

DeletionProtection <bool>

Flag indicating if backup requires explicit deletion.

UerVisible <bool>

Flag indicating if backup is visible to users.

HypervisorID<string>

The hypervisor identifier of the provisioned backup.

ScheduleId <Guid>

The unique identifier of the maintenance schedule associated with the backup.

VMName <string>

The name of the associated VM in the hypervisor.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

VMId <string>

The identifier for the associated VM in the hypervisor.

ProvVMConfigurationVersion <int>

The version of the custom configuration used by the associated VM at the time of backup creation.

HostingUnitUid <Guid>

The unique identifier of the hosting unit that was used to create the associated VM.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection that was used to create the associated VM.

Notes

In the case of failure, the following errors can result. Error Codes ————

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Get-ProvVMBackupLimit

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Gets the limit on user-visible provisioned backups for a provisioning scheme.

Syntax

```
Get-ProvVMBackupLimit
    [[-ProvisioningSchemeUid] <Guid>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Obtains the number of user-visible backups allowed for a provisioning scheme. If this limit is met or exceeded, no new user-visible backups can be made.

Examples

EXAMPLE 1

Gets the number of user-visible backups allowed for a Virtual Machines in the Provisioning Scheme Uid 5135a865-ba49-4e5f-87f2-2d65ee7a4e51.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvVMBackupLimit -provisioningSchemeName 5135a865-ba49-4e5f-87f2-2
    d65ee7a4e51
            ProvisioningSchemeUid     : 5135a865-ba49-4e5f-87f2-2
               d65ee7a4e51
            BackupLimit               : 5
```

Parameters

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedBackupLimit

The object has the following properties:

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the backup.

BackupLimit <int>

The number of user-visible backups allowed for the provisioning scheme.

Notes

In the case of failure, the following errors can result. Error Codes ————

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvVMConfiguration

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

Gets the custom configuration properties for virtual machines created using Machine Creation Services.

Syntax

```
Get-ProvVMConfiguration
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-VMName <String>]
    [-VMId <String>]
    [-Version <Int32>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability to list current configuration properties for virtual machines created using Machine Creation Services.

The returned list of properties details what has been applied to VMs specifically with Set-ProvVM. It does not consistute the full set of properties VMs will have when the configuration is applied, to view that information use Get-ProvVMConfigurationResultantSet

Examples

EXAMPLE 1

Configuration is listed on the ProvScheme. Get-ProvVMConfiguration is used to obtain configuration data for all machines in example-catalog. Compare with Example 1 under Get-ProvVMConfigurationResultantSet

```
Get-ProvScheme -ProvisioningSchemeName example-catalog | select
    ProvisioningSchemeName, ServiceOffering, CustomProperties
ProvisioningSchemeName : example-catalog
ServiceOffering        : serviceoffering.folder\Standard_D2_v3.
    serviceoffering
CustomProperties       : <CustomProperties xmlns="http://schemas.citrix
    .com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
                           <Property xsi:type="StringProperty" Name="
                              SchemaVersion" Value="2" />
                           <Property xsi:type="StringProperty" Name="
                              UseManagedDisks" Value="true" />
                           <Property xsi:type="StringProperty" Name="
                              OsType" Value="Windows" />

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	True

-VMId

The ID of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-Version

The version of the machine configuration.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedMachineConfiguration

The object has the following properties:

Version <int>

The current version of the configuration

CpuCount <int>

The number of processors allocated to the VM.

MemoryInMB <int>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The maximum amount of memory allocated to the VM.

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in cloud hypervisors.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

VMId <string>

The identifier for the VM in the hypervisor.

VMName <string>

The name of the VM in the hypervisor.

Get-ProvVMConfigurationResultantSet

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

Gets the resultant configuration properties for virtual machines created using Machine Creation Services.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvVMConfigurationResultantSet
    [-ProvisioningSchemeUid <Guid>]
    [[-ProvisioningSchemeName] <String>]
    [-VMName <String>]
    [-VMId <String>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to list the resultant configuration properties for virtual machines created using Machine Creation Services. This merges properties at the provisioning scheme level with those set on a machine with Set-ProvVM specifically.

To configure a machine with custom configuration data, see Set-ProvVM To list just the properties specific to a machine, use Get-ProvVMConfiguration

Examples

EXAMPLE 1

Configuration is listed on the ProvScheme. Get-ProvVMConfigurationResultantSet is used to obtain configuration data for all machines in example-catalog. Compare with Example 1 under Get-ProvVMConfiguration

```
Get-ProvScheme -ProvisioningSchemeName example-catalog | select
    ProvisioningSchemeName, ServiceOffering, CustomProperties
ProvisioningSchemeName : example-catalog
ServiceOffering        : serviceoffering.folder\Standard_D2_v3.

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-VMId

The ID of the VM in the hypervisor.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	0
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ProvisionedMachineConfigurationResultantSet

The object has the following properties:

CpuCount <int>

The number of processors allocated to the VM.

MemoryInMB <int>

The maximum amount of memory allocated to the VM.

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the VM.

VMId <string>

The identifier for the VM in the hypervisor.

VMName <string>

The name of the VM in the hypervisor.

Get-ProvVMDetails

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Gets details of a VM created using Machine Creation Services.

Syntax

```
Get-ProvVMDetails
   -ProvisioningSchemeUid <Guid>
   -VMName <String>
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-ProvVMDetails
   -ProvisioningSchemeName <String>
   -VMName <String>
   [-ReturnTotalRecordCount]
   [-MaxRecordCount <Int32>]
   [-Skip <Int32>]
   [-SortBy <String>]
   [-Filter <String>]
   [-FilterScope <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to view detailed information about VMs created using Citrix Machine Creation Services.

Examples

EXAMPLE 1

Gets the VM details of “myVM1”in provisioning scheme “myCatalog”.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvVMDetails -ProvisioningSchemeName "catalog" -VMName "myVM1"

CpuCount                    : 2
DiskInfo                    : {

83
84  WindowsActivationType       : KeyManagementService
85  WriteBackCacheDiskSize      : 0
86  WriteBackCacheMemorySize    : 0
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

The name of the provisioning scheme. If empty

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-VMName

The name of the virtual machine.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ReturnTotalRecordCount

See about_Prov_Filtering for details.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

See about_Prov_Filtering for details.

Type:	Int32
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

See about_Prov_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SortBy

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

See about_Prov_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.VMDetailsFull

The object has the following properties:

Name <string>

The Name of the VM.

ProvisioningSchemeName <string>

The name of the provisioning scheme.

CpuCount <int>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The number of CPUs.

MemoryMB <int>

The amount of memory in MB.

Persistent <bool>

The persistency setting of the VM.

IdentityType <string>

The identity type of the VM.

ProvisioningSchemeVersion <string>

The version of the provisioning scheme.

ImageOutOfDate <bool>

The image is out of date.

LastBootTime <datetime>

The last boot time of the VM.

UseWriteBackCache <bool>

The write back cache setting of the VM.

WriteBackCacheDiskSize <int>

The size of the write back cache disk.

WriteBackCacheMemorySize <int>

The size of the write back cache memory.

Identities <string>

The domain name or Azure AD tenant ID of the VM.

ProvVMConfigurationVersion <int>

The version of the VM configuration.

WindowsActivationType <string>

The Windows activation type of the VM.

DiskInfo <string>

The disk information of the VM in JSON format.

NetworkInfo <string>

The network information of the VM in JSON format.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

MCSInfo <string>

The MCS information of the VM in JSON format.

ImageInfo <string>

The image information of the VM in JSON format.

SecurityInfo <string>

The security information of the VM in JSON format.

VMInfo <string>

Other general information of the VM in JSON format.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned.

CouldNotQueryDatabase The query required to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Get-ProvVMPrices

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Gets the list of vitrual machine's prices.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-ProvVMPrices
   -HypervisorConnectionUid <Guid>
   -HostedMachineIds <String[]>
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Let you retrieve the list of vitrual machine's power on and power off prices.

Examples

EXAMPLE 1

Returns the virtual machine's prices

```
$vmIds = @('testgroup/vm1', 'testgroup/vm2')
$res = Get-ProvVMPrices -HypervisorConnectionUid $con.
   HypHypervisorConnectionUid -HostedMachineIds $vmIds
$res
PowerOff                            PowerOn
   VMId
--------                            -------
   ----
Citrix.MachineCreation.Sdk.VMPrice Citrix.MachineCreation.Sdk.VMPrice
   testgroup/vm1
Citrix.MachineCreation.Sdk.VMPrice Citrix.MachineCreation.Sdk.VMPrice
   testgroup/vm2
$res[0].PowerOn

Parameters

-HypervisorConnectionUid

Connection Uids group to specific hypervisor.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-HostedMachineIds

The unique VM Id array within the hosting connection, For Azure it will be '{resourcegroupname}/{vm name}'

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	True

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.VirtualMachinePriceResult

This object provides details of vitrual machine's price.

VMId <string> An Id of virtual machine.

PowerOn <Citrix.MachineCreation.Sdk.VMPrice> The price of the VM when it is powered on.

PowerOff <Citrix.MachineCreation.Sdk.VMPrice> The price of the VM when it is powered off.

Notes

The Get-ProvVMPrices cmdlet returns an object containing three sub-objects:

- The Id of virtual machine.
- The price of the VM when it is powered on.
- The price of the VM when it is powered off.

Import-ProvScheme

August 14, 2025

Import a provisioning scheme into the site

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Import-ProvScheme
       [-ProvisioningSchemeData <String>]
       [-Scope <String[]>]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet imports a provisioning scheme into the site. The data passed to this cmdlet should generally be obtained through the Export-ProvScheme cmdlet from a different site.

Examples

EXAMPLE 1

Import the JSON encoded data that is in $provisioningSchemeData.

```
Import-ProvScheme -ProvisioningSchemeData $provisioningSchemeData

CleanOnBoot                  : True
ControllerAddress            : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }

WriteBackCacheMemorySize     : 256
Warnings                     : {
  }

WriteBackCacheDiskIndex      : 0
```

Parameters

-ProvisioningSchemeData

JSON encoded string of a provisioning scheme, image history, and VMs created with the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Scope

The administration scopes to be applied to the new provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

String

You can pipe a JSON encoded string of a provisioning scheme to Import-ProvScheme.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

CouldNotQueryDatabase The query required to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

Import-ProvVM

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Import provisioning virtual machines under the given provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Import-ProvVM
       [-ProvisioningSchemeName <String>]
       -ProvisioningVirtualMachineData <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Import-ProvVM
       [-ProvisioningSchemeUid <Guid>]
       -ProvisioningVirtualMachineData <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

This cmdlet reads the list of provisioning virtual machines (VMs) of a given provisioning scheme and imports them to the database. The list of VMs can be obtained from the output of the Export-ProvScheme cmdlet. If a VM in the list already exists in the database, it will fail silently. If the provisioning scheme the VM is associated with does not exist, it will return an error. This cmdlet returns a list of VM objects imported successfully.

Examples

EXAMPLE 1

Import the JSON encoded provisioning virtual machines that is in $ExportedProvVMs

```
Import-ProvVM -ProvisioningSchemeName ExampleCatalog -
    provisioningVirtualMachineData $ExportedProvVMs

FailureReason                                : The VM already exists

```

Parameters

-ProvisioningVirtualMachineData

JSON encoded string of VMs created with the provisioning scheme

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ImportProvVmModel

The returned objects provides details of the provisioning virtuam machines and contains the following information.

FailureReason <string> The reason for the failure of importing the VM.

ImportStatus <string> The status of the imported VM.

ADAccountName <string> The name of the AD computer account that the VM is using.

ADAccountSid <string> The SID of the AD computer account that the VM is using.

CpuCount <int> The number of processors allocated to the VM.

CreationDate <DateTime> The date and time when the VM was created.

Domain <string> The Domain of the AD computer account that the VM is using.

ImageOutOfDate <bool> Indicates if the image will be updated next time the VM is started.

Lock <bool> Indicates whether the VM is locked or not.

MemoryMB <int> The maximum amount of memory allocated to the VM.

PropertyUpdateWindowEnd <DateTime> Defines the end of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

PropertyUpdateWindowStart <DateTime> Defines the start of the time window wherein if the VM is booted, it will be updated to the latest provisioning scheme and personalization settings.

ProvisioningSchemeName <string> The name of the provisioning scheme associated with the VM.

ProvisioningSchemeUid <Guid> The unique identifier of the provisioning scheme associated with the VM.

ProvisioningSchemeVersion <int> The version of the provisioning scheme currently used by this VM.

ProvVMConfigurationVersion <int> The version of the custom configuration currently used by this VM.

Tag <string> Provides the string associated with a locked VM.

VMId <string> The identifier for the VM in the hypervisor.

VMName <string> The name of the VM in the hypervisor.

AssignedImage <string> The identifier (in the hypervisor) for the hard disk image that the VM is currently assigned.

BootedImage <string> The identifier (in the hypervisor) for the hard disk image with which the VM is currently started.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitUid <Guid> The unique identifier of the hosting unit that was used to create the VM.

HypervisorConnectionUid <Guid> The unique identifier of the hypervisor connection that was used to create the VM.

IdentityDiskIndex <int> The disk index on which the identity disk is attached.

LastBootTime <DateTime> The date and time of the last start of the VM.

OSDiskIndex <int> The disk index on which the hard disk image, from which the VM is currently started, is attached. It is set to [int]::MinValue for VMs inherited from versions of XenDesktop 5.6 or earlier.

PersonalVDiskIndex <int> The disk index on which the personal vdisk is attached. Defaults to [int]::MinValue for VMs without a personal vDisk.

PersonalVDiskStorage <string> The identifier (in the hypervisor) for the storage on which the personal vDisk image attached to the VM is located. This is set only if the VM has a personal vDisk attached.

StorageId <string> The identifier (in the hypervisor) for the storage on which the hard disk image, from which the VM is currently started, is located.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]> The NIC/network mappings Used to create the VM.

IdentityDiskId <string> The identifier (in the hypervisor) for the identity disk attached to the VM.

IdentityDiskStorage <string> The identifier (in the hypervisor) for the storage on which the identity disk image from which the VM is currently started is located.

PersonalVDiskId <string> The identifier (in the hypervisor) for the personal vDisk attached to the VM. This is set only if the VM has a personal vDisk attached.

SecurityGroups <string[]> The security groups that has been applied to the VM. This only applies in a Cloud provisioning context.

AdditionalStorage <System.Collections.Generic.Dictionary[string, AdditionalStorageDiskImage]> Additional storage disk images attached to this VM keyed by their storage tier names.

UseFullDiskCloneProvisioning <bool> Indicates if the VM was created using the dedicated full disk clone feature.

WriteBackCacheMemorySize <int> The size of the write-back memory cache if specified in MB.

CustomVmData <string> Hypervisor specific custom data packet that has been associated with the virtual machine if any.

WorkgroupMachine <bool> Indicates if the VM is joined to a workgroup.

WindowsActivationType <string> Windows Activation Type of the Provisioned Virtual Machine. The default value is unknown and the field is populated once the virtual machine registers with DDC. This is supported only on 2303 and successive versions.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WindowsActivationStatus <string> Windows Activation Status of the provisioned virtual machine. This is by default set to unknown and is updated when the vda registers with the DDC. The updated values can be Active:The virtual machine is licensed and activated, Inactive:The virtual machine is unlicensed, Errored:An error occured while trying to activate the system.

WindowsActivationStatusErrorCode <string> The default value is Unknown. If successful, it displays as Success, else it displays with the associated error code.

WindowsActivationStatusVirtualMachineError <string> Provides a detailed information of potential error message seen while activating the windows system

Notes

The scope of Import-ProvVm is limited to importing (newly added) VMs only. It assumes

the items below.

1. Import-AcctIdentityPool is done.
2. Import-ProvScheme is done.
3. The input data to Import-ProvVM includes the list of Provisioning VMs.

Lock-ProvVM

August 14, 2025

Locks one or more VM(s).

Syntax

```
Lock-ProvVM
    -ProvisioningSchemeName <String>
    [-VMID] <String[]>
    [-Tag <String>]
    [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Lock-ProvVM
    -ProvisioningSchemeUid <Guid>
    [-VMID] <String[]>
    [-Tag <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to 'lock'virtual machine(s) with a tag string. This indicates that the VM is being used, and prevents other commands from removing the VM without unlocking it.

Examples

EXAMPLE 1

Locks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4'in the provisioning scheme 'MyScheme'with the tag 'LockedString'.

```
Lock-ProvVM -provisioningSchemeName MyScheme -VMId  bc79802c-ba6e-8de8
    -99e9-4c35d7ad24b4 -Tag LockedString
```

EXAMPLE 2

Locks all the VMs in the provisioning scheme 'MyScheme'with the tag 'LockedString'.

```
Get-ProvVM -provisioningSchemeName MyScheme | Lock-ProvVM -Tag
    LockedString
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme for which VMs must be locked.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme for which VMs must be locked.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-VMID

Array of the virtual machine Ids (hypervisor context).

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Tag

The string to be held against the VM being locked.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Lock-ProvVM.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

VMDoesNotExist

The specified VM cannot be located.

VMAlreadyLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

PermissionDenied

The user is not authorized to perform this operation

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Move-ProvVMDisk

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Move the disks of full clone virtual machines to a new storage.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Move-ProvVMDisk
    [-ProvisioningSchemeName] <String>
    -VMName <String[]>
    -DestinationStorageId <String[]>
    -DiskType <String[]>
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Move-ProvVMDisk
    [-ProvisioningSchemeUid] <Guid>
    -VMName <String[]>
    -DestinationStorageId <String[]>
    -DiskType <String[]>
    [-RunAsynchronously]
    [-PurgeJobOnSuccess]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to move the disks of full clone virtual machines to a new storage and the new storage info will be updated to MCS database.

Examples

EXAMPLE 1

Move the disks of machine01 in provisioning scheme myProvScheme. Move OS and Identity disks to datastore1 and WBC disk to datastore2.

```
Move-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName "
    machine01" -DiskType OS,Identity,WBC -DestinationStorageId
    datastore1,datastore1,datastore2
```

EXAMPLE 2

Move the disks of machine01 in provisioning scheme myProvScheme. Move OS and Identity disks to datastore1 and keep WBC disk storage unchanged.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Move-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName "
    machine01" -DiskType OS,Identity,WBC -DestinationStorageId
    datastore1,datastore1,None
```

EXAMPLE 3

Move the disks of machine01 in provisioning scheme myProvScheme. Move WBC disk to datastore2 and keep OS and Identity disks storage unchanged.

```
Move-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName "
    machine01" -DiskType OS,Identity,WBC -DestinationStorageId None,None
    ,datastore2
```

EXAMPLE 4

Move the disks of machine01 and machine02 in provisioning scheme myProvScheme. The VMs don't have WBC disk. Move OS and Identity disks to datastore1. The example applies to both CleanOnBoot and FullClone VMs.

```
Move-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName ("
    machine01","machine02") -DiskType OS,Identity -DestinationStorageId
    datastore1,datastore1
```

EXAMPLE 5

Move all VMs'disks in provisioning scheme myProvScheme. Move OS and Identity disks to datastore1 and WBC disk to datastore2

```
,(Get-ProvVM -ProvisioningSchemeName "myProvScheme") | Move-ProvVMDisk
    -ProvisioningSchemeName "myProvScheme" -DiskType OS,Identity,WBC -
    DestinationStorageId datastore1,datastore1,datastore2
```

Parameters

-VMName

List of VM names that will be have the disk moving.

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-DestinationStorageId

Indicates the destination storage Ids for OS/Identity/WBC disks. Each disk should provide corresponding destionation storage. If don't want to move a disk, set its destination storage to string "None". The storage details can refer to Get-ProvSchemeResourceInStorage

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DiskType

Indicates the types of disks. "OS","Identity"and "WBC". All available types of citrix provisioned disks in the VM must be provided regardless of moving or not. For CleanOnBoot VM, only citrix provisioned disks can be selected to move. For full clone VM, only support to move all disks together including customer privately attached disks.

Type:	String[]
Accepted values:	OS, Identity, WBC
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeName

The name of the provisioning scheme from which VMs'disks will be moved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which VMs'disks will be moved.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether an identifier for the task must returned before completion of the task. The progress of the task can be monitored using 'get-ProvTask'command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMName'and 'ProvisioningSchemeName'to move disks.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For move vm disks task, this is always “Move-ProvVMDisk”.

Status <string>

Where in its lifecycle the task is.

DiskMovedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See DiskMoveFailedVirtualMachines for details of the object parameters.

DiskMoveFailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

NotStartedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

The cmdlet is associated with a task of type MoveVMDiskTask, and while active will move through the following operations (CurrentOperation field):

ValidatingInputs

MoveVMDisks

ReplicateBaseDisks

RemoveStaleBaseDsik

Only one long-running task for each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

New-ProvImageDefinition

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Create a new image definition.

Syntax

```
New-ProvImageDefinition
   [-ImageDefinitionName] <String>
   [-Description <String>]
   -OsType <OsType>
   -VDASessionSupport <VDASessionSupport>
   [-Metadata <Hashtable>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Lets you create a new image definition. An image definition can contain multiple image versions (See New-ProvImageVersion). The image definition defines basic information of all its image versions.

Examples

EXAMPLE 1

Create a new image definition with name “MyImage”.

```
New-ProvImageDefinition ImageDefinitionName MyImage -OsType Windows -
   VDASessionSupport MultiSession -Description "Windows image"

  CreateTime              : 1/1/2022 12:00:00
  Description             : Windows image
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
OsType                  : Windows
VDASessionSupport       : MultiSession
ImageDefinitionName     : MyImage
ImageDefinitionUid      : 7585f0de-192e-4847-a6d8-22713c3a2f42
LatestVersion           : 0
VersionsCount           : 0
```

Parameters

-OsType

A value indicating the OS type for the image definition.

Type:	OsType
Accepted values:	Windows, Linux
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VDASessionSupport

A value indicating the VDA session support for the image definition.

Type:	VDASessionSupport
Accepted values:	MultiSession, SingleSession
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ImageDefinitionName

The name of the image definition to be created.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-Description

A value indicating the image description.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

The metadata to be associated with this image definition.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definitions and contains the following information:

CreationTime <DateTime>

The date and time when the image definition was created.

Description <string>

The description for this image definition.

OsType <string>

The OS type for this image definition.

VDASessionSupport <string>

The session support of VDA for this image definition.

ImageDefinitionName <string>

The name of this image Definition.

ImageDefinitionUid <Guid>

The unique identifier for this image definition.

LatestVersion <int>

The latest version number in this definition.

VersionsCount <int>

The total versions count in this definition.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image definition, if specified.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

New-ProvImageVersion

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Create an image version in one image definition.

Syntax

```
New-ProvImageVersion
   -ImageDefinitionName <String>
   [-Description <String>]
   [-Metadata <Hashtable>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-ProvImageVersion
   -ImageDefinitionUid <Guid>
   [-Description <String>]
   [-Metadata <Hashtable>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Create a new version in one image definition, the ImageVersionNumber is self-incremented.

Examples

EXAMPLE 1

Create a new version for image definition “myImage”.

```
New-ProvImageVersion  -ImageDefinitionName myImage

  ImageVersionNumber      : 1
  ImageVersionUid         : b1c7602c-b080-4a63-846b-9d2429d54bd1
  ImageDefinitionName     : myImage
  ImageDefinitionUid      : 42bd09f5-3fac-44a6-8b1c-7c09f1079cc0
  CreationTime            : 4/2/2022 2:57:21 AM
  Metadata                : {
  }

  Description             : version 1
  ImageVersionSpecsCount  : 0
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ImageDefinitionName

The name for the image definition used for the image version.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionUid

The identifier for the image definition used for the image version.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-Description

A value indicating the image version description.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

The metadata to be associated with this image version.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageVersion

This object provides details of the image versions and contains the following information:

CreationTime <DateTime>

The date and time when the image version was created.

Description <string>

The description for this image version.

ImageDefinitionName <string>

The name of the image Definition the created image version belongs to.

ImageDefinitionUid <Guid>

The unique identifier of the image Definition the created image version belongs to.

ImageVersionUid <int>

The unique identifier for this image version.

ImageVersionNumber <int>

The version number fot this image version.

ImageVersionSpecsCount <int>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The total image version specs count in this image version.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image version, if specified.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

New-ProvImageVersionSpec

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

Prepare an image version spec in one image definition which can be used by provisioning scheme to provisioning virtual machines.

Syntax

```
New-ProvImageVersionSpec
   -SourceImageVersionSpecUid <Guid>
   [-VMCpuCount <Int32>]
   [-VMMemoryMB <Int32>]
   -NetworkMapping <Hashtable>
   [-ServiceOffering <String>]
   [-CustomProperties <String>]
   [-MachineProfile <String>]
   [-Metadata <Hashtable>]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

The prepared image version spec can be assigned to provisioning schemes to provision virtual machines

A snapshot is used rather than a VM, so that the content of the hard disk for the image scheme can be easily determined.

As the snapshot is specified using a path into the Citrix Host Service Powershell Provider, the Citrix Host Service Powershell snap-in must also be loaded for this cmdlet to be used.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Create a prepared image version spec.

```
New-ProvImageVersionSpec -NetworkMapping @{
 "0" = "XDHyp:\HostingUnits\azure\\virtualprivatecloud.folder\East US.
    region\virtualprivatecloud.folder\rg.resourcegroup\vpc.
    virtualprivatecloud\network.network"  }
  -ServiceOffering "XDHyp:\HostingUnits\azure\serviceoffering.folder\
     Standard_B2s.serviceoffering" -SourceImageVersionSpecUid f80ede4d
     -4c43-4acc-8181-468af5f014f7 -RunAsynchronously

TaskId                     : dec22eae-3230-40cf-b4a0-4e365a937da4
Active                     : True
Host                       : E73178-22-1
DateStarted                : 11/9/2023 8:30:01 AM
Metadata                   : {
  }

ImageVersionSpecUid        : 20d7319f-56f2-4152-af26-1c5e131c39e4

TaskStateInformation       : LocatingResources
Type                       : NewProvImageVersionSpec
```

Parameters

-SourceImageVersionSpecUid

The identifier for the source image version spec.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMCpuCount

The number of processors used by virtual machines created from the image scheme.

Type:	Int32

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	The number of CPUs assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory used by virtual machines created from the image scheme.

Type:	Int32
Position:	Named
Default value:	The amount of memory assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating machines in Cloud Hypervisors.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the image version spec that are specific to the target hosting infrastructure.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

The inventory path to the source that is used as a template. This profile identifies the values for the VMs created by the catalog. This must be a path to an item in the same hosting unit that the hosting unit name or hosting unit UID refers to. Valid paths are of the format: XD-Hyp:\HostingUnits\<HostingUnitName>\<path>\<snapshot>.snapshot

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

Gets or sets metadata of the image version spec.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Host.DataModel.ImageVersionSpec

This object provides details of the image instances and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The date and time when the task was started.

Metadata <IDictionary<string,string»

The metadata to apply to the image version spec, if specified.

ImageVersionSpecUid <string>

The unique identifier of the image version spec that the task was for.

ImageDefinitionName <string>

The name of the image definition for which the image version spec is created.

ImageVersionNumber <string>

The version number of the image version spec that the task was for.

ImageVersionUid <Guid>

The unique identifier of the image version spec that the task was for.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new image version will use.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new image version will use.

MasterImage <string>

The inventory path to the VM snapshot copy used in this image version spec.

CustomProperties <string>

The properties of the image version that are specific to the target hosting infrastructure.

DiskSize <int>

The size of the disk.

MachineProfile <string>

The inventory path to the source VM used by the scheme as a template.

NetworkMaps <Citrix.MachineCreation.DataModel.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

Warnings <Citrix.MachineCreation.DataModel.ProvSchemeWarning[]>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Warning states that have occurred with this image version spec.

TaskType <Citrix.XDInterServiceTypes.JobType>

The type of the task. For new image version tasks this is always “NewImageVersionSpec”.

LastUpdateTime <DateTime>

The date and time of the last task status update.

CurrentOperation <string>

Operation specific phase of the overall “Running”task state.

TerminatingError <Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

TaskProgress <double>

The progress of the task 0-100%.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

DateFinished <DateTime>

The date and time when the task was completed.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

Status <string>

Where in its lifecycle the task is.

TaskStateInformation <string>

Holds string data providing more details about the current task state.

Type <Citrix.XDInterServiceTypes.JobType>

The Type of the task. For new image version tasks this is always “NewImageVersion”.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringImageVersion

Indicates that the task is storing the image version data to the database.

Finished

Indicates that the task has completed with no errors.

ImageVersionSpecAlreadyExists

Indicates that the task failed because an image version spec on an image version already exists.

MasterVMImageIsNotPartOfImageDefinitionHostingUnit,

Indicates that the hosting unit that the master image originated from is not the hosting unit that the image definition is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM Image path does not refer to a Snapshot item.

InvalidMasterVMConfiguration

The VM snapshot specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot specified as the master is currently in an invalid state.

InsufficientResources

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

New-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Creates a new Maintenance Cycle

Syntax

```
New-ProvMaintenanceCycle
   -Operation <OperationType>
   [-MaintenanceCycleDescription <String>]
   [-AllVMs]
   -ProvisioningSchemeUid <Guid>
   -ScheduledStartTimeInUTC <DateTime>
   -MaxDurationInMinutes <Int32>
   [-PurgeDBAfterInDays <Int32>]
   [-SessionWarningTimeInMinutes <Int32>]
   [-SessionWarningLogOffTitle <String>]
   [-SessionWarningLogOffMessage <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-ProvMaintenanceCycle
   -Operation <OperationType>

```

Description

Schedules a maintenance cycle either for a provisioning scheme or for a list of vms as specified by the user. The cycle will be executed for the operation given during cmdlet execution and is meant to start at the time specified in ScheduledStartTimeInUTC. MaxDurationInMinutes indicates the maximum amount of time allocated for the maintenance cycle

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Parameters

-Operation

Specifies the operation to be executed in a maintenance cycle

Type:	OperationType
Accepted values:	ImageUpdate, HardwareUpdate, ResetOSDisk, ResetIDDisk
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-MaxDurationInMinutes

Indicates the total allocated duration in minutes to the maintenance cycle

Type:	Int32
Position:	Named
Default value:	30
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

An array of virtual machine names to which the maintenance cycle operation need to be executed

Type:	String[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ProvisioningSchemeUid

Indicates the Uid of the provisioningscheme

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ScheduledStartTimeInUTC

Indicates the time in UTC at which the maintenance cycle will be started This must be a date time powershell object and user is expected to supply it as a parameter to the cmdlet

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeName

Indicates the Name of the provisioningscheme

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-StartsNow

Indicates that the maintenance cycle has to be started immediately

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AllVMs

Indicate that all virtual machines in the prov scheme has to be considered by the maintenance cycle

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-MaintenanceCycleDescription

A brief overview to understand what the maintenance cycle is about

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeDBAfterInDays

The duration of time in days for mcs to have the data in database after maintenance cycles goes into completed states, once the time expires the data will be purged

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningTimeInMinutes

Buffer Time provided to the user to save date before powering down the vm by mcs

Type:	Int32
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningLogOffTitle

Short Heading for the message to be displayed to the user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningLogOffMessage

Brief Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-Operations

Indicates the operations to be performed on the maintenance cycle

Type:	MaintenanceCycleOperationType[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

-CatalogName

Indicates the catalog bank to be used for the maintenance cycle

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

-SessionLogOffMessage

Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

The cmdlet can be used for the following valid operations 1. ResetOSDisk - Supported by default 2. ImageUpdate - Supported by default 3. HardwareUpdate -Supported by default 4. ResetIDDisk - Controlled by the Feature Toggle "McsMaintenanceCyclesResetIdentityDiskOperation". This feature toggle must be enabled to create maintenance cycles to perform Reset Identity Disk.

The cmdlet is associated to create a maintenance cycle for a respective operation provided by the user. It is expected for MCS to start the maintenance cycle at the scheduled time and process vms one by one to complete the said operation Error Codes ————MaintenanceCycleNotEnabled

MaintenanceCycle Feature Not Enabled

MaintenanceCycleOperationFailed

MaintenanceCycle Feature Operation has failed

MaintenanceCycleInvalidDateObject

MaintenanceCycle Feature Operation has failed due to invalid date object

MaintenanceCycleInputMissing

MaintenanceCycle Feature Operation has failed due to a missing input parameter

MaintenanceCyclePreflightCheckFailed

MaintenanceCycle Feature Operation has failed due to a failed pre flight check

MaintenanceCycleDatabaseCompatibilityIssue

MaintenanceCycle Feature Operation has failed due to a database compatibility issue

Description

Allows you to create a new provisioning scheme. The creation process makes a copy of the hard disk attached to a virtual machine snapshot or VM template and stores it in every storage location that the hosting unit referenced by the provisioning scheme defines. This is a long-running task and typically takes several minutes to complete (depending on the size of the hard disk that is being copied and the number of snapshots that the hard disk consists of).

A snapshot or VM template must be used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

Because the snapshot or VM template are specified using a path into the Citrix Host Service PowerShell Provider, the Citrix Host Service PowerShell snap-in must also be loaded to use this cmdlet.

This cmdlet requires information to be provided that is retrieved using other snap-ins that form part of the Citrix Machine Creation Services:

Hosting Unit Service Snapin

The snap-in that provides information about the hypervisors.

AD Identity Service Snapin

The snap-in that provides information about the identity pools.

The provisioning scheme is a collection of all of the data that is required to form a template against which virtual machines can be created. It therefore requires the following:

Hosting Unit

A reference to an item defined in the Host Service that defines the hypervisor, the network, and the storage to be used.

Identity Pool

A reference to the collection of Active Directory accounts that is used for VMs created from the provisioning scheme.

Examples

EXAMPLE 1

Creates a new provisioning scheme with the name “XenPS”using the hosting unit “XenHu”and the identity pool “idPool1”from the master VM snapshot called “Base.snapshot”.

```
1 New-ProvScheme -ProvisioningSchemeName XenPS -HostingUnitName XenHu -
      IdentityPoolName idPool1 -CleanOnBoot -MasterImageVM XDHyp:\
      HostingUnits\XenHU\Base.vm\Base.snapshot
2

```

EXAMPLE 2

Creates a new provisioning scheme with the name “AWS1”using the hosting unit “aws-test”and the identity pool “idPool1”from the master VM snapshot called “TemplateAmi”. The machine instance “server-vda”is used as a Machine Profile when creating the provisioning scheme so all other parameters are taken from the instance.

```
$provScheme = New-ProvScheme -ProvisioningSchemeName AWS1 -
    HostingUnitName aws-test -IdentityPoolName idPool1 -MasterImageVM "
    XDHyp:\HostingUnits\aws-test\TemplateAmi (ami-06927522c36bf4109).
    template" -CleanOnBoot -MachineProfile "XDHyp:\HostingUnits\aws-test
    \us-east-1a.availabilityzone\server-vda (i-0c136ee2a01a3dd60).vm"
```

EXAMPLE 3

Creates a new provisioning scheme with the name “AWS2”using the hosting unit “aws-test”and the identity pool “idPool2”from the master VM snapshot called “TemplateAmi”. The version “1”of the launch template with name “machine-profile-lt”and id “lt-06927522c36bg5698”is used as a Machine Profile when creating the provisioning scheme so all other parameters are taken from this launch template version. If instance type value (ServiceOffering) is empty in the machine profile launch template version and no service offering is provided in cmdlet parameter, the cmdlet will return error.

```
$provScheme = New-ProvScheme -ProvisioningSchemeName AWS2 -
    HostingUnitName aws-test -IdentityPoolName idPool2 -MasterImageVM "
    XDHyp:\HostingUnits\aws-test\TemplateAmi (ami-06927522c36bf4109).
    template" -CleanOnBoot -MachineProfile "XDHyp:\HostingUnits\aws-test
    \machine-profile-lt (lt-06927522c36bg5698).launchtemplate\lt
    -06927522c36bg5698 (1).launchtemplateversion"
```

EXAMPLE 4

Creates a new provisioning scheme with the name “XenPS”using the hosting unit “XenHu”and the identity pool “idPool1”from the master VM snapshot called “Base.snapshot”asynchronously. To get the task details, use Get-ProvTask -TaskID <task id>.

```
New-ProvScheme -ProvisioningSchemeName XenPS -HostingUnitName XenHu -
    IdentityPoolName idPool1 -CleanOnBoot -MasterImageVM XDHyp:\
    HostingUnits\XenHU\Base.vm\Base.snapshot -RunAsynchronously

Parameters

-HostingUnitName

The name of the hosting unit to be used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolName

The name of the identity pool to be used for the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The unique identifier of the hosting unit to be used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier of the identity pool to be used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageVersionSpecUid

The identifier for the image version spec used for the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ProvisioningSchemeName

The name of the provisioning scheme to be created. This must not be a name that is being used by an existing provisioning scheme, and must not contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-MasterImageVM

The path in the hosting unit provider to the VM snapshot or template that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot or Template item in the same hosting unit specified by HostingUnitName or HostingUnitUid. Valid paths are of the format:

XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<SnapshotName>.snapshot
XDHyp:\HostingUnits\<HostingUnitName>\<path>\<TemplateName>.template

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-UseWriteBackCache

Indicates whether write-back cache is enabled for the VMs created from this provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

The FunctionalLevel of the VDA installed on the given MasterImageVM.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMCpuCount

The number of processors that will be used to create VMs from the provisioning scheme. Only supported for on-prem hypervisors and cannot be used alongside ServiceOffering.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	The number of CPUs assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory that will be used to created VMs from the provisioning scheme in MB. Only supported for on-prem hypervisors and cannot be used alongside ServiceOffering.

Type:	Int32
Position:	Named
Default value:	The amount of memory assigned to the base image VM snapshot or VM template.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CleanOnBoot

Indicates whether the VMs created from this provisioning scheme are reset to their initial condition each time they are started.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Scope

The administration scopes to be applied to the new provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, VMs are created with a single NIC, which is mapped to the default network in the hosting unit. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Metadata

The metadata to be associated with this provisioning scheme.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating VMs in Cloud Hypervisors. Cannot be used alongside either VMCpuCount or VMMemoryMB.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecurityGroup

The security groups to apply to VMs created in Cloud Hypervisors.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TenancyType

Indicates whether to use tenancy type Shared, Instance or Host when creating VMs in Cloud Hypervisors.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accepted values:	Shared, Instance, Host
Position:	Named
Default value:	Shared
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

Defines the inventory path to the source VM used by the provisioning scheme as a template. This profile identifies the properties for the VMs created from the scheme. The VM must be in the hosting unit that HostingUnitName or HostingUnitUid refers to. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written back to the CustomProperties. See about_Prov_MachineProfile for more details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-CustomProperties

The properties of the provisioning scheme that are specific to the target hosting infrastructure. See about_Prov_CustomProperties for more information.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ResetAdministratorPasswords

Indicates whether the passwords for administrator accounts are reset on created machines.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UseFullDiskCloneProvisioning

Indicates whether VMs should be created using the dedicated full disk clone feature.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Validate

Indicates whether a dry run of the configuration validation will be performed.

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-MasterImageNote

A note for the master image.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-RunAsynchronously

Indicates whether the command returns before it completes. If specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This can not be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-InitialBatchSizeHint

Provides a predictive hint for the number of initial VMs that will be added to the MCS catalog when the scheme is successfully created. Callers should supply this parameter in situations where the completion of New-ProvScheme will be closely followed by a New-ProvVM call to create an initial batch of VMs in the catalog.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PVSSite

PVS Site to be assigned to the VMs in the Provisioning Scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2209

-PVSvDisk

PVS vDisk to be assigned to the VMs in the Provisioning Scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2209

-ProvisioningSchemeType

The type of Provisioning Scheme to created, either MCS or PVS, defaults to MCS

Type:	ProvisioningSchemeType
Accepted values:	MCS, PVS, Manual
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2303

-ForceCreate

If specified, the provisioning scheme will be created even in the event of creation failure.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-KeepPreparationVMOnFailure

If specified, the image preparation VM will not be deleted and the provisioning scheme will be created in case of image preparation failure. The image preparation VM can be used for troubleshooting purposes and can be removed on the hypervisor manually or will be removed automatically when the provisioning scheme is deleted.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-DataDiskPersistence

If specified, the provisioning scheme will be created using the data disk and indicates whether to use Persistent or NonPersistent data disk during VM creation. This property applies to provisioning scheme with CleanOnBoot enabled.

Type:	String
Accepted values:	Persistent, NonPersistent
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-DataDisk

If specified, the provisioning scheme will use the path of the Data disk specified.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-UsePersonalVDiskStorage

Indicates whether personal vDisks are used for the VMs created from this provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2209

-NoImagePreparation

Indicates that image preparation should not be performed on this provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

-DedicatedTenancy

Indicates whether to use dedicated tenancy when creating VMs in Cloud Hypervisors.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2303

-VhdTemplateSource

A file path to a source VHD template to be used when performing application scanning during image preparation. The presence of this parameter in conjunction with VhdResultDestination implies that application scanning is to be performed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2209

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-VhdResultDestination

A file path (including file name) where the VHD disk file containing the results of application scanning should be written.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2209

-AppScanResultsFile

File name to which the results of application scanning should be written.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2209

-AzureAdJoinType

Specifies the Azure Active Directory join type.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109
Removed in:	Citrix Virtual Apps and Desktop 7 2206

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new provisioning scheme tasks, this is always NewProvisioningScheme.

Status <string>

Where in its lifecycle the task is.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

LastUpdateTime <DateTime>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateStarted <DateTime>

The date and time when the task was started.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Storage <Citrix.MachineCreation.Sdk.NewProvSchemeStorage[]>

Storage objects to be used for the new provisioning scheme task.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warnings associated with the new provisioning scheme task.

ProvisioningSchemeName <string>

The name of the provisioning scheme being created.

MasterImage <string>

The inventory path of the VM snapshot or template to be used as the master VM image for the task.

IdentityPoolName <string>

The name of the identity pool to be used by the new provisioning scheme.

IdentityPoolUid <guid>

The unique identifier name of the identity pool to be used by the new provisioning scheme.

HostingUnitName <string>

The name of the hosting unit to be used by the new provisioning scheme.

HostingUnitUid <guid>

The unique identifier of the hosting unit to be used by the new provisioning scheme.

CustomProperties <string>

The properties of the provisioning scheme that are specific to the target hosting infrastructure.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InitialBatchSizeHint <int>

The number of VMs that are expected to be added to the scheme as an initial batch.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme being created.

TaskState <Citrix.MachineCreation.Sdk.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

The task has begun but has not done anything yet.

LocatingResources,

The workflow is locating resources from other services.

HostingUnitNotFound

The task failed because the required hosting unit could not be located.

VirtualMachineBackupNotFound

The task failed because the required VM snapshot or VM template could not be located.

ConsolidatingMasterImage

The task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

The task is replicating the consolidated master image.

StoringProvisioningScheme

The task is storing the provisioning scheme data in the database.

Finished

The task completed with no errors.

ProvisioningSchemeAlreadyExists

The task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

The task failed because the specified identity pool could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

The task failed because the hosting unit from which the master image originated is not the same hosting unit that the provisioning scheme is using.

MasterVmImageIsNotABackup

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The task failed because the master VM path does not refer to a snapshot or VM template item.

ProvisioningSchemeNotFound

The task failed because it could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

The task failed because a task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The task failed because the VM snapshot or VM template specified as the master has an invalid configuration.

InvalidMasterVMState

The task failed because the VM snapshot or VM template specified as the master is currently in an invalid state.

InsufficientResources

The task failed because the hypervisor did not have enough resources to complete the task.

DiskConsolidationFailed

The disk consolidation task failed. Details are in the task state information string.

StorageNotFound

The task failed because no associated storage was found in the hosting unit.

ConfigurationError

The task failed because the service is unable to contact one of the other services. This is because not all appropriate Configuration Service registrations have been performed.

RequestedFeatureNotEnabled

The task failed because a requested feature is not enabled.

MachineProfileNotSupported

The task failed because machine profile is not supported.

FailedToReadMachineProfile

Failed to read the Machine Profile.

Canceled

The task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Additional information about the current task state.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

TaskProgress <double>

The progress of the task 0-100%.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

MasterImageNote <string>

The note of the master image.

WriteBackCacheDiskSize <int>

The size of any write-back cache disk (Setting WriteBackCacheDiskSize to 0 is not allowed).

WriteBackCacheMemorySize <int>

The size of the write-back cache (Setting WriteBackCacheMemorySize to 0 is not allowed).

WriteBackCacheDriveLetter <char>

The drive letter of write back cache disk (default empty which means to be allocated by operating system).

Scopes <Citrix.Fma.Sdk.ServiceCoreScopeReference[]>

The delegated administration scopes to which the scheme will belong.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The list of NIC to network associations, if specified.

ProvisioningSchemeMetadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the provisioning scheme, if specified.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

DedicatedTenancy <bool>

Whether to use dedicated tenancy when creating VMs in Cloud Hypervisors.

ResetAdministratorPasswords <bool>

Whether to reset the passwords for administrator accounts on created machines.

StatusMessageSubstitutions <string[]>

List of strings to be substituted into custom error or status messages from provisioning plug-ins.

GpuTypeId <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The id of the GPU type used by this provisioning scheme, null if no GPU.

UseFullDiskCloneProvisioning <bool>

Indicates whether the machines are provisioned using the dedicated full disk clone feature.

Notes

The cmdlet is associated with a task of type NewProvisioningScheme, and while active will move through the following operations (CurrentOperation field):

ValidatingInputs

ConsolidatingMasterImage

PreparingMasterImage

ReplicatingMasterImage

CommittingScheme

Only one long-running task for each provisioning scheme can be processed at a time.

In case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ScopeNotFound

One or more of the scopes nominated for the new provisioning scheme do not exist.

ImageVersionNotFound

The specified image version for the new provisioning scheme do not exist.

ImageVersionNotReady

The specified image version for the new provisioning scheme is not ready for use.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

VhdParametersMustBeSupplied

When parameter VhdTemplateSource or VhdResultDestination is supplied, both parameters are required to be supplied.

ServiceDoesNotSupportFullDiskClone

The full disk clone parameter is being used when the service does not support the full disk clone feature. Upgrade the service or remove the parameter.

FullDiskCloneDoesNotSupportCleanOnBootVMs

The full disk clone functionality is applicable to dedicated provisioned machines only.

CannotUseWriteBackCacheWithCleanOnBootDisabled

Cannot turn on writebackcache on persistent catalog. Do not use -UseWriteBackCache without specifying -CleanOnBoot.

New-ProvVM

August 14, 2025

Creates new virtual machines.

Syntax

```
New-ProvVM
   -ProvisioningSchemeName <String>
   -ADAccountName <String[]>
   [-FastBuild]
   [-NetworkMapping <Hashtable>]
   [-AutoAssignVLAN]
   [-SecurityGroup <String[]>]
   [-MachinesPerAssistant <Int32>]
   [-MaxAssistants <Int32>]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
New-ProvVM
   -ProvisioningSchemeUid <Guid>
   -ADAccountSid <String[]>
   [-FastBuild]
   [-NetworkMapping <Hashtable>]
   [-AutoAssignVLAN]
   [-SecurityGroup <String[]>]
   [-MachinesPerAssistant <Int32>]
   [-MaxAssistants <Int32>]

    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Lets you create new virtual machines with the configuration specified by a provisioning scheme.

The virtual machines are created using all of the storage specified in the provisioning scheme. The storage are used in a Round Robin mechanism.

For the duration of this task, the AD accounts are locked by the AD Identity Service, which prevents the same accounts from being used by other machine creation tasks.

Examples

EXAMPLE 1

Creates a new virtual machine using the AD account “domain\account”in the provisioning scheme “MyScheme”.

```
New-ProvVM -ProvisioningSchemeName MyScheme -ADAccountName "domain\
    Account"

```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme in which the VMs are created.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ADAccountName

A list of the Active Directory account names that are used for the VMs. The accounts must be provided in a domain-qualified format. This parameter accepts Identity objects as returned by the New-AcctADAccount cmdlet,

or any PSObject with string properties "Domain"and "ADAccountName".

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ADAccountSid

A list of the Active Directory account sids that are used for the VMs.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2303

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme in which the VMs are created.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-FastBuild

Indicates whether the command can run faster by using optimizations in the creation process. This may mean that VMs created cannot be started until ResetVM operations have been performed by the Broker and Machine Identity Services.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VMs are created with network settings as inherited from the provisioning scheme. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AutoAssignVLAN

Indicates whether the VLAN of the network should be automatically assigned to the new VM or if the VLAN from the master image should be used

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SecurityGroup

The security groups to apply to machines created in Cloud Hypervisors.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachinesPerAssistant

The number of concurrent volume operations that may be performed by each volume worker helper machine.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-MaxAssistants

The maximum number of volume worker help machines that may be created for this operation.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For provisioning new VM tasks, this is always "NewVirtualMachine".

Status <string>

Where in its lifecycle the task is.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateStarted <DateTime>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The date and time when the task was started.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

MasterImage <string>

The inventory path of the VM snapshot that was used as the master image for the task.

MasterImageId <string>

The unique identifier of the VM snapshot as assigned by the hosting unit.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the task.

StatusMessageSubstitutions <string[]>

List of strings to be substituted into custom error or status messages from provisioning plug-ins.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the task.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

HypervisorInMaintenanceMode

Indicates that the hypervisor is not available for normal use.

NoAvailableStorage

Indicates that no storage is available for the hypervisor.

NoAvailableNetwork

Indicates that no network is available for the hypervisor.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

The job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation

Provides more detailed information about the current task state.

HostingUnitUid

The unique identifier of the hosting unit that is used by the provisioning task.

HostingUnitName <string>

The name of the hosting unit that is used by the provisioning task.

IdentityPoolUid <guid>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The unique identifier of the identity pool that is used by the provisioning task.

IdentityPoolName <string>

The name of the identity pool that is used by the provisioning task.

VirtualMachinesToCreateCount <int>

The total number of virtual machines that the task is trying to create.

VirtualMachinesCreatedCount <int>

The number of virtual machines that the task has created so far. Details of the machines that were created are in the CreatedVirtualMachines parameter.

VirtualMachinesCreationFailedCount <int>

The number of virtual machines that the task has failed to create. Details of the machines that were not created are in the FailedVirtualMachines parameter.

CreatedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

Object array of created virtual machines summary information. The object properties are:

ADAccountName <string>

The domain qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

The status of the virtual machine.

StatusAdditionalInformation <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Extra information about the Status.

VMId <string>

The virtual machine identifier within the hypervisor in which the VM resides.

VMName <string>

The display name of the virtual machine within the hypervisor in which the VM resides.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See CreatedVirtualMachines for details of the object parameters.

Notes

The cmdlet is associated with a task of type NewVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

CreatingVirtualMachines

ReleasingAccountLocks

Only one long-running task in each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed

for various reasons.

WorkflowHostUnavailable

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The task could not be started because the database connection is inactive.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified.

When running asynchronously, the cmdlet terminates before the job does,

so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller being used, or Citrix Virtual Apps and Desktops logs.

New-ProvVMBackupOperation

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Creates new provisioned backups for a virtual machine.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
New-ProvVMBackupOperation
   [-BackupName <String>]
   [-BackupDescription <String>]
   [-UserVisible <Boolean>]
   [-DoNotShutdownMachines]
   [-MaintenanceCycleDescription <String>]
   [-AllVMs]
   -ProvisioningSchemeUid <Guid>
   -ScheduledStartTimeInUTC <DateTime>
   -MaxDurationInMinutes <Int32>
   [-PurgeDBAfterInDays <Int32>]
   [-SessionWarningTimeInMinutes <Int32>]
   [-SessionWarningLogOffTitle <String>]
   [-SessionWarningLogOffMessage <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```

    [<CommonParameters>]
```

Description

Lets you create new backups of virtual machines, including the boot disk and hardware attributes. The machine must be created by MCS and persistent.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Creates backups based on the virtual machines in the provisioning scheme “MyScheme”.

```
New-ProvVMBackupOperation -ProvisioningSchemeName MyScheme -StartsNow
```

EXAMPLE 2

Creates backups from virtual machines “vm01”, “vm02”, and “vm03”in the provisioning scheme “MyScheme”.

```
New-ProvVMBackupOperation -ProvisioningSchemeName MyScheme -VMNames
    vm01,vm02,vm03 -StartsNow
```

Parameters

-MaxDurationInMinutes

Indicates the total allocated duration in minutes to the maintenance cycle

Type:	Int32
Position:	Named
Default value:	30
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

An array of virtual machine names to which the maintenance cycle operation need to be executed

Type:	String[]
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

Indicates the Uid of the provisioning scheme

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledStartTimeInUTC

Indicates the time in UTC at which the maintenance cycle will be started This must be a date time powershell object and user is expected to supply it as a parameter to the cmdlet

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

Indicates the Name of the provisioning scheme

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartsNow

Indicates that the maintenance cycle has to be started immediately

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-AllVMs

Indicate that all virtual machines in the prov scheme has to be considered by the maintenance cycle

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-BackupName

The name to use for each of the backups. The name must be unique relative to other provisioned backups for the targeted virtual machine. Certain backup and machine properties can be specified in using the form ‘{PropertyName}’. These properties include:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- For the Provisioned Backup:
  - CreationUTCDateTime
  - BackupVersion
  - BackupStatus
  - BackupUid
- For the Provisioned Virtual Machine:
  - VMId
  - VMName
  - ProvisioningSchemeVersion

Type:	String
Position:	Named
Default value:	{VMName}-{BackupUid}
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-BackupDescription

Description to use for each of the backups.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserVisible

Sets whether the backup is visible to users. Default value is true.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotShutdownMachines

Indicates if a backup will be taken on virtual machines without shutting them down first.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-MaintenanceCycleDescription

A brief overview to understand what the maintenance cycle is about

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeDBAfterInDays

The duration of time in days for mcs to have the data in database after maintenance cycles goes into completed states, once the time expires the data will be purged

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningTimeInMinutes

Buffer Time provided to the user to save date before powering down the vm by mcs

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningLogOffTitle

Short Heading for the message to be displayed to the user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SessionWarningLogOffMessage

Brief Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

Maintenance cycle associated with creating backups.

Description

Creates a new Schedule for Backing up virtual machines in a provisioning scheme via maintenance cycles

Examples

Parameters

-ProvisioningScheduleName

A Unique name provided for the provisioning schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RecurringSchedule

Indicates how frequently rhe operation needs to be run, can be daily, weekly or monthly

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDurationInMinutes

Indicates the total allocated duration in minutes to the provisioning schedule

Type:	Int32
Position:	Named
Default value:	30
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-VMName

An array of virtual machine names to which the maintenance cycle operation need to be executed

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ProvisioningSchemeUid

The Uid of the Provisioning scheme to be associated with the provisioning schedule

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ScheduledStartTimeInUTC

Indicates the start time for the provisioning schedule

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the Provisioning scheme to be associated with the provisioning schedule

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartsNow

Indicates that the maintenance cycle has to be started immediately

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-AllVMs

Indicate that all virtual machines in the prov scheme has to be considered by the maintenance cycle

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-MaxNumberOfBackups

The maximum number of backups that can exist, per virtual machine as part of the provisioning schedule

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-UserVisible

Sets whether the backups taken by this schedule are visible to users. Default value is true.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-DoNotShutdownMachines

Indicates if a backup will be taken on virtual machines without shutting them down first.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-ScheduleDescription

A brief overview of the provisioning schedule

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeDBAfterInDays

The duration of time in days for mcs to wait before purging relevant info from the database upon completion

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SessionWarningTimeInMinutes

Buffer Time provided to the user to save data before powering down the vm by mcs

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningLogOffTitle

Short Heading for the message to be displayed to the user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningLogOffMessage

Brief Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-MaxAllocatedDurationInMinutes

Indicates the total allocated duration in minutes to the provisioning schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningInMinutes

Buffer Time provided to the user to save data before powering down the vm by mcs

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

-PurgeMaintenanceCycleInfoAfterInDays

The duration of time in days for mcs to wait before purging relevant info from the database upon completion

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Removed in:	Citrix Virtual Apps and Desktop 7 2411

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to update the hard disk image used to create virtual machines. If the provisioning scheme is a 'CleanOnBoot'type, then the next time that virtual machines are started, their hard disks are updated to this new image. Regardless of the 'CleanOnBoot'type, all new virtual machines created after this command will use this new hard disk image.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

A snapshot or VM template is used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot or VM template are specified using a path into the Citrix Host Service PowerShell Provider, the Citrix Host Service PowerShell snap-in must also be loaded to use this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The previous hard disk image path is stored into the history (see Get-ProvSchemeMasterVMImageHistory). The data stored in the history allows to do a rollback to revert to the previous hard disk image if required.

Examples

EXAMPLE 1

Updates the master hard disk image for the provisioning Scheme "MyScheme"to use the "base.snapshot"hard disk image.

```
Publish-ProvMasterVMImage -ProvisioningSchemeName MyScheme -
    MasterImageVM XDHyp:\HostingUnits\HostUnit1\RhoneCC_baseXP.vm\base.
    snapshot

TaskId                  : 248f102f-073f-45fe-aea9-1819a6d6dd1f

TaskStateInformation    :
```

EXAMPLE 2

Updates the master hard disk image for the Provisioning Scheme "upgrade fail"using the optional parameter "-KeepPreparationVMOnFailure"to show how to keep the image preparation VM when image preparation fails to assist in troubleshooting the failure. The image preparation VM can be removed on the hypervisor manually or will be removed automatically on the next Publish-ProvMasterVMImage operation for the same provisioning scheme.

```
$task = Publish-ProvMasterVMImage -MasterImageVM "XDHyp:\HostingUnits\
    xenres\small.vm\Small.snapshot" -ProvisioningSchemeName "upgrade
    fail" -KeepPreparationVMOnFailure
```

Parameters

-MasterImageVM

The path in the hosting unit provider to the VM snapshot or template that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot or Template item in the same hosting unit used by the provisioning scheme specified by ProvisioningSchemeName or ProvisioningSchemeUid. Valid paths are of the format:

XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<SnapshotName>.snapshot
XDHyp:\HostingUnits\<HostingUnitName>\<path>\<TemplateName>.template

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to which the hard disk image should be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme to which the hard disk image should be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-DataDisk

The path in the hosting unit provider to the data disk that will be used. This identifies the hard disk to be used. This must be a path to a disk item in the same hosting unit used by the provisioning scheme

© 1997–2025 Citrix Systems, Inc. All rights reserved.

specified by ProvisioningSchemeName or ProvisioningSchemeUid. Valid paths are of the format:

XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VMName>.vm\<MyDataDisk>.disk

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-VhdTemplateSource

A file path to a source VHD template to be used when performing application scanning during image preparation. The presence of this parameter in conjunction with VhdResultDestination implies that application scanning is to be performed

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VhdResultDestination

A file path (including file name) where the VHD disk file containing the results of application scanning should be written.

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-AppScanResultsFile

File name to which the results of application scanning should be written.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FunctionalLevel

The FunctionalLevel of the VDA installed on the given MasterImageVM.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MasterImageNote

The note of the master image.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-RunAsynchronously

Indicates whether the cmdlet should return before it completes. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database once the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DoNotStoreOldImage

Indicates that the current image should not be added to the image history list for the provisioning scheme. This is useful when rolling back to a previous image.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-KeepPreparationVMOnFailure

If specified, the image preparation VM will not be deleted in case of image preparation failure. The image preparation VM can be used for troubleshooting purposes and can be removed on the hypervisor manually or will be removed automatically on the next Publish-ProvMasterVMImage operation for the same provisioning scheme.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Publish-ProvMasterVMImage.

Outputs

Guid

When "RunAsynchronously"is specified, this identifier is returned to provide the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For publish master image for provisioning scheme tasks this is always "PublishImage".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is being used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the task.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the task.

MasterImage <string>

The path of the VM snapshot or template that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool being used for this task.

IdentityPoolUid <guid>

The unique identifier of the identity pool being used for this task.

HostingUnitName <string>

The name of the hosting unit being used for this task.

HostingUnitUid

The unique identifier of the hosting unit being used for this task.

MasterImageNote

The note of the master image.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot or VM template could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringProvisioningScheme

Indicates that the task is storing the provisioning scheme data to the database.

Finished

Indicates that the task has completed with no errors.

ProvisioningSchemeAlreadyExists

Indicates that the task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

Indicates that the task failed because the identity pool specified could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

Indicates that the hosting unit that the master image originated from is not the same hosting unit that the provisioning scheme is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM image path does not refer to a snapshot or a VM template item.

ProvisioningSchemeNotFound

Could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

A task for a provisioning scheme with the same name is already running.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InvalidMasterVMConfiguration

The VM snapshot or VM template specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot or VM template specified as the master is currently in an invalid state.

InsufficientResources

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Holds string data providing more details about the current task state.

TaskProgress <double>

The progress of the task 0-100%.

Notes

The cmdlet is associated with a task of type PublishImage, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

ConsolidatingMasterImage

PreparingMasterImage

ReplicatingMasterImage

CommittingScheme

Only one long-running task per provisioning scheme can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvImageDefinition

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Remove an image definition.

Syntax

```
Remove-ProvImageDefinition
      [-ImageDefinitionName] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageDefinition
      -ImageDefinitionUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove an image definition and its image versions. The image definition can contain multiple image versions. If it still has image versions used by provisioning scheme, the image scheme can not be removed.

Examples

EXAMPLE 1

Remove the image definition by name and its image versions.

```
Remove-ProvImageDefinition -ImageDefinitionName MyImage
```

Parameters

-ImageDefinitionUid

The unique identifier for the image definition to be removed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionName

The name of the image definition to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageDefinition

You can pipe an object containing a parameter called 'ImageDefinitionName'or 'ImageDefinitionUid' to Remove-ProvImageDefinition.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

IllegalParameter

One or more parameters are illegal or are not specified.

ImageDefinitionNotFound

The specified image definition could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ProvImageDefinitionConnection

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Remove an image definition connection.

Syntax

```
Remove-ProvImageDefinitionConnection
      -ImageDefinitionName <String>
      -HypervisorConnectionName <String>
      [-RunAsynchronously]

      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove the link between an image definition and a hypervisor connection.

Examples

EXAMPLE 1

Add an image version spec.

```
Remove-ProvImageDefinitionConnection -ImageDefinitionUid 7ccc900b-f737
   -416a-8f65-68383343007b -HypervisorConnectionUid 436cb4f7-2b57-484c-
   a364-d3c7795cb0c7 -RunAsynchronously

TaskId                   : 8935bbab-8d8a-4e15-96ea-e3a2c654a241
Active                   : True
Host                     : E73178-78-1
```

Type                      : RemoveProvImageDefinitionConnection
```

Parameters

-ImageDefinitionName

The name of image definition.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionName

The name of the hypervisor connection to be used.

Type:	String
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageDefinitionUid

The identifier of image definition.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HypervisorConnectionUid

The name of the hypervisor connection to be used.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

ImageDefinitionUid <Guid>

The unique identifier of the image definition.

ImageDefinitionName <string>

The name of the image definition.

HypervisorConnectionName <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The name of the hypervisor connection being used by this image definition connection.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection being used by this image definition connection.

CustomProperties <string>

The custom properties of the image definition connection.

TaskType <Citrix.XDInterServiceTypes.JobType>

The type of the task. For new image version tasks this is always "RemoveProvImageDefinitionConnection".

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

UnableToRemoveImageDefinitionConnectionDueToNotExists

Unable to remove the image definition connection because it does not exist.

UnableToRemoveImageDefinitionConnectionDueToBeingUsedByImageVersionSpecs

Unable to remove the image definition connection because it is being used by image version specs.

Remove-ProvImagesPendingDelete

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2212

Remove pending image to delete.

Syntax

```
Remove-ProvImagesPendingDelete
      [-Id] <Int32>
      [-ForceDelete]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove image which are pending to be delete

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Trying to delete a image which is in use

```
Remove-ProvImagesPendingDelete -Id 1 -ForceDelete
Remove-ProvImagesPendingDelete : Image is in use.
At line:1 char:1
+ Remove-ProvImagesPendingDelete -PendingDeleteId 1 -ForceDelete
+ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
+ CategoryInfo          : InvalidOperation: (:) [Remove-
    ProvImagesPendingDelete], InvalidOperationException
+ FullyQualifiedErrorId : Citrix.XDPowerShell.MachineCreationStatus.
    DiskIsInUse,Citrix.MachineCreation.Sdk.Commands.
    RemoveProvImagesPendingDeleteCommand
```

EXAMPLE 2

Trying to delete the image which does not exits

```
Remove-ProvImagesPendingDelete -Id 3 -ForceDelete
Remove-ProvImagesPendingDelete : There is no pending image to delete.
At line:1 char:1
+ Remove-ProvImagesPendingDelete -PendingDeleteId 3 -ForceDelete
+ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
+ CategoryInfo          : InvalidOperation: (:) [Remove-
    ProvImagesPendingDelete], InvalidOperationException
+ FullyQualifiedErrorId : Citrix.XDPowerShell.MachineCreationStatus.
    NoPendingDiskToDelete,Citrix.MachineCreation.Sdk.Commands.
    RemoveProvImagesPendingDeleteComman
d
```

Parameters

-Id

Pendig image record ID, in DB

Type:	Int32
Position:	2
Default value:	0
Required:	True
Accept pipeline input:	True (ByPropertyName)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ForceDelete

If this switch is enabled, we force delete the image from hypervisor

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Remove-ProvImageVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Remove specified image version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-ProvImageVersion
      [-ImageDefinitionName] <String>
      [-ImageVersionNumber] <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersion
      [-ImageVersionUid] <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove an image version if there are no image version specs in this version.

Examples

EXAMPLE 1

Removes image version with Guid 90e93b9d-a225-4701-ad50-fa1546af35ac.

```
Remove-ProvImageVersion -ImageVersionUid 90e93b9d-a225-4701-ad50-
    fa1546af35ac
```

EXAMPLE 2

Removes image version 1 in image1.

```
Remove-ProvImageVersion -ImageVersionNumber 1 -ImageDefinitionName
    image1
```

Parameters

-ImageDefinitionName

The name of image definition which the image version belongs to.

Type: String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageVersionUid

The identifier of image version.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageVersionNumber

The version number of image version.

Type:	Int32
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ImageVersion

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ImageVersionNotFound

The specified image version could not be located.

UnableToRemoveImageVersionWithImageVersionSpecs

Unable to remove an image version with image version specs

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Remove-ProvImageVersionSpec

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

Remove specified image version spec.

Syntax

```
Remove-ProvImageVersionSpec
       [-ImageVersionSpecUid] <Guid>
       [-PurgeDBOnly]
       [-RunAsynchronously]
       [-PurgeJobOnSuccess]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove an image version spec and its relevant hard disk image that has been prepared.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

Examples

EXAMPLE 1

Remove a image version spec with uid “51c92c8d-2213-439b-9fa0-38539fc4a622”.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-ProvImageVersionSpec -ImageVersionSpecUid 51c92c8d-2213-439b-9
    fa0-38539fc4a622 -PurgeDBOnly

TaskId                 : 021c8997-ac1c-45b8-ab28-25eeb8c3540c
Active                 : False
Host                   : E73178-9-1
DateStarted            : 10/19/2023 1:10:11 AM
Metadata               : {
  }

ImageVersionSpecUid    : 51c92c8d-2213-439b-9fa0-38539fc4a622
PurgeDbOnly            : True
TaskStateInformation   : Completed
TaskState              : Finished
TaskType               : RemoveProvImageVersionSpec
LastUpdateTime         : 10/19/2023 1:10:11 AM
CurrentOperation       :
TerminatingError       :
TaskProgress           : 100
WorkflowStatus         : Completed
DateFinished           : 10/19/2023 1:10:11 AM
TaskExpectedCompletion : 10/19/2023 1:10:11 AM
ActiveElapsedTime      : 0
Status                 : Finished
Type                   : RemoveProvImageVersionSpec
```

Parameters

-ImageVersionSpecUid

The identifier of the image version spec to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-PurgeDBOnly

If this option is specified, this command will only remove the image version data from the Citrix site database. However, the disk images created in the image version still remain in the hypervisor. The

© 1997–2025 Citrix Systems, Inc. All rights reserved.

hypervisor administrator can remove hard disk images using the tools provided by the hypervisor itself. This option can also be used when you are no longer able to contact the hypervisor and you want to remove the image version from Citrix site database. This parameter cannot be used with "ForgetVM" .

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall “Running”task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new reset disk tasks, this is always “Reset-ProvVMDisk”.

Status <string>

Where in its lifecycle the task is.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ImageVersionSpecUid <Guid>

The unique identifier of the image version spec that the task was for.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following: Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ImageVersionSpecNotFound

Indicates that the required image version spec could not be located.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Remove-ProvImageVersionSpecHostingUnit

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Remove the replica of the prepared image version spec from the hosting unit.

Syntax

```
Remove-ProvImageVersionSpecHostingUnit
      -ImageVersionSpecUid <Guid>
      -HostingUnitName <String>
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvImageVersionSpecHostingUnit
      -ImageVersionSpecUid <Guid>
      -HostingUnitUid <Guid>
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove the replicas of an image version spec shared to other hosting units.

Examples

EXAMPLE 1

Remove an image version spec hosting unit.

```
Remove-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid 05e7aa58-76
   be-4bca-9d3c-9cc7a21dea2b -HostingUnitName west28 -RunAsynchronously

TaskId                : a80eab0a-7a2b-432a-8b72-28b704c7a1b2
Active                : True
Host                  : R80109-19-1
DateStarted           : 5/31/2024 7:18:20 AM
```

Status                  : Running
TaskStateInformation    : DeleteReplicaFromHostingUnit
Type                    : RemoveProvImageVersionSpecHostingUnit
```

Parameters

-ImageVersionSpecUid

The identifier for the image version spec.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit to be used.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-HostingUnitName

The name of the hosting unit to be used.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid> The identifier for the task that was performed. Active <Boolean> Indicates whether the task is still processing or is complete. Host <string> The name of the host on which the task is running or was run. DateStarted <DateTime> The date and time when the task was started. ImageDefinitionUid <Guid> The unique identifier of the image definition. ImageDefinitionName <string> The name of the image definition. HypervisorConnectionName <string> The name of the hypervisor connection being used by this image definition connection. HypervisorConnectionUid <Guid> The unique identifier of the hypervisor connection being used by this image definition connection. CustomProperties <string> The custom properties of the image definition connection. TaskType <Citrix.XDInterServiceTypes.JobType> The type of the task. For new image version tasks this is always "RemoveProvImageDefinitionConnection". ActiveElapsedTime <int> Number of seconds the task has taken for active execution. TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState> The state of the task.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

TaskAlreadyRunningForImageVersionSpec

The operation could not be completed because there is already an active task running for this image version spec.

UnableToRemoveImageVersionSpecHostingUnitDueToAssociatedProvisioningScheme The operation could not be completed because the image version spec is associated with a provisioning scheme.

Remove-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Removes a Maintenance Cycle

Syntax

```
Remove-ProvMaintenanceCycle
      -MaintenanceCycleId <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes/Deletes the maintenance cycle if it is still not yet started

Examples

Parameters

-MaintenanceCycleId

Indicates the Guid of the maintenance cycle to be deleted

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-ProvMetadataConfiguration

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Remove VM metadata configuration settings for a plugin.

Syntax

```
Remove-ProvMetadataConfiguration
      [-PluginType] <String>
      [-ConfigurationName] <String>
      [-ConfigurationValue] <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove configure metadata setting.

Examples

EXAMPLE 1

Remove Azure VM extension AADLoginForWindows from the supported list. Only customer added item can be removed.

```
Remove-ProvMetadataConfiguration -PluginType "AzureRmFactory" -
   ConfigurationName "Extension" -ConfigurationValue "
   AADLoginForWindows"
```

Parameters

-PluginType

The name of the hypervisor plug-in factory. Currently, AzureRmFactory is the only supported plug-in factory.

Type:	String
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 50

-ConfigurationName

The configuration name. Currently, Extension is the only supported configuration.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 50

-ConfigurationValue

The value for metadata configuration, for example Azure extension type.

Type:	String
Position:	4
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationDoesNotExist

The configuration cannot be found in the database.

ConfigurationCitrixDefined

The user cannot remove Citrix defined configurations.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details, check the Windows event logs on your self-hosted delivery controller or contact Citrix support if using Citrix DaaS (Citrix-hosted delivery controller).

Remove-ProvOperationEvent

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Removes one or more MCS operation events.

Syntax

```
Remove-ProvOperationEvent
      [-EventRecordId <Int64[]>]
      [-LinkedObjectType <String>]
      [-LinkedObjectUid <Guid>]
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Allows you to remove a set of existing MCS operation events.

Examples

EXAMPLE 1

Removes all of the operation events of the provisioning scheme with id 7585f0de-192e-4847-a6d8-22713c3a2f42.

```
Remove-ProvOperationEvent -LinkedObjectType ProvisioningScheme -
   LinkedObjectUid 7585f0de-192e-4847-a6d8-22713c3a2f42
```

Parameters

-EventRecordId

The array of event record id which all associated operation events will be removed.

Type: Int64[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-LinkedObjectType

The type of the linked object for which all associated operation events will be removed.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LinkedObjectUid

The unique identifier of the linked object for which all associated operation events will be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-All

All operation events will be removed.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-EventId

The array of event id which all associated operation events will be removed.

Replaced with parameter EventRecordId.

Type:	Int32[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2407

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Remove-ProvSchedule

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Removes a Provisioning Schedule

Syntax

```
Remove-ProvSchedule
       -ScheduleId <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Removes/Deletes a provisioning schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Parameters

-ScheduleId

Indicates the Guid of the provisioning schedule to be deleted

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Remove-ProvScheme

August 14, 2025

Removes a provisioning scheme

Syntax

```
Remove-ProvScheme
       [-ProvisioningSchemeName] <String>
       [-PurgeDBOnly]
       [-ForgetVM]
       [-RunAsynchronously]
       [-PurgeJobOnSuccess]
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ProvScheme
       -ProvisioningSchemeUid <Guid>
       [-PurgeDBOnly]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [-ForgetVM]
        [-RunAsynchronously]
        [-PurgeJobOnSuccess]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove a provisioning Scheme. The provisioning scheme must not contain any VMs unless the 'ForgetVM'or 'PurgeDBOnly'option is specified. If either option is specified, all associated provisioned snapshots will be deleted. Use the Get-ProvTask command to monitor the progress of this task.

Examples

EXAMPLE 1

Remove the empty provisioning scheme by name.

```
Remove-ProvScheme -ProvisioningSchemeName $provScheme.
    ProvisioningSchemeName
```

EXAMPLE 2

Deletes provisioning scheme 'Catalog-1'data from the Citrix site database

```
Get-ProvScheme -ProvisioningSchemeName Catalog-1 | Remove-ProvScheme -
    PurgeDBOnly

TaskId                : 02693f9c-8fa0-41c8-ab23-15853537fbb1

TaskExpectedCompletion :
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 64

-PurgeDBOnly

If this option is specified, this command will only remove the provisioning scheme data from the Citrix site database. However, the VMs and related resources created in the provisioning scheme still remain in the hypervisor. The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. This option can also be used when you are no longer able to contact the hypervisor and you want to remove the provisioning scheme from Citrix site database. This parameter cannot be used with "ForgetVM".

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

-ForgetVM

If this option is specified, this command will remove the provisioning scheme data from the Citrix site database and also delete Citrix-assigned identifiers(like tags or custom-attributes) on provisioning scheme, VMs and their related resources from hypervisor. However, the VMs and related resources created in the provisioning scheme still remain in the hypervisor after removing identifiers(like tags or custom-attributes). The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. This parameter is only applied to persistent VMs and cannot be used with "PurgeDBOnly".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvScheme.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information: TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new reset disk tasks, this is always "Reset-ProvVMDisk".

Status <string> ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

If the hosting unit referenced by the provisioning scheme no longer exists (that is, has been removed using the Hosting Unit PowerShell snap-in), the provisioning scheme data is deleted from the data-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

base without errors. However, the hard disks associated with the provisioning scheme cannot be removed and remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

UnableToRemoveProvisioningSchemeDueToAssociatedVM

The provisioning scheme contained VMs and the 'ForgetVM' or 'PurgeDBOnly' parameter was not specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The cmdlet is associated with a task of type DisusedImageCleanUp, and while active will move through the following operations (CurrentOperation field)

Remove-ProvSchemeControllerAddress

August 14, 2025

Removes controller addresses from a provisioning scheme.

Syntax

```
Remove-ProvSchemeControllerAddress
      [-ProvisioningSchemeName] <String>
      [-ControllerAddress] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeControllerAddress
      -ProvisioningSchemeUid <Guid>
      [-ControllerAddress] <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes the specified controller addresses from the specified provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Remove all controller addresses from the provisioning scheme with the name "scheme1".

```
Get-ProvScheme -ProvisioningSchemeName scheme1 | Remove-
    ProvSchemeControllerAddress

CleanOnBoot                  : True
ControllerAddress            : {
  }

CpuCount                     : 1
DiskSize                     : 20
HostingUnitName              : HostUnit1
HostingUnitUid               : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
IdentityPoolName             : idPool1

```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme that controller addresses are to be removed from.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme that controller addresses are to be removed from.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ControllerAddress

Specifies the array of controller DNS names to be removed from the provisioning scheme.

Type:	String[]
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

Type:	String[]
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Remove-ProvSchemeControllerAddress.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ControllerAddressNotFound

The specified address was not associated with the provisioning scheme.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeImageVersionSpecHistory

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

Removes the image version spec history of provisioning scheme.

Syntax

```
Remove-ProvSchemeImageVersionSpecHistory
      -ImageVersionSpecHistoryUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeImageVersionSpecHistory
      [-ProvisioningSchemeName] <String>
      [-ImageVersionSpecHistoryUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeImageVersionSpecHistory
      -ProvisioningSchemeUid <Guid>
      [-ImageVersionSpecHistoryUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove the record of previously used image version specs for provisioning schemes.

Examples

EXAMPLE 1

Removes all history for the provisioning scheme called “MyScheme”.

```
Remove-ProvSchemeImageVersionSpecHistory -ProvisioningSchemeName
   MyScheme
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Removes all history for all provisioning schemes.

```
Get-ProvScheme | Remove-ProvSchemeImageVersionSpecHistory
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	1 to 64

-ImageVersionSpecHistoryUid

The unique identifier of the image version spec history item.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Remove-ProvSchemeImageVersionSpecHistory.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeMasterVMImageHistory

August 14, 2025

Removes the history of provisioning scheme master image VMs.

Syntax

```
Remove-ProvSchemeMasterVMImageHistory
      [-ProvisioningSchemeName] <String>
      [-VMImageHistoryUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-ProvSchemeMasterVMImageHistory
      -ProvisioningSchemeUid <Guid>
      [-VMImageHistoryUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMasterVMImageHistory
      -VMImageHistoryUid <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove the record of previously used master image VMs or snapshots for provisioning schemes.

Examples

EXAMPLE 1

Removes all history for the provisioning scheme called "MyScheme".

```
Remove-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName MyScheme
```

EXAMPLE 2

Removes all history for all provisioning schemes.

```
Get-ProvScheme | Remove-ProvSchemeMasterVMImageHistory
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True
Length range:	1 to 64

-VMImageHistoryUid

The unique identifier of the image history item.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called ‘ProvisioningSchemeName’to Remove-ProvSchemeMasterVMImageHistory.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

Remove-ProvSchemeMetadata

August 14, 2025

Removes metadata from the given provisioning scheme.

Syntax

```
Remove-ProvSchemeMetadata
      [-ProvisioningSchemeUid] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
      [-ProvisioningSchemeUid] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
      [-InputObject] <ProvisioningScheme[]>
      -Name <String>
      [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
       [-InputObject] <ProvisioningScheme[]>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
       [-ProvisioningSchemeName] <String>
       -Name <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Remove-ProvSchemeMetadata
       [-ProvisioningSchemeName] <String>
       -Map <PSObject>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given provisioning scheme.

Examples

EXAMPLE 1

Remove all metadata from all provisioning scheme objects.

```
Get-ProvScheme | % {
  Remove-ProvSchemeMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type: String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Id of the provisioning scheme

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ProvisioningSchemeName

Name of the provisioning scheme

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

Objects to which the metadata is to be added.

Type:	ProvisioningScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvSchemeMetadata.

PSObject

A metadata map object can be piped to the Remove-ProvSchemeMetadata command.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeScope

August 14, 2025

Remove the specified provisioning scheme(s) from the given scope(s).

Syntax

```
Remove-ProvSchemeScope
      [-Scope] <String[]>
      -ProvisioningSchemeUid <Guid[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeScope
      [-Scope] <String[]>
      -InputObject <ProvisioningScheme[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeScope
      [-Scope] <String[]>
      -ProvisioningSchemeName <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

The Remove-ProvSchemeScope command is used to remove one or more provisioning schemes from the given scope(s).

To remove a provisioning scheme from a scope you need permission to change the scopes of the provisioning scheme.

If the provisioning scheme is not in a specified scope, that scope will be silently ignored.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Removes a single provisioning scheme from the 'Finance'scope.

```
Remove-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073
    -4080-A0EE-EC74CB537C52
```

EXAMPLE 2

Removes a single provisioning scheme from multiple scopes.

```
Remove-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702
    C5D0-C073-4080-A0EE-EC74CB537C52
```

EXAMPLE 3

Removes all visible provisioning schemes from the 'Finance'scope.

```
Get-ProvScheme | Remove-ProvSchemeScope Finance
```

EXAMPLE 4

Removes provisioning schemes whose name starts with an 'A'from the 'Finance'scope.

```
Remove-ProvSchemeScope Finance -ProvisioningSchemeName A*
```

Parameters

-InputObject

Specifies the ProvisioningScheme objects to be removed.

Type:	ProvisioningScheme[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ProvisioningSchemeUid

Specifies the ProvisioningScheme objects to be removed by the unique identifier of the provisioning scheme(s).

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

Specifies the ProvisioningScheme objects to be removed by the name of the provisioning scheme(s).

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-Scope

Specifies the scopes to remove the objects from.

Type:	String[]
Position:	2

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvSchemeScope.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvSchemeVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Removes a provisioning scheme configuration version

Syntax

```
Remove-ProvSchemeVersion
      [-ProvisioningSchemeName] <String>
      -Version <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeVersion
      -ProvisioningSchemeUid <Guid>
      -Version <Int32>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability to remove a prior provisioning scheme configuration version.

Examples

EXAMPLE 1

Removes version 3 of provisioning scheme MyScheme.

```
Remove-ProvSchemeVersion -ProvisioningSchemeName MyScheme -Version 3
```

EXAMPLE 2

Removes version 1 of provisioning scheme with Uid 5b37b311-fa3f-49dd-b93b-661b9e6fa571.

```
Remove-ProvSchemeVersion -ProvisioningSchemeUid 5b37b311-fa3f-49dd-b93b
    -661b9e6fa571 -Version 1
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme with the version to be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-Version

The version to remove. Cannot be the current provisioning scheme version in use or a version referenced by any machine in the provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme with the version to be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Remove-ProvSchemeVersion.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound The specified provisioning scheme could not be located.

ProvisioningSchemeVersionNotFound The specified ProvisioningScheme version could not be located.

ProvisioningSchemeVersionRemovalConflict The provisioning scheme version cannot be removed due to it being referenced by other resources.

CannotRemoveCurrentProvisioningSchemeVersion The provisioning scheme version cannot be removed since it is the current version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

Remove-ProvSchemeWarning

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Removes one or more provisioning scheme warnings.

Syntax

```
Remove-ProvSchemeWarning
      [-All]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeWarning
      [-ProvisioningSchemeName <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-ProvSchemeWarning
      [-ProvisioningSchemeUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvSchemeWarning
      [-WarningId <Int32>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Allows you to remove a set of existing provisioning scheme warnings.

Examples

EXAMPLE 1

Removes all of the provisioning scheme warnings matching the specified ProvisioningSchemeUid.

```
Remove-ProvSchemeWarning -ProvisioningSchemeUid 7585f0de-192e-4847-a6d8
    -22713c3a2f42
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme for which all associated warnings will be removed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme for which all associated warnings will be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WarningId

The id of the warning to remove.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-All

Remove all warnings.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Remove-ProvServiceConfigurationData

August 14, 2025

Removes configuration data from the service.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Remove-ProvServiceConfigurationData
      [[-Name] <String>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove data item from the Machine Creation Service configuration data.

Examples

EXAMPLE 1

Removes the configuration data item with name "MyName".

```
Remove-ProvServiceConfigurationData -Name "MyName"
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

The name of the configuration data item to remove.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure the following errors can be produced.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. For more details see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Remove-ProvServiceMetadata

August 14, 2025

Removes metadata from the given Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-ProvServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvServiceMetadata
      [-InputObject] <Service[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given MachineCreation Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-ProvService | % {
  Remove-ProvServiceMetadata -Map $_.MetadataMap  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the MachineCreation Service

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

MachineCreation service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvTask

August 14, 2025

Removes completed tasks from the database for the Machine Creation Service.

Syntax

```
Remove-ProvTask
       [-TaskId] <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Enables completed tasks that have run within the Machine Creation Service to be removed from the database.

Examples

EXAMPLE 1

Remove entries for all completed tasks from the Machine Creation Service.

```
Get-ProvTask -active $false | Remove-ProvTask
Success
```

Parameters

-TaskId

Specifies the identifier for the task to be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-ProvTask command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InvalidParameterCombination

The cmdlet parameters are inconsistent.

InvalidWorkflow

The specified task could not be found.

InvalidWorkflowState

The task was not in an appropriate state for the requested operation.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvTaskMetadata

August 14, 2025

Removes metadata from the given Task.

Syntax

```
Remove-ProvTaskMetadata
      [-TaskId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvTaskMetadata
      [-TaskId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvTaskMetadata
      [-InputObject] <Task[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvTaskMetadata
      [-InputObject] <Task[]>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Task.

Examples

EXAMPLE 1

Remove all metadata from all Task objects.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvTask | Remove-ProvTaskMetadata
```

Parameters

-Name

The metadata property to remove.

Type:	String
Aliases:	Property
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskId

Id of the Task.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Remove-ProvTaskMetadata command.

PSObject

A metadata map object can be piped to the Remove-ProvTaskMetadata command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

DatabaseError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Remove-ProvVM

August 14, 2025

Removes virtual machines created by Machine Creation Services.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-ProvVM
      [-ProvisioningSchemeName] <String>
      -VMName <String[]>
      [-PurgeDBOnly]
      [-ForgetVM]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvVM
      [-ProvisioningSchemeUid] <Guid>
      -VMName <String[]>
      [-PurgeDBOnly]
      [-ForgetVM]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Allows you to remove VMs from the Machine Creation Services and hypervisor. Any snapshots of the virtual machines will also be deleted.

Examples

EXAMPLE 1

Remove all VMs from provisioning scheme XenPS

```
,(Get-ProvVM -ProvisioningSchemeName XenPS) | Remove-ProvVM XenPS

            TaskId                        : cfb506a5-cc7e-4a49-ac7b-
               dd960029d0d3
            Active                        : False
            Host                          : DDC
            DateStarted                   : 10/10/2021 16:39:45
            Metadata                      : {
  }

            CurrentOperation              :
            TaskProgress                  : 100
            LastUpdatedTime               : 10/10/2021 16:39:50
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
13              ActiveElapsedTime             : 5
14              DateFinished                  : 10/10/2021 16:39:50

24   }
25
26              ProvisioningSchemeName        : XenPS
27              ProvisioningSchemeUid         : e1afc8fb-3f52-42ea-9a17-305
                    fdb0b6ee4
28              TaskState                     : Finished
29              TaskStateInformation          :
30              WorkflowStatus                : Completed
31              TaskExpectedCompletion        : 10/10/2021 16:39:50
```

Parameters

-VMName

List of VM names that will be removed from the provisioning scheme.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme from which VMs will be removed.

Type:	String
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which VMs will be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeDBOnly

If this option is specified, this command will only remove VM objects from the Machine Creation Services database; however, the VMs and hard disk copies still remain in the hypervisor. The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. If not specified, the VMs and hard disk copies are also removed from hypervisor storage. This parameter is exclusive with "ForgetVM".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ForgetVM

If this option is specified, this command will only remove VM objects from the Machine Creation Services database; however, the VMs and hard disk copies still remain in the hypervisor after removing VMs'citrix tags/identifiers. The hypervisor administrator can remove the VMs and hard disk images using the tools provided by the hypervisor itself. If not specified, the VMs and hard disk copies are also removed from hypervisor storage. This parameter is only applied to persistent VMs and exclusive with "PurgeDBOnly".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMName'and 'ProvisioningSchemeName'to Remove-ProvVM.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new Remove-ProvVM tasks, this is always "RemoveVirtualMachine".

Status <string>

Where in its lifecycle the task is.

PurgeDBOnly <bool>

Whether the named VMs are only removed from the Machine Creation Service database, but still remain in the hypervisor.

ForgetVm <bool>

Whether the named VMs are only removed from the Machine Creation Service database, but still remain in the hypervisor after removing VMs' citrix tags/identifiers.

RemovedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

Object array of removed virtual machines summary information. The object properties are:

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See RemovedVirtualMachines for details of the object parameters.

ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

The cmdlet is associated with a task of type RemoveVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

RemovingVirtualMachines

Only one long-running task for each provisioning scheme can be processed at a time.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

This task still operates if the hosting unit or VMs in the hypervisor are missing. This removes the data from the Citrix Machine Creation Services, but the VMs remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Remove-ProvVMBackup

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Removes provisioned backups created by Machine Creation Services.

Syntax

```
Remove-ProvVMBackup
      [-ProvisioningSchemeName] <String>
      [-VMName <String>]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvVMBackup
      [-ProvisioningSchemeUid] <Guid>
      [-VMName <String>]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-ProvVMBackup
      -BackupUid <Guid>
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Allows you to remove provisioned backups from the Machine Creation Services and hypervisor.

Examples

EXAMPLE 1

Remove all Provisioned Backups from provisioning scheme XenPS

```
,(Get-ProvVMBackup -ProvisioningSchemeName XenPS) | Remove-ProvVM XenPS

TaskId                 : cfb506a5-cc7e-4a49-ac7b-dd960029d0d3
Active                 : False
Host                   : DDC
DateStarted            : 10/10/2021 16:39:45
Metadata               : {
  }

CurrentOperation       :
TaskProgress           : 100
LastUpdatedTime        : 10/10/2021 16:39:50
ActiveElapsedTime      : 5
DateFinished           : 10/10/2021 16:39:50
TerminatingError       :
Type                   : RemoveBackup
Status                 : Finished
RemovedBackups       : {
 ... }

FailedBackups        : {
  }

ProvisioningSchemeName : XenPS
ProvisioningSchemeUid  : e1afc8fb-3f52-42ea-9a17-305fdb0b6ee4
TaskState              : Finished
TaskStateInformation   :
WorkflowStatus         : Completed
TaskExpectedCompletion : 10/10/2021 16:39:50
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-BackupUid

The Uid of the backup to removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme from which backups will be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which backups will be removed.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-VMName

The name of the VM from which backups will be removed.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedBackup

You can pipe an object containing parameters called 'VMName', 'ProvisioningSchemeName', and optionally 'BackupName'to Remove-ProvVMBackup.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

The date and time of the last task status update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new Remove-ProvVMBackup tasks, this is always "RemoveProvisionedBackup" .

Status <string>

Where in its lifecycle the task is.

StatusAdditionalInformation <string>

Extra information about the Status.

RemovedBackups <Citrix.DesktopUpdateManager.SDK.ProvisionedBackup[]>

Object array of removed backups summary information. The object properties are:

CreationDate <DateTime>

The date and time when the backup was created.

Domain <string>

The Domain of the AD computer account that the VM is using.

ProvisioningSchemeName <string>

The name of the provisioning scheme associated with the backup.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme associated with the backup.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme used by the associated VM at the time of backup creation.

ProvVMConfigurationVersion <int>

The version of the custom configuration used by the associated VM at the time of backup creation.

BackupUid <Guid>

The unique identifier of the provisioned backup.

HypervisorID<string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The hypervisor identifier of the provisioned backup.

BackupName <string>

The name of the provisioned backup.

VMId <string>

The identifier for the associated VM in the hypervisor.

VMName <string>

The name of the associated VM in the hypervisor.

HostingUnitUid <Guid>

The unique identifier of the hosting unit that was used to create the associated VM.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection that was used to create the associated VM.

DeletionProtection <bool>

Flag indicating if backup requires explicit deletion.

FailedBackups <Citrix.DesktopUpdateManager.SDK.ProvisionedBackup[]>

See RemovedVirtualMachines for details of the object parameters.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

The cmdlet is associated with a task of type RemoveBackup, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

RemovingBackups

Only one long-running task for each provisioning scheme can be processed at a time.

This task still operates if the hosting unit or backups in the hypervisor are missing. This removes the data from the Citrix Machine Creation Services, but the VMs remain in the hypervisor.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed The requested task could not be started.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

WorkflowHostUnavailable The task could not be started because the database connection is inactive.

CommunicationError An error occurred while communicating with the service.

InvalidParameterCombination Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Rename-ProvImageDefinition

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Changes the parameter values for a image definition.

Syntax

```
Rename-ProvImageDefinition
      [-ImageDefinitionName] <String>
      -NewImageDefinitionName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-ProvImageDefinition
      -ImageDefinitionUid <Guid>
      -NewImageDefinitionName <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to rename an existing image definition.

Examples

EXAMPLE 1

Renames an image definition from “CurrentName”to “NewName”.

```
Rename-ProvImageDefinition -ImageDefinitionName CurrentName -
    NewImageDefinitionName NewName

  CreationTime           : 1/1/2022 12:00:00
  Description            : Windows image
  OsType                 : Windows
  VDASessionSupport      : MultiSession
  ImageDefinitionName    : NewName
  ImageDefinitionUid     : 7585f0de-192e-4847-a6d8-22713c3a2f42
  Metadata               :
  LatestVersion          : 2
  VersionsCount          : 2
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ImageDefinitionUid

The unique identifier of the image definition that is to be renamed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-NewImageDefinitionName

The new name for the image definition. This must not be a name that is being used by an existing image definition, and it must not contain any of the following characters \/;:#.*?=<>|[]()'""

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionName

The current name of the image definition.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definition and contains the following information:

CreationTime <DateTime>

The date and time when the image definition was created.

Description <string>

The description of the image definition.

OsType <string>

The OS type for the image versions in this image definition.

VDASessionSupport <string>

The Session support of VDA for this image definition.

ImageDefinitionName <string>

The name of the image definition.

ImageDefinitionUid <Guid>

The unique identifier for the image definition.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image definition, if specified.

LatestVersion <int>

The latest version number in this definition.

VersionsCount <int>

The total versions count in this definition.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Rename-ProvScheme

August 14, 2025

Renames a provisioning scheme.

Syntax

```
Rename-ProvScheme
      [-ProvisioningSchemeName] <String>
      [-NewProvisioningSchemeName] <String>
      [-PassThru]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Rename-ProvScheme
      -ProvisioningSchemeUid <Guid>
      [-NewProvisioningSchemeName] <String>
      [-PassThru]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Provides the ability to change the name of an existing provisioning scheme. The unique identifier of the provisioning scheme never changes after it has been created, therefore, the provisioning scheme can always be identified by its unique identifier regardless of any name changes.

Examples

EXAMPLE 1

Renames a provisioning scheme from “currentName”to “NewName”.

```
Rename-ProvScheme -provisioningSchemeName CurrentName -
    NewProvisioningSchemeName NewName
```

EXAMPLE 2

Renames a provisioning scheme from “currentName”to “NewName”and displays the resulting state.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Rename-ProvScheme -provisioningSchemeName CurrentName -
    NewProvisioningSchemeName NewName -PassThru

CleanOnBoot                   : True

WriteBackCacheDiskIndex       : 0
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme that is to be renamed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The current name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NewProvisioningSchemeName

The new name for the provisioning scheme. This must not be a name that is being used by an existing provisioning scheme, and it must not contain any of the following characters \/;:#.*?=<>|[]()’””

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-PassThru

Defines whether the command returns a result showing the new state of the updated identity pool.

Type:	SwitchParameter
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool>

Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int>

The number of processors that will be used to create VMs.

DiskSize <int>

The disk size (in GB) that will be used to create VMs.

HostingUnitName <string>

The name of the hosting unit being used by this provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

HostingUnitUid <Guid>

The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string>

The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool being used by this provisioning scheme.

MachineCount <int>

The count of machines created with this provisioning scheme.

MachineProfile <string>

The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string>

The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime>

The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int>

The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];>

The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string>

The name of this provisioning scheme.

ProvisioningSchemeUid <Guid>

The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int>

The version of the provisioning scheme.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool>

Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]>

The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]>

The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool>

Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string>

The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool>

Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string>

The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

SecurityGroups <string[]>

The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string>

Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string>

Deprecated.

CurrentMasterImageUid <Guid>

The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

IdentityType <string>

Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool>

Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool>

Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int>

The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int>

The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]>

Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int>

The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNameAlreadyExists

A provisioning scheme with the same name as the new provisioning scheme name already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Repair-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Repairs a Maintenance Cycle

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Repair-ProvMaintenanceCycle
      -MaintenanceCycleId <Guid>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Initiates the recovery of virtual machines part of the maintenance cycle which is stuck in Running State. It is recommended that the cmdlet is only used when directed by support

Examples

Parameters

-MaintenanceCycleId

Indicates the Guid of the maintenance cycle

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Request-ProvVMUpdate

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

(DEPRECATED) Requests a property update on provisioned virtual machines.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Request-ProvVMUpdate
        -ProvisioningSchemeName <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Request-ProvVMUpdate
        -ProvisioningSchemeName <String>
        -VMName <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Request-ProvVMUpdate
        -ProvisioningSchemeUid <Guid>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Request-ProvVMUpdate
        -ProvisioningSchemeUid <Guid>
        -VMName <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet has been deprecated and replaced by Set-ProvVMUpdateTimeWindow. Please see the examples on this page that describe how to transition to the new cmdlet.

Provides the ability to synchronize the properties of existing virtual machines with any changes occurred on the provisioning scheme.

This cmdlet updates the ProvisioningSchemeUpdateRequested field on virtual machines to the current time, which indicates that the machines will synchronize to the property updates occurred on the provisioning scheme upon next start.

Examples

EXAMPLE 1

To request all machines in a catalog to apply property updates on next boot, use Set-ProvVMUpdateTimeWindow with parameters -StartsNow and -DurationInMinutes -1.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Request-ProvVMUpdate -ProvisioningSchemeName AzuPS

is equivalent to

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AzuPS -StartsNow -
    DurationInMinutes -1
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names requesting for update. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will request for a property update.

Type:	String[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Request-ProvVMUpdate.

Outputs

None

By default, this cmdlet returns no output.

Notes

Running Set-ProvScheme to update provisioning scheme properties will only affect future provisioned machines. To request existing VMs in a catalog to be brought up to date upon the next power on, use this cmdlet to request certain or all VMs created from the provisioning scheme associated with the catalog to be updated.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Set-ProvVMUpdateTimeWindow

Reset-ProvEnabledFeatureList

August 14, 2025

Refreshes the MachineCreation service's list of enabled features.

Syntax

```
Reset-ProvEnabledFeatureList
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Synchronizes the currently selected Citrix MachineCreation Service instance's list of enabled features with that held by the Central Configuration Service.

By default toggling site features on or off can take up to 10 minutes to propagate to all services in the site. However, after a toggle is changed, if this cmdlet is run for each service instance in the site the changes propagate effectively immediately.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Refreshes the selected MachineCreation service instance's list of enabled features.

```
Reset-ProvEnabledFeatureList
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Reset-ProvRecommendation

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Resets recommendations for given target(s).

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Reset-ProvRecommendation
     -TargetUids <Guid[]>
     -TargetType <String>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Resets recommendations for given target(s).

Examples

EXAMPLE 1

Resets the recommendation(s) for given targets.

```
Reset-ProvRecommendation -TargetUids [Guid1, Guid2] -TargetType
   ProvisioningScheme
```

Parameters

-TargetUids

The id(s) of the targets such as ProvisioningSchemeUid.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetType

The type of target - ProvisioningScheme or HostingUnit.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Accepted values:	ProvisioningScheme
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Reset-ProvServiceGroupMembership

August 14, 2025

Reloads the access permissions and configuration service locations for the MachineCreation Service.

Syntax

```
Reset-ProvServiceGroupMembership
     [-ConfigServiceInstance] <ServiceInstance[]>
     [-LoggingId <Guid>]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

Description

Reloads the access permissions and configuration service locations for the MachineCreation Service.

The Reset-ProvServiceGroupMembership cmdlet must be run on at least one instance of the service type (Prov) after installation and registration with the configuration service. Without this operation, the MachineCreation services will be unable to communicate with other services in the Citrix Virtual Apps and Desktops deployment.

When the cmdlet is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ProvServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment.

If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Examples

EXAMPLE 1

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

```
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    ProvServiceGroupMembership
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 2

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

```
Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress
    OtherServer.example.com | Reset-ProvServiceGroupmembership
```

Parameters

-ConfigServiceInstance

Specifies the configuration service instance object that represents the service instance for the type 'InterService'that references a configuration service for the deployment.

Type:	ServiceInstance[]
Position:	2
Default value:	LocalHost
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ServiceInstance[]

Service instances containing a ServiceInstance object that refers to the Central Configuration Service interservice interface can be piped to the Reset-ProvServiceGroupMembership command.

Outputs

Citrix.MachineCreation.Sdk.ServiceInstance

Reset-ProvServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the MachineCreation Service instance.

Notes

If the command fails, the following errors can be returned:

- NoSuitableServiceInstance

  None of the supplied service instance objects were suitable for resetting service group membership.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Reset-ProvVMDisk

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2209

Resets the OS disk of persistent VMs or the Identity disk of persistent and non-persistent VMs.

Syntax

```
Reset-ProvVMDisk
      [-ProvisioningSchemeName] <String>
      -VMName <String[]>
      [-RunAsynchronously]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
      [-Identity]
      [-Recreate]
      [-PurgeJobOnSuccess]
      [-Force]
      [-LoggingId <Guid>]
      [-WhatIf]
      [-Confirm]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Reset-ProvVMDisk
     [-ProvisioningSchemeName] <String>
     -VMName <String[]>
     [-RunAsynchronously]
     [-OS]
     [-PurgeJobOnSuccess]
     [-Force]
     [-LoggingId <Guid>]
     [-WhatIf]
     [-Confirm]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Reset-ProvVMDisk
     [-ProvisioningSchemeUid] <Guid>
     -VMName <String[]>
     [-RunAsynchronously]
     [-Identity]
     [-Recreate]
     [-PurgeJobOnSuccess]
     [-Force]
     [-LoggingId <Guid>]
     [-WhatIf]
     [-Confirm]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

```
Reset-ProvVMDisk
     [-ProvisioningSchemeUid] <Guid>
     -VMName <String[]>
     [-RunAsynchronously]
     [-OS]
     [-PurgeJobOnSuccess]
     [-Force]
     [-LoggingId <Guid>]
     [-WhatIf]
     [-Confirm]
     [<CitrixCommonParameters>]
     [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Allows you to reset the disks of persistent VMs from Machine Creation Services and hypervisor.

Examples

EXAMPLE 1

Reset the OS disks of all VMs in provisioning scheme myProvScheme

```
,(Get-ProvVM -ProvisioningSchemeName "myProvScheme") | Reset-ProvVMDisk
    -ProvisioningSchemeName "myProvScheme" -OS

TaskId                 : 2706e50b-aff9-44c7-a3e3-8c8c7f1f4ac5

EXAMPLE 4

Reset all configurations in the identity disks of all VMs in provisioning scheme myProvScheme

```
,(Get-ProvVM -ProvisioningSchemeName "myProvScheme") | Reset-ProvVMDisk
    -ProvisioningSchemeName "myProvScheme" -Identity
```

EXAMPLE 5

Completely recreate he identity disk for VM machine01

```
Reset-ProvVMDisk -ProvisioningSchemeName "myProvScheme" -VMName "
   machine01" -Identity -Recreate
```

Parameters

-OS

Indicates that the OS disk should be reset. This parameter is exclusive with “Identity”. Either “OS”or “Identity”must be provided.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Identity

Indicates that the identity disk should be reset. This parameter is exclusive with "OS". By default, all configurations in the identity disk will be reset. "Repair-AcctIdentity -Target IdentityInfo"should be executed before this command. For hybrid Azure AD, Set-AcctADAccountUserCert -Force should be executed to reset the DeviceKeyPair in advance.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-VMName

List of VM names that will be have the disk reset.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme from which VM disks will be reset. This feature is available on VMware, Azure, AWS and Citrix hypervisor.

Type:	String
Position:	2
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme from which VM disks will be reset.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Recreate

Indicates whether the identity disk will be completely recreated. This parameter is only used with "Identity".

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-RunAsynchronously

Indicates whether the command returns before it completes. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the Get-ProvTask command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Suppresses prompts for confirmation before proceeding to reset the disk of the specified VMs.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WhatIf

Shows what would happen if the cmdlet runs. The cmdlet is not run.

Type:	SwitchParameter
Aliases:	wi
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Confirm

Prompts for confirmation before running the cmdlet.

Type:	SwitchParameter
Aliases:	cf
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-ResetIdentityInfo

Indicates whether only machine password and trust keys in the configuration file will be reset. This parameter is only used with “Identity”.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311
Removed in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMName'and 'ProvisioningSchemeName'to Reset-ProvVMDisk.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information: TaskId <Guid>

The identifier for the task that was performed.

Active <bool>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time when the task was started.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

CurrentOperation <string>

Operation specific phase of the overall "Running"task state.

TaskProgress <double>

The progress of the task 0-100%.

LastUpdateTime <DateTime>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The date and time of the last task status update.

ActiveElapsedTime <int>

Number of seconds the task has taken for active execution.

DateFinished <DateTime>

The date and time when the task was completed.

TerminatingError < Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskterminatingError>

Diagnostic information if the task completely fails.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new reset disk tasks, this is always "Reset-ProvVMDisk".

Status <string>

Where in its lifecycle the task is.

ResetVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents.

Message <string>

The exception message.

Details <string>

The full exception content including stack trace.

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state.

Status <string>

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The status of the virtual machine.

StatusAdditionalInformation <string>

Extra information about the Status.

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

ProvisioningSchemeName <string>

The name of the provisioning scheme from which the VM was created.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme from which the VM was created.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Provides more detailed information about the current task state.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

TaskExpectedCompletion <DateTime>

The date and time at which the task is expected to complete.

Notes

Only one long-running task for each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes ————ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

The cmdlet is associated with a task of type ResetVirtualMachine, and while active will move through the following operations (CurrentOperation field)

Restart-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Restarts a Maintenance Cycle

Syntax

```
Restart-ProvMaintenanceCycle
       -MaintenanceCycleId <Guid>
       -ScheduledStartTimeInUTC <DateTime>
       -MaxDurationInMinutes <Int32>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

If a maintenance cycle has failed or is incomplete due to outdoor causes such as the hypervisor was down or insufficient time, this cmdlet helps to restart the cycle and process any failed/not-processed jobs

Examples

Parameters

-MaintenanceCycleId

Indicates the Guid of the maintenance cycle

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ScheduledStartTimeInUTC

Indicates the new start time in UTC at which the maintenance cycle will be restarted This must be a date time powershell object and user is expected to supply it as a parameter to the cmdlet

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDurationInMinutes

Indicates the new total allocated duration in minutes to the restarted maintenance cycle

Type:	Int32
Position:	Named
Default value:	30
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Restart-ProvSchedule

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Restarts a Provisioning Schedule

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Restart-ProvSchedule
       -ScheduleId <Guid>
       -NextScheduledStartTimeInUTC <DateTime>
       -RecurringSchedule <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Reactivates a cancelled Provisioning Schedule with a new start time and frequency

Examples

Parameters

-ScheduleId

Indicates the Guid of the Provisioning Schedule

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-NextScheduledStartTimeInUTC

Indicates the new start time in UTC at which the Provisioning Schedule will be restarted This must be a date time powershell object and user is expected to supply it as a parameter to the cmdlet

Type:	DateTime
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RecurringSchedule

Indicates the new recurring frequency

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Restore-ProvVMToBackupOperation

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Schedules the Restoration of the persistent VM to one of its specified provisioned backups.

Syntax

```
Restore-ProvVMToBackupOperation
        -ScheduledStartTimeInUTC <DateTime>
        -BackupUid <Guid>
        [-DiskOnly]
        [-MaintenanceCycleDescription <String>]
        -MaxDurationInMinutes <Int32>
        [-PurgeDBAfterInDays <Int32>]
        [-SessionWarningTimeInMinutes <Int32>]
        [-SessionWarningLogOffTitle <String>]
        [-SessionWarningLogOffMessage <String>]
        [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Restore-ProvVMToBackupOperation
        [-StartsNow]
        -BackupUid <Guid>
        [-DiskOnly]
        [-MaintenanceCycleDescription <String>]
        -MaxDurationInMinutes <Int32>
        [-PurgeDBAfterInDays <Int32>]
        [-SessionWarningTimeInMinutes <Int32>]
        [-SessionWarningLogOffTitle <String>]
        [-SessionWarningLogOffMessage <String>]
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Schedules the persistent VM's hardware and boot disk to be restored to a previous state via a maintenance cycle operation.

Examples

Parameters

-ScheduledStartTimeInUTC

Scheduled a time for the operation to run.

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartsNow

Run the operation now.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-BackupUid

The unique identifiers of the provisioned backups to be used as the basis of restoring.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDurationInMinutes

Indicates the total allocated duration in minutes to the maintenance cycle

Type:	Int32
Position:	Named
Default value:	30
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-DiskOnly

Indicates only the boot disk of the VM should be restored. The hardware configuration of the VM will be untouched

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaintenanceCycleDescription

A brief overview to understand what the maintenance cycle is about

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeDBAfterInDays

The duration of time in days for mcs to have the data in database after maintenance cycles goes into completed states, once the time expires the data will be purged

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-SessionWarningTimeInMinutes

Buffer Time provided to the user to save date before powering down the vm by mcs

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningLogOffTitle

Short Heading for the message to be displayed to the user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningLogOffMessage

Brief Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Schedule-ProvVMUpdate

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2212

(DEPRECATED) Schedules a property update on provisioned virtual machines.

Syntax

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeName <String>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeName <String>
        -VMName <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeUid <Guid>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

```
Schedule-ProvVMUpdate
        [-StartTimeInUTC <String>]
        [-StartsNow]
        [-DurationInMinutes <Int32>]
        -ProvisioningSchemeUid <Guid>
        -VMName <String[]>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

This cmdlet has been deprecated and replaced by Set-ProvVMUpdateTimeWindow. Set-ProvVMUpdateTimeWindo is the new name for Schedule-ProvVMUpdate and provides all the same functionality, please use it going foward in place of Schedule-ProvVMUpdate.

Provides the ability to synchronize the properties of existing virtual machines with any changes occurred on the provisioning scheme.

This cmdlet defines a time window where a provisioning scheme update will take place against either specific machines

in a catalog or an entire catalog. The update will take place when the machine is next booted within the time window.

On each VM an update is scheduled, ProvisioningSchemeUpdateRequested defines the start of the time window and

ProvisioningSchemeUpdateUntil defines the end of the time window. These fields will be cleared upon a successful

provisioning scheme update or if the time window has expired when the machine has booted

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names to schedule an update for. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will be scheduled for a property update

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTimeInUTC

The start time in UTC format of the time window the schedule is active for. Mutually exclusive with StartsNow switch. Must be no more than 5 seconds in the past. The string will be converted into a DateTime using parsing rules defined by the DateTime.Parse method, which allows for a timezone offset to specify time in any timezone. If no timezone offset is specified, UTC will be assumed. See the example usages of Schedule-ProvVMupdate or this link for more details https://docs.microsoft.com/en-us/dotnet/api/system.datetime.parse?view=net-6.0#the-string-to-parse

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-StartsNow

Whether this schedule should start right away. Mutually exclusive with specific StartTimeInUTC. Implied to be set if StartTimeInUTC is not specified

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInMinutes

The duration in minutes of the time window the schedule is active for. If less than 0, indicates the schedule has no end time

Type:	Int32
Position:	Named
Default value:	120 minutes
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Schedule-ProvVMUpdate.

Outputs

None

By default, this cmdlet returns no output.

Notes

Running Set-ProvScheme to update provisioning scheme properties will only affect future provisioned machines. To schedule existing VMs in a catalog to be brought up to date upon the next power on, use this cmdlet to schedule certain or all VMs created from the provisioning scheme associated with the catalog to be updated.

Set-ProvDBConnection

August 14, 2025

Configures a database connection for the MachineCreation Service.

Syntax

```
Set-ProvDBConnection
   [-DBConnection] <String>
   [-Force]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies the database connection string for use by the currently selected Citrix MachineCreation Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Set-ProvDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
    Trusted_Connection=True"
```

EXAMPLE 2

Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.

```
Set-ProvDBConnection -DBConnection $null
```

Parameters

-DBConnection

Specifies the database connection string to be used by the MachineCreation Service. Passing in $null will clear any existing database connection configured.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-ProvDBConnection cmdlet returns an object describing the status of the MachineCreation Service together with extra diagnostics information. Possible values are:

- OK

  The MachineCreation Service instance is configured with a valid database and service schema. The service is operational.

- DBUnconfigured

  No database connection string is set for the MachineCreation Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the MachineCreation Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBNewerVersionThanService

  The version of the MachineCreation Service currently in use is newer than, and incompatible with, the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

- DBOlderVersionThanService

  The version of the MachineCreation Service schema on the database is newer than, and incompatible with, the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the MachineCreation Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the MachineCreation Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Set-ProvDBCredentials

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Configures the database server SQL credentials for the MachineCreation Service.

Syntax

```
Set-ProvDBCredentials
   [-Credentials] <PSCredential>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvDBCredentials
   [-Login] <String>
   [-Password] <SecureString>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Specifies SQL credentials to be used by the currently selected Citrix MachineCreation Service instance to authenticate with the database server. By default Windows authentication is used and no SQL credentials are required.

If used, SQL credentials must be specified before the service's schema is obtained and created, and before the database connection string is set. The credentials must also be specified for each additional MachineCreation Service prior to it being added to the site.

If the database connection string is already set and Windows authentication is in use, it is not possible to specify SQL credentials, however, if SQL credentials are already in use then they can be changed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Prompts for SQL credentials and sets them for use by the current service instance.

```
Set-ProvDBCredentials
```

EXAMPLE 2

Prompts for SQL credentials and sets them for use by the current service instance. This form is useful where the same credentials are being used multiple times.

```
$sqlCred = Get-Credential
Set-ProvDBCredentials $sqlCred
```

EXAMPLE 3

Sets the SQL credentials to the explicitly specified login and password values.

```
$password = ConvertTo-SecureString 'P@ssW0rd' -AsPlainText -Force
Set-ProvDBCredentials 'CvadLogin' $password
```

EXAMPLE 4

Clears previously set SQL credentials and reverts to use of the default Windows authentication. This can only be done if no connection string is set.

```
Set-ProvDBCredentials $null
```

Parameters

-Credentials

A PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Login

The SQL login to be used for SQL authentication.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

The password to be used for SQL authentication.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-ProvImageDefinition

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Changes the parameter values for a image definition.

Syntax

```
Set-ProvImageDefinition
    [-ImageDefinitionName] <String>
    [[-Description] <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvImageDefinition
    -ImageDefinitionUid <Guid>
    [[-Description] <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to update the parameters of an existing image definition.

The following parameters are allowed to be updated:

The description of the image definition.

Examples

EXAMPLE 1

Update a image definition name with uid “7585f0de-192e-4847-a6d8-22713c3a2f42”.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-ProvImageDefinition -ImageDefinitionUid 7585f0de-192e-4847-a6d8
    -22713c3a2f42 -Description 'Windows image'

CreationTime           : 1/1/2022 12:00:00
Description            : Windows image
OsType                 : Windows
VDASessionSupport      : MultiSession
ImageDefinitionName    : Image1
ImageDefinitionUid     : 7585f0de-192e-4847-a6d8-22713c3a2f42
Metadata               :
LatestVersion          : 2
VersionsCount          : 2
```

Parameters

-ImageDefinitionUid

The identifier of the image definition to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionName

The name of the image definition to be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

A value indicating the image definition description.

Type:	String
Position:	3
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageDefinition

This object provides details of the image definition and contains the following information:

CreationTime <DateTime>

The date and time when the image definition was created.

Description <string>

The description of the image definition.

OsType <string>

The OS type for the image versions in this image definition.

VDASessionSupport <string>

The Session support of VDA for this image definition.

ImageDefinitionName <string>

The name of the image definition.

ImageDefinitionUid <Guid>

The unique identifier for the image definition.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image definition, if specified.

LatestVersion <int>

The latest version number in this definition.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

VersionsCount <int>

The total versions count in this definition.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Set-ProvImageVersion

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Changes the parameter values for an image version.

Syntax

```
Set-ProvImageVersion
   [-ImageDefinitionName] <String>
   [-ImageVersionNumber] <Int32>
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvImageVersion
   -ImageVersionUid <Guid>
   [-Description <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the parameters of an existing image version.

The following parameters are allowed to be updated:

The description of the image version.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Update a image definition description with image definition name “MyImage”and image version number “1”.

```
Set-ProvImageVersion -ImageDefinitionName MyImage -ImageVersionNumber 1
    -Description "version with app1"

ImageVersionNumber      : 1
ImageVersionUid         : b1c7602c-b080-4a63-846b-9d2429d54bd1
ImageDefinitionName     : myImage
ImageDefinitionUid      : 42bd09f5-3fac-44a6-8b1c-7c09f1079cc0
CreationTime            : 4/2/2022 2:57:21 AM
Metadata                : {
  }

Description             : version with app1
ImageVersionSpecsCount  : 0
```

Parameters

-ImageVersionUid

The identifier of the image version to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageDefinitionName

The name of the image definition to be updated.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-ImageVersionNumber

The version number of the image version to be updated.

Type:	Int32
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

-Description

The description of the image version to be updated.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ImageVersion

This object provides details of the image version and contains the following information:

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CreationTime <DateTime>

The date and time when the image version was created.

Description <string>

The description for this image version.

ImageDefinitionName <string>

The name of the image Definition the created image version belongs to.

ImageDefinitionUid <Guid>

The unique identifier of the image Definition the created image version belongs to.

ImageVersionUid <int>

The unique identifier for this image version.

ImageVersionNumber <int>

The version number fot this image version.

ImageVersionSpecsCount <int>

The total image version specs count in this image version.

Metadata <System.Collections.Generic.Dictionary[string, string];>

The metadata to apply to the image version, if specified.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

© 1997–2025 Citrix Systems, Inc. All rights reserved.

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

UnsupportedByServer

The requested operation is not supported by this version of the service.

Set-ProvRecommendation

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Sets the State and RemindIn of a list of recommendations.

Syntax

```
Set-ProvRecommendation
   -RecommendationIds <Guid[]>
   [-RecommendationState <String>]
   [-Reason <String>]
   [-RemindInDateTimeInUTC <DateTime>]
   [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to set the RecommendationState from New to Dismiss or Accept and also set a reminder datetime.

Examples

EXAMPLE 1

Sets the State, Reason and RemindInDateTimeInUTC for given recommendation(s).

```
$reminder = [DateTime]::UtcNow.AddMinutes(10)
Set-ProvRecommendation -RecommedationIds @("Guid1", "Guid2") -
    RecommedationState Dismiss -RemindInDateTimeInUTC $reminder -Reason
    "Not applicable"
```

Parameters

-RecommendationIds

The id(s) of the recommendations to be updated.

Type:	Guid[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RecommendationState

The state of the recommendations - Dismiss or Accept.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accepted values:	Dismiss, Accept
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Reason

The reason why you want to dismiss the recommendation.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RemindInDateTimeInUTC

The datetime by when you would be reminded of this recommendation.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Set-ProvResourceTags

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2209

Set provisioning resources tags.

Syntax

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-ProvResourceTags
   [-ProvisioningSchemeName] <String>
   [-InputObject <ProvisionedVirtualMachine[]>]
   [-VMName <String>]
   [-VMBatchSize <Int32>]
   [-ResourceType <ResourceType>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvResourceTags
   -ProvisioningSchemeUid <Guid>
   [-InputObject <ProvisionedVirtualMachine[]>]
   [-VMName <String>]
   [-VMBatchSize <Int32>]
   [-ResourceType <ResourceType>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to update the tags of the resources created by Citrix during provisioning. The two types of resources created by Citrix are machine catalog level, and virtual machine level. They can be tagged separately or at the same time. Resources are tagged with 'CitrixProvisioningSchemeId', 'CitrixVirtualSiteId'and 'CitrixCustomerId'.

Examples

EXAMPLE 1

Tag MachineCatalog resources in provisioning scheme called "MyProvisioningSchemeName".

```
Set-ProvResourceTags -ProvisioningSchemeName MyProvisioningSchemeName -
   ResourceType MachineCatalog -OutVariable result

          SuccessfulVirtualMachineCount FailedVirtualMachineCount
             TagOperationErrors
          ----------------------------- -------------------------
             ------------------
                                      0                         0 {
 image.snapshot }

          $result.TagOperationErrors

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
            ResourceName   ResourceType   TagFailureReason
            ------------   ------------   ----------------
            image.snapshot MachineCatalog OperationNotAllowed
```

EXAMPLE 2

Tag both MachineCatalog and all VirtualMachine resources in provisioning scheme called "MyProvisioningSchemeName".

```
,(Get-ProvVM -ProvisioningSchemeName myProvisioningSchemeName) | Set-
   ProvResourceTags -ProvisioningSchemeName MyProvisioningSchemeName -
   OutVariable result

            SuccessfulVirtualMachineCount FailedVirtualMachineCount
               TagOperationErrors
            ----------------------------- ------------------------
               ------------------
                                        5                         2 {
 myVirtualMachine0, myVirtualMachine1 }

            $result.TagOperationErrors

            ResourceName      ResourceType   TagFailureReason
            ------------      ------------   ----------------
            myVirtualMachine0 VirtualMachine OperationNotAllowed
            myVirtualMachine1 VirtualMachine OperationNotAllowed
```

EXAMPLE 3

Tag VirtualMachine MyVirtualMachine0's resources in provisioning scheme called "MyProvisioningSchemeName".

```
Set-ProvResourceTags -ProvisioningSchemeName MyProvisioningSchemeName -
   VMName MyVirtualMachine0 -ResourceType VirtualMachine -OutVariable
   result

SuccessfulVirtualMachineCount FailedVirtualMachineCount
   TagOperationErrors
------------------------------ -------------------------
   ------------------
                             1                         0 {
  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme to be tagged.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme to be tagged.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 64

-InputObject

The VM name list to be tagged.

Type:	ProvisionedVirtualMachine[]
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

The VM name to be tagged.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMBatchSize

The maximum number of VMs to be tagged in a batch. Range 1-60 with default of 10.

Type:	Int32
Position:	Named
Default value:	10
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceType

Specifies the type of resource. Supported resource types are:

MachineCatalog

VirtualMachine

All

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	ResourceType
Accepted values:	All, MachineCatalog, VirtualMachine
Position:	Named
Default value:	All
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'or 'ProvisioningSchemeUid'to Set-ProvResourceTags.

Outputs

Citrix.MachineCreation.Sdk.TagOperationDetailedSummary

The Set-ProvResourceTags that contains the following parameters:

SuccessfulVirtualMachineCount <int>

The number of virtual machines to which their machine level resources were tagged successfully.

FailedVirtualMachineCount <int>

The number of virtual machines to which their machine level resources were not tagged.

TagOperationErrors <Citrix.MachineCreation.Sdk.TagOperationError[]>

The list of resources that failed to be tagged. Each one has the following parameters:

ResourceType <string>

Type of the resource.

ResourceName <string>

Name of the resource.

TagFailureReason <string>

Reason for the tag operation failure. This can be one of the following:

OperationNotAllowed

The operation is not allowed because the resources are not in the right state to tag.

TooManyRequests

The request is being throttled because too many requestes arrive.

UnexpectedTagFailure

Failed to tag with unexpected exception.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

SetProvSchemeTagsFailed

An unexpected error occurred while setting machine catalog level resources tags.

SetProvVMTagsFailed

An unexpected error occurred while setting virtual machine level resources tags.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Description

Provides the ability to update the parameters of an existing provisioning scheme. It increments the provisioning scheme's ProvisioningSchemeVersion by 1 each time it is called.

The following parameters are allowed to be updated:

- Number of CPUs that will be used for VMs created from the provisioning scheme.
- Maximum amount of memory that will be used for VMs created from the provisioning scheme.
- Identity pool that will be used for VMs created from the provisioning scheme.
- Machine profile that will be used for VMs created from the provisioning scheme.
- Cloud service offering that will be used for VMs created from the provisioning scheme.
- Custom properties of the provisioning scheme that are specific to the target hosting infrastructure.

To change the provisioning scheme name, see Rename-ProvScheme.

Examples

EXAMPLE 1

Updates a provisioning scheme called "MyScheme"to use two processors on the VMs that are created from the provisioning scheme.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -VMCpuCount 2

CleanOnBoot                  : True
ControllerAddress            : {
 ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com }

CpuCount                     : 2

```
WriteBackCacheDiskIndex      : 0
```

EXAMPLE 3

Updates a provisioning scheme to have a new MachineProfile. The provisioning scheme state is then reverted back to version 1 and the original MachineProfile.

```
Get-ProvScheme | select ProvisioningSchemeName, MachineProfile,
    ProvisioningSchemeVersion

ProvisioningSchemeName MachineProfile

    ProvisioningSchemeVersion
---------------------- --------------

    -------------------------
AzureCatalog           XDHyp:\HostingUnits\AzureRes\machineprofile.
    folder\rg.resourcegroup\machineprofile.templatespec\1.0.
    templatespecversion                                        1

Set-ProvScheme -ProvisioningSchemeName AzureCatalog -MachineProfile
    XDHyp:\HostingUnits\AzureRes\machineprofile.folder\rg.resourcegroup\
    machineprofile.templatespec\2.0.templatespecversion

Get-ProvScheme | select ProvisioningSchemeName, MachineProfile,
    ProvisioningSchemeVersion

ProvisioningSchemeName MachineProfile

    ProvisioningSchemeVersion
---------------------- --------------

    -------------------------
AzureCatalog           XDHyp:\HostingUnits\AzureRes\machineprofile.
    folder\rg.resourcegroup\machineprofile.templatespec\2.0.
    templatespecversion                                        2

Set-ProvScheme -ProvisioningSchemeName MyScheme -Version 1

Get-ProvScheme | select ProvisioningSchemeName, MachineProfile,
    ProvisioningSchemeVersion

ProvisioningSchemeName MachineProfile

    ProvisioningSchemeVersion
---------------------- --------------

    -------------------------
AzureCatalog           XDHyp:\HostingUnits\AzureRes\machineprofile.
    folder\rg.resourcegroup\machineprofile.templatespec\1.0.
    templatespecversion                                        1
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

EXAMPLE 4

Updates a provisioning scheme called “MyScheme”to explicitly attach NICs to the network named “Network 2”for new VMs that are created from the provisioning scheme.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -NetworkMapping @{
 "0" = "XDHyp:\HostingUnits\XenHU\Network 2.network" }
```

EXAMPLE 5

Updates a provisioning scheme called “MyScheme”to use the machine profile from the aws ec2 instance - “machine-profile-vm (i-00c55f1107b662c04)”.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -MachineProfile "XDHyp
    :\HostingUnits\AwsHostingUnit\us-east-1a.availabilityzone\machine-
    profile-vm (i-00c55f1107b662c04).vm"
```

EXAMPLE 6

Updates a provisioning scheme called “MyScheme”to use the machine profile from the version “1”of the aws launch template with name “machine-profile-lt”and id “lt-06927522c36bg5698”.

```
Set-ProvScheme -ProvisioningSchemeName MyScheme -MachineProfile "XDHyp
    :\HostingUnits\AwsHostingUnit\machine-profile-lt (lt-06927522
    c36bg5698).launchtemplate\lt-06927522c36bg5698 (1).
    launchtemplateversion"
```

Parameters

-IdentityPoolName

The name of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-IdentityPoolUid

The unique identifier of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The identifier of the provisioning scheme to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme to be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Version

Specifies a prior version to change the provisioning scheme state to. Cannot be used in conjunction with other parameters that change the provisioning scheme configuration (e.g. -CustomProperties).

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-VMCpuCount

The number of processors that will be used to create VMs from the provisioning scheme, replacing the present one. Only supported for on-prem hypervisors and cannot be used alongside ServiceOffering.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory that will be used to created VMs from the provisioning scheme in MB, replacing the present one. Only supported for on-prem hypervisors and cannot be used alongside ServiceOffering.

Type:	Int32

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the provisioning scheme that are specific to the target hosting infrastructure. See about_Prov_CustomProperties for more information. If a property name already exists its value is updated; otherwise it is added.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating VMs in Cloud Hypervisors, replacing the present one. Cannot be used alongside either VMCpuCount or VMMemoryMB.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

Defines the inventory path to the source VM used by the provisioning scheme as a template. This profile identifies the properties for the VMs created from the scheme. The VM must be in the hosting unit that HostingUnitName or HostingUnitUid refers to. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written back to the CustomProperties. See about_Prov_MachineProfile for more details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2109

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, the current NICs setting of the provisioning scheme is not updated; otherwise the NICs setting is updated, and new machines will be created with the number of NICs specified in the map, with each NIC attached to the specified network. Cannot set to an empty value.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2206

-SecurityGroup

The Security Groups to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2212

-WriteBackCacheDiskSize

Specifies the size in Gigabytes of the disk to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme.Setting this parameter to 0 is not allowed.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-WriteBackCacheMemorySize

Specifies the size in Megabytes of the memory to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme. Setting this parameter to 0 is not allowed.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2308

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

CleanOnBoot <bool> Indicates whether the VMs created will be reset to a clean state on each start.

ControllerAddress <string[]> The DNS names of the controllers associated with this provisioning scheme.

CpuCount <int> The number of processors that will be used to create VMs.

DiskSize <int> The disk size (in GB) that will be used to create VMs.

HostingUnitName <string> The name of the hosting unit being used by this provisioning scheme.

HostingUnitUid <Guid> The unique identifier of the hosting unit being used by this provisioning scheme.

IdentityPoolName <string> The name of the identity pool being used by this provisioning scheme.

IdentityPoolUid <Guid> The unique identifier of the identity pool being used by this provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

MachineCount <int> The count of machines created with this provisioning scheme.

MachineProfile <string> The inventory path to the source VM used by the provisioning scheme as a template.

MasterImageVM <string> The inventory path to the VM snapshot copy used by this provisioning scheme.

MasterImageVMDate <DateTime> The date and time when the VM snapshot copy used by this provisioning scheme was made.

MemoryMB <int> The maximum amount of memory that will be used to created VMs in MB.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]> The metadata associated with this provisioning scheme.

MetadataMap <IDictionary[string, string];> The metadata associated with this provisioning scheme arranged in key value pairs.

ProvisioningSchemeName <string> The name of this provisioning scheme.

ProvisioningSchemeUid <Guid> The unique identifier for this provisioning scheme.

ProvisioningSchemeVersion <int> The version of the provisioning scheme.

TaskId <Guid> The identifier of any current task that is running for the provisioning scheme.

VMMetadata <char[]> The metadata that will be used to created VMs in a plain text format.

PersonalVDiskDriveLetter <char> The drive letter for the personal vDisk.

PersonalVDiskDriveSize <int> The size of the personal vDisk in GB.

UsePersonalVDiskStorage <bool> Indicates whether this provisioning scheme uses personal vDisk storage.

NetworkMaps <Citrix.MachineCreation.Sdk.NetworkMap[]> The NIC/network mappings that will be used to create VMs.

Scope <Citrix.MachineCreation.Sdk.ScopeReference[]> The administration scopes associated with this provisioning scheme.

DedicatedTenancy <bool> Indicates whether dedicated tenancy is used when creating VMs in Cloud Hypervisors.

GpuTypeId <string> The id of the GPU (Graphics Processor Unit) Type used by this scheme. It is null if there is no GPU.

ResetAdministratorPasswords <bool> Indicates whether the passwords for administrator accounts are reset on created machines.

ServiceOffering <string> The service offering that the scheme uses when creating VMs in Cloud Hypervisors.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

SecurityGroups <string[]> The security groups that will be applied to machines created in Cloud Hypervisors.

TenancyType <string> Tenancy type to be used when creating VMs in Cloud Hypervisors. (See New-ProvScheme.)

AzureAdJoinType <string> Deprecated.

CurrentMasterImageUid <Guid> The unique identifier of the current master image used by the provisioning scheme. (See Get-ProvSchemeMasterVMImageHistory.)

CustomProperties <string> Properties of the provisioning scheme which that are specific to the target hosting infrastructure. (See about_Prov_CustomProperties)

IdentityType <string> Identity type used to join created machines to a directory service. (See New-ProvScheme.)

UseFullDiskCloneProvisioning <bool> Indicates whether VMs will be created using the dedicated full disk clone feature.

UseWriteBackCache <bool> Indicates whether this provisioning scheme will use the write-back cache feature.

WriteBackCacheDiskSize <int> The size of the write-back cache disk to be used in GB. Specify only when UseWriteBackCache is true.

WriteBackCacheMemorySize <int> The size of the write-back memory cache in MB. Specify only when UseWriteBackCache is true.

Warnings <Citrix.MachineCreation.Sdk.ProvSchemeWarning[]> Warning states that have occurred with this provisioning scheme.

WriteBackCacheDiskIndex <int> The disk index for the write-back cache disk. Specify only when UseWriteBackCache is true.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound The specified provisioning scheme could not be located.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

HostingUnitNotFound The hosting unit referenced by the provisioning scheme could not be resolved.

NetworkPathResolutionFailed The specified network mapping contains invalid or empty network path value.

InvalidMachineProfileMetadata Unable to read the metadata from machine profile.

MachineProfileNotSupportedByHypervisor The hypervisor does not support any functional capability for MachineProfile.

MachineProfileUpdateNotSupported Adding a MachineProfile to the catalog is not supported.

IncorrectTenancyType MachineProfile TenancyType does not match with provisioning scheme.

ServiceOfferingPathResolutionFailed The Service Offering path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

SecurityGroupPathResolutionFailed The Security Group path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

InvalidProvisioningSchemeVersionMaximum The provisioning scheme maximum is set to an invalid value. Value values are in the range (1, 32000).

ProvisioningSchemeVersionMaximumExceeded The change in provisioning scheme could not be performed due to the maximum version number being exceeded. Older versions were not able to be pruned.

Each time Set-ProvScheme is called, a snapshot of the current configuration is saved. To view the prior saved configurations, use Get-ProvVMConfiguration. To adjust the maximum number of prior configurations MCS saves, use Set-ProvServiceConfigurationData to change MaxProvSchemeVersions.

Running Set-ProvScheme to update provisioning scheme properties will only affect future provisioned machines. To have existing VMs in a catalog be brought up to date, use Set-ProvVMUpdateTimeWindow to set a time window for certain or all VMs created from the provisioning scheme associated with the catalog to be updated on next power on within the given time window.

Set-ProvSchemeImage

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Update the master image associated with the provisioning scheme.

Syntax

```
Set-ProvSchemeImage
   [-ProvisioningSchemeName] <String>
   -ImageVersionSpecUid <Guid>
   [-DoNotStoreOldImage]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeImage
   -ProvisioningSchemeUid <Guid>
   -ImageVersionSpecUid <Guid>
   [-DoNotStoreOldImage]
   [-RunAsynchronously]
   [-PurgeJobOnSuccess]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability to update the hard disk image used to provision virtual machines. If the provisioning scheme is a 'CleanOnBoot'type, then the next time that virtual machines are started, their hard disks are updated to this new image. Regardless of the 'CleanOnBoot'type, all new virtual machines created after this command will use this new hard disk image.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

A snapshot or VM template is used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot or VM template are specified using a path into the Citrix Host Service PowerShell Provider, the Citrix Host Service PowerShell snap-in must also be loaded for this cmdlet to be used.

The previous hard disk image path is stored into the history (see Get-ProvSchemeMasterVMImageHistory). The data stored in the history allows for a rollback to be undertaken, to revert to the previous hard disk image if required.

Examples

EXAMPLE 1

Updates the image version spec for the provisioning Scheme "MyScheme"to use the image versipn spec 5991ba52-cad1-4e9c-b34f-1a6156e5f140.

```
Set-ProvSchemeImage -ProvisioningSchemeName MyScheme -
    ImageVersionSpecUid 5991ba52-cad1-4e9c-b34f-1a6156e5f140

TaskId                 : 248f102f-073f-45fe-aea9-1819a6d6dd1f
Active                 : False
Host                   : MyHost
DateStarted            : 17/05/2010 17:37:57
Type                   : SetProvisioningSchemeImage
Status                 :
CurrentOperation       :
TaskExpectedCompletion : 17/05/2010 17:38:43
LastUpdateTime         : 17/05/2010 17:38:43
ActiveElapsedTime      : 46
DateFinished           : 17/05/2010 17:38:43
TerminatingError       :
WorkflowStatus         : Completed
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
ImageVersionNumber     : 2
ImageVersionUid        : 5991ba52-cad1-4e9c-b34f-1a6156e5f140
ImageDefinitionName    : myImage
```

Warnings               : {
  }

DiskSize               : 32
```

Parameters

-ProvisioningSchemeUid

The provisioning uid identifier to which the hard disk image should be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ImageVersionSpecUid

The identifier for the image version spec uid used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2402

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeName

The provisioning scheme to which the hard disk image should be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the Get-ProvTask cmdlet.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history will be removed from the database once the task has finished. This cannot be specified for tasks that are run asynchronously.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-DoNotStoreOldImage

Indicates that the current image should not be added to the image history list for the provisioning scheme. This is useful when rolling back to a previous image.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Guid

When "RunAsynchronously"is specified, this identifier is returned to provide the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For set provisioning scheme image tasks this is always "SetProvisioningSchemeImage".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is being used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot or VM template that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme will use.

IdentityPoolUid <guid>

The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

MasterImageNote

The note of the provisioning scheme image.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot or VM template could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringProvisioningScheme

Indicates that the task is storing the provisioning scheme data to the database.

Finished

Indicates that the task has completed with no errors.

ProvisioningSchemeAlreadyExists

Indicates that the task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

Indicates that the task failed because the identity pool specified could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

Indicates that the hosting unit that the master image originated from is not the same hosting unit that the provisioning scheme is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM image path does not refer to a snapshot or a VM template item.

ProvisioningSchemeNotFound

Could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

A task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The VM snapshot or VM template specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot or VM template specified as the master is currently in an invalid state.

InsufficientResources

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation <string>

Holds string data providing more details about the current task state.

TaskProgress

The progress of the task 0-100%.

Notes

Only one long-running task per provisioning scheme can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

© 1997–2025 Citrix Systems, Inc. All rights reserved.

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type SetProvisioningSchemeImage, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

ReplicatingMasterImage

CommittingScheme

Set-ProvSchemeMetadata

August 14, 2025

Adds or updates metadata on the given provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeUid] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-InputObject] <ProvisioningScheme[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-InputObject] <ProvisioningScheme[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeName] <String>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvSchemeMetadata
   [-ProvisioningSchemeName] <String>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Provides the ability for additional custom data to be stored against given provisioning scheme objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the provisioning scheme with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                     Value
---                                     -----
property                                value
```

Parameters

-Name

Specifies the property name of the metadata to be added or updated. The property must be unique for the provisioning scheme specified. If the name already exists, its value is updated. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Value

Specifies the value for the property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[string, string];”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

Id of the provisioning scheme

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeName

Name of the provisioning scheme

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	True

-InputObject

ProvisioningScheme objects to which the metadata is to be added or updated.

Type:	ProvisioningScheme[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe a ProvisioningScheme object or any object containing a parameter called 'ProvisioningSchemeName' or 'ProvisioningSchemeUid' to Set-ProvSchemeMetadata.

PSObject

A metadata map object can be piped to the Set-ProvSchemeMetadata command.

Outputs

System.Collections.Generic.Dictionary[string, string]

Set-ProvSchemeMetadata returns a dictionary containing the new (name, value)-pairs for the metadata being set.

Key <string>

Name of the property.

Value <string>

Value for the property.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Set-ProvSchemeWarning

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2303

Sets the WarningStateType of a list of provisioning schemes warnings.

Syntax

```
Set-ProvSchemeWarning
    [-All]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvSchemeWarning
    [-ProvisioningSchemeName <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvSchemeWarning
    [-ProvisioningSchemeUid <Guid>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvSchemeWarning
    [-WarningId <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to set the WarningStateType from New to Acknowledged.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Sets the warning with a WarningId of 42 to Acknowledged.

```
Set-ProvSchemeWarning -WarningId 42
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme for which all associated warnings will be set to Acknowledged.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme for which all associated warnings will be set to Acknowledged.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-WarningId

The id of the warning to set to Acknowledged.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-All

All warnings for all provisioning schemes will be set to Acknowledged.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData Only a subset of the available data was returned

CouldNotQueryDatabase The query to get the database was not defined.

PermissionDenied The user does not have administrative rights to perform this operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

CommunicationError An error occurred while communicating with the service.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Set-ProvServiceConfigurationData

August 14, 2025

Sets the value for the given key in the service configuration data.

Syntax

```
Set-ProvServiceConfigurationData
   [-Name] <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Provides the ability to store configuration data for the Machine Creation Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Sets MaxProvSchemeVersions to 15 in the service configuration.

```
Set-ProvServiceConfigurationData -Name "MaxProvSchemeVersions" -Value
    15

Name                                 Value
--------                             -----
MaxProvSchemeVersions                   15
```

Parameters

-Value

Specifies the value for the name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Name

Specifies the key name of the configuration data to be added. The name must be unique. If the name already exists, its value is updated.

The name cannot contain any of the following characters \/;:#.*?=<>|[]()’””

Type:	String
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#*?=<>|[]()"'

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.MachineCreation.Sdk.ServiceConfigurationData

Set-ProvServiceConfigurationData returns an object containing the new definition of the configuration.

Name <string>

Specifies the name for the item of data.

Value <string>

Specifies the value of the data.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred. For more details see the Windows event logs on the controller being used, or Citrix Virtual Apps and Desktops logs.

Set-ProvServiceMetadata

August 14, 2025

Adds or updates metadata on the given Service.

Syntax

```
Set-ProvServiceMetadata
   [-ServiceHostId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvServiceMetadata
   [-ServiceHostId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvServiceMetadata
   [-InputObject] <Service[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvServiceMetadata
   [-InputObject] <Service[]>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -Map <PSObject>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Allows you to store additional custom data against given MachineCreation Service objects.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Service with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ProvServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2
    A06DDD0805C -Name property -Value value

Key                                      Value
---                                      -----
property                                 value
```

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()’”

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String,String]”).

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Service

Type:	Guid
Position:	2
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

MachineCreation service objects to which metadata is to be added.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.Dictionary[String,String]

Set-ProvServiceMetadata returns a dictionary containing the new (name, value)-pairs.

- Key <string>

  Specifies the name of the property.

- Value <string>

  Specifies the value for the property.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  The cmdlet parameters are inconsistent.

- UnknownObject

  One of the specified objects was not found.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Set-ProvTaskMetadata

August 14, 2025

Adds or updates metadata on the given Task.

Syntax

```
Set-ProvTaskMetadata
   [-TaskId] <Guid>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-ProvTaskMetadata
   [-TaskId] <Guid>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Name <String>
   -Value <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvTaskMetadata
   [-InputObject] <Task[]>
   -Map <PSObject>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Use this cmdlet to store additional custom data against given Task object.

Examples

EXAMPLE 1

Add metadata with a name of ‘property’and a value of ‘value’to the Task with the identifier ‘4CECC26E-48E1-423F-A1F0-2A06DDD0805C’.

```
Set-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name
    property -Value value

Key                                    Value
---                                    -----

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-Value

Specifies the value for the property.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 1000

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1"= "val1"; "name2"= "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[string, string];").

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TaskId

Id of the Task.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Objects to which the metadata is to be added.

Type:	Task[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Set-ProvTaskMetadata command.

PSObject

A metadata map object can be piped to the Set-ProvTaskMetadata command.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

System.Collections.Generic.Dictionary[string, string]

Set-ProvTaskMetadata returns a dictionary containing the new (name, value)-pairs for the metadata being set.

Key <string>

Name of the property.

Value <string>

Value for the property.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Set-ProvVM

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2308

Changes the configuration for a specific provisioned virtual machine.

Syntax

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMId <String>
   [-CpuCount <Int32>]
   [-MemoryInMB <Int32>]
   [-CustomProperties <String>]
   [-ServiceOffering <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMId <String>
   [-RevertToProvSchemeConfiguration]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMName <String>
   [-CpuCount <Int32>]
   [-MemoryInMB <Int32>]
   [-CustomProperties <String>]
   [-ServiceOffering <String>]
   [-MachineProfile <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeUid <Guid>
   -VMName <String>
   [-RevertToProvSchemeConfiguration]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVM
   -ProvisioningSchemeName <String>
   -VMId <String>

    [<CommonParameters>]
```

Description

Provides the ability to update the configuration of an existing persistent provisioned virtual machine.

These properties are specific customizations unique to the virtual machine and do not apply to any other VMs in the catalog. The final properties the machine will use are a combination of those currently set on the provisioning scheme combines with the settings specified here. Any properties set at the ProvVM-level with this command will override any settings at the ProvScheme-level.

To view the current specific configuration for a machine, use Get-ProvVMConfiguration

To view the final set of properties a machine will have applied (taking into account ProvScheme-level settings), use Get-ProvVMConfigurationResultantSet

Any configuration changes made will not apply right away to the machine. To apply the updates, set an update time window for the machine with Set-ProvVMUpdateTimeWindow and start the machine within the window. Currently, this feature is applicable only to the AWS and Azure environments.

Examples

EXAMPLE 1

Sets the configuration for machine1 to use 2 CPUs. Sets an update time window starting now and reboots the machine to apply the update.

```
Get-ProvVM -ProvisioningSchemeName MyScheme -VMName machine1 | select
    VMName, ProvVMConfigurationVersion
VMName      ProvVMConfigurationVersion
------      --------------------
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```

 A, A, E, A... }

VMName                 : machine1
Version                : 3
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme the VM is a part of

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

The VM name

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMId

The VM ID

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RevertToProvSchemeConfiguration

If supplied, all existing configuration is cleared for the given machine. It is mutally exclusive with parameters that apply configuration settings

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The identifier of the provisioning scheme the VM is a part of

Type:	Guid

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-CpuCount

The number of processors. Not supported for cloud hypervisors

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MemoryInMB

The maximum amount of memory in megabytes. Not supported for cloud hypervisors

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-CustomProperties

The properties of the provisioned virtual machine that are specific to the target hosting infrastructure. See about_Prov_CustomProperties for more information. If a property name already exists its value is updated; otherwise it is added. These properties are merged with prior custom properties set.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The cloud ServiceOffering to use. Not supported for on-prem hypervisors

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

A path to the template used to obtain hypervisor-specific settings to be applied to the VM. Some settings have a corresponding CustomProperty. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written to the CustomProperties. See about_Prov_MachineProfile for more details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Set-ProvVMBackup

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Set the values for a backup.

Syntax

```
Set-ProvVMBackup
   -BackupUid <Guid>
   [-DeletionProtection <Boolean>]
   [-BackupDescription <String>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Changes the configuration for a specific provisioned backup.

Examples

EXAMPLE 1

Enables deletion protection for backup1.

```
Set-ProvVMBackup -BackupId backupid1 -DeletionProtection $true -
    Description "description"
```

Parameters

-BackupUid

The unique identifier for the backup

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DeletionProtection

Sets whether the backup is deletion protected. see “Remove-ProvVmBackup”for more details.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-BackupDescription

Sets the descriptions of the backup.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Set-ProvVMBackupLimit

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Sets the limit for number of user-visible backups.

Syntax

```
Set-ProvVMBackupLimit
   -ProvisioningSchemeUid <Guid>
   -BackupLimit <Int32>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Caps the number of the user-visible backups allowed per machine in a provisioning scheme. Zero is interpreted as no limit. If this limit is met or exceeded, no new user-visible backups can be made.

Examples

EXAMPLE 1

Set the backup limit for provisioning scheme uid 378cece5-a824-41f7-9e92-74be76672be6 to 5.

```
Set-ProvVMBackupLimit -ProvisioningSchemeUid 378cece5-a824-41f7-9e92-74
    be76672be6 -BackupLimit 5
```

Parameters

-ProvisioningSchemeUid

The unique identifier for the provisioning scheme the Backup is a part of

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-BackupLimit

The number of user-visible backups allowed for a given machine in a provisioning scheme

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

None

By default, this cmdlet returns no output.

Set-ProvVMUpdateTimeWindow

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2305

Sets a time window on provisioned virtual machines during which they will undergo a property update on boot.

Syntax

```
Set-ProvVMUpdateTimeWindow
   [-StartTimeInUTC <String>]
   [-StartsNow]
   [-DurationInMinutes <Int32>]
   -ProvisioningSchemeName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Set-ProvVMUpdateTimeWindow
   [-StartTimeInUTC <String>]
   [-StartsNow]
   [-DurationInMinutes <Int32>]
   -ProvisioningSchemeName <String>
   -VMName <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Set-ProvVMUpdateTimeWindow
    [-StartTimeInUTC <String>]
    [-StartsNow]
    [-DurationInMinutes <Int32>]
    -ProvisioningSchemeUid <Guid>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Set-ProvVMUpdateTimeWindow
    [-StartTimeInUTC <String>]
    [-StartsNow]
    [-DurationInMinutes <Int32>]
    -ProvisioningSchemeUid <Guid>
    -VMName <String[]>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to synchronize the properties of existing virtual machines with any changes occurred on the provisioning scheme with Set-ProvScheme and any configuration applied with Set-ProvVM.

This cmdlet defines a time window where a property update will take place against either specific machines in a catalog or an entire catalog. The update will take place when the machine is next booted within the time window. Note that running this command does not make the machine automatically reboot or turn on sometime within the time window to apply the update. The power action to initiate the update must either be performed as a part of an autoscale schedule or manually through Studio or the New-BrokerHostingPowerAction cmdlet within the time window. If the time window passes before the machine is booted successfully, the update will not apply and will have to be set again with this cmdlet.

On each VM an update window is set, ProvisioningSchemeUpdateRequested defines the start of the time window and ProvisioningSchemeUpdateUntil defines the end of the time window.

After the update, ProvisioningSchemeVersion on the VM will be updated to match the current version of the ProvScheme, and the ProvVMConfigurationVersion will match the latest configuration on the VM.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Change the MachineProfile for the azure-catalog provisioning scheme with Set-ProvScheme, this increments the provisioning scheme version to 2. Set all 4 VMs in azure-catalog to have a property update in the time window starting 3/12/2022 at 3am UTC and lasting for 60 minutes. Times for ProvisioningSchemeUpdateRequested and ProvisioningSchemeUpdateUntil are displayed in local time (EST in this case). If a catalog machine is booted in that time window, it will update to the latest provisioning scheme settings. The first restart of machine azu01 in this example performs no action since it's before the time window starts, while the second restart is within the window, so the machine is updated and the time window is cleared.

```
Set-ProvScheme -ProvisioningSchemeName azure-catalog -MachineProfile "
    XDHyp:\HostingUnits\azure-unit\machineprofile.folder\new-template.vm
    "

Get-ProvScheme | select ProvisioningSchemeName,
    ProvisioningSchemeVersion
ProvisioningSchemeName   ProvisioningSchemeVersion
----------------------   --------------------------
azure-catalog                                    2

Get-ProvVM | select VMName, ProvisioningSchemeVersion,
    ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil
VMName       ProvisioningSchemeVersion
    ProvisioningSchemeUpdateRequested  ProvisioningSchemeUpdateUntil
------       -------------------------
    ---------------------------------  -----------------------------
azu01                                1
azu02                                1
azu03                                1
azu04                                1

Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
    StartTimeInUTC "3/12/2022 3am" -DurationInMinutes 60

Get-ProvVM | select VMName, ProvisioningSchemeVersion,
    ProvisioningSchemeUpdateRequested, ProvisioningSchemeUpdateUntil

   PM         3/11/2022 11:37:14 PM
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-VMName

List of VM names set a time window for. If not specified, all VMs in the machine catalog associated with the specified provisioning scheme will have the time window applied

Type:	String[]

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-StartTimeInUTC

The start time in UTC format of the time window. Mutually exclusive with StartsNow switch. Must be no more than 5 seconds in the past. The given string will be converted into a DateTime using parsing rules defined by the DateTime.Parse method, which allows for a timezone offset to specify time in any timezone. If no timezone offset is specified, UTC will be assumed. See the example usages of Set-ProvVMUpdateTimeWindow or this link for more details https://docs.microsoft.com/en-us/dotnet/api/system.datetime.parse?view=net-6.0#the-string-to-parse

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-StartsNow

Whether this time window should start right away at the current time. Mutually exclusive with specific StartTimeInUTC. Implied to be set if StartTimeInUTC is not specified

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DurationInMinutes

The duration in minutes of the time window. If less than 0, indicates the time window has no upper bound

Type:	Int32
Position:	Named
Default value:	120 minutes
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId'and 'ProvisioningSchemeName'to Set-ProvVMUpdateTimeWindow.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Stop-ProvTask

August 14, 2025

Stops currently running Machine Creation Service tasks.

Syntax

```
Stop-ProvTask
    [-TaskId] <Guid>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Enables tasks currently running in the Machine Creation Service to be stopped. Once stopped, tasks cannot be resumed.

Examples

EXAMPLE 1

Terminate all tasks currently executing on the Machine Creation Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-ProvTask -active $true | Stop-ProvTask
Success
```

EXAMPLE 2

Terminate the named task executing on the Machine Creation Service.

```
Stop-ProvTask -TaskId bd52e688-e40d-4790-83de-9f7633481454
Success
```

Parameters

-TaskId

Specifies the identifier for the task to be stopped.

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

PSObject

Objects containing the TaskId parameter can be piped to the Stop-ProvTask command.

Outputs

None

By default, this cmdlet returns no output.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidWorkflow

The specified task could not be found.

InvalidWorkflowHost

The specified task is executing on a different server.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

DatabaseError

There was a problem communicating with the database.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs

on the controller or the Citrix Virtual Apps and Desktops logs.

Switch-ProvCatalog

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2507

Switch the Catalog, Provisioning Scheme, and Machines to a new host connection, with support for rollback and resource cleanup.

Syntax

```
Switch-ProvCatalog
      [-BrokerCatalogUid] <Int32>
      [-CleanupSourceResources]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-Force]
      [-LoggingId <Guid>]
      [-WhatIf]
      [-Confirm]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Switch-ProvCatalog
      [-BrokerCatalogUid] <Int32>
      [-Rollback]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-Force]
      [-LoggingId <Guid>]
      [-WhatIf]
      [-Confirm]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Switch-ProvCatalog
      [-BrokerCatalogUid] <Int32>
      [-DestinationHypervisorConnectionName] <String>
      [[-DestinationHostingUnitName] <String>]
      [-CreateMasterImageAtDestination]
      [-RunAsynchronously]
      [-PurgeJobOnSuccess]
      [-Force]
      [-LoggingId <Guid>]
      [-WhatIf]
      [-Confirm]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Allows you to switch the catalog to a new host connection. This starts a long-running task which will switch the catalog, its Provisioning Scheme and the Machines to the given destination host connec-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tion. The new host connection information will be updated in the MCS and Broker database. Additionally, it allows rollback and resource cleanup for the previously switched catalog.

Examples

EXAMPLE 1

Switch the catalog with broker catalog Uid 1, its ProvScheme, and ProvVMs from "SourceUnit"to "DestinationUnit".

```
Switch-ProvCatalog -BrokerCatalogUid 1 -SourceHostingUnitName "
    SourceUnit" -DestinationHostingUnitName "DestinationUnit"
```

EXAMPLE 2

Rollback the catalog with broker catalog Uid 1, its ProvScheme, and ProvVMs to "SourceUnit".

```
Switch-ProvCatalog -BrokerCatalogUid 1 -Rollback
```

EXAMPLE 3

Rollback the catalog with broker catalog Uid 1, its ProvScheme, and ProvVMs to "SourceUnit"and suppress confirmation prompt.

```
Switch-ProvCatalog -BrokerCatalogUid 1 -Rollback -Force
```

EXAMPLE 4

CleanUp the source host connection resources for the catalog with broker catalog Uid 1, if it was switched previously with the migrated base images to the destination host connection.

```
Switch-ProvCatalog -BrokerCatalogUid 1 -CleanupSourceResources
```

EXAMPLE 5

CleanUp the source host connection resources for the catalog with broker catalog Uid 1, if it was switched previously with the migrated base images to the destination host connection and suppress confirmation prompt.

```
Switch-ProvCatalog -BrokerCatalogUid 1 -CleanupSourceResources -Force
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-BrokerCatalogUid

The Broker Uid of the catalog to switch.

Type:	Int32
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DestinationHypervisorConnectionName

The name of the destination host connection.

Type:	String
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Rollback

Reverts a previous attempt to switch the host connection for a catalog.

Type:	SwitchParameter
Position:	3
Default value:	False
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-CleanupSourceResources

Clean up the source host connection resources after the switch is successful. This operation is not reversible and -Rollback cannot be performed on the catalog after this operation!

Type:	SwitchParameter
Position:	3
Default value:	False
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-RunAsynchronously

Indicates whether an identifier for the task must be returned before completion of the task. The progress of the task can be monitored using 'Get-ProvTask'command.

Type:	SwitchParameter
Position:	Named
Default value:	True
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeJobOnSuccess

Indicates that the task history is removed from the database when the task completes. This cannot be specified for tasks that run asynchronously.

Type:	SwitchParameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Force

Suppresses prompts for confirmation before running the cmdlet with -Rollback or -CleanupSourceResources.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-WhatIf

Shows what would happen if the cmdlet runs. The cmdlet is not run.

Type:	SwitchParameter
Aliases:	wi
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Confirm

Prompts for confirmation before running the cmdlet with -Rollback or -CleanupSourceResources.

Type:	SwitchParameter
Aliases:	cf
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DestinationHostingUnitName

Required only for an MCS provisioned catalog. The name of the destination hosting unit. If not provided, the first hosting unit associated with the host connection will be used.

Type:	String
Position:	4
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-CreateMasterImageAtDestination

Create a new master image at destination hosting unit for an MCS provisioned catalog.

Type:	SwitchParameter
Position:	5
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

- TaskId <Guid>: The identifier for the task that was performed.
- Active <bool>: Indicates whether the task is still processing or is complete.
- Host <string>: The name of the host on which the task is running or was run.
- DateStarted <DateTime>: The date and time when the task was started.
- Metadata <Citrix.MachineCreation.Sdk.Metadata[]>: The list of metadata stored for the task. For new tasks, this is empty until metadata is added.
- CurrentOperation <string>: Operation specific phase of the overall "Running"task state.
- TaskProgress <double>: The progress of the task 0-100%.
- LastUpdateTime <DateTime>: The date and time of the last task status update.
- ActiveElapsedTime <int>: Number of seconds the task has taken for active execution.
- DateFinished <DateTime>: The date and time when the task was completed.
- TerminatingError <Citrix.Fma.Sdk.ServiceCore.CommonCmdlets.TaskTerminatingError>: Diagnostic information if the task completely fails.
- Type <Citrix.XDInterServiceTypes.JobType>: The type of task. For Switch-ProvCatalog task, this is always "Switch-ProvCatalog".
- Status <string>: Where in its lifecycle the task is.

Notes

The cmdlet is associated with a task of type SwitchProvCatalogTask, and while active will move through the following operations (CurrentOperation field):

- ValidatingInputs
- SwitchProvCatalog

Only one long-running task for each catalog can be processed at a time. In the case of failure, the following errors can result:

- CatalogNotFound: The specified catalog could not be located.
- CatalogNotReady: The specified catalog is not in Ready state.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- JobCreationFailed: The requested task could not be started.
- DatabaseError: An error occurred in the service while attempting a database operation.
- DatabaseNotConfigured: The operation could not be completed because the database for the service is not configured.
- ServiceStatusInvalidDb: An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.
- WorkflowHostUnavailable: The task could not be started because the database connection is inactive.
- CommunicationError: An error occurred while communicating with the service.
- InvalidParameterCombination: Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.
- PermissionDenied: The user does not have administrative rights to perform this operation.
- ConfigurationLoggingError: The operation could not be performed because of a configuration logging error.
- ExceptionThrown: An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Test-ProvDBConnection

August 14, 2025

Tests whether a database is suitable for use by the Citrix MachineCreation Service.

Syntax

```
Test-ProvDBConnection
    [-DBConnection] <String>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvDBConnection
    [-DBConnection] <String>
    [-Credentials] <PSCredential>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Test-ProvDBConnection
    [-DBConnection] <String>
    [-Login] <String>
    [-Password] <SecureString>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix MachineCreation Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a MachineCreation SDK cmdlet.

Examples

EXAMPLE 1

Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

```
Test-ProvDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;
   Trusted_Connection=True"
```

Parameters

-DBConnection

Specifies the database connection string to be tested by the currently selected Citrix MachineCreation Service instance.

Type: String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	1
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Credentials

If using SQL authentication, a PSCredential object containing the SQL credentials to be used. This can be created using the Get-Credential cmdlet. The credentials required are the SQL server login and its associated password. By default Windows authentication is used and no credentials need to be specified.

Type:	PSCredential
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Login

If using SQL authentication, the SQL server login to use. By default Windows authentication is used and no login needs to be specified.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-Password

If using SQL authentication, the SQL server password to use. By default Windows authentication is used and no password needs to be specified.

Type:	SecureString
Position:	3
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-ProvDBConnection cmdlet returns an object describing the status of the selected MachineCreation Service instance that would result if the connection string were used with the Set-ProvDBConnection cmdlet together with extra diagnostics information for the specified connection string. The actual current status of the service is not changed. Possible diagnostic values are:

- OK

  The Set-ProvDBConnection command would succeed if it were executed with the supplied connection string.

- DBUnconfigured

  No database connection string is set for the MachineCreation Service instance.

- DBRejectedConnection

  The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The specified database does not exist, is not visible to the MachineCreation Service instance, or the service's schema within the database is invalid.

- DBNotFound

  The specified database could not be located with the configured connection string.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBNewerVersionThanService

  The version of the MachineCreation Service currently in use is newer than, and incompatible with, the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

- DBOlderVersionThanService

  The version of the MachineCreation Service schema on the database is newer than, and incompatible with, the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is in progress.

- PendingFailure

  Connectivity between the MachineCreation Service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the MachineCreation Service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

- Unknown

  The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned:

- InvalidDBConnectionString

  The database connection string has an invalid format.

- DatabaseConnectionDetailsAlreadyConfigured

  There was already a database connection configured. After a configuration is set, it can only be set to $null.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- ConfigurationLoggingError

  The operation could not be performed because of a configuration logging error.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Test-ProvImageDefinitionNameAvailable

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2402

Check if the proposed image definition name is unused.

Syntax

```
Test-ProvImageDefinitionNameAvailable
    -ImageDefinitionName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to validate if the proposed name for an image definition is unused. This check is not limited to scopes of existing image definitions, therefore, the names of inaccessible image definition are also checked.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

This tests whether the value of $NewDefinitionName is unique or not, and can be used to create a new image definition or rename an existing one without failing. True is returned if the name is good.

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName
   $NewDefinitionName

Name      : NewDefinition1
Available : True
```

Parameters

-ImageDefinitionName

The name or names of the image definition(s) to be tested.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False
Length range:	1 to 64

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

Citrix.MachineCreation.Sdk.ImageDefinition

You can pipe an object containing a parameter called 'ImageDefinitionName'to Test-ProvImageDefinitionNameAva

Outputs

Citrix.MachineCreation.Sdk.NameAvailability

Key value pairs of name and its availability.

Name <string>

The image definition name to be tested.

Available <bool>

The availability of the name.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Test-ProvInventoryItem

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2206

Check if an inventory item can be used as an input for machine profile.

Syntax

```
Test-ProvInventoryItem
    -HostingUnitName <String>
    -InventoryPath <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvInventoryItem
    -HostingUnitUid <Guid>
    -InventoryPath <String>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to validate if an inventory item can be used as an input for the MachineProfile parameter while creating or updating a provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Validates if the Azure template spec inventory item located at XDHyp:\HostingUnits\AzureRes\machineprofile.folde
can be used as input for MachineProfile to either New-ProvScheme or Set-ProvScheme. Since the
cmdlet returns no response, the template is a valid MachineProfile.

```
Test-ProvInventoryItem -HostingUnitName AzureRes -InventoryPath
    machineprofile.folder\rg.resourcegroup\machineprofile.templatespec
    \1.0.templatespecversion
```

EXAMPLE 2

Validates if version 1.0 of the Azure template spec machineprofile found under the hosting unit with
identifier 8101028f-2570-4e17-9129-8e0cfc1e2558 can be used as input for MachineProfile to either
New-ProvScheme or Set-ProvScheme. The cmdlet returns some validation errors that must be fixed
before the template can be used.

```
Test-ProvInventoryItem -HostingUnitUid 8101028f-2570-4e17-9129-8
    e0cfc1e2558 -InventoryPath machineprofile.folder\rg.resourcegroup\
    machineprofile.templatespec\1.0.templatespecversion

ErrorMessage
---------------
Error: Provided disk encryption set ID in MachineProfile (input from
    the Azure template spec) does not exist
Error: Invalid storage account type in MachineProfile (input from the
    Azure template spec)
```

Parameters

-HostingUnitName

The name of the hosting unit used for the provisioning scheme.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-HostingUnitUid

The identifier for the hosting unit used for the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-InventoryPath

The partial inventory path to be validated as a machine profile. It should only contain the relative path from the hosting unit given in either the HostingUnitName or HostingUnitUid parameters. See the examples for how specify this partial path.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.MachineCreation.Sdk.InventoryItemValidationResult

This object provides a validation error message from the inventory item and contains the following information:

ErrorMessage <string>

String describing a validation error from the inventory item.

Notes

In the case of failure, the following errors can result.

Error Codes

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Test-ProvSchemeNameAvailable

August 14, 2025

Check if the proposed provisioning scheme name is unused.

Syntax

```
Test-ProvSchemeNameAvailable
    -ProvisioningSchemeName <String[]>
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Provides the ability to validate if the proposed name for a provisioning scheme is unused. This check is not limited to scopes of existing provisioning schemes, therefore, the names of inaccessible schemes are also checked.

Examples

EXAMPLE 1

This tests whether the value of $NewSchemeName is unique or not, and can be used to create a new provisioning scheme or rename an existing one without failing. True is returned if the name is good.

```
Test-ProvSchemeNameAvailable -ProvisioningSchemeName $NewSchemeName

Name      : NewScheme1
Available : True
```

Parameters

-ProvisioningSchemeName

The name or names of the provisioning scheme(s) to be tested.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False
Length range:	1 to 64

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Test-ProvSchemeNameAvailable.

Outputs

Citrix.MachineCreation.Sdk.NameAvailability

Key value pairs of name and its availability.

Name <string>

The provisioning scheme name to be tested.

Available <bool>

The availability of the name.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Test-ProvSetProvScheme

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Introduced in: Citrix Virtual Apps and Desktop 7 2308

Test the parameters that can be used for updating provisioning scheme with Set-ProvScheme command

Syntax

```
Test-ProvSetProvScheme
    -ProvisioningSchemeUid <Guid>
    [-VMCpuCount <Int32>]
    [-VMMemoryMB <Int32>]
    [-CustomProperties <String>]
    [-ServiceOffering <String>]
    [-PassThru]
    [-MachineProfile <String>]
    [-NetworkMapping <Hashtable>]
    [-SecurityGroup <String[]>]
    [-WriteBackCacheDiskSize <Int32>]
    [-WriteBackCacheMemorySize <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvSetProvScheme
    [-ProvisioningSchemeName] <String>
    [-VMCpuCount <Int32>]
    [-VMMemoryMB <Int32>]
    [-CustomProperties <String>]
    [-ServiceOffering <String>]
    [-PassThru]
    [-MachineProfile <String>]
    [-NetworkMapping <Hashtable>]
    [-SecurityGroup <String[]>]
    [-WriteBackCacheDiskSize <Int32>]
    [-WriteBackCacheMemorySize <Int32>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

```
Test-ProvSetProvScheme
    -ProvisioningSchemeUid <Guid>
    [-VMCpuCount <Int32>]
    [-VMMemoryMB <Int32>]
    -IdentityPoolUid <Guid>
    [-CustomProperties <String>]
    [-ServiceOffering <String>]
    [-PassThru]
    [-MachineProfile <String>]

    [-SecurityGroup <String[]>]
    [-WriteBackCacheDiskSize <Int32>]
    [-WriteBackCacheMemorySize <Int32>]
    [-LoggingId <Guid>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
15      [<CitrixCommonParameters>]
16      [<CommonParameters>]
```

Description

Provides the ability to validate the parameters of an existing provisioning scheme without actually updating the provisioning scheme. It will output all the validation failures if any.

The following parameters can be tested:

- Number of CPUs that will be used for VMs created from the provisioning scheme.
- Maximum amount of memory that will be used for VMs created from the provisioning scheme.
- Identity pool that will be used for VMs created from the provisioning scheme.
- Machine profile that will be used for VMs created from the provisioning scheme.
- Cloud service offering that will be used for VMs created from the provisioning scheme.
- Custom properties of the provisioning scheme that are specific to the target hosting infrastructure.

Examples

EXAMPLE 1

Validates the given provisioning scheme parameters

```
1  Test-ProvSetProvScheme -ProvisioningSchemeName MyScheme -
      WriteBackCacheDiskSize 50 -VMCpuCount 50 -VMMemoryMB 1000
2  ErrorId                                          ErrorCategory
                  ErrorMessage
3  -------                                          -------------
                  ------------
4  WriteBackCacheParametersNotNeeded
      McsValidationErrorCategory WriteBackCacheDiskSize is not needed when
       write back cache is disabled.
5  CpuAndMemorySettingViaServiceOfferingOnly  McsValidationErrorCategory
      Hypervisor does not support setting cpu or memory directly, they can
       only be specified via ServiceOffering.
```

Parameters

-IdentityPoolName

The name of the identity pool to be used for the provisioning scheme, replacing the present one.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-IdentityPoolUid

The unique identifier of the identity pool to be used for the provisioning scheme, replacing the present one.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

The identifier of the provisioning scheme to be updated.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ProvisioningSchemeName

The name of the provisioning scheme to be updated.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMCpuCount

The number of processors that will be used to create VMs from the provisioning scheme, replacing the present one.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMMemoryMB

The maximum amount of memory that will be used to created VMs from the provisioning scheme in MB, replacing the present one.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-CustomProperties

The properties of the provisioning scheme that are specific to the target hosting infrastructure. See about_Prov_CustomProperties for more information. If a property name already exists its value is updated; otherwise it is added.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ServiceOffering

The Service Offering to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PassThru

Returns the affected record. By default, this cmdlet does not generate any output.

Type:	SwitchParameter
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineProfile

Defines the inventory path to the source VM used by the provisioning scheme as a template. This profile identifies the properties for the VMs created from the scheme. The VM must be in the hosting unit that HostingUnitName or HostingUnitUid refers to. If any properties are present in the MachineProfile but not the CustomProperties, values from the template will be written back to the CustomProperties. See about_Prov_MachineProfile for more details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-NetworkMapping

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, the current NICs setting of the provisioning scheme is not updated; otherwise the NICs setting is updated, and new machines will be created with the number of NICs specified in the map, with each NIC attached to the specified network. Cannot set to an empty value.

Type:	Hashtable
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SecurityGroup

The Security Groups to use when creating VMs in Cloud Hypervisors, replacing the present one.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheDiskSize

Specifies the size in Gigabytes of the disk to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-WriteBackCacheMemorySize

Specifies the size in Megabytes of the memory to use as a Write Back Cache when UseWriteBackCache is set during the Provisioning Scheme creation. This parameter can only be set or modified if the Provisioning Scheme was previously created with UseWriteBackCache. This parameter only applies to newly created VMs and does not affect VMs which have already been created from the Provisioning Scheme. Setting this parameter to 0 is not allowed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

IList<Citrix.MachineCreation.Sdk.ProvSchemeValidationFailure>

This object provides a list of validation error messages for given provisioning scheme parameters and contains the following information:

ErrorId <string> Error code

ErrorCategory <string> The source of error - MCS or Plugin

ErrorMessage <string> Friendly message describing the validation failure

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound The specified provisioning scheme could not be located.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb An error occurred in the service while attempting a database operation - communication with the database failed for for various reasons.

CommunicationError An error occurred while communicating with the service.

PermissionDenied The user does not have administrative rights to perform this operation.

ConfigurationLoggingError The operation could not be performed because of a configuration logging error.

HostingUnitNotFound The hosting unit referenced by the provisioning scheme could not be resolved.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

NetworkPathResolutionFailed The specified network mapping contains invalid or empty network path value.

WriteBackCacheParametersNotNeeded WriteBackCacheDiskSize is not needed when write back cache is disabled.

CpuAndMemorySettingViaServiceOfferingOnly Hypervisor does not support setting cpu or memory directly, they can only be specified via ServiceOffering.

NetworkPathResolutionFailed The specified network path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

InvalidMachineProfileMetadata Unable to read the metadata from machine profile.

MachineProfileNotSupportedByHypervisor The hypervisor does not support any functional capability for MachineProfile.

MachineProfileUpdateNotSupported Adding a MachineProfile to the catalog is not supported.

IncorrectTenancyType MachineProfile TenancyType does not match with provisioning scheme.

ServiceOfferingPathResolutionFailed The Service Offering path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

SecurityGroupPathResolutionFailed The Security Group path could not be resolved. Please ensure that the path includes a drive specification and path to a location within a HostingUnit.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Unlock-ProvScheme

August 14, 2025

Unlocks a provisioning scheme.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Unlock-ProvScheme
       [-ProvisioningSchemeName] <String>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

```
Unlock-ProvScheme
       -ProvisioningSchemeUid <Guid>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to unlock a provisioning scheme that has the Id of a failed task still associated with it. This allows another long-running task to operate on that scheme. The cmdlet will not unlock a scheme with a task still marked as being active. Use Stop-ProvTask (or, if the task is registered with a failed server, Stop-ProvTask) to stop any active task first.

Examples

EXAMPLE 1

Unlocks the provisioning scheme 'MyScheme'.

```
Unlock-ProvScheme -provisioningSchemeName MyScheme
```

Parameters

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-ProvisioningSchemeName

The name of the provisioning scheme.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False
Length range:	1 to 64

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Unlock-ProvScheme.

Outputs

None

By default, this cmdlet returns no output.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

NoOp

The specified provisioning scheme had no task object associated.

TaskActive

The task object associated with the provisioning scheme is still active.

DatabaseError

An error occurred in the service while attempting a database operation.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CouldNotQueueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Unlock-ProvVM

August 14, 2025

Unlocks a virtual machine.

Syntax

```
Unlock-ProvVM
       -ProvisioningSchemeName <String>
       [-VMID] <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Unlock-ProvVM
       -ProvisioningSchemeUid <Guid>
       [-VMID] <String[]>
       [-LoggingId <Guid>]
       [<CitrixCommonParameters>]
       [<CommonParameters>]
```

Description

Provides the ability to unlock a virtual machine.

Examples

EXAMPLE 1

Unlocks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4'in the provisioning scheme 'MyScheme'.

```
Unlock-ProvVM -provisioningSchemeName MyScheme -VMId  bc79802c-ba6e-8
    de8-99e9-4c35d7ad24b4
```

EXAMPLE 2

Unlocks all the VMs in the provisioning scheme 'MyScheme'.

```
Get-ProvVM -provisioningSchemeName MyScheme | Unlock-ProvVM
```

EXAMPLE 3

Unlocks all the VMs that are currently locked.

```
Get-ProvVM -Locked $True | Unlock-ProvVM
```

Parameters

-ProvisioningSchemeName

The name of the provisioning scheme.

Type: String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	True

-ProvisioningSchemeUid

The unique identifier of the provisioning scheme.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-VMID

The virtual machine Id in the hypervisor.

Type:	String[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

You can pipe an object containing parameters called 'VMId' and 'ProvisioningSchemeName' to Unlock-ProvVM.

Outputs

None

By default, this cmdlet returns no output.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

VMDoesNotExist

The specified VM cannot be located.

VMAlreadyUnLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or Citrix Virtual Apps and Desktops logs.

Unpublish-ProvMasterVMImage

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2012

Remove a prepared master image from a provisioning scheme.

Syntax

```
Unpublish-ProvMasterVMImage
          -VMImageHistoryUid <Guid>
          [-LoggingId <Guid>]
          [<CitrixCommonParameters>]
          [<CommonParameters>]
```

```
Unpublish-ProvMasterVMImage
          [-ProvisioningSchemeName] <String>
          [-LoggingId <Guid>]
          [<CitrixCommonParameters>]
          [<CommonParameters>]
```

```
Unpublish-ProvMasterVMImage
          -ProvisioningSchemeUid <Guid>
          [-LoggingId <Guid>]
          [<CitrixCommonParameters>]
          [<CommonParameters>]
```

Description

Provides the ability to remove a master image and its hard disk copies that has been prepared for a provisioning scheme to create virtual machines.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The master image is removed from the image history of the provisioning scheme (see Get-ProvSchemeMasterVMImageHistory).

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

Examples

EXAMPLE 1

Removes the prepared master images for the provisioning Scheme "MyScheme".

```
1 Unpublish-ProvMasterVMImage -ProvisioningSchemeName MyScheme
```

EXAMPLE 2

Removes a prepared image identified by its history record.

```
1 Unpublish-ProvMasterVMImage -VMImageHistoryUid 7585f0de-192e-4847-a6d8
    -22713c3a2f42 -Revoke
```

Parameters

-ProvisioningSchemeUid

Unique identifier of the provisioning scheme from which the specified master image should be removed.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-VMImageHistoryUid

Unique identifier of the master image to be removed.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeName

Name of the provisioning scheme from which the specified master image should be removed.

Type:	String
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName)
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

Citrix.MachineCreation.Sdk.ProvisioningScheme

You can pipe an object containing a parameter called 'ProvisioningSchemeName'to Unpublish-ProvMasterVMImage.

Outputs

None

By default, this cmdlet returns no output.

Notes

If a VM Image History UID is specified, the cmdlet will remove the image if it is in the prepared state. If the image is the current image of the provisioning scheme, an error will be returned: there must be a current image associated with a provisioning scheme. The Publish-ProvMasterVMImage cmdlet may be used to replace a current image with a new or previously prepared image.

If a provisioning scheme name or UID is specified, the cmdlet will remove the prepared master image associated with that provisioning scheme if it exists. No error will be returned if no prepared image exists. The current image of the scheme will not be removed.

In the case of failure, the following errors can result.

Error Codes

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNotReady

The specified provisioning scheme is not in Ready state.

Update-ProvMaintenanceCycle

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Updates a specific maintenance cycle

Syntax

```
Update-ProvMaintenanceCycle
      -MaintenanceCycleId <Guid>
      [-ScheduledStartTimeInUTC <DateTime>]
      [-MaintenanceCycleDescription <String>]
      [-MaxDurationInMinutes <Int32>]
      [-PurgeDBAfterInDays <Int32>]
      [-SessionWarningTimeInMinutes <Int32>]
      [-SessionWarningLogOffTitle <String>]
      [-SessionWarningLogOffMessage <String>]
      [-VMName <String[]>]
      [-ProvisioningSchemeUid <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Updates specific parameters on a maintenance cycle using maintenance cycle Id

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Parameters

-MaintenanceCycleId

The Id of the Maintenance Cycle

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ScheduledStartTimeInUTC

Indicates the scheduled time for the Maintenance Cycle

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaintenanceCycleDescription

Specifies the description to a Maintenance Cycle

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDurationInMinutes

Indicates the total allocated duration in minutes to the Maintenance Cycle

Type:	Int32
Position:	Named
Default value:	30
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-PurgeDBAfterInDays

The duration of time in days for mcs to wait before purging relevant info from the database upon completion

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningTimeInMinutes

Buffer Time provided to the user to save date before powering down the vm by mcs

Type:	Int32
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningLogOffTitle

Crisp Header from the user for the maintenance cycle

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionWarningLogOffMessage

Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

An array of virtual machine names to which the maintenance cycle operation need to be executed

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ProvisioningSchemeUid

Provisioning Scheme Uid for the maintenance cycle to be serviced

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Update-ProvVMBackupSchedule

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Updates a specific schedule

Syntax

```
Update-ProvVMBackupSchedule
      [-MaxNumberOfBackups <Int32>]
      -ScheduleId <Guid>
      [-MaxDurationInMinutes <Int32>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
5         [-NextScheduledStartTimeInUTC <DateTime>]
6         [-RecurringSchedule <String>]
7         [-VMName <String[]>]
8         [-ProvisioningSchemeUid <Guid>]
9         [-PurgeDBAfterInDays <Int32>]
10        [-SessionWarningTimeInMinutes <Int32>]
11        [-SessionWarningLogOffTitle <String>]
12        [-SessionWarningLogOffMessage <String>]
13        [-LoggingId <Guid>]
14        [<CitrixCommonParameters>]
15        [<CommonParameters>]
```

Description

Updates specific parameters on a schedule via the schedule Id

Examples

Parameters

-ScheduleId

The Id of the schedule

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxNumberOfBackups

The maximum number of backups that can exist, per virtual machine as part of the provisioning schedule

Type:	Int32
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxDurationInMinutes

Indicates the total allocated duration in minutes to the provisioning schedule

Type:	Int32
Position:	Named
Default value:	30
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-NextScheduledStartTimeInUTC

Indicates the next scheduled time for the provisioning schedule

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-RecurringSchedule

Indicates how frequently the operation needs to be run, can be daily, weekly or monthly

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-VMName

An array of virtual machine names to which the maintenance cycle operation need to be executed

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-ProvisioningSchemeUid

Provisioning Scheme Uid for the provisioning schedule to be serviced

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeDBAfterInDays

The duration of time in days for mcs to wait before purging relevant info from the database upon completion

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningTimeInMinutes

Buffer Time provided to the user to save date before powering down the vm by mcs

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningLogOffTitle

Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningLogOffMessage

Message intended to be displayed to the user before powering down the vm

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Removed Parameters

Parameters in this section were available in older releases, and have been removed or replaced due to changes in functionality.

-MaxAllocatedDurationInMinutes

Indicates the total allocated duration in minutes to the provisioning schedule

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

-SessionWarningInMinutes

Buffer Time provided to the user to save date before powering down the vm by mcs

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-PurgeMaintenanceCycleInfoAfterInDays

The duration of time in days for mcs to wait before purging relevant info from the database upon completion

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Removed in:	Citrix Virtual Apps and Desktop 7 2411

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

None

By default, this cmdlet returns no output.

Topic

about_MonitorMonitorSnapin

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Short Description

The Monitor Service PowerShell snap-in provides administrative functions for the Monitor Service.

Command Prefix

All commands in this snap-in have the noun prefixed with ‘Monitor’.

Long Description

The Monitor Service PowerShell snap-in enables both local and remote administration of the Monitor service. It provides
facilities to query the Monitor service configuration settings and to modify those settings. It also provides the
standard set of Citrix Virtual Apps and Desktops 7 service cmdlets.

XenDesktop - Advanced Dataset Filtering

Short Description

Describes the common filtering options for XenDesktop cmdlets.

Long Description

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where {
  $_.Size = 'Small'  }
  | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed
on the server, returning only the required results.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

Based on the use case, you can filter results or separate results into multiple pages. You may also use both approaches together.

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
# ReturnTotalRecord example
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>],
    PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

```
Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and
    Severity -ge 2)'
```

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

```
Get-<Noun> -Filter {
  Count -ne $null  }
```

The full -Filter syntax is provided below.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter {
  Company -eq 'Citrix' -and Product -like 'Xen*'  }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Special_Characters), or switch to a filter expression and the -eq operator:

```
# Escape examples
Get-<Noun> -Company "Abc[*]"                # Matches Abc*
Get-<Noun> -Company "Abc`*"                 # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "Abc*"  }
     # Matches Abc*
Get-<Noun> -Filter {
  Company -eq "A`"B`'C"  }
  # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
# Simple filtering examples
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq “Circle”}
Get-<Noun> -Filter { Shape -like ‘C*’}

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter {
  StartTime -ge "2010-08-23T12:30:00.0Z"  }

$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter {
  StartTime -ge $d  }

$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter {
  StartTime -ge $d  }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter {
  StartTime -ge '-2'  }
          # Two days ago
Get-<Noun> -Filter {
  StartTime -ge '-1:30'  }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        # Hour and a half ago
Get-<Noun> -Filter {
  StartTime -ge '-0:0:30'  }
     # 30 seconds ago
```

Array Properties

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter {
  User -like "Fred*"  }

Get-<Noun> -Filter {
  Users -contains "Fred*"  }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter {
  User -eq "Frederick"  }

# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter {
  User -lt 'F'  }
```

Complex Expressions

When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter {
  Shape -eq 'Circle' -or Shape -eq 'Square'  }

$shapes = 'Circle','Square'
Get-<Noun> -Filter {
  Shape -in $shapes  }

```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
$sides = 1..4
Get-<Noun> -Filter {
  Sides -notin $sides  }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter {
  Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')  }

Get-<Noun> -Filter {
  Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')  }
```

Paging

Citrix recommends that you avoid paging by using *Properties* or the *-Filter* mechanism.

However, if more objects are required, then the SDK supports deterministic paging though filtering. You must sort and filter objects to have a unique identifier for an object. This unique identifier helps you to page through objects and avoid reordering. Most of the Broker objects have a unique ID that can be used for paging. However, you must sort the other objects that do not have a unique ID either by time or some other unique field.

Example:

```
# Paging example
$allSessions = @()
$lastUid = 0
while ($true)
{

  $sessions = @(Get-BrokerSession -Filter {
  Uid -gt $lastUid  }
  -MaxRecordCount 1000 -Sortby 'Uid')
```

if ($sessions.Length -eq 0)
{

break;

}
$lastUid = $sessions[-1].Uid
$allSessions += $sessions
}

In this example, a list is created and the lowest possible value for the chosen unique field is initialized. The unique ID in this example is zero. In a loop, sessions are requested using a filter searching for

© 1997–2025 Citrix Systems, Inc. All rights reserved.

objects
with a unique ID greater than zero. The number of objects is restricted to the first 1000 entries.
It is important to sort by the field that is used as a filter.

The filtering UID ($lastUid) is set to the unique ID of the final object retrieved.
The loop begins again using this unique ID value as the lower bound.
This loop continues until all sessions are retrieved and stored in an array ($allSessions).

Filter Syntax Definition

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= “{“<ComponentList> “}”

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= “(“<ComponentList> “)”|

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= “-and”| “-or”

<NotOperator> ::= “-not”| “!”

<ComparisonOperator>

::= “-eq”| “-ne”| “-le”| “-ge”| “-lt”| “-gt”|

“-like”| “-notlike”| “-contains”| “-notcontains”|
“-in”| “-notin”

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
“$null”| “$true”| “$false”

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings

© 1997–2025 Citrix Systems, Inc. All rights reserved.

formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30"means 1 hour and 30 minutes ago.

Add-MonitorDirectorAgent

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Returns a boolean

Syntax

```
Add-MonitorDirectorAgent
   -Component <String>
   -Fqdn <String>
   [-ResourceLocationId <Guid>]
   [-ResourceLocationName <String>]
   [-Domain <String>]
   [-Username <String>]
   [-Password <String>]
   [-Token <String>]
   [-Mode <String>]
   [-IsAgentUpgrade <Boolean>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a boolean stating whether respective stack monitoring agent is registered successfully

Examples

EXAMPLE 1

Registers the agent and saves its information in Monitor DB

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Add-MonitorDirectorAgent -ComponentType "PVS" -Hostname "AWPVS-1HBF0.
    bvt.local"
```

Parameters

-Component

Type of component this agent is installed on

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Fqdn

FQDN for the machine where the component and agent are installed

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLocationId

Resource location the agent is targeted for

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLocationName

Resource location name the agent is targeted for

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-Domain

Domain for the admin user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Username

Username for the admin user

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Password

Password for the admin user

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Token

One-Time registration token to be checked for successful registration

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Mode

Mode of Director Agent Installation - Manual/Auto

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Accepted values:	Manual, Auto
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-IsAgentUpgrade

Is Agent Upgrade Required

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Returns a boolean stating whether respective stack monitoring agent is registered successfully

Add-MonitorNotificationPolicyCondition

August 14, 2025

Add conditions to the existing policy specified and returns the updated policy.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Add-MonitorNotificationPolicyCondition
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyCondition
   -InputObject <MonitorNotificationPolicy>
   [-AlertThreshold <Int32>]
   [-AlarmThreshold <Int32>]
   [-AlertRenotification <TimeSpan>]
   [-AlarmRenotification <TimeSpan>]
   [-SearchWindow <TimeSpan>]
   [-AlertConditionPersistenceInterval <TimeSpan>]
   [-AlarmConditionPersistenceInterval <TimeSpan>]
   [-Granularity <TimeSpan>]
   [-AlertSampleCount <Int32>]
   [-AlarmSampleCount <Int32>]
   [-AlertSamplePercent <Int32>]
   [-AlarmSamplePercent <Int32>]
   [-DataSource <Int32>]
   [-UptimeHoursThreshold <Int32>]
   [-UptimePeriodType <MachineUptimePeriodType>]
   [-NextRunAt <DateTime>]
   [-AlertTriggeredBy <PowerActionTriggeredBy>]
   [-AlertReasonOfFailure <PowerActionFailureReasonCode>]
   [-AlarmTriggeredBy <PowerActionTriggeredBy>]
   [-AlarmReasonOfFailure <PowerActionFailureReasonCode>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyCondition
   -Uid <Int64>
   -ConditionType <ConditionType>
   [-AlertThreshold <Int32>]
   [-AlarmThreshold <Int32>]
   [-AlertRenotification <TimeSpan>]
   [-AlarmRenotification <TimeSpan>]
   [-SearchWindow <TimeSpan>]
   [-AlertConditionPersistenceInterval <TimeSpan>]
   [-AlarmConditionPersistenceInterval <TimeSpan>]
   [-Granularity <TimeSpan>]
   [-AlertSampleCount <Int32>]
   [-AlarmSampleCount <Int32>]
   [-AlertSamplePercent <Int32>]
   [-AlarmSamplePercent <Int32>]
   [-DataSource <Int32>]
   [-UptimeHoursThreshold <Int32>]
   [-UptimePeriodType <MachineUptimePeriodType>]
   [-NextRunAt <DateTime>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    [-AlertTriggeredBy <PowerActionTriggeredBy>]
    [-AlertReasonOfFailure <PowerActionFailureReasonCode>]
    [-AlarmTriggeredBy <PowerActionTriggeredBy>]
    [-AlarmReasonOfFailure <PowerActionFailureReasonCode>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Add conditions to the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Add SessionsConcurrentCount condition to the policy matching the id 100

```
$timeSpan = New-TimeSpan -Seconds 30
$alertThreshold = 10
$alarmThreshold = 20

Add-MonitorNotificationPolicyCondition -Uid 100 -ConditionType
    SessionsConcurrentCount -AlertThreshold $alertThreshold -
    AlarmThreshold $alarmThreshold  -AlertRenotification $timeSpan -
    AlarmRenotification $timeSpan
```

Parameters

-InputObject

Specifies the policy object to which the conditions to be added

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Uid

Specifies the unique identifier of the policy to which the conditions to be added

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ConditionType

Type of the condition using a text string converted to an enum value Possible values are

- SessionsConcurrentCount
- SessionsPeakconnectedCount
- SessionsPeakDisconnectedCount
- AverageLogonDuration
- RDSLoadEvaluator
- ConnectionFailuresRate
- ConnectionFailuresCount
- FailedServerMachineCount
- FailedDesktopMachineCount
- LogonDuration
- IcaRoundtripTime
- IcaRoundtripTimeAverage
- IcaRoundtripTimeSessionCount
- IcaRoundtripTimeSessionPercent
- MemoryUsage
- CpuUsage
- FailedMachinePercentage
- UnregisteredMachinesPercentage
- CCAgentDiscovery
- CCAgentLogger
- CCCredentialProvider
- CCWebRelayProvider
- CCNetScalerCloudGateway

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CCADProvider
- CCCDFCaptureService
- CCConnectionLeaseExchangeService
- CCHeartbeatFailure
- MachineUptime
- FailedPowerOnAction
- FailedPowerOffAction

Type:	ConditionType
Accepted values:	Unknown, SessionsConcurrentCount, SessionsPeakconnectedCount, SessionsPeakDisconnectedCount, AverageLogonDuration, RDSLoadEvaluator, ConnectionFailuresRate, ConnectionFailuresCount, FailedServerMachineCount, FailedDesktopMachineCount, LogonDuration, IcaRoundtripTime, IcaRoundtripTimeAverage, IcaRoundtripTimeSessionCount, IcaRoundtripTimeSessionPercent, MemoryUsage, CpuUsage, FailedMachinePercentage, LocalHostCacheNotification, LocalHostCacheConfigSyncFailure, LocalHostCacheConfigSyncServiceFailure, UnregisteredMachinesPercentage, CCAgentWatchDog, CCAgentDiscovery, CCAgentLogger, CCCredentialProvider, CCWebRelayProvider, CCNetScalerCloudGateway, CCADProvider, CCCDFCaptureService, CCConnectionLeaseExchangeService, CCHeartbeatFailure, MachineUptime, FailedPowerOnAction, FailedPowerOffAction
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-AlertThreshold

Threshold value at which the warning notification will be triggered

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmThreshold

Threshold value at which the critical notification will be triggered

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertRenotification

Duration after which the warning notification will be re-triggered

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmRenotification

Duration after which the critical notification will be re-triggered

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-SearchWindow

The amount of time the condition query will look back for the matching record when it examines the data.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertConditionPersistenceInterval

The amount of time the condition query will look back to check if the alert condition was persisted.

Type:	TimeSpan
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmConditionPersistenceInterval

The amount of time the condition query will look back to check if the alarm condition was persisted.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Granularity

Defines the granularity of the rate in seconds. This value is applicable for 'ConnectionFailuresRate' condition.

Type:	TimeSpan
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertSampleCount

Defines the count of instances to measure before raising the warning notification. This value is applicable for ICA RTT (Session Count) condition.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlarmSampleCount

Defines the count of instances to measure before raising the critical notification. This value is applicable for ICA RTT (Session Count) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AlertSamplePercent

Defines the percentage of instances to measure before raising the warning notification. This value is applicable for ICA RTT (Session Percent) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AlarmSamplePercent

Defines the percentage of instances to measure before raising the critical notification. This value is applicable for ICA RTT (Session Percent) condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DataSource

Defines the data source type of condition.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-UptimeHoursThreshold

Defines the threshold hours for machine uptime. This value is applicable for 'MachineUptime'condition.

Type:	Int32
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-UptimePeriodType

Defines the threshold period - hours/day, hours/week or hours/month for machine uptime. This value is applicable for 'MachineUptime'condition.

Type:	MachineUptimePeriodType
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-NextRunAt

Defines the next evaluation time for machine uptime alert. This value is applicable for 'MachineUptime'condition.

Type:	DateTime
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AlertTriggeredBy

Defines the source of power action that cases alert. Applicable for 'FailedPowerOnAction'and 'Failed-PowerOffAction'alerts. Possible values are

- Any
- Administrator
- Autoscale
- EndUser
- Schedule

Type:	PowerActionTriggeredBy
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-AlertReasonOfFailure

Defines the reason of power action failure. Applicable for 'FailedPowerOnAction'and 'FailedPowerOf-fAction'alerts. Possible values are

- Any
- HypervisorRateLimitExceeded
- HypervisorReportedFailure

Type:	PowerActionFailureReasonCode
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-AlarmTriggeredBy

Defines the source of power action that cases alarms. Applicable for 'FailedPowerOnAction'and 'FailedPowerOffAction'alerts. Possible values are

- Any
- Administrator
- Autoscale
- EndUser
- Schedule

Type:	PowerActionTriggeredBy
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-AlarmReasonOfFailure

Defines the reason of power action failure. Applicable for 'FailedPowerOnAction'and 'FailedPowerOffAction'alerts. Possible values are

- Any
- HypervisorRateLimitExceeded
- HypervisorReportedFailure

Type:	PowerActionFailureReasonCode
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the updated policy object

Add-MonitorNotificationPolicyEmailAddresses

August 14, 2025

Add email addresses to the existing policy specified and returns the updated policy.

Syntax

```
Add-MonitorNotificationPolicyEmailAddresses
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyEmailAddresses
   -InputObject <MonitorNotificationPolicy>
   -EmailAddresses <String[]>
   -EmailCultureName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyEmailAddresses
   -Uid <Int64>
   -EmailAddresses <String[]>
   -EmailCultureName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Add email addresses to the existing policy specified and returns the updated policy.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Add email addresses to the policy matching the id 100

```
$emailaddress = @()
$emailaddress += "user1@abc.com"

Add-MonitorNotificationPolicyEmailAddresses -Uid 100 -EmailAddresses
    $emailaddress -EmailCultureName "en-US"
```

Parameters

-InputObject

Specifies the policy object to which the conditions to be added.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-EmailAddresses

Collection of email addresses to be added

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-EmailCultureName

Text encoding of the culture to return the email in

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy to which the conditions to be added.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Collection[MonitorNotificationPolicy]

Returns the collection of policy objects created

Add-MonitorNotificationPolicyTargets

August 14, 2025

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Add targets to the existing policy specified and returns the updated policy

Syntax

```
Add-MonitorNotificationPolicyTargets
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyTargets
   -InputObject <MonitorNotificationPolicy>
   [-Scope <String>]
   [-TargetKind <TargetKind>]
   -TargetIds <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Add-MonitorNotificationPolicyTargets
   -Uid <Int64>
   [-Scope <String>]
   [-TargetKind <TargetKind>]
   -TargetIds <String[]>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Add targets to the existing policy specified and returns the updated policy

Examples

EXAMPLE 1

Add targets to the policy matching the id 100

```
$targetIds = @()
$targetIds += "766cde70-3c69-4481-a658-4e11247ac70c"

Add-MonitorNotificationPolicyTargets -Uid 100 -Scope "My Test Targets"
   -TargetKind Site -TargetIds $targetIds
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-InputObject

Specifies the policy object to which the targets to be added

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TargetIds

Object reference to the array of target ids.

Site GUID - for target type Site,

DesktopGroup UUID - for DesktopGroup, RdsWorker target types,

User SID - for User target type

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy to which the targets to be added

Type:	Int64
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Scope

Description of the collection of target ids

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-TargetKind

String representation of the target type enum.

Possible values are

Site

DesktopGroup

RdsWorker

User

Type:	TargetKind
Accepted values:	Unknown, Site, DesktopGroup, RdsWorker, User
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

MonitorNotificationPolicy

Returns the policy object

Add-MonitorWebhookProfile

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Creates a new webhook profile.

Syntax

```
Add-MonitorWebhookProfile
   -Name <String>
   -Description <String>
   -Url <String>
   -Headers <System.Collections.Generic.Dictionary`2[System.String,
      System.String]>
   -PayloadFormat <String>
   -Platform <WebhookProfilePlatform>
   -Type <WebhookProfileType>
   -MethodType <WebhookMethodType>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

This cmdlet creates a new webhook profile with the specified properties. A webhook profile allows you to configure an endpoint for receiving notifications.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Demonstrates how to create a new webhook profile with a specified name, description, URL, headers, payload format, platform, type of call, and method type.

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
    ()
$headers.Add("Content-Type", "application/json")
$headers.Add("Authorization", "Basic *************")
$payloads = '{
  "text": "$PAYLOAD"  }
 '
$url ="https://url.net"
Add-MonitorWebhookProfile -Name "webhookprofile1" -Description "
    Description" -Url $url -Headers $headers -PayloadFormat $payloads -
    Platform Slack -Type Webhook -MethodType POST
```

Parameters

-Name

Specifies the name of the new webhook profile.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Provides a description for the new webhook profile.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Url

The URL of the webhook endpoint where notifications or data will be sent.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Headers

Dictionary of headers for the webhook, where each key-value pair represents a header name and its value.

Type:	System.Collections.Generic.Dictionary‘2[System.String,Syste
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-PayloadFormat

Template for the data payload in JSON format to be sent to the webhook URL.

Type:	String

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Platform

webhook platform type. Possible values are Slack MicrosoftTeams ServiceNow Others

Type:	WebhookProfilePlatform
Accepted values:	Unknown, Slack, MicrosoftTeams, ServiceNow, Others
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-Type

webhook call type. Possible values are Webhook Api

Type:	WebhookProfileType
Accepted values:	Unknown, Webhook, Api
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-MethodType

http method type to make call to webhook Possible values are POST PUT

Type:	WebhookMethodType
Accepted values:	POST, PUT
Position:	Named
Default value:	POST
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2503

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Indicates whether the webhook profile was created successfully. Returns true if successful; otherwise, false.

Get-DirectorAgentHttps

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2503

Gets the HTTPS configuration used by Citrix Infra Monitor Service.

Syntax

```
Get-DirectorAgentHttps
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the HTTPS configuration used by the Citrix Infra Monitor Service. This setting is used to modify the behavior of the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Gets the HTTPS configuration used by the Citrix Infra Monitor Service.

```
Get-DirectorAgentHttps
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.bool

HTTPS configuration used by Citrix Infra Monitor Service.

Related Links

- Set-DirectorAgentHttps

Get-MonitorConfiguration

August 14, 2025

Gets configuration settings that are used by the Monitor Service.

Syntax

```
Get-MonitorConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets the configuration settings used by the Monitor Service. These settings are used to modify the behavior of the service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the settings in the site database.

```
Get-MonitorConfiguration
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

String

List of configuration settings used by the Monitor Service.

Related Links

- Set-MonitorConfiguration

Get-MonitorDataStore

August 14, 2025

Gets details for each of the Monitor data stores.

Syntax

```
Get-MonitorDataStore
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns an object for each of the Monitor data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the database connection string for the Monitor Service.

```
Get-MonitorDataStore

ConnectionString : Server=.\SQLEXPRESS;Initial Catalog = databaseName;
    Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSecondarySchema
Status           : DBUnconfigured
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Citrix.Monitor.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops 7 logs.

Get-MonitorDBConnection

August 14, 2025

Returns the database connection string for the specified data store used by the Monitor Service.

Syntax

```
Get-MonitorDBConnection
    [[-DataStore] <String>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns the database connection string from the currently selected Monitor Service instance.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

Examples

EXAMPLE 1

Gets the database connection string in use by the Monitor Service instance running on controller "controller1.mydomain.net".

```
Get-MonitorDBConnection -AdminAddress controller1.mydomain.net
Server=serverName\SQLEXPRESS;Initial Catalog=databaseName;Integrated
    Security=True
```

Parameters

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	2
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

The database connection string configured for the current Monitor Service instance.

Notes

If the command fails, the following errors can be returned:

- NoDBConnections

  The database connection string for the MonitorService has not been specified.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-MonitorDBSchema

August 14, 2025

Gets SQL scripts to create or maintain the database schema for the Citrix Monitor Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-MonitorDBSchema
    [-DataStore <String>]
    [-DatabaseName <String>]
    [-ServiceGroupName <String>]
    [-ScriptType <ScriptTypes>]
    [-LocalDatabase]
    [-Sid <String>]
    [-DatabaseRights <String>]
    [-AzureDatabase]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets SQL scripts that can be used to create a new Citrix Monitor Service database schema, add a new Monitor service to an existing site, remove a Monitor service from a site, or create a database server logon for a Monitor service.

If no Sid parameter is provided, the scripts obtained relate to the currently selected Monitor service instance, otherwise the scripts relate to Monitor service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied.

The current service instance is the one on the local machine, or the one most recently specified using the -AdminAddress parameter of a Monitor SDK cmdlet.

The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured.

The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Monitor service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Creation of database user
- Addition of database user to Monitor service roles

If ScriptType is Evict, the returned script contains:

- Removal of Monitor service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

ScriptType Database is deprecated, and FullDatabase should be used instead.

If the service uses two data stores they can exist in the same database.

You do not need to configure a database before using this command.

Examples

EXAMPLE 1

Gets a script to create the full database schema for the Citrix Monitor Service and copies it to a file called "C:\MonitorSchema.sql"

This script can be used to create the service schema in a database with name "MySiteDB", which must already exist, and must not already contain a Monitor service schema.

```
Get-MonitorDBSchema -DatabaseName MySiteDB -ServiceGroupName
    MyServiceGroup > C:\MonitorSchema.sql
```

EXAMPLE 2

Gets a script to create the appropriate database server logon for the Monitor service. This can be used when configuring a mirror server for use.

```
Get-MonitorDBSchema -DatabaseName MySiteDB -ScriptType Login > C:\
    MonitorLogins.sql
```

EXAMPLE 3

Get the full database schema for the secondary data store of the Monitor Service and copy it to a file called 'C:\MonitorSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB'that does not already contain a Monitor Service secondary schema.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-MonitorDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup
    -DataStore Secondary > C:\MonitorSchema.sql
```

Parameters

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	Named
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-DatabaseName

Specifies the name of the database into which the new Monitor service schema is to be placed, or in which it already exists. The database itself is not created by any of the script types; it must already exist before the scripts are run.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-ServiceGroupName

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Monitor services that share the same database instance and are consid-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

ered equivalent; that is, all the services within a service group can be used interchangeably.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	`\/;:#.*?=<>|[]()"'`

-ScriptType

Specifies the type of database script returned. Available script types are:

- FullDatabase

  Creates a database schema for the Citrix Monitor Service in a database instance that does not already contain one. This is used when creating a new site. DatabaseName and ServiceGroupName are required parameters for this script type.

- Instance

  Adds a Monitor Service instance to a database and so to the associated site. Appropriate database server logons and users are created to allow the service instance access to the required service schemas.

- Evict

  Removes a Monitor Service instance from the database and so from the site. All reference to the service instance is removed from the database. DatabaseName and Sid are required parameters for this script type.

- Login

  Adds a logon for the Monitor Service instance to a database server. This is specifically for use when configuring SQL Server mirroring where the mirror server must have appropriate logons created for all service instances in the site.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Database

  This is deprecated. FullDatabase should be used instead.

Type:	ScriptTypes
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LocalDatabase

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Monitor services. If this parameter is specified inappropriately, the service instance will not be able to connect to the database.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Sid

Specifies the SID of the controller on which the Monitor Service instance to remove from the database is running (only valid for a script type of Evict).

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-DatabaseRights

Specifies the right the database script should expect to be run under. Available rights are:

- Mixed

  Creates a database schema which uses all rights.

- SysAdmin

  Creates a database schema which does the minimum with the SysAdmin (sa) rights.

- DbOwner

  Creates a database schema which only needs Database Owner (dbo) rights.
  This script expects to be used after the SysAdmin script has been run.

Type:	String
Position:	Named
Default value:	Mixed
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Specifies that the generated schema must be compatible with Azure SQL limits, including not generating code for logins.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2003

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

String

A string containing the required SQL script for applying to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

- Create the database schema.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

- Create the user and the role (providing the schema does not already exist).
- Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

- Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

ScriptType value of 'Database'is deprecated; 'FullDatabase'should be used instead.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned:

- GetSchemasFailed

  The database schema could not be found.

- ActiveDirectoryAccountResolutionFailed

  The specified Active Directory account or Group could not be found.

- DatabaseError

  An error occurred in the service while attempting a database

- operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the

- service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorDBVersionChangeScript

August 14, 2025

Gets an SQL service schema update script for the Citrix Monitor Service.

Syntax

```
Get-MonitorDBVersionChangeScript
   [-DataStore <String>]
   -DatabaseName <String>
   -TargetVersion <Version>
   [-AzureDatabase]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Gets an SQL script that can be used to update the current Citrix Monitor Service database schema. An update can be an upgrade or downgrade.

A script can be obtained to update the current service schema to any version that is reachable by applying available schema update packages that have been uploaded by the Citrix Monitor Service.

Typically, this mechanism is used to update the current service schema to a newer version, however it can also be used to revert previously applied updates.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The SQL script obtained can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SQLCMD mode'.

The schema update packages used to generate update scripts are stored in the database; because of this, any Citrix Monitor Service in the site can be used to obtain a schema update script.

The fact that an update package is available in the database does not mean that the update has actually been applied to the service's schema. In addition, application of an update does not remove the associated update packages.

Take care when using the update scripts. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK. The database should be backed-up before an update is attempted. The database script may also require exclusive use of the schema, in which case all Citrix Monitor Services must be shutdown before applying the update.

Once an update has been applied to the service schema, any existing Citrix Monitor Services that are incompatible with the updated schema will cease to operate. The service state, as reported by Get-MonitorServiceStatus, provides information about the service compatibility (e.g. DBNewerVersionThanService).

Examples

EXAMPLE 1

Gets an SQL update script to update the current schema to version 7.40.0.0. The resulting update_740.sql script is suitable for direct use with the SQL Server SQLCMD utility.

```
$update = Get-MonitorDBVersionChangeScript -DatabaseName MyDb -
    TargetVersion 7.40.0.0
$update.Script > update_740.sql
```

Parameters

-DatabaseName

The name of the database containing the Citrix Monitor Service schema to be updated.

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 128

-TargetVersion

The required target service schema version of the update. This is the service schema version obtained after the update script is applied.

Type:	Version
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-DataStore

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Type:	String
Position:	Named
Default value:	Site
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AzureDatabase

Indicates that script is to update an Azure database. If this switch is not used when an Azure database is to be updated, the update will fail when an attempt is made to apply it.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2311

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

Outputs

PSObject

The Get-MonitorDBVersionChangeScript cmdlet returns a PSObject containing a script that can be used to update the Citrix Monitor Service database schema. The object has the following properties:

- Script

  The raw text of the SQL script to apply the update.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- CanUndo

  If true, indicates that after the update has been applied, a script to revert from the updated schema to the schema state prior to the update can be obtained.
  Because Get-<#= CmdletPrefix #>DBVersionChangeScript gets only update scripts relating to the current schema version, a script to revert an update can be obtained only after the update has been applied.

- NeedExclusiveAccess

  If true, indicates that the update requires exclusive access to the Citrix <#= ServiceName #> Service's schema while the update is applied; all Citrix <#= ServiceName #> Services must be shutdown during the update.

Notes

The PSObject returned by this cmdlet contains the following properties:

- Script

  The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

- NeedExclusiveAccess

  Indicates whether all services in the service group must be shut down during the update or not.

- CanUndo

  Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Monitor services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-MonitorServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned:

- NoOp

© 1997–2025 Citrix Systems, Inc. All rights reserved.

The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the <#= ServiceName #> Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Get-MonitorFeatureToggleStatus

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Returns the status of feature toggle name passed as parameter

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-MonitorFeatureToggleStatus
   -FeatureToggleName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

When run on the PoSh cmdlet, it takes the feature toggle name and processes it to check cache for its status.

Examples

EXAMPLE 1

When run on the PoSh cmdlet, it takes the feature toggle name and processes it to check cache for its status.

```
Get-MonitorFeatureToggleStatus -FeatureToggleName "
   DirectorConfigSyncFailureAlert"
```

Parameters

-FeatureToggleName

Feature toggle name to check status for

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Status of the feature toggle

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Related Links

- Get-MonitorFeatureToggleStatus

Get-MonitorInstalledDBVersion

August 14, 2025

Gets a list of all available database schema versions for the Monitor Service.

Syntax

```
Get-MonitorInstalledDBVersion
    [-DataStore <String>]
    [-Upgrade]
    [-Downgrade]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Gets the current version number of the Citrix Monitor Service database schema when called with no parameters.

When called with the -Upgrade parameter, gets the service schema version numbers to which an upgrade could be performed.

When called with the -Downgrade parameter, gets the service schema version numbers to which a downgrade could be performed.

The SQL scripts to perform schema upgrades and downgrades can be obtained using the Get-MonitorDBVersionChangeScript cmdlet. Citrix recommends that where possible service schema upgrades are performed using Studio rather than manually via the SDK.

Only one of the -Upgrade or -Downgrade parameters may be supplied at once.

Examples

EXAMPLE 1

Gets the current Citrix Monitor Service database schema version number.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
Get-MonitorInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
7      40     0      0
```

EXAMPLE 2

Get the versions of the Monitor Service database schema for which upgrade scripts are supplied.

```
Get-MonitorInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
7      41     0      0
```

Parameters

-DataStore

Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Upgrade

Specifies that only schema versions to which the current database version can be upgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Downgrade

Specifies that only schema versions to which the current database version can be downgraded should be returned.

Type:	SwitchParameter
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

Version

Get-MonitorInstalledDBVersion returns database schema version numbers as requested.

Notes

If the command fails, the following errors can be returned:

- InvalidParameterCombination

  Both the Upgrade and Downgrade flags were specified.

- NoOp

  The operation was successful but had no effect.

- NoDBConnections

  The database connection string for the Monitor Service has not been specified.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-MonitorNotificationEmailServerConfiguration

August 14, 2025

Gets email server configuration

Syntax

```
Get-MonitorNotificationEmailServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Retrurns the existing email server configurations required to send email alerts.

Examples

EXAMPLE 1

Returns the email configuration

```
GetMonitorNotificationEmailServerConfigurationCommand
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series

© 1997–2025 Citrix Systems, Inc. All rights reserved.

of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

ICollection<MonitorNotificationEmailServerConfiguration> System.String

Email server configuration

Related Links

- Set-MonitorNotificationEmailServerConfiguration

Get-MonitorNotificationPolicy

August 14, 2025

Returns a list of MonitorNotificationPolicy objects matching the specified parameters

Syntax

```
Get-MonitorNotificationPolicy
   [-Uid <Int64>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

```
Get-MonitorNotificationPolicy
   -Name <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a list of MonitorNotificationPolicy objects matching the specified parameters

Examples

EXAMPLE 1

Returns the policy object having the Id equals to 1

```
Get-MonitorNotificationPolicy -Id 1
```

EXAMPLE 2

Returns the policy object having the name contains 'Server OS Policy'

```
Get-MonitorNotificationPolicy -Name 'Server OS Policy'
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Name

Returns all of the policies contains the specified name.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	True

-Uid

Returns the policy with the specified id.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

System.Collections.Generic.ICollection`1[[Citrix.Monitor.Sdk.PowerShell.MonitorNotificationPolicy, Citrix.Monitor.PowerShellSnapIn, Version=7.7.0.95, Culture=neutral, PublicKeyToken=e6a2b8abcb991548]]

Returns a collection of policies.

Get-MonitorNotificationSnmpServerConfiguration

August 14, 2025

Gets email server configuration

Syntax

```
Get-MonitorNotificationSnmpServerConfiguration
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns the existing Snmpserver configurations required to send Snmp alerts.

Examples

EXAMPLE 1

Returns the Snmp configuration

```
Get-MonitorNotificationSnmpServerConfiguration
```

Parameters

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

ICollection<MonitorNotificationEmailServerConfiguration> System.String

Snmp server configuration

Related Links

- Set-MonitorNotificationSnmpServerConfiguration

Get-MonitorService

August 14, 2025

Gets the service record entries for the Monitor Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-MonitorService
    [-Metadata <String>]
    [-Property <String[]>]
    [-ReturnTotalRecordCount]
    [-MaxRecordCount <Int32>]
    [-Skip <Int32>]
    [-SortBy <String>]
    [-Filter <String>]
    [-FilterScope <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns instances of the Monitor Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Examples

EXAMPLE 1

Get all the instances of the Monitor Service running in the current service group.

```
Get-MonitorService

Uid                : 1
ServiceHostId      : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName            : MyServer.company.com
MachineName        : MYSERVER
CurrentState       : On
LastStartTime      : 04/04/2011 15:25:38
LastActivityTime   : 04/04/2011 15:33:39
OSType             : Win32NT
OSVersion          : 6.1.7600.0
ServiceVersion     : 5.1.0.0
DatabaseUserName   : NT AUTHORITY\NETWORK SERVICE
Sid                : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {
 MySiteService1, MySiteService2... }
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-Metadata

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*"matches records with a metadata entry having a key name of "abc"and a value starting with the letter "x".

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Property

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Type:	String[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-ReturnTotalRecordCount

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Monitor_Filtering for details.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	SwitchParameter
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-MaxRecordCount

Specifies the maximum number of records to return.

Type:	Int32
Position:	Named
Default value:	250
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Skip

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Type:	Int32
Position:	Named
Default value:	0
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-SortBy

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Type:	String
Position:	Named
Default value:	The default sort order is by name or unique identifier.
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Filter

Gets records that match a PowerShell-style filter expression. See about_Monitor_Filtering for details.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-FilterScope

Gets only results allowed by the specified scope id.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2106

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.Service

The Get-MonitorServiceInstance command returns an object containing the following properties.

- Uid <Integer>

  Specifies the unique identifier for the service in the group. The unique identifier is an index number.

- ServiceHostId <Guid>

  Specifies the unique identifier for the service instance.

- DNSName <String>

  Specifies the domain name of the host on which the service runs.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- MachineName <String>

  Specifies the short name of the host on which the service runs.

- CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

  Specifies whether the service is running, started but inactive, stopped, or failed.

- LastStartTime <DateTime>

  Specifies the date and time at which the service was last restarted.

- LastActivityTime <DateTime>

  Specifies the date and time at which the service was last stopped or restarted.

- OSType

  Specifies the operating system installed on the host on which the service runs.

- OSVersion

  Specifies the version of the operating system installed on the host on which the service runs.

- ServiceVersion

  Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

- DatabaseUserName <string>

  Specifies the Active Directory account name with permissions to access the database for this service instance. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

- Sid <string>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- ActiveSiteServices <string[]>

  Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned:

- UnknownObject

  One of the specified objects was not found.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PartialData

  Only a subset of the available data was returned.

- InvalidFilter

  A filtering expression was supplied that could not be interpreted for this cmdlet.

- CouldNotQueryDatabase

  The query required to get the database was not defined.

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-MonitorServiceAddedCapability

August 14, 2025

Gets any added capabilities for the Monitor Service on the controller.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Get-MonitorServiceAddedCapability
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables updates to the Monitor Service on the controller to be detected.

There is no requirement for a database connection to be configured in order for this command to be used.

Examples

EXAMPLE 1

Get the added capabilities of the Monitor Service.

```
Get-MonitorServiceAddedCapability
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You cannot pipe input into this cmdlet.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Outputs

String

Comma separated string containing added capabilities.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated

- Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-MonitorServiceInstance

August 14, 2025

Gets the service instance entries for the Monitor Service.

Syntax

```
Get-MonitorServiceInstance
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Returns service interfaces published by instances of the Monitor Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a Central Configuration Service so that other services can locate the functionality.

You do not need to configure a database connection to use this command.

Examples

EXAMPLE 1

Get all instances of the Monitor Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

```
Get-MonitorServiceInstance
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Monitor.Sdk.ServiceInstance

The Get-MonitorServiceInstance command returns an object containing the following properties.

- ServiceGroupUid <Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- ServiceGroupName <String>

  Specifies the name of the service group of which the service is a member.

- ServiceInstanceUID <Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a Central Configuration Service. Unregistered service instances do not have unique identifiers.

- ServiceType <String>

  Specifies the service instance type. For this service, the service instance type is always <#= CmdletPrefix #>.

- Address

  Specifies the address of the service instance. The address can be used to access the service and, when registered in the Central Configuration Service, can be used by other services to access the service.

- Binding

  Specifies the binding type that must be used to communicate with the service instance. In this release of Citrix Virtual Apps and Desktops, the binding type is always 'wcf_HTTP_kerb'. This

© 1997–2025 Citrix Systems, Inc. All rights reserved.

indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

- Version

  Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

- ServiceAccount <String>

  Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

- ServiceAccountSid <String>

  Specifies the Active Directory account security identifier for the machine on which the service instance is running.

- InterfaceType <String>

  Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  - SDK - for PowerShell operations
  - InterService - for operations between different services
  - Peer - for communications between services of the same type

- Metadata <Citrix.Monitor.Sdk.Metadata[]>

  The collection of metadata associated with registered service instances, which are service instances held by and obtained from a Central Configuration Service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-MonitorServiceStatus

August 14, 2025

Gets the current status of the Monitor Service on the controller.

Syntax

```
Get-MonitorServiceStatus
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Enables the status of the Monitor Service on the controller to be determined. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Before using this cmdlet, you don't have to configure the database connection for the Service.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Examples

EXAMPLE 1

Get the current status of the Monitor Service.

```
Get-MonitorServiceStatus

ServiceStatus  ExtraInfo
-------------- ---------
DBUnconfigured {
 ... }
```

Parameters

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-MonitorServiceStatus cmdlet returns an object containing the status of the Monitor Service together with extra diagnostics information.

- DBUnconfigured

  The Monitor Service does not have a database connection configured.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- DBRejectedConnection

  The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

- InvalidDBConfigured

  The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

- DBNotFound

  The specified database could not be located with the configured connection string.

- DBMissingOptionalFeature

  The Monitor is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

- DBMissingMandatoryFeature

  The Monitor is connected to a database that is valid, but it does not have the full functionality required so the Monitor cannot function. Upgrading the database is required.

- DBNewerVersionThanService

  The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

- DBOlderVersionThanService

  The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

- DBVersionChangeInProgress

  A database schema upgrade is currently in progress.

- OK

  The Monitor Service is running and is connected to a database containing a valid schema.

- PendingFailure

  Connectivity between the Monitor Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

- Failed

  Connectivity between the Monitor and the database has been lost for an extended period of time, or has failed due to a configuration problem. The Monitor service cannot operate while its connection to the database is unavailable.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

- Unknown

  The service status cannot be determined.

Notes

If the command fails, the following errors can be returned:

- DatabaseError

  An error occurred in the service while attempting a database operation.

- DatabaseNotConfigured

  The operation could not be completed because the database for the service is not configured.

- DataStoreException

  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- PermissionDenied

  You do not have permission to execute this command.

- AuthorizationError

  There was a problem communicating with the Citrix Delegated Administration Service.

- CommunicationError

  There was a problem communicating with the remote service.

- ExceptionThrown

  An unexpected error occurred. For more details, see the Windows event logs on the controller or the Citrix Virtual Apps and Desktops logs.

Get-MonitorWebhookProfile

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2411

Retrieves one or more webhook profile configurations.

Syntax

```
Get-MonitorWebhookProfile
    [-Uid <Int64>]
    [-Name <String>]
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

This cmdlet fetches the configuration(s) of existing webhook profile(s) based on the specified unique identifier (Uid) or name. If no parameters are provided, it returns all webhook profiles.

Examples

EXAMPLE 1

Retrieves the webhook profile with the unique identifier equal to 1.

```
Get-MonitorWebhookProfile -Uid 1
```

EXAMPLE 2

Retrieves the Webhook Profile object having the name equals to 'WebhookProfile1'

```
Get-MonitorWebhookProfile -Name 'WebhookProfile1'
```

Parameters

-Uid

Specifies the unique identifier of the webhook profile to retrieve.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Name

Specifies the name of the webhook profile to retrieve. This can be a partial name to match multiple profiles.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	True

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

ICollection<MonitorWebhookProfile> System.String

A collection of one or more MonitorWebhookProfile objects matching the query.

New-MonitorCssEventNotification

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Sends a ConfigSyncService failure event notification to Monitor Service.

Syntax

```
New-MonitorCssEventNotification
   -Mode <Int32>
   -Level <Int32>
   [-ConsecutiveDbImportFailCount <Int32>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
    -SourceMachineName <String>
    -ResourceLocId <Guid>
    -NotificationTime <DateTime>
    [-LoggingId <Guid>]
    [<CitrixCommonParameters>]
    [<CommonParameters>]
```

Description

Sends a ConfigSyncService failure event notification to Monitor Service. These cmdlet is called by the CSS service.

Examples

EXAMPLE 1

Inserts the CSS event notification to NotificationCssEvent records. Updates the level in case there is a change in it.

```
New-MonitorCssEventNotification -AdminAddress "W2K19ST-VN9BLQD.sgs.
    local:89" -Mode 0 -Level 1 -ConsecutiveDbImportFailCount 4 -
    SourceMachineName "W2K19ST-VN9BLQD.sgs.local" -ResourceLocId $(New-
    Guid) -NotificationTime $(Get-Date)
```

Parameters

-Mode

Mode of the event LHC Outage or CSS failure

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Level

Level warning or critical

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SourceMachineName

Connector or notification source machine name

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ResourceLocId

Resource location Id of the notification source

Type:	Guid
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-NotificationTime

Time the event sent from ConfigSyncService

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ConsecutiveDbImportFailCount

Count of the consecutive DB import failure on Connector/Controller machine

Type:	Int32
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Status of the setting a new CSS failure event notification

Related Links

New-MonitorLhcReports

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2311

Returns a boolean

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
New-MonitorLhcReports
   -EndDate <DateTime>
   -Duration <Single>
   -MachineInZoneCount <Int32>
   -MachineRegisteredCount <Int32>
   -ReconnectedSessionCount <Int32>
   -SessionBrokeredCount <Int32>
   -ZoneName <String>
   -ControllerName <String>
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

Description

Returns a boolean stating whether a new lhc report was added or not

Examples

EXAMPLE 1

Inserts multiple attributes into LhcReport after the cloud connector outage is over

```
New-MonitorLhcReports -Duration 120 -EndDate 2023-09-05T09
   :13:39.1835337Z -MachineInZoneCount 1 -MachineRegisteredCount 2 -
   SessionBrokeredCount 3 -ReconnectedSessionCount 4 -ZoneName "
   Bangalore" -ControllerName "Dynasty"
```

Parameters

-EndDate

End date of LHC

Type:	DateTime
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept wildcard characters:	False

-Duration

Duration of LHC in minutes

Type:	Single
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineInZoneCount

Count of Machines in zone

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-MachineRegisteredCount

Count of machines registered

Type:	Int32
Position:	Named
Default value:	None
Required:	True

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

-ReconnectedSessionCount

Count of sessions reconnected

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-SessionBrokeredCount

Count of sessions brokered

Type:	Int32
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ZoneName

Name of zone

Type:	String
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-ControllerName

Name of Controller/Cloud connector

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Returns a bool stating LhcReport was saved into db

Related Links

New-MonitorNotificationPolicy

August 14, 2025

Returns a new MonitorNotificationPolicy object

Syntax

```
New-MonitorNotificationPolicy
   -Name <String>
   [-Description <String>]
   [-Webhook <String>]
   [-IsSnmpEnabled <Boolean>]
   [-Enabled <Boolean>]
   [-IsEmailAttachmentEnabled <Boolean>]
   [-IsWebhookAttachmentEnabled <Boolean>]
   [-WebhookProfileId <Int64>]
   [-LoggingId <Guid>]
   [<CitrixCommonParameters>]
   [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Returns a new policy instance using the specified parameters

Examples

EXAMPLE 1

Creates session policy and persist the data into database

```
New-MonitorNotificationPolicy -Name "Policy1" -Description "Policy
    Description" -Enabled $true
```

EXAMPLE 2

Creates an enabled “Policy1”with a description and links it to a webhook profile with ID 1.

```
New-MonitorNotificationPolicy -Name "Policy1" -Description "Policy
    Description" -Enabled $true -WebhookProfileId 1
```

Parameters

-Name

Name of policy to create

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Description

Description of policy to create

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Webhook

Webhook URL of policy to create

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsSnmpEnabled

boolean value representing if SNMP is enabled for new Policy

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Enabled

Boolean paramter indicating the enabled state of the policy. true - Enabled, false - Disabled

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	Boolean
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-IsEmailAttachmentEnabled

boolean value representing if email attachment is enabled for new Policy

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

-IsWebhookAttachmentEnabled

boolean value representing if webhook attachment is enabled for new Policy

Type:	Boolean
Position:	Named
Default value:	False
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2407

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-WebhookProfileId

Unique identifier for the webhook profile to be associated with the policy.

Type:	Int64
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False
Introduced in:	Citrix Virtual Apps and Desktop 7 2411

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -

© 1997–2025 Citrix Systems, Inc. All rights reserved.

WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the collection of policy objects created

Related Links

- Get-MonitorNotificationPolicy
- Set-MonitorNotificationPolicy
- Remove-MonitorNotificationPolicy

Remove-MonitorDirectorAgent

August 14, 2025

Introduced in: Citrix Virtual Apps and Desktop 7 2407

Returns a boolean

Syntax

```
Remove-MonitorDirectorAgent
      [-Component <String>]
      [-Fqdn <String>]
      [-ResourceLocationId <Guid>]
      [-AgentId <Guid>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Description

Returns a boolean stating whether respective stack monitoring agent is deregistered successfully

Examples

EXAMPLE 1

Deregisters the agent and saves its information in Monitor DB

```
Remove-MonitorDirectorAgent -ComponentType "PVS" -Fqdn "AWPVS-1HBF0.bvt
    .local -ResourceLocationId "4068b075-2e31-4686-ad3c-2300b16fcfd2"
```

Parameters

-Component

Type of component this agent is installed on

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-Fqdn

FQDN for the machine where the component and agent are installed

Type:	String
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-ResourceLocationId

Resource location the agent is targeted for

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-AgentId

AgentId the agent is targeted for

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Boolean

Returns a boolean stating whether respective stack monitoring agent is deregistered successfully

Remove-MonitorNotificationPolicy

August 14, 2025

Removes persisted policy from the database by marking them as deleted

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-MonitorNotificationPolicy
      [-InputObject <MonitorNotificationPolicy[]>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicy
      [-Uid <Int64[]>]
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Removes the policy object from database by marking them as deleted and disable all the condtions associated with that

Examples

EXAMPLE 1

Removes the policy with id 1

```
Remove-MonitorNotificationPolicy -Id 1
```

EXAMPLE 2

Removes the policy with id matching the policy object specified

```
Remove-MonitorNotificationPolicy -InputObject $policy
```

Parameters

-InputObject

Removes all of the instances with the id matching in the specified policy objects

Type:	MonitorNotificationPolicy[]
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-Uid

Removes all of the instances with the specified ids. If any of the ids are invalid, an exception is thrown.

Type:	Int64[]
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named
Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

Return success if all operations are succeeded

Return success if all operations are succeeded. An exception is thrown otherwise

Remove-MonitorNotificationPolicyConditions

August 14, 2025

Remove conditions from the existing policy specified and returns the updated policy.

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Syntax

```
Remove-MonitorNotificationPolicyConditions
      -InputObject <MonitorNotificationPolicy>
      -Conditions <ConditionType[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicyConditions
      -Uid <Int64>
      -Conditions <ConditionType[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove conditions from the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Removes the condition SessionPeakconnectedCount from policy matching id 100

```
Remove-MonitorNotificationPolicyConditions -Uid 100 -Conditions
   SessionsPeakconnectedCount
```

Parameters

-InputObject

Specifies the policy object from which the conditions to be removed.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

© 1997–2025 Citrix Systems, Inc. All rights reserved.

-Conditions

Collection of condition types to be removed

Type:	ConditionType[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy from which the conditions to be removed.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Type:	Guid
Position:	Named

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Default value:	None
Required:	False
Accept pipeline input:	False
Accept wildcard characters:	False

CitrixCommonParameters

This cmdlet supports the common Citrix parameters: -AdminAddress, -AdminClientIP, -BearerToken, -TraceParent, -TraceState and -VirtualSiteId. For more information, see about_CitrixCommonParameters.

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutVariable, -OutBuffer, -PipelineVariable, -Verbose, -WarningAction, and -WarningVariable. For more information, see about_CommonParameters.

Inputs

None

You can't pipe objects to this cmdlet.

Outputs

MonitorNotificationPolicy

Returns the updated policy object

Remove-MonitorNotificationPolicyEmailAddresses

August 14, 2025

Remove email addresses from the existing policy specified and returns the updated policy.

Syntax

```
Remove-MonitorNotificationPolicyEmailAddresses
      -InputObject <MonitorNotificationPolicy>
      -EmailAddresses <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicyEmailAddresses
      -Uid <Int64>
      -EmailAddresses <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove email addresses from the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Removes the email addresses from the policy matching id 100

```
Remove-MonitorNotificationPolicyEmailAddresses -Uid 100 -EmailAddresses
    $emailAddresses
```

Parameters

-InputObject

Specifies the policy object from which the email addresses to be removed

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-EmailAddresses

Collection of email addresses to be removed

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy from which the email addresses to be removed.

Type:	Int64
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

Remove-MonitorNotificationPolicyTargets

August 14, 2025

Remove targets from the existing policy specified and returns the updated policy.

Syntax

```
Remove-MonitorNotificationPolicyTargets
      -InputObject <MonitorNotificationPolicy>
      -TargetIds <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorNotificationPolicyTargets
      -Uid <Int64>
      -TargetIds <String[]>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

Description

Remove targets from the existing policy specified and returns the updated policy.

Examples

EXAMPLE 1

Removes the targets from policy matching id 100

```
$targetIds = @()
$targetIds += "766cde70-3c69-4481-a658-4e11247ac70d"

Remove-MonitorNotificationPolicyTargets -Uid 100  -TargetIds $targetIds
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Parameters

-InputObject

Specifies the policy object from the targets to be removed

Type:	MonitorNotificationPolicy
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-TargetIds

Object reference to the array of target ids.

Site GUID - for target type Site

DesktopGroup UUID - for DesktopGroup, RdsWorker target types

Type:	String[]
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

-Uid

Specifies the unique identifier of the policy from the targets to be removed

Type:	Int64
Position:	Named
Default value:	None

© 1997–2025 Citrix Systems, Inc. All rights reserved.

Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False

Remove-MonitorServiceMetadata

August 14, 2025

Removes metadata from the given Service.

Syntax

```
Remove-MonitorServiceMetadata
      [-ServiceHostId] <Guid>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorServiceMetadata
      [-ServiceHostId] <Guid>
      -Map <PSObject>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorServiceMetadata
      [-InputObject] <Service[]>
      -Name <String>
      [-LoggingId <Guid>]
      [<CitrixCommonParameters>]
      [<CommonParameters>]
```

```
Remove-MonitorServiceMetadata
      [-InputObject] <Service[]>
```

© 1997–2025 Citrix Systems, Inc. All rights reserved.

```
        -Map <PSObject>
        [-LoggingId <Guid>]
        [<CitrixCommonParameters>]
        [<CommonParameters>]
```

Description

Provides the ability to remove metadata from the given Monitor Service.

Examples

EXAMPLE 1

Remove all metadata from all Service objects.

```
Get-MonitorService | % {
  Remove-MonitorServiceMetadata -Map $_.MetadataMap  }
```

Parameters

-Name

The metadata property to remove.

Type:	String
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	False
Accept wildcard characters:	False
Length range:	1 to 64
Disallowed characters:	\/;:#.*?=<>|[]()"'

-Map

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “Sys-

© 1997–2025 Citrix Systems, Inc. All rights reserved.

tem.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Type:	PSObject
Position:	Named
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False

-ServiceHostId

Id of the Monitor Service

Type:	Guid
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByPropertyName, ByValue)
Accept wildcard characters:	False

-InputObject

Monitor service objects from which metadata is to be removed.

Type:	Service[]
Position:	2
Default value:	None
Required:	True
Accept pipeline input:	True (ByValue)
Accept wildcard characters:	False
